**Simarûba**, Sarg. (*B. gummifera*, Jacq.). GUMBO-LIMBO or WEST INDIAN BIRCH. Lvs. odd-pinnate with 3-5 pairs of lfts.; lfts. ovate, acute, membranous, smooth on both sides, entire, the netted veins prominent on the under side; fls. staminate and pistillate, appearing before the lvs. or as they unfold, in knotty racemes somewhat resembling those of the choke cherry: fr. a drupe, with a 3-valved succulent rind and 3-5 nuts.—A tall tree with a straight trunk and spreading head, found in Fla., Mex., and Cent. Amer. and the W. Indies. Wood very light, specific gravity when dry 30; useless even for fuel; decays very rapidly. It yields a sweet, aromatic balsam, which is used in Trop. Amer. as a medicine for internal and external application; dried, it is known in the trade as Chibou, or Cachibou resin, or Gomart resin. It is known as a hardy greenhouse plant, and thrives in a compost of loam and peat. Prop. by cuttings under glass, with bottom heat.

G. T. HASTINGS.

**BUSH-FRUIT**. A term used to designate those small-fruits that grow on woody bushes. It includes all small-fruits—as that term is used in America—excepting strawberries and cranberries. Bush-fruits is an English term, but it has been adopted in this country, notably in Card's book on "Bush-Fruits." The common bush-fruits are currants, gooseberries, raspberries, blackberries, and dewberries.

**BUTCHER'S BROOM**: *Sarcococca*.

**BÛTEA** (Earl of Bute). *Leguminosae*. Three or 4 species of trees or woody vines of India and China, with deep scarlet papilionaceous fls. in racemes, and pinnate lvs. In the Old World rarely grown in stoves. In this country 1 is cult. in S. Calif.

**frondosa**, Roxbg. A leafy tree, yielding gum or lac: lfts. 3, roundish, pubescent beneath, the lateral ones

697. *Bupleurum fruticosum*.

unsymmetrical: fls. 2 in. long, orange-crimson, very showy; stamens 9 together and 1 free. E. India and Burma. Rheede Hort. Mal. 6:16, 17.—Reaches a height of 50 ft. Inspissated juice is known as Bengal or Palas kino, or butea gum, which has astringent properties, resembling true kino. Seeds used in India as a vermifuge. The tree yields also stick-lac. The coarse, fibrous material obtained from the inner bark is used for caulking the seams of boats. Dried fls. yield a yellow or orange dye.

**BUTNÈRIA:** *Calycanthus*.

**B Û T O M U S** (Greek, *bous*, ox, and *temno*, to cut; the leaves too sharp for the mouths of cattle). *Eutomaceæ*. Hardy perennial aquatic of easy culture in ponds.

The *Butomaceæ* comprises 3 genera. *Butomus* is allied to *Alisma*, but with several ovules in each carpel; perianth-segms. all prominent and colored; stamens 9; carpels 6, tapering above: lvs. sedge-like. All the species

698. *Butomus umbellatus*. ( $\times \frac{1}{4}$ )

are referred by DC., in Mon. Phan., Vol. III, to *B. umbellatus*, and to the Australian *Butomopsis*, which is also a monotypic genus (by some, however, included in *Tenagocharis*).

**umbellatus**, Linn. **FLOWERING RUSH**. Fig. 698. Rhizome thick: lvs. 2-3 ft. long, iris-like, sheathing at the base, 3-cornered: fls. rose-colored, 25-30 in an umbel, on a long scape; sepals 3; petals 3. Summer. Eu., Asia, in still water. Prop. by division.

**BUTTERCUP:** Species of *Ranunculus*.

**BUTTERFLY WEED:** *Asclepias tuberosa*.

**BUTTERNUT:** *Juglans*.

**BUTTERWORT:** *Pinguicula*.

**BUTTON-BUSH:** *Cephalanthus*.

**BUTTONWOOD:** *Platanus*.

**BÛXUS** (ancient Latin name). *Buxaceæ*. **BOX TREE**. Ornamental small trees or shrubs grown chiefly for their handsome evergreen foliage.

Leaves opposite, short-petioled, penninerved, entire, glabrous or nearly so, coriaceous: fls. monœcious, apetalous, in axillary or terminal clusters, consisting usually of 1 terminal pistillate fl., with usually 6 sepals and with a 3-celled superior ovary with 3 short styles and several lateral staminate fls. with 4 sepals and 4 stamens: fr. an obovate or nearly globular 3-pointed caps, separating into 3 valves, each containing 2 shining black seeds.—About 30 species in the mts. of Cent.

and E. Asia, N. Afr., and S. Eu., also in W. India and Cent. Amer.

These are evergreen shrubs of rather slow growth, with shining, small foliage and inconspicuous flowers and fruits. *Buxus japonica* seems to be the hardiest species, and it has proved quite hardy at the Arnold Arboretum; and *B. microphylla* is of about the same hardiness, while *B. sempervirens* is somewhat tenderer; *B. balearica* and *B. Wallichiana* are still more tender. *B. sempervirens* stands pruning very well, and in the old formal gardens of Europe was formerly much used for hedges, and sometimes trimmed into the most fantastic shapes; the dwarf variety is still often planted for bordering flowerbeds. The very hard and close-grained wood is in great demand for engraving and finer turnery work.

The box tree thrives in almost any well-drained soil, and best in a partially shaded position.

Propagation is by cuttings from mature wood early in fall, kept during the winter in the cool greenhouse or under handlights in the open; in more temperate regions they may be inserted in a shady place in the open air; 4 to 6 inches is the best size for outdoor cuttings. Layers will also make good plants. The dwarf variety is usually propagated by division. In planting borders, it is essential to insert the divided plants deeply and as firmly as possible, and to give plenty of water in the beginning. Seeds are sown soon after maturity, but it requires a long time to raise plants of good size from them.

A. Width of lvs. less than  $\frac{1}{2}$  in.

B. Lvs. oval to oblong-lanceolate, broadest about or below the middle: branchlets usually slightly pubescent.

**sempervirens**, Linn. **COMMON BOX TREE**. Fig. 699. Shrub or small tree, to 25 ft.: branches quadrangular: lvs. oval-oblong or oval, rarely roundish oval or lanceolate, usually obtuse,  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. long, petioles usually pubescent: fls. in axillary clusters; staminate fls. sessile, with a central gland half as long as the calyx. S. Eu., N. Afr., Orient, China. H.W. 3, p. 29. F.E. 18 pl. 81. Gn. 55 p. 62.—Wood much used for engraving. Lvs. employed in medicine. Very variable in size, color and shape of the lvs.; some of the most commonly

cult. forms are the following: Var. **arborëscens**, Linn. Fig. 700. Tall shrub or small tree: lvs. usually oval. The typical form. Var. **argentea**, Loud. (var. **argenteo-marginata**, Hort.). Lvs. irregularly edged with silvery white. Var. **aurea**, Loud. (var. **aurea maculata**, Baill.). Lvs. variegated with yellow or entirely yellow. Var. **marginata**, Loud. (var. **aurea marginata**, Baill. and Hort.). Lvs. edged yellow. Var. **glauca**, Koch (var. **macrophylla glauca**, Hort.). Lvs. oval, glaucous. Var. **rotundifolia**, Baill. (var. **latifolia**, Hort.). Lvs. broadly oval. Var. **Handsworthii**, Koch. Of upright habit, with rather large dark green lvs. Var. **oleaeifolia**, Hort. Of upright habit, with oblong lvs., resembling those of the olive. Var. **elegans**, Hort. (var. **oleaeifolia elegans**, Hort.). A variegated form of the preceding variety. Var. **bullata**, Koch. With large bullate lvs. Var. **angustifolia**, Loud. (var. **longifolia**, Hort., var. **salicifolia**,

699. *Buxus sempervirens*. ( $\times \frac{1}{2}$ )  
The lower spray shows the under surface.

Hort.) Shrubby: lvs. oblong-lanceolate. Var. *myrtifolia*, Loud. Usually low: lvs. small, elliptic-oblong. Var. *rosmarinifolia*, Baill. Low: lvs. small, linear-oblong, revolute at the margin. Var. *suffruticosa*, Linn. (var. *nana*, Hort.). Dwarf: lvs. small, oval or sometimes obovate; flowering clusters usually only terminal.

BB. Lvs. usually obovate, broadest above the middle: branchlets glabrous.

*japonica*, Muell. Arg. (*B. obcordata*, Hort. *B. Fortunei*, Hort.). Shrub, 6 ft., with spreading branches: lvs. cuneate, obovate or roundish obovate, obtuse or emarginate at the apex,  $\frac{1}{2}$ – $1\frac{1}{4}$  in. long, light green with glabrous petioles; clusters axillary; staminate fls. sessile, with a central gland as long as the calyx. China, Japan. S.I.F. 2:38.—Very distinct with its spreading slender branches and light green, lustrous foliage.

*microphylla*, Sieb. & Zucc. (*B. japonica* var. *microphylla*, Muell. Arg.). Dwarf, often prostrate shrub, quite glabrous: lvs. obovate or obovate-lanceolate,  $\frac{1}{4}$ –1 in. long; clusters mostly terminal; staminate fls. sessile, with a central gland like the former. Japan.

AA. Width of lvs.  $\frac{1}{2}$  in. or more.

*baleàrica*, Willd. Shrub, 6–15 ft.: lvs. elliptic or oblong, acute or obtuse at the apex, 1–2 in. long, light green: clusters axillary; staminate fls. pedicelled. S. Spain, Balear.—Handsome shrub, but less hardy than the former.

*B. californica*, Lk. = *Simmondsia californica*.—*B. Fortunei*, Carr. = *B. longifolia*.—*B. Fortunei*, Hort. = *B. japonica*.—*B. Harlandii*, Hance. Branches pubescent: lvs. narrow obovate, emarginate,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long. China.—*B. longifolia*, Boiss. (*B. Fortunei*, Carr.). Lvs. narrow-elliptic or lanceolate, 1– $1\frac{1}{2}$  in. long. Orient, China.—*B. longifolia*, Hort. = *B. sempervirens* var. *angustifolia*.—*B. Wallichiana*, Baill. Branches pubescent: lvs. linear-elliptic, 1– $2\frac{1}{2}$  in. long. Himalayas.

ALFRED REHDER.

**BYRSÓNIMA** (name refers to use of some species in tanning, in Brazil). *Malpighiaceæ*. Perhaps 100 Trop. American trees and shrubs, frequently climbing, rarely known in cult. Lvs. opposite, thick, simple, entire, the stipules often connate: fls. white, yellow or pink, in terminal simple or branched racemes; sepals and petals 5, the former bearing a pair of glands, the latter clawed and the blades concave; stamens 10, the filaments united at base and bearded: fr. a 3-celled fleshy drupe, with bony seeds, often edible. *B. lucida*, HBK., occurs in Fla. and W. Indies, a much-branched evergreen shrub, with fls. white turning yellowish or rose; apparently not in the trade. *B. crassifolia*, HBK. Mex. and S., is offered in S. Calif. Shrub or small tree: lvs. ovate, tapering each way: fls. yellow in pubescent erect racemes. Said to bear the "nanche," a popular fruit of the Mexicans. This has a sour fermented taste; it is offered for sale in the markets of the west coast Mexican towns, and is eaten raw with salt, or in soups, or in stuffing for meats. The astringent bark, rich in tannin, is used medicinally.

700. *Buxus sempervirens* var. *arborescens*.

# C

**CABBAGE.** The more or less compact leaf-formed head of *Brassica oleracea*; also applied, with designations, to related forms of the same species, as Welsh cabbage, tree cabbage. Closely related plants are the kales (Fig. 706), collards, Brussels sprouts, cauliflower. See *Brassica*.

The Chinese cabbage of this country is a wholly different species from the common cabbages. It does not form a compact and rounded head, but a more or less open and soft mass of leaves, after the manner of Cos lettuce. It is of easy culture, but must be grown in the cool season, for it runs quickly to seed in hot and dry weather.

The culture of the cabbage antedates reliable historical record. Writers of Pliny's time or before refer to variations in growth and character which must have resulted from selections and cultivation for many generations, under conditions very different from those which seem to be the natural habitat of the plant on the comparatively barren chalk cliffs of England, and in similar locations in Europe.

It is indeed hard to realize that the scrawny and somewhat starved-looking plant shown in Fig. 628 (Vol. I) could be the ancestral origin of such corpulent, overfed individuals as are shown in Figs. 701 to 704. Such a change in habit of growth can be accounted for only by the plant's possession of exceptional capacity for using the more abundant food-supply furnished by cultivation for many generations, and the storing of it in a way that makes it available for man's use rather than for the mere perpetuation and multiplication of the parent plants.

*Characteristics of the plant and requisites for best development.*

The cabbage is classed by botanists as a slow-growing bi-annual, and has three distinct periods of life: First, the more or less rapid growth of leaf and plant. Second, a more or less distinct resting period during which the formation of embryonic blossoms is started. Third, the growth and development of the flower and seed. The cultivated cabbages retain very persistently these distinct growing periods, but have added what might be classed as another, that of head-formation, which is in reality simply a distinct division of the first. This additional head-forming period, although essential to the plant's value as a cultivated vegetable,

is not at all necessary for the growth and perpetuation of the plant, which, when it has been held in check by long-continued severe frost or drought, will often revert to the original order of growth and pass directly from the growing to the seeding stages with no attempt at head-formation.

Cultivated cabbage thrives best in a moist and comparatively cool climate, and will not reach its best and rarely a satisfactory or profitable development in a hot dry one, nor where there are likely to be even occasional days of high temperature or hot dry winds. Even if there is abundant moisture in the soil, a few hot dry days, such as corn and tomato plants would delight in, will often not only check but permanently prevent any vigorous or profitable growth. This sensitiveness to over-heat is most pronounced during the second or

unnatural period of growth, and the least so during the first. Young plants will often thrive in temperatures in which it would be quite impossible to induce older ones to form a solid head. Excessive heat is quite as injurious, and often more so, than freezing, but the latter is especially injurious to the younger plants, particularly if they are growing rapidly, the older ones being little injured by frost which would kill rapid-growing seedlings. One notable effect of exposure of young plants to severe or long-continued low temperature is that it takes the place of the resting period, and thus cuts out the second or head-forming period, so that the plant, as soon as established in the field, begins to shoot to seed without forming any head. The degree to which the plant suffers from unfavorable temperature seems to vary not only with different varieties but in different locations. In the Puget Sound country, cabbage plants are often killed by exposure to low temperatures, which those of the same variety and age growing in similar

soil and exposure on Long Island would endure with little apparent injury. In the United States, favorable climatic conditions are most likely to occur in succession during the winter, spring and fall months, as one moves northeast along the Gulf and Atlantic coasts, or in the West along the coast north from Portland, Oregon, and in isolated sections south of that point. Some of the finest cabbages ever produced in America have been grown at points on the Pacific coast as far south as Los Angeles, California. There are also locations,

701. Conical form of cabbage—Jersey Wakefield.

702. Round-headed type of cabbage.

703. Savoy cabbage.

704. A modern cabbage plant in head—Early Flat Dutch.

especially in New York, Ohio, Indiana, Michigan and Wisconsin, near the Great Lakes, or where smaller but deep inland lakes abound, in which cabbage does exceptionally well, but generally, in common with most cruciferous plants, they do better near the sea, in such

705. Section of cabbage head, showing the thickened rachis and leaf-stalks, and the buds in the axils.

locations as the Eastern Shore of Maryland, Long Island and Puget Sound regions, than in the interior or on the borders of even very large bodies of fresh water.

As the plant is a native of the temperate zone, and thrives best in it, and cannot long endure high temperatures, one does not think of it as particularly sun-loving; but there are few garden plants to which abundant sunlight is more essential and shade more detrimental than the cabbage.

In its native habitat, the

plants are found growing alone or in small open groups where they are fully exposed to the sun. Similar conditions are essential to its best development under cultivation so that it can rarely be profitably grown in the shade or in crowded groups or rows, and "shooting to seed" or other failure to form a head is often due to the crowding of the seedlings in the seed-row.

The cabbage is one of the grossest and least fastidious feeders of cultivated plants, and while an abundance of easily accessible food is essential for its profitable culture, it is less particular than most plants as to its proportions and physical condition, if only it has an abundance. Large crops of the best quality are often produced by the use of fresh green and uncomposted manures in almost limitless quantities. Some growers object to the use of manure from hog-pens, yet some of the largest, healthiest and best crops ever seen have been grown by the liberal use of hog manure. Strange as it may seem, abundant fertilization hastens rather than retards the plant reaching marketable condition.

The plant is more particular as to its water-supply than its food-supply, and suffers even more quickly than most vegetables from a lack of sufficient moisture in the air or soil. On the other hand, it cannot long endure an excess, particularly in the soil, and soon succumbs to wet feet. A well-drained soil which at the same time is fairly retentive of moisture is essential to profitable cabbage-culture.

Even more than with most garden vegetables, the physical condition of the soil is a most important factor in determining the development of the cabbage. Large and often very profitable crops may be grown on soils which would be classed as clay, loam, gravel, sand or muck, provided they are rich and friable, but seldom a large, or profitable crop can be grown on even a very fertile soil which after rains quickly hardens and bakes so as to be impervious to air. Permanent friability rather than superior fertility makes some soils exceedingly profitable for cabbage, while it is difficult and often impossible to grow a paying crop on others which are even richer and better watered, but which are liable to cake after every rain. This is especially true of some soils that are generally classed as a very rich clay or muck. Permanent friability is the most essential quality for profitable cabbage-culture, and the want of it the most common cause of failure to grow a profitable crop.

*Varieties of cabbage.* Figs. 701-704, 707.

Few vegetables show a wider range of variation. There are sorts that can be grown to edible maturity

on a square foot and in 90 to 120 days from the seed, while others can hardly be crowded into a square yard or reach prime edible maturity in less than 200 days; sorts so short-stemmed that the flat head seems to rest on the ground, others in which the globular head crowns a stalk 16 to 20 inches long; kinds in which the leaves are long, round, or broad, smooth, or savoyed, light yellowish green, dark green or so dark red as to seem black, with surfaces which are glazed, smooth, or covered with thick bloom. There are many early-maturing kinds, each having characteristics adapting them for different cultural conditions and uses, that will, in fertile soil and a temperature between 60° and 80° by day, and never below 40° at night, form salable heads in 90 to 110 or 120 days from the germination of the seed; others that mature in mid-season; still others that grow the entire season and increase in solidity even while stored for winter.

American seedsmen offer cabbage seed under over 500 more or less distinct varietal names, a large proportion of which stand for different stocks rather than for distinct varietal forms: here only the most distinct types and the most commonly used names are mentioned.

*Early York, Etampes, Large York, etc.*—Very compact, upright-growing smooth-leaved sorts which are comparatively tender to both heat and cold, and form vertically oval comparatively soft heads of excellent quality, but better suited to European than American climatic conditions and market requirements.

*Early Jersey, Large Wakefield, Winnigstadt, etc.*—Compact-growing, very sure-heading sorts which are very hardy to both heat and cold and form comparatively small, but closely wrapped hard sharply conical heads which are of attractive appearance, but not of the best quality. Well suited to the general soil and climatic conditions and very popular in America.

*Enkhuizen Glory, Early Summer, Fottler's Drumhead, etc.*—Second-early sorts, forming small compact to large spreading short-stemmed plants, and nearly round to distinctly flat heads which mature quickly, are of good quality but not well adapted for distant shipment or winter storage.

*Flat Dutch, Drumhead, Ballhead or Hollander, etc.*—Large spreading comparatively slow-growing plants, forming round to oval hard heads, having the leaves very closely wrapped and overlapping in the center. They are generally good keepers, often improving not only in solidity but in quality during storage.

*Savoy.*—A class in which the leaves of both plant and head are crumpled or savoyed instead of smooth as in the preceding. There are varieties of all the forms of smooth-leaved sorts. The plants are hardy, but are slow to form heads, which are likely to be small

706. Curled kale.—*Brassica oleracea* var. *acephala*.

and more or less open or loose-centered, but they are of superior flavor, and this class is worthy of more general cultivation in the home-garden and for local market.

*Red cabbage.*—A class of which there are many varietal forms, and in which the plants and heads vary from purple shaded green to deep red. The heads are generally small, but very solid and are especially suited for use as "cold slaw."

*Portugal Sea-Kale, Tronchuda or Chinese cabbage.*—These are distinct classes and species of cabbage, intermediate in character between the more common sorts and the more distant kales. They have never become generally popular in America, though they are rather largely grown and used by the Asiatics, particularly on the Pacific coast. The sea-kale cabbage is not to be confounded with sea-kale, which is a very different plant.

These are but a few of the almost limitless, more or less distinct variations offered by seedsmen, yet each of them was thought by someone to be superior in some location, under some conditions, or for some purpose. The general recognition of the value of each variation, and the consequent popularity of the sorts in which the variation is best developed, are constantly changing, partly because of local conditions of climate, but more largely because of changes in transportation and market facilities and conditions.

#### *Cultural methods.*

Ideal climatic conditions are found only in very limited areas, and the common cultural practice in each locality is largely shaped by the degree to which local conditions approach them. In the country north of Washington in which a well-lighted and heated greenhouse and experienced help are available, the simplest method, and one by which the very best of early cabbage can be grown, is to plant the seed in flats some sixty to ninety days before danger of killing by frost is past, and as soon as the central bud or leaves appear (which should be in ten to fourteen days) to "prick out" the plants, setting them 2 to 4 inches apart in other flats, according to the relative importance in that particular culture of earliness and cost of production. The house should be given abundant ventilation, and temperatures exceeding 70° or 85° by day and 50° or 60° at night carefully avoided. Often it will be found very advantageous, as soon as the plants are well established, to remove them to well-lighted coldframes. These should be carefully tended in order to give all the air possible, and to avoid over-heating by the sun or falling below 35° at night, and the plants transferred to the open ground as early as this can be done without danger from killing frosts. Some very successful growers plant seed in well-protected coldframes so as to secure a thin, even stand, and by careful attention secure a slow but steady growth through the winter, and the seedlings are first transplanted to the open ground as soon as danger from killing frosts is over. A common practice from Philadelphia or Baltimore southward is to sow the seed in the fall in carefully prepared beds in sheltered locations, and, as soon as the plants are large enough, to transplant them to flat-topped ridges about 30 to 36 inches from center to center and as high as can be formed by two or three back-furrows. These ridges usually are run east to west and the plants are set on the south, the north or the top, or sometimes in the furrow between them, depending upon the judgment of the planter as to which location will give the best result on that particular farm and exposure and in that particular season, as sometimes one and sometimes another location gives the best results. In some sections and often only on certain farms of a section this method gives large very early-maturing and profitable crops, while in different fields, even on the same farm, a large proportion of the plants so handled will be killed by frost or will shoot to seed without heading. In certain locations, notably in the vicinity of Charleston, South Carolina, cabbage-plant farms have been established, from which plants in prime condition for setting in the field can be secured by the million. The location and exposure, and the character of the soil of the most successful of these farms is such that the plants are rarely killed or seriously checked by frost, but make a constant but slow growth all winter and can be pulled at any time so as to retain abundant root and vigor and be safely shipped long distances. The seed is sown and the plant-beds treated much as one would treat a bed of onions for sets or pickles, except that in many cases the rows are as close as 3 inches and the bed receives little or no cultivation after the seed is planted.

Objections that are sometimes well founded to plants from such farms are, that they are slow "taking

hold" and a large proportion of them "shoot to seed" without heading, or the heads are small and of poor quality; but such failures often come from the use by the plant-raiser of cheap and inferior seed, or from the crowded rows and careless handling, or from the farmer sending for and setting the plants too early, or from holding them too long before setting. Some plant-raisers take pains to advertise that they do not guarantee plants shipped by them before December 1 to give satisfactory results (though they often do), but that they are willing to guarantee that plants shipped by them from December 1 to April 1 will, in suitable soil and exposure and with good cultivation, produce full crops of marketable cabbage. Most farmers who use 20,000 to 30,000 plants could grow on their own farms as good plants or better than they could buy from even the best and most reliable growers, and often at materially less cost; but it is

707. Cabbage shapes: Flat; round or ball; egg-shaped; oval; conical.

questionable whether many of them would do so, and it is not surprising that the practice of buying plants, particularly when earliness in market maturity is desirable, is rapidly extending.

The best distance between plants will depend not only upon the variety used but upon the character of the soil, kind of labor available and the condition and way in which the crop is to be marketed. Such small upright-growing sorts as Early York, Etampes, or true Jersey Wakefield, which are to be marketed when still quite soft, can be well grown set as close as 6 or 8 by 18 to 24 inches, requiring 20,000 to 30,000 plants to the acre; but in America such close planting necessitates so much hand labor that it is seldom profitable, and 8 to 12 by 28 to 30 or 36 inches, requiring from 8,000 to 15,000 or 20,000 plants to the acre, is usually found the more profitable distance.

The best method of setting, whether by hand, hand-planters, or machine, will be determined by local conditions. The plants should "take hold" in two to four days and start into vigorous growth in ten days to three weeks, the time depending upon the condition of the plants, and the way they are handled, quite as much as upon the weather. After active growth has commenced, it should continue at a constantly accelerated rate until the head begins to harden, and although toward the last the plants may not seem to increase in size, the heads will gain in weight. The cabbage suffers less than most vegetables from mutilation of the root, yet deep cultivation is undesirable because unnecessary. The essential thing is to prevent any crusting over, and the keeping of the surface in such good tilth as to permit of the free aëration of the soil.

One of the best crops of early cabbage on record was secured from what was regarded as naturally a rather unfavorable soil that was not very heavily fertilized, but received a shallow cultivation with a harrow tooth cultivator every day (except Sundays and on four days when the surface was so wet from rain that it would puddle) after the plants were set until the crop was in market condition.

The time of planting for fall and winter cabbage and the general cultural methods most likely to give good results in any particular location are the same for both seasons, the time of maturity being determined more by the varietal character of the seed than by method of culture. The cultural practice usually followed by neighboring and equally successful growers is often radically different. One planter may always, on some fixed day in May or June, sow seed in flats and as soon as the seedlings are well started pick them out into other flats, and then again into a plant-bed and wait for a favorable day, if necessary until August, before putting them in the field. An equally successful neighboring grower may wait until as late as the last of June and sow thinly in well-prepared seed-beds and transplant from them to the field, while still another may wait for favorable weather even until the last of July and then plant seed in place as is the usual practice of some most successful growers. In New England, growers often drill the seed in place, and when the plants are well established chop out the superfluous ones.

708. An outdoor method of storing cabbage.

The weight or quantity of seed used for a given area varies greatly, as the size of the individual seeds vary, not only with different varieties but with different lots of the same sort. Some growers expect to get plants enough for an acre from less than an ounce, while others require two to five times as much, and those who sow in place often will use four to eight ounces to the acre. Superlative crops have been known to be grown by radically different methods, and very often successful growers have some peculiarity of practice which they deem essential to the best results, but which a neighboring and equally successful grower regards as a foolish waste of labor; but, however the practice of successful growers may differ, there are some points in which they all agree. Among these are, the use of the best obtainable seed of some particular variety which they have found by experience, or which they believe is best adapted to their conditions and is uniform in time of maturity, so that all the heads are in prime condition and may be gathered at the same time, which is an important factor in determining cost of production, while uniformity in shape, form and color are equally important in determining salability. The quality of the seed used, while not the only factor, is generally the most important one in determining the uniformity of product of any particular culture. Unchecked and constantly accelerated rate of growth are most important factors in securing the best possible development of any particular culture. Every check, whether it come from overcrowding of the seedlings, careless transplanting, or the caking and want of friability in the surface soil, tends to divert the energy of the plant from the unnatural and excessive leaf-formation upon which

its value as a cultivated vegetable depends to the more natural but less useful formation of blossoms and seed. Just how on any particular farm the most favorable conditions can be secured cannot be told in general cultural directions, but must be decided by the grower from his knowledge of the character and wants of the plant, the condition of the soil, and last, but by no means least, his facilities for controlling the conditions upon which the growth of the crop depends.

#### Harvesting.

This is the simplest and easiest part of cabbage-growing. With an easily acquired dexterity, each head in five or six rows can be cut, trimmed and tossed into a central windrow by a single well-directed stroke of a well-sharpened spade or heavy hoe. Occasionally, because of some unnatural growth of the plant, or want of attention, a head will need retrimming, but by the exercise of a little care, practically all of them can be kept in marketable shape. From the windrows, the heads are gathered and loaded loose into cars, delivered to factories or placed in storage. Yields secured vary greatly, being influenced by the sort, the quality of the seed, the character of the soil, loss from insects and disease; they generally range from five to twenty tons to the acre. The crop is usually readily salable in the fall, delivered at factory or on board cars at prices ranging from \$4, or even less, to \$10 to \$20 a ton.

#### Marketing.

*Cabbage greens.*—In some sections, notably southern Mississippi and Louisiana, considerable acreage is grown and marketed as cabbage greens. The seed is sown in place or the plants are set quite close in the row, and as soon as they have commenced active

growth and long before they have formed a distinct head, they are cut and marketed much in the same manner as spinach or kale, but this method of culture and use is very limited.

*Early cabbage* is generally considered marketable as soon as the leaves have closed into a head, even if this is still so soft and loose that it would be quite unmarketable later in the season. If cabbages are cut when soft and immature, they soon wilt and lose all crispness and palatability; to avoid this, the earlier shipments are made in small open crates containing less than a score of heads, or sometimes in larger closed ones carrying ice, and often in refrigerator cars. Later in the season, as the heads become larger and harder, they are shipped in slat crates about 12 by 18 by 38 inches, or in ventilated burlap-covered barrels holding about two and three-fourths bushels.

*Fall and winter cabbages* are usually sold by the ton, of much more closely trimmed heads than are considered marketable earlier in the season, and are commonly shipped in open and well-ventilated cars without special container or packing, except as may be necessary to protect from hard freezing. Many acres are grown on contracts with shippers, packers of sauerkraut, and the like, who contract for the delivery direct from the field to factory or on board cars, of the usable product of a certain acreage at an agreed price per ton. While this is sometimes a very satisfactory arrangement, many careless and incompetent growers are induced to contract, and their neglected crops become infected with disease and insects which spread to the fields of even the most careful growers, and the crop in the vicinity of such factories and shipping-points soon becomes unprofitable.

*Storing.*

Formerly the most common practice was to let the plants stand until danger of hard freezing, then pulling, allowing the roots to retain what earth they would, but breaking off some of the most spreading leaves and crowding the plants together (with heads all up or all

709. Cabbage in winter storage in cabbage-house.

down and at a uniform height), with earth packed between them, in long shallow trenches that were gradually covered with sufficient coarse straw or litter to protect from severe freezing. A variation of this method is to pull, leaving what roots and earth adheres, and set as closely and level as possible in a shallow cellar not over 3 feet deep, which after filling is covered with a roof of boards, tarred paper and litter sufficient to keep out rain and frost, and high enough in the center to allow of handling the cabbage. It is essential to success with either trench or cellar that they be located where there is the least possible danger from standing water, rats and other vermin, and as well protected as possible from severe winds and cold. Advantages of this method are that heads quite too soft to be salable become hard and firm, and that cabbages so stored retain to a remarkable degree their crispness and flavor, and are thought by some to be even better than when fresh from the field; but when taken from the trench or cellar, they soon lose their crispness and will not stand shipment so well as heads which were trimmed before storing. A very common method is to cut and partially trim the heads and place in piles 4 to 6 feet high and broad, and of convenient length, built over a board-covered trench which is ventilated by open ends and tiles up through the cabbage, the piles being gradually covered and the openings closed so as to prevent hard freezing (Fig. 708).

In certain sections a large proportion of the cabbages grown for late winter and early spring market are trimmed and stored in bins or on shelves in frostproof storehouses (Fig. 709).

*Diseases.*

*Clubroot* (*P.asmodiophora brassicae*).—A soil parasite affecting cabbage and other cruciferous plants. It thrives best in acid soils and in some cases can be checked by a liberal use of lime, but its presence in any field in destructive abundance is seldom suspected until too late to save the crop. Planting cabbage or other cruciferous crops on such a field should not be repeated for several years, during which it should have continued dressings of lime and ashes. Care should be taken to secure uncontaminated soil for seed-beds, and to destroy all affected plants before cattle have access to them, as the disease may be carried by such refuse in the manure from cattle who have eaten it.

*Wilt or Yellowing, Black-rot, Stem-rot, Fusarium, Phoma*.—Infectious diseases which sometimes become so abundant in certain sections as to prevent the profitable culture of cabbage. They are all distributed by means of contaminated seed, by manure from cattle fed on diseased refuse, by soil carried on tools from affected fields; distribution in this way should be carefully avoided. All diseased plants should be destroyed by fire as soon as noticed. The soil used in the seed-beds should be sterilized by live steam or

soaked in a weak solution of formaldehyde (one part to 260 of water). The seed should be soaked fifteen minutes in the weak solution of formaldehyde, then rinsed in clear water and immediately planted.

*Animal pests.*

*Flea beetles*.—The securing of vigorous plants is sometimes prevented by the attacks of innumerable flea beetles, *Phyllotreta vittata*. This may be prevented by surrounding the beds with frames made of 10- to 12-inch boards connected across the top with 2-inch strips and then covered with 20- to 40-thread to the inch cheesecloth. This should be put on as soon as the seed is planted and be removed, in order to harden the plants, four to six days before they go to the field.

*Cut-worms*.—These are best guarded against by keeping the field perfectly clear of all vegetation for six to ten days before setting, then mix four quarts of bran meal or flour, one cup of molasses or sugar, and two tablespoonfuls of paris green, with water enough to make about the consistency of milk, and sprinkle on twenty to fifty times its bulk of fresh-cut grass and scatter over the field the night before setting the plants.

*Cabbage worm*.—Keep careful watch of the plants and if the green worms appear in abundance and seem to reach full size, sprinkle or spray the plants with kerosene and whale-oil soap emulsion, or paris green and water in the proportion of four gallons of emulsion and one pound of paris green to fifty gallons of water. After the heads are two-thirds grown, powdered hellebore, one ounce to two gallons of water, should be substituted for the poisonous paris green mixture.

*Root-knot* (*Necrotodes*).—Although seldom very destructive north of Philadelphia, this is often the unsuspected cause of failure in the South, particularly of fall crops in light lands. The only practical remedy is the avoidance of affected fields or sterilizing the soil by freezing or live steam.

*Seed-breeding and -growing.* Figs. 710, 711.

It is only through careful study of the practical value and correlation of varietal differences, the exercise of great care in selection and growing of the plants, and in the saving of the seed, that this or any vegetable can be improved or even its present good qualities maintained. Under favorable conditions the plant is capable of producing abundant seed, a single plant having been known to yield thirty-five ounces, enough to plant 25 to 40 acres, but such yields are very exceptional, and one-half to four ounces a plant is much more common. Although botanically the plant is self-fertile, when isolated it seldom yields much and often no viable seed. It transmits very persistently through many generations any distinct variation, but often without expression, although such hitherto unexpressed variations are apt to appear in the seed of self-fertilized plants, so that such seed is frequently less uniform than that from a field of plants of the same ancestry. At least one of our popular varieties is made up of the descendants of a single isolated plant, but it is a curious fact that in the second and subsequent generations 90 per cent of the plants, although quite uniform, were very different in character from that of the selected individual from which they were descended. The originator of one of our best varieties maintains that it is essential to the production of the best seed of that sort that seed-plants of very different types should be set together, and by crossing they will produce seed giving plants of the desired type. In spite of these facts, it is thought that the practice which will give the best results with other plants is equally desirable for the cabbage, and that first a distinct and well-defined conception of the varietal form desired must be formed and the stock started from the plant or plants whose seed most uniformly developed into plants of the desired

710. Wild cabbage plant in seed. Chalk-cliffs of England.

character, rather than from those in which it was exceptionally well developed. Often even professional seed-growers have but a very vague and constantly changing conception of what a given variety should be.

The greatest profit is not from the field that produces even a good many of the most perfect specimens, but from that in which the largest proportion of the plants are most uniformly of the desired character. In order to produce seed which will give such results, one must first form a very clear conception of just what one wants in plant and head, and learn the relation between easily noted but economically unimportant qualities, and others not so easily seen but more important in determining value. Having selected a number of ideal plants, one should grow these either singly, or in groups of three or four that are nearest alike. Save and number the seed of each plant separately and plant a small sample of each number, carefully noting the numbers in which the product was most uniformly of the desired character. From the

711. Cultivated cabbage in seed.

reserved seed of the numbers which most uniformly developed the desired form, one can start a stock for field planting. It is not safe, however, to rest there; one must start a new selection of the desired character so as to continually renew one's stock. In raising seed, plant-

ings should be made a little later than one would for fall market cabbage. As the plants develop, each lot should be repeatedly looked over and not only those which show no disposition to form a head, or one in which the inclosing leaves do not pass over the center, but also those which show any departure (even if it be of itself a desirable one) from the desired form, should be removed. The plants should be left in place until there is danger of the ground being closed by frost and should then be pulled, a few of the larger leaves removed and then packed into narrow trenches in sheltered and well-drained localities, taking pains to pack the earth closely about the roots and stems. Gradually, as necessary to prevent hard freezing, they should be covered with earth and with coarse litter, the aim being to keep them as cold as possible without actually freezing, and to prevent them starting into growth. As early in the spring as possible, they should be set for seeding, giving each plant about twice the space needed for market cabbage. In setting, the plants, should be more or less inclined, so that while the top of the head is but little above the surface, the roots are not buried in hard and cold subsoil. As they are set, the heads should be scarred across the top, not deep enough to injure the sprouting center, but so as to facilitate its pushing its way through the head. The seedstalks should not be cut until they begin to shed the seed, which turns black and seems ripe before it is fully mature.

The entire plant should be cut and stored until quite dry, when the seed can be easily threshed, cleaned, and spread not over  $\frac{1}{2}$  inch deep in full sunlight for a few days and then stored.

*Commercial seed-growing.*—Although one occasion-

ally sees heavily seeded plants in all parts of the United States, cabbage seed rarely proves a profitable crop, except in very limited areas along Long Island Sound, the eastern shores of New Jersey, Maryland and Virginia, and in the Puget Sound region, where the yield commonly secured varies from 300 to 700 pounds to the acre, although exceptional crops sometimes reach 1,500 to 2,000 pounds. The common method of growing does not vary materially from that described, except that very often too little care is exercised in securing stock seed, and it is sowed or the plants set so late that they fail to develop sufficiently to enable one to do very effective roguing out of inferior stock. In Holland, seed is often raised from much better matured heads than are commonly used in America and which are cut from the root, but leaving more stem than for market use, and planted so that the top is level with or slightly below the surface. Treated in this way, they root like a great cutting and form loose, well-branched plants which are not so liable to injury from wind, and are said to yield more seed than would be produced if the entire plant was used. It is possible that this method might give good results in the Puget Sound region, but it would not in the East.

W. W. TRACY.

**CABÓMBA** (aboriginal name). *Nymphaëaceæ*. FAN-WORT. Submersed aquatics of the western hemisphere, used in ponds and aquaria.

Flowers small; sepals and petals 3, persistent; stamens 3-6; carpels 3-18, separate: submerged lvs. finely dissected, mostly opposite.—Six species.

*caroliniana*, Gray (*C. aquatica*, DC., not Aubl. *C. viridifolia*, Hort.). WASHINGTON PLANT. FISH-GRASS. Floating lvs. green, oblong-linear: fls. axillary,  $\frac{1}{2}$  in. broad, white, with 2 yellow spots at base of each petal; stamens 6. Ponds and slow streams, S. Ill. to N. C., Fla. and Texas. A.G. 15:157.—Hardy as far north as Phila. if not frozen. The commonest plant for fish-globes and aquaria; roots easily in earth, grows well, is dense and bushy, and a good oxygenator; prefers water free from lime. Prop. by cuttings set in earth in 1-2 ft. of water at 55-70° F. Commonly sold for aquaria in bunches of 6-12 shoots 8 in. long, wrapped with lead at base; without earth the bunch lasts 4-8 weeks, when it drops most of its lvs. and must be replaced. Var. *rosafolia*, Hort., is a form with reddish lvs., less durable, and more difficult to prop. A. G. 15:157. Var. *pulcherrima*, Harper, has stp. reddish purple, lvs. darker with narrower segms. and petals bright purple. Ga. The true *C. aquatica*, Aubl., of Trop. Amer., with yellow fls. and nearly orbicular floating lvs., is shown in B.M. 7090.

H. S. CONARD.

**CACÀLIA** (ancient Greek name). *Compositæ*. Perennial herbs of wide distribution, some of which are planted in the open for ornament.

Flowers paniculate or corymbose, the florets all hermaphrodite, with white, flesh-colored, or orange, exclusively tubular corollas, each of the 5 lobes with a midnerve: achenes glabrous: lvs. petioled, alternate. The genus is by some considered as a section of *Senecio*, differing in never having ray-fls.—Species about 40, about one-fourth Asian and the remainder mostly American. They need protection in the North.

*lutea*, Mill. A slender rather attractive perennial, with alternate, widely separated lvs. half clasping the st.: fls. orange-yellow, in heads about  $\frac{1}{2}$  in. diam., corymbose. St. Helena; perhaps not a true cacalia.

*C. aurea* and *C. lutea* of gardens may be *Emilia*.—*C. coccinea*, Sims=Emilia.

N. TAYLOR.†

**CACALIOPSIS** (*Cacalia*-like). *Compositæ*. Perennial, for garden planting.

Heads discoid, very many-fld. of perfect yellow florets; corolla rather deeply 5-cleft, the lobes lanceolate: lvs. palmate.—One species, little known in cult.

**Nardósmia**, Gray. Stout, 1-2 ft. high, loose, woolly, but becoming nearly glabrous: lvs. nearly all radical, not unlike those of *Petasites palmata*, long-stalked, 5-9-cleft or very rarely parted, the lobes dentate or cut: heads an inch high, in a loose cluster at the summit of the nearly naked st., fragrant. Pine woods, Calif. to Wash.—Intro. by Gillett in 1881 as a border plant.

**CACAO, COCOA:** *Theobroma*.

**CACTUS, CACTI.** The plants correctly designated by this name constitute the family *Cactaceæ*. Scarcely any group in the whole vegetable kingdom is more remarkable for its strange and varied forms, the beauty of its flowers, and wonderful adaptation to desert life. It is not, however, confined to desert regions; for in the moist forests of the tropics of the New World it is represented by a number of interesting forms often epiphytal or scrambling in their habit of growth, with beautiful flowers and sometimes with delicious edible fruit.

712. Tips of *Rhipsalis cassytha*.

713. Skeleton of *Opuntia* stem.

714. *Pereskia aculeata*.

715. *Opuntia* joint with leaves.

The *Cactaceæ* are confined to America, the only apparent exception being the genus *Rhipsalis*, composed of plants with the habits of the mistletoe, growing on the trunks and branches of trees, and bearing small pellucid glutinous berries (Fig. 712). This genus, endemic in tropical America, has found its way to Africa, the island of Mauritius and even to Ceylon; and several opuntias, or prickly pears, occur on the shores of the Mediterranean, in South Africa, and Australia, where they have made themselves so thoroughly at home as to be regarded by many writers as indigenous. The *Cactaceæ* are not confined to tropical or even semi-tropical regions. At least two species of *Opuntia* extend northward into British Columbia, and species of *Echinocereus*, *Echinocactus*, and *Mamillaria* are found in the state of Colorado. The xerophytic forms flourish especially in the southwestern United States, the Mexican plateau, the peninsula of Lower California, where there are great cactus forests, and the vicinity of Tehuacan, in the southern part of the Mexican state of Puebla, a region celebrated for its remarkable and gigantic tree-like forms related to the genus *Cereus*. For an account of the vegetation of the deserts of the southwestern states and of Mexico, the reader is referred to Frederick V. Coville's "Botany of the Death Valley Expedition," published as Vol. IV of the "Contributions from the United States National Herbarium, 1893," Coville and MacDougal's "Desert Botanical Laboratory of the Carnegie Institution—1903"; and to D. T. MacDougal's

tion as low as possible. They have a more or less pronounced woody axis surrounded by pulpy cellular tissue (parenchyma) in which the water-supply is stored. The stomata are usually situated in depressions or grooves in the leathery cuticle; and as an additional means for checking transpiration, the cell-sap is nearly always mucilaginous, while in some forms latex cells are present, filled with milky or gummy fluid which hardens on exposure to the air and effectively heals wounds in the soft fleshy plant. Certain species of *Echinocactus* (viznagas) are like great barrels studded with spines and filled with pulp of the consistency of watermelon rind,

which is sometimes made into conserves like citron (dulces de viznaga). Other forms, like species of *Pereskia*, *Pereskioopsis*, and arboreal opuntias have hard, woody stems and branches. The reticulated skeletons of certain species of opuntia (Fig. 713) are manufactured into walking-sticks, legs of furniture, napkin rings, and even into veneering for woodwork. In Lower California and some parts of South America, where other vegetation is lacking, the stems of columnar cerei, or "cardones," are used for constructing habitations, inclosures, and for timbering mines. Columnar cacti are also planted for living fences, or hedges, especially the "organ cactus" (*Mytillocactus geometrizans*) of tropical Mexico. Leaves are present in nearly all cacti, but in some species they are mere vestiges and can scarcely be seen with the naked eye. In other species they are large and perfectly developed, either with distinct petiole and feather

716. Cactus spines.

717. *Opuntia leptocaulis*, showing sheathed spines.

the genera *Opuntia* and *Pereskopsis*, the areoles also bear minute short barbed which will penetrate the skin and become detached at the slightest contact and are the source of annoying irritation which often persists for many hours.

The spines (Fig. 716) are not connected with the axis of the stem or branches, but emerge from the areoles. In some forms they are simple and straight, bristle-like, awl-shaped, or short and conical. In others they are bent like fishhooks or are curved and horn-like, with transverse ribs. Sometimes they are minutely downy or hairy and sometimes even plumose or feathery. They may be either naked or enveloped in a membranous barbed sheath (Fig. 717). They may be grouped in star-like clusters, with straight or curved rays spreading from a common center, or in comb-like fascicles, with the radial spines arranged in two rows on each side of a longitudinal axis (pectinate). In addition to the radial spines, there are usually erect central spines either straight and rigid, or more or less curved. One of the most striking forms is that of the organ cactus, *Myrtillocactus geometrizans*, in which the stout erect central spine resembles the blade of a dagger and the radials a guard for the hilt. In contrast with this may be mentioned the spines of *Pelecyphora aselliformis*, which resemble miniature sow-bugs, or aselli (Fig. 718).

The flowers in most cases issue from the upper portion of the areoles, but in certain mamillarias and allied

forms they come forth from between the tubercles or from their base at the end of a dorsal groove. Usually the flowers are solitary and sessile, but in the genus *Pereskia* (Fig. 714) they are peduncled and often clustered. They may be tinted with rose-color, crimson, purple, yellow or orange, or rarely with copper-color or scarlet, but they are never blue. Often they are pure white at first, gradually becoming suffused with rose-color in age. In a few species they are inconspicuous, as in the epiphytal *Rhipsalis* (Fig. 712). Some are diurnal, others nocturnal; some open at sunrise and close at night or when the sky becomes clouded; others open at a certain hour and close at another fixed hour of the day or night; some last for only a few hours, others for a day, and some persist for several days. Some, like the "night-blooming cereus" are delightfully fragrant, while others are ill-smelling or have no perceptible odor.

The perianth is not divided sharply into calyx and corolla, although the outer floral leaves are usually sepal-like and the inner ones are true petals. In one great division of the family including *Opuntia*, which has been named *Rotatifloræ*, the perianth is more or less wheel-shaped or widely spreading (Fig. 719); in the other division, *Tubulifloræ*, to which *Cereus* belongs, the floral leaves form a tube, often

remarkably long and slender, and crowned with a spreading limb. The floral leaves are not arranged in definite series but somewhat like those of a water-lily, the scale-like lower or outer leaves gradually becoming broad and petaloid as they approach the center (Fig. 720). In all cases the perianth crowns the ovary, and sometimes persists after withering on the apex of the fruit (Fig. 721). The stamens are very numerous and are inserted on the petals or perianth-tube (Fig. 722). The single style is longer and stouter than the slender filaments, and usually terminates into a radially divided stigma (Fig. 723). Sometimes the stigma is conspicuously colored and issues star-like from the center of the

722. *Echinocactus* flower, showing insertion of stamens.

723. *Opuntia* flower, showing styles and ovary.

726. *Opuntia* fruit.

mass of stamens, as in the genus *Echinocereus*, in which the emerald-green star contrasts prettily with the golden-yellow or orange-colored stamens, rising from a rosette of rose-purple petals (Fig. 724). The ovary (Fig. 723), although formed of several carpels, is 1-celled. The placentæ are parietal, bearing an indefinite number of ovules, the stalks of which (funiculi) become fleshy as the seeds develop and form a sugary pulp around the seeds.

The fruits of the Cactaceæ are variable in form. That of the leafy *Pereskia* is apple-shaped and bears a number of leaf-like bracts on the skin (Fig. 725), on which account the fruit of *P. aculeata* is called blad-appel, or leaf-apple, in the Dutch colonies, while in the British West Indies it is known as Barbados gooseberry and is made into tarts and sauces like real gooseberries. In some of the pereskiopses, the fruit is elongated and shaped like a prickly pear, with watery rind and seeds covered with cottony hairs. In *Opuntia* and *Nopalea* the fruit is commonly called prickly pear, or tuna (by the ancient Aztecs, *nochtli*). These fruits bear small fleshy leaves at first, like the flattened pads of the plants, and when the leaves fall off the areoles persist armed with the irritating sharp-barbed glochidia described above (Figs. 717 and 726).

Many species allied to the genus *Cereus* bear edible fruits, usually called pitahayas. Those of the tall columnar cardones (*Lemaireocereus*) are covered with easily detachable tufts of wool and spines but never bear glochidia. Those of *Cephalocereus* (Fig. 721) are spineless. The triangular climbing forms which are often trained over garden walls in tropical countries, sometimes bear enormous juicy fruits of fine flavor (Fig. 727). Those of *Echinocactus* (Fig. 728) are more or less scaly. The fruits of certain species of *Echinocereus*, called *alicoches* by the Mexicans, are known to Americans as strawberry cacti, on account of the fine flavor of their juicy pulp. Those of *Echinocactus longihamatus* are known in northern Mexican markets as *limas de viznaga*, or cactus limes, on account of their acid taste; and the small smooth crimson fruits of many *mamillarias* are called *chilitos*, on account of their resemblance to small chili peppers. Very much like them are the fruits of melon cacti (Fig. 729) which issue from the dense crown of bristles like scarlet radishes or fire-crackers tipped with a fuse.

The seeds of the Cactaceæ vary considerably in

the different groups, and are sometimes useful in making generic determinations.

Thus the woolly seeds of *Pereskopsis* are sharply distinct from the black glossy seeds of the genus *Pereskia*, with which the first-named genus was at one time confused. In *Opuntia* and *Nopalea* they are flat, hard and bony, somewhat ear-shaped in the flat-jointed opuntias (Figs. 730, 733,) and usually discoid and marginless in cylindrical opuntias (Figs. 730, 735). In *Cereus* they are glossy black, with the testa either quite smooth or minutely pitted (Figs. 730, 732); in *Echinocereus* they are covered with minute tubercles or granules (Figs. 730, 734). In *Echinocactus*, which is not a very homogeneous group, the seeds are pitted in some species and tuberculate in others. In one section of *Mamillaria* (*Eumamillaria*) they are glossy and marked with sunken rounded pits (Figs. 730, 731), while in another section, which should probably be made a distinct genus (*Coryphantha*) they are frequently smooth. In the closely allied *Ariocarpus* they are relatively large and tuberculate. In the genus *Pelecypora*, they are sometimes kidney-shaped, as in *P. aselliformis*, and sometimes of a peculiar boat-like form with a very large umbilicus, as in *P. pectinata*. In the epiphytal *Rhipsalis cassytha* they are kidney-shaped and finely granular.

The seeds of many of the species of *Pachycereus* ("cardones") are used by the Indians of Lower California and Mexico for food. In southern Puebla the fruit of *Pachycereus columnar-trajani*, called *tetezo* figs (higos de tetetzo) are a regular food staple, offered for sale in the markets of Tehuacan during the month of May.

Other cactus fruits of great economic importance are those of the giant *Cereus* of our arid southwestern region, *Carnegiea gigantea*, locally known as *pitahayas de sahuara*, first brought to notice in the year 1540 by the members of Coronado's expedition. They are not spiny like the fruits of *Pachycereus* and they burst open when quite ripe. The fruit of *Lemaireocereus Thurberi*, known as *pitahaya dulce*, although much sweeter, bears clusters of stout spines issuing from tufts

724. *Echinocereus* flower, showing radiate stigma.

725. *Pereskia* fruit.

727. Fruit of *Hylocereus*.

of wool. Closely allied to it is *Lemaireocereus griseus* of central and southern Mexico, which yields much nutritious fruit. The fruit of the organ cactus, *Mytillocactus geometrizans*, sold in the markets as garambullas, either fresh or dried, must also be mentioned as of economic importance.

Of medicinal importance is the narcotic peyote or "mezcal button"

728. Fruit of *Echinocactus*.

729. Melon cactus bearing fruits.

(*Lophophora Williamsii*), used as an intoxicant and febrifuge by certain tribes of Indians, and regarded by some of them with superstitious reverence. This little plant was regarded by some of the early Spanish writers as a fungus and was used by the Mexican Indians to produce marvelous visions.

For an account of the methods of propagation and culture of cacti and their application to ornamental gardening the reader is referred to a paper by Charles Henry Thompson, on "Ornamental Cacti: Their Culture and Decorative Value," issued by the United States Department of Agriculture as Bulletin No. 262 of the Bureau of Plant Industry, December 17, 1912. See also *Succulents*, vol. VI.

W. E. SAFFORD.

**CÁCTUS** (shortened from *Melocactus* by Linnæus). *Cactaceæ*. A single small species, sometimes grown in under-glass collections and in open succulent gardens South.

Stems globose or ovoid, with vertical ribs, crowned at maturity with a "cephalum"—a prolongation of the axis densely covered with small tubercles imbedded in wool and bearing in their axils small fls. and berries. The plant has the appearance of an *Echinocactus*, but the fls. and berries resemble those of *Mamillaria*.

**Melocactus**, Linn. (*Melocactus communis*, Link & Otto). Fig. 731. Ribs 10-20, acute; areoles nearly 1 in. apart; radial spines 8-11, straight or curved, subulate; centrals 1-4; cephalum at first low, hemispherical, becoming cylindrical in time, reaching a height of 8 in.; the dense wool of the cephalum is pierced by many red or brown bristles; fls. red, slender; fr.  $\frac{2}{3}$  in. long, crowned by the persistent remains of the fl., red. W. Indies; called there "Turk's head." B.M. 3090. J. N. ROSE.

**CADÁLVENA:** *Kaempferia*.

**CÁDIA** (Arabic name, *Kadi*). *Leguminosæ*, tribe *Sophorææ*. Small evergreen shrubs of Arabia and Africa, remarkable for their regular mallow-like flowers.

Leaves pinnate; fl. axillary, mostly solitary, drooping; stamens 10, free, shorter than the petals; pod linear, acuminate, flattened, leathery.—Four species.

Can be grown outdoors in Calif. or S. Fla.; in the N. in the temperate house. Prop. by seeds and cuttings.

**purpurea**, Forsk. (*C. varia*, L'Her.). A small shrub, the branches woody; lfts. 20-40 pairs, very narrow, almost sessile; fls. bell-shaped, pedunculate, rose-red, the corolla about 1-1½ in. long and very veiny, not spiny. Arabia.

*C. Ellisiana*, Baker, has few large lfts. and rose-colored fls. Madagascar. B.M. 6685.—*C. pubescens*, Bojer. Lfts. 8-10 pairs, broad-oblong. Madagascar.

N. TAYLOR.†

**CÆSALPÍNIA** (Andreas Cæsalpinus, 1519-1603, Italian botanist). *Leguminosæ*. **BRASILETTO**. Including *Guilandina*, and *Poinciana* in part. Ornamental tropical or subtropical trees or shrubs chiefly grown for their showy flowers and also for their attractive finely divided foliage; some species yield tanning materials and dye-stuff.

Calyx with short tube and 5 imbricated lobes, the lowest concave and larger; petals 5, clawed, usually orbicular or obovate and nearly equal; stamens 10, curved; ovary sessile with few ovules and a slender elongated style; pod ovate to lanceolate, usually compressed, often indehiscent.—About 30 species in tropical and semi-tropical regions. The genus belongs to the subfamily Cæsalpinioidæ, in which the fls. are not papilionaceous, and is allied to *Gleditsia*.

Cæsalpinias are armed or unarmed trees or shrubs, rarely climbers, with finely divided bipinnate leaves and conspicuous yellow or sometimes partly red flowers in racemes, often forming terminal panicles. Many species are very showy in flower and are favorites in tropical and subtropical countries; in this country they can be grown only in Florida and southern California except *C. japonica*, which is the hardiest species and will probably stand the winter in sheltered locations as far north as Washington, D. C. They are also grown sometimes in warm glasshouses.

Propagation is readily effected by seeds, which should be well soaked in warm water for some hours before sowing. A sandy soil should be chosen for the seed-bed, and lightly shaded. After the plants show the first true leaf, they should be potted off into small pots of ordinary garden soil, not too rich, made light by the addition of sand, if of a clayey nature. The plants grow very rapidly, and must be shifted into larger pots as their size requires for greenhouse culture, but in tropical climates may be transplanted into permanent positions outdoors after they reach a fair size in pots. The dwarf species are elegant subjects for subtropical gardening during the summer months in temperate climates, provided a sunny location is given them, as they revel in rather dry very warm soil, and do not require artificial watering after being established. A rocky, sunny situation may be given *C. pulcherrima* and its variety *flava*, where they will bloom during many weeks of summer, until frost checks them, if strong plants about a foot high are selected in early summer. Care should be taken to harden off plants gradually in the house, so that they may not be chilled when transplanted outdoors. While they will do well in a poor soil, an application of manure or chemical fertilizer may be given them to advantage, causing them to make a more vigorous growth and give better and larger heads of flowers. In the tropics, and also in subtropical climates, these shrubs and trees are always admired and are commonly planted for ornament. The royal poinciana (*C. regia*, but properly *Poinciana regia*, which see), and also the dwarf poinciana, or flower-fence (*C. pulcherrima*), will thrive in close proximity to the sea, and are valuable for planting in exposed coast situations. (E. N. Reasoner.)

**A. Stamens long-exserted:** fls. very showy; trees, unarmed or nearly so.

**Gilliesii**, Wall. Shrub or small tree, with very many small lfts., scarcely  $\frac{1}{2}$  in. long, oblong, obtuse, glabrous:

730. Seeds of Cacti.

1. *Mamillaria*; 2. *Cereus*; 3. Flat-jointed opuntias; 4. *Echinocereus*; 5. Cylindrical opuntias.

XXI. Cherry.—Specimen fruits of one of the heart cherries.

fls. light yellow, with brilliant red stamens protruding 3-5 in., in terminal racemes; sepals hairy-fringed. S. Amer. B.M. 4006 (as *Poinciana Gilliesii*, Hook.). F.S. 1:61. R.H. 1893:400. G.C. III. 15:73. Gn. 76, p. 4.—A very showy and worthy plant which bears in Calif. the popular name of "Bird of Paradise" like *Strelitzia Reginae*. It will stand a temperature as low as 20° F.

**pulcherrima**, Swartz. BARBADOS PRIDE. BARBADOS FLOWER-FENCE. DWARF POINCIANA. Shrub, with few scattered prickles, delicate, evergreen, mimosa-like lvs. with 12-18 pinnae, each with 20-24 oblique-oblong lfts. less than 1 in. long, and very gaudy red-and-yellow crisped fls. on the ends of the new growth: stamens and style red, and long-exserted. Generally distributed in the tropics. B.M. 995. P.M. 3:3. Gn. 75, p. 594.—One of the most popular shrubs in warm climates, as S. Fla. There is a var. *flava*, with yellow fls.

731. Cactus Melocactus. (× 1/2)

AA. Stamens not much exceeding the petals, or shorter.

B. Lfts. very obtuse.

c. Branches unarmed.

**pannosa**, Brandeg. Medium-sized tree with slender branches spreading horizontally and clothed with white, deciduous bark: lvs. decomposed; pinnae 2-4, each with 4-6 oblong and retuse lfts.: fls. yellow, showy: pod glandular, 1-2-seeded. Lower Calif.—A rapid-growing species which can be used for fences and is therefore called "palo estaca" in Lower Calif.

cc. Branches prickly.

d. Pod smooth: shrubs.

**sepiaria**, Roxbg. Scrambling pubescent shrub: lvs. glaucous, slightly pubescent beneath; pinnae 12-20, each with 16-24 oblong lfts., rounded at both ends, 1/2-1 in. long: fls. yellow in simple stalked racemes. India.—Furnishes dye-wood; also used as a hedge plant.

**japonica**, Sieb. & Zucc. Loose, spreading shrub, armed with stout, recurved prickles: lvs. with 6-16 pinnae, each with 10-20 lfts., oblong, very obtuse: fls. in large, panicle-like clusters, canary-yellow, the stamens bright red. Japan. B.M. 8207. G.C. III. 42:43. R.H. 1912:60 Gn. 40:588; 61, p. 81; 76, p. 411. J.H. III. 34:531; 51.181.—Endures the winters in some

parts of England. The hardiest species of the genus, probably hardy as far north as Washington, D. C.

**Nûga**, Ait. Vigorous climber: branches flexuose with copious hooked prickles: lvs. glabrous; pinnae 4-6, each with 4-6 ovate-obtuse lfts. 1 1/2-2 in. long: fls. bright yellow in large panicles; calyx glabrous: pods ovoid-oblong, 2 in. long, indehiscent, 1-seeded. Himalayas and Philippine Isls. to N. Austral. and Polynesia. Blanco, Fl. Filip. 150.

DD. Pod prickly: tree.

**echinata**, Lam. Tree, with prickly rusty pubescent branches: lvs. unarmed, glabrous; pinnae 5-9, each with 15-20 rhombic-oblong obtuse lfts. 1/2-3/4 in. long: fls. yellow in axillary and terminal racemes; calyx pubescent; stamens shorter than petals: pod oblong, 3 in. long. Brazil. Fl. Brasil. 15, 2:22.—Yields dye-wood.

BB. Lfts. acute or mucronulate: pod prickly.

**minax**, Hance. Diffuse shrub, thorny: pinnae 10, with 12-20 ovate-lanceolate glabrous lfts. 1-1 1/2 in. long: racemes panicle, many-fl'd., with very large bracts; fls. white and purple: pods 7-seeded (seeds large and black), prickly. China.

**Bônduc**, Roxbg. Climbing shrub, with prickly, pubescent bipinnate lvs., oblong-ovate mucronate lfts. 1 1/2-3 in. long, yellow fls., and a few large yellow seeds in a short, prickly pod. Tropics; S. Fla.

*C. bijuga*, Swartz (Acacia Bancroftiana, Bert.). Spiny shrub, with ultimate lfts. in 2 pairs: fls. paniculate. Jamaica.—*C. kauaiensis*, Mann=Mezoneuron kauaiense.—*C. regia*, Dietr.=Poinciana regia.—*C. vernalis*, Champ. Tall climbing prickly shrub: fls. in racemes. China. B.M. 8132.

L. H. B. and ALFRED REHDER.

CAHOUN: *Attalea Cohune*.

CAILLËA: *Dichrostachys*.

**CAJÂNUS** (aboriginal name). *Leguminosæ*. A tropical shrub, grown for the nutritious peas. One variable species, probably originally from Africa.

**indicus**, Spreng. (*Cytisus Cajan*, Linn.). GRANDUL. CONGO PEA. PIGEON PEA. DHAL. TOOR. URHUR. Erect, 3-10 ft., villous or often tomentose: lfts. elliptic-oblong, exstipellate, resinous-punctate beneath: fls. yellow and maroon, pea-like, continuing all through the year, in axillary racemes: pod pea-like, hairy, constricted between the many seeds. Much cult. in the tropics for the seeds or pulse, being treated usually as an annual. It varies greatly in stature and in character of seeds: *C. flavus*, DC., has yellow fls. and 2-3-seeded pods which are not spotted; *C. bicolor*, DC., a smaller plant, has red-striped fls., and 4-5-seeded pods which are spotted. See B.M. 6440 and R.H. 1874:190. The pigeon pea is much grown in the W. Indies, some varieties being preferred for human food and some for live-stock; run wild.

L. H. B.

CAJÓPHORA: *Blumenbachia*.

CALABASH: *Crescentia*.

CALABASH GOURD: *Lagenaria*.

**CALADIUM** (origin of name obscure). *Aracæ*. Warmhouse large-leaved plants, grown for the foliage; also employed in summer bedding.

Herbaceous perennials, arising from large rhizomes or tubers, acaulescent, with usually beautifully marked, long-petioled lvs.; the secondary nerves oblique to the few spreading primary nerves: peduncles usually solitary; spathe with the tube convolute, constricted at the throat, the blade boat-shaped; spadix erect, a little shorter than the spathe, the lower part naked, stipe-like, the staminate part longer than the pistillate; fls. unisexual: fr. a berry, white.—A dozen or less species in Trop. S. Amer. Two of the species are immensely variable, and many named horticultural varieties are in the trade. Engler in DC. Monog. Phan. 2:45? (1879); also F. S. 13.

As soon as *Caladium* plants begin to lose their leaves in the fall, water should gradually be withheld until the leaves are all gone. The pots should then be removed to a position under a bench, and laid on their sides, or taken from the soil and placed in sand. During the resting period they should not be subjected to a lower temperature than 60° F., and kept neither too wet nor too dry. About the beginning of March the tubers should be started for the earliest batch to be grown in pots. Arrange the tubers in their sizes, and keep each size by itself. The largest-sized tubers will start quickest, and it is desirable to begin with these for pot-plants. Start them in chopped moss in boxes. The tubers may be arranged rather close together in the box, and merely covered over with the moss to the depth of about an inch. The new roots are made from the top part of the tuber, so it is important that this part should be covered to encourage the roots. For starting, a heat varying between 70° and 85° will suffice. As soon as a healthy lot of roots makes its appearance, the plants should be potted, using as small-sized pots as possible. The soil for this potting should be principally leaf-mold, with a little sand. In a short

732. *Caladium bicolor* var. *Chantini*. (No. 17).

time they will need another shift; the soil should on this occasion be a little stronger; give a position near the glass, and shade from strong sunshine.—New forms are raised from seed, this operation being an exceedingly easy one with the caladium, as they cross-fertilize very readily. The flowers, unlike those of the Anthurium, are monœcious, the females ripening first. To pollinate them, part of the spathe must be cut away. Seedlings at first have the foliage green, and it is not until the fifth or sixth leaf has been developed that they show their gaudy colorings. Propagation of the kinds is effected by dividing the old tubers, the cut surfaces of which should be well dusted with powdered charcoal to prevent decay.—As bedding plants, the fancy-leaved caladiums are gradually becoming more popular. To have them at their best for this purpose, the ground should be worked for some time previous to planting out, with a goodly quantity of bone meal incorporated with the soil. The tubers are best put out in a dormant state, as then they make very rapid progress, and eventually make finer plants than when they are first started in the greenhouse, as by this system they are too likely to sustain a check in the hardening-off process, and lose their leaves. The fine, highly colored

kinds are not so well suited for outdoor work as those having green predominating in the foliage, but some of the kinds, such as Dr. Lindley and Rosini, do remarkably well. Frequent watering with manure-water is absolutely necessary to the development of the foliage, both outdoors and in. (G. W. Oliver.)

It will be seen that most of the cultivated caladiums are considered to be forms of *C. bicolor* and *C. picturatum*. Only five species are concerned in the following list: *Schomburgkii*, 1; *marmoratum*, 7; *bicolor*, 8; *picturatum*, 48; *Humboldtii*, 57.

#### A. Blade not at all peltate, obliquely elliptical-ovate.

1. *Schömburgkii*, Schott. Petiole slender, 4 times longer than the blade, sheathed one-third its length; blade obliquely elliptical-ovate; midrib and 4-5 acutely ascending primary nerves silvery, pale, or red; sparsely spotted above, paler beneath. French Guiana to Para.—Runs into the following forms:

##### (1) Veins red.

2. Var. *marmoreum*, Engl. Blade dull green, with brownish red nerves, bordered with yellow.

3. Var. *erythræum*, Engl. (*C. Schmitzii*, Lem. *C. cordatum*, Hort.). Midribs and nerves red. I.H. 8:297.

4. Var. *pictum*, Engl. With white or red spots between the red veins. S. Amer.

##### (2) Veins silvery or green.

5. Var. *argyroneurum*, Engl. (*C. argyroneuron*, C. Koch. *C. Schalleri*, Lem.). Midrib and veins silvery I.H. 8:297.

6. Var. *subrotundum*, Engl. (*C. subrotundum*, Lem.). Lf.-blade rounded at the base, or shortly cordate, with white or red spots. Brazil.

#### AA. Blade distinctly peltate.

B. Lf. sagittate-oblong-ovate; basal lobes united for two-thirds their length, or more.

7. *marmoratum*, Mathieu (*Alocasia Roëzlii*, Bull. *C. thripedestum*, Lem.). Petiole cylindrical, 12-16 in. long, twice as long as the blade, variegated; blade 6-8 in. long, 4-6 in. wide, dark green, with irregular gray, yellowish green and snow-white spots, glaucous-green beneath, sagittate-oblong-ovate, the upper lobe semi-ovate, slightly cuspidate, the basal ones unequal, one-third or one-half as long as the upper, connate two-thirds to three-fourths their length: spathe-blade pale green, 2-3 in. long. Ecuador. I.H. 5, p. 59, desc.

**BB.** *Lf.* not as above; basal lobes united one-third their length or less.

**C.** Shape of *lf.* ovate-triangular, or ovate-sagittate (8-47).

8. **bicolor**, Vent. (*Arum bicolor*, Ait.). Petiole smooth, 3-7 times as long as the blade, pruinose toward the apex; blade ovate-sagittate, or ovate-triangular, variegated above, glaucous beneath; upper lobe semi-ovate, narrowing gradually to a cuspidate point, the basal ones one-half to but little shorter than the upper, oblong-ovate, obtuse, connate one-fifth to one-third their length. S. Amer. Intro. into cult. in 1773. B.M. 820.—Very common in cult., furnishing many of the fancy-leaved caladiums. The marked varieties are as follows (9-47):

(1) *Lf.-blade and veins of one color.*

9. Var. **Velloziànum**, Engl. (*C. Velloziànum*, Schott. *C. Purdieànum*, Schott. *C. pusillum*, C. Koch. *C. Spruceànum*, Schott. *C. firmulum*, Schott.). *Lf.*-blade dark green above; basal lobes connate past the middle. Brazil, Peru. R.B. 10:169.

(2) *Lf.-blade more or less variegated.*

(a) *With a colored disk* (Nos. 10-18).

(b) *Disk transparent.*

10. Var. **transpàrens**, Engl. (*C. transpàrens*, Hort.). Blade with a pale green, nearly transparent disk; midrib and primary veins red-purple.

11. Var. **rubicundum**, Engl. (*C. bicolor*, Kunth). Petiole green, or variegated green and violet; blade green, with a red, transparent, central disk, and a very narrow red line between the disk and the margin.

(bb) *Disk opaque.*

(c) *Purple disk.*

12. Var. **Baràquinii**, Engl. (*C. Saràquinii*, Hort.). Petiole violet; blade with a purple-red disk; beautiful green between the disk and margin; nerves and midrib red-violet. Para. I.H. 7:257. F.S. 13:1378.

13. Var. **Kétteleri**, Engl. (*C. Kétteleri*, Hort.). Petiole crimson, variegated toward the base; blade with purple disk, midrib and primary veins, sparsely marked between the veins with many small, rosy spots.

(cc) *Red disk.*

14. Var. **spléndens**, Engl. (*C. ròseum*, Hort. *C. spléndens*, Hort.). Petiole green below, red above; blade with a red disk at the middle; midvein and primary veins red-purple; green between the nerves and along the margin. Lowe, 4.

15. Var. **Lèopoldii**, Engl. (*C. Lèopoldii*, Hort. *C. Gàrdtii*, C. Koch. *C. Rogièrii*, Chant. & Lem.). Petiole violet beneath, red-purple above; blade with a broad, reddish disk; margin green, red-spotted; midrib and primary veins dark red-purple. Para, 1864.

16. Var. **albomaculatùm**, Engl. (*C. Alfred Bleu*). Petiole green; blade green, with red disk, midrib and primary veins, and marked clear to the margin with many large, white spots between the nerves.

(ccc) *Rose disk.*

17. Var. **Chàntinii**, Engl. (*C. Chàntinii*, Lem. *C. Connàrtii*, Hort. *C. amànum*, Hort. *C. Martersteigianum*, Hort. *C. punctatissimum*, Hort. *C. Haageànum*, Hort.). Fig. 732. Petiole more or less violet; blade broadly red-purple along the midrib and primary nerves, rosy at the center, and with very numerous, unequal spots between the nerves clear to the marginal vein. Para, 1858. I.H. 5:185. F.S. 13:1350-51. B.M. 5255. A.F. 8:129. G. 12:375.

(ccce) *Light green disk.*

18. Var. **Houllétii**, Engl. (*C. Houllétii*, Lem. *C. Mooreànum*, Hort.). Petiole green, the sheath and a little of the base violet-variegated; basal lobes of the

blade somewhat introrse, rounded, connate one-third; blade obscurely green toward the margin, the midrib and primary veins slightly reddish, and with a pale disk marked with many irregular white spots.

(aa) *Without a colored disk.*

(b) *Margins colored throughout.*

(c) *Red margin.*

19. Var. **marginàtum**, Engl. (*C. marginàtum*, C. Koch). Blade dark green, with a red line on the outer margin.

(cc) *Yellow margin.*

20. Var. **Kramerianum**, Engl. (*C. Kramerianum*, Hort.). Veins purple; yellow margin.

21. Var. **Stangeànum**, Engl. (*C. Stangeànum*, C. Koch). Blade reddish; green along the narrow margin, yellowish toward the margin.

(ccc) *Solid white margin.*

22. Var. **Perrièrii**, Engl. (*C. Perrièri*, Lem.). Petiole violet-black; blade dull green, with many red-purple spots, and white along the margin. Brazil, 1861.

(ccce) *Spotted margin.*

23. Var. **Éckhartii**, Engl. (*C. Éckhartii*, Hort.). Petiole violet-blotched at the base, green above the middle; blade green, with few rosy spots along the margin, and small white ones in the middle.

24. Var. **Hèndersonii**, Engl. (*C. Hèndersonii*, Hort.). Petiole variegated violet and green, reddish toward the apex; blade mostly green, reddish next the lower parts of the nerves; midrib and primary veins red-purple spotted; small red spots along the margin.

25. Var. **Sièboldii**, Engl. (*C. Sièboldii*, Hort.). Petiole violet and green, reddish toward the apex; basal lobes of the *lf.* somewhat introrse, connate one-third their length, dark green; midrib and primary veins beautifully red-purple spotted, and a very narrow white border, marked with small purple-red spots. A.F. 8:127.

(ccccc) *Purple margin.*

26. Var. **Houbyànum**, Engl. (*C. Houbyànum*, Hort.). Petiole dirty green on the lower surface, bright red above; blade bright green, with large pale spots, and small red-purple ones between the midrib and primary veins; a red-purple spot above the insertion of the petiole, and a pale purple line around the margin.

27. Var. **pellucidum**, Engl. (*C. pellucidum*, DC.). Petiole reddish, variegated with violet; blade broadly reddish purple spotted along the midrib and primary veins, and more or less marked with transparent, reddish purple spots between the primary veins; a continuous purple line along the outer margin.

(bb) *Margin colored only on basal sinus.*

28. Var. **Devosiànum**, Engl. (*C. Devosiànum*, Lem. *C. Wallisii*, Hort. *C. Ottònis*, Hort.). Petiole green; blade bright green, with small, irregular white spots between the midrib and primary veins, and a narrow crimson border at the sinus. Para. I.H. 9:322.

29. Var. **hæmatostigmatum**, Engl. (*C. hæmatostigmatum*, Kunth. *C. pellucidum*, DC. *C. discolor*, Hort.). Petiole violet; blade dark green, with a purple line on the basal sinus, and sparsely marked with blood-red spots. Para.

30. Var. **pœcile**, Engl. (*C. pœcile*, Schott. *C. pallidinnervium*, Hort.). Petiole reddish brown, or closely streaked-variegated; blade dark green; midrib and primary veins paler, often whitish; a red-purple spot where the petiole joins the blade, narrowly purple-margined in the sinus. Brazil.

31. Var. **regale**, Engl. (*C. regale*, Lem. *C. Wàgnieri*, Hort. *C. surinamense*, Miq. *C. sagittafolium*, Sieb.). Blade bright green, purple-margined at the sinus, every-

where marked with small, confluent white spots. W. Indies, 1710. I.H. 9:316.

(bbb) *Margin and disk without color.*

(c) *Variegated green blade.*

32. Var. *Brongniartii*, Engl. (*C. Brongniartii*, Lem.). Very large; petiole variegated violet and green, reddish toward the apex; blade green, except along the nerves below, where it is colored reddish, paler green between the primary nerves, deep green toward the margin; veins and nerves red-purple. Brazil, 1858. F.S. 13:1348-9. I.H. 5, p. 58, desc.

33. Var. *mirabile*, Engl. (*C. mirabile*, Lem.). Petiole green; blade bright green, densely covered with large and small irregular pale green spots between the primary nerves and midvein. Para. I.H. 10:354.

(cc) *Blue-green blade.*

34. Var. *pictum*, Kunth (*C. pictum*, DC.). Petiole greenish, variegated beneath; basal lobes connate one-fifth their length; blade thin, blue-green, marked with large, irregular, usually confluent, pale yellowish semi-transparent spots. Lowe, 43.

(ccc) *Colorless blade.*

35. Var. *Duchártrei*, Engl. (*C. Duchártrei*, Hort.). The long petiole green above, variegated below the middle with violet-black; blade colorless, except the midrib and all the veins, or here and there pale rosy or red-spotted, or even more or less dirty green. A.F. 8:129.

(cccc) *Solid green blade.*

(d) *Dark green.*

36. Var. *argyróspilum*, Engl. (*C. argyróspilum*, Lem.). Petiole grayish red, sparsely and finely streaked; blade a most beautiful green, with a crimson spot at the middle, and with many small white spots between the primary veins. Para. F.S. 13:1346-7.

733. *Caladium picturatum* var. *Belleymei*. (No. 49.)

37. Var. *Curwádlii*, Engl. (*C. Curwádlii*, Hort.). Petiole greenish, slightly violet-blotched toward the base; blade reddish purple along the midrib and primary veins, marked between the veins with large white spots; otherwise dark green.

38. Var. *Köchii*, Engl. (*C. Köchii*, Hort.). Lf-blade more rounded, dark green, with small white spots midway between the midrib and margin. Para, 1862.

39. Var. *macrophyllum*, Engl. (*C. macrophyllum*, Lem. *C. griseo-argenteum*, Hort.). Petiole green; blade dark green, marked everywhere with many small, scarcely confluent white or slightly rosy spots. Para, 1862. I.H. 9:316.

40. Var. *Neumannii*, Engl. (*C. Neumannii*, Lem.). Petiole green; blade very beautiful dark green, with scarcely paler veins, marked between the primary veins with large and small white-margined, reddish purple spots. F.S. 13:1352-3. B.M. 5199.

(dd) *Light green.*

(e) *Not spotted.*

41. Var. *rubellum*, Engl. (*C. rubellum*, Hort. *C. Reichenbachianum*, Stange). Blade green, with reddish purple midrib and primary veins.

42. Var. *rubrovenium*, Engl. (*C. rubrovenium*, Hort. *C. rubronervium*, Hort.). Petiole variegated green and violet; blade small, oblong-ovoid, the basal lobes somewhat introrse, obtuse, connate almost to the middle, pale caulescent or red-green along the midrib and primary veins; veins pale red or scarlet. Para, 1862.

(ee) *Spotted.*

(f) *With white spots.*

43. Var. *Laucheanum*, Engl. (*C. Laucheanum*, C. Koch). Blade bright green, with white spots at the middle.

(ff) *With purple and white spots.*

44. Var. *Wightii*, Engl. (*C. Wightii*, Hort.). Petiole pale green; blade very beautiful green, marked between the primary veins with large, red-purple and small white spots. French Guiana.

(fff) *With red or crimson spots.*

45. Var. *Enkeanum*, Engl. (*C. Enkeanum*, C. Koch). Blade bright green, marked with large and small red spots.

46. Var. *Lindenii*, Engl. (*C. Lindenii*, Hort.). Blade bright green, with confluent small red spots.

47. Var. *Verschaffeltii*, Engl. (*C. Verschaffeltii*, Lem.). Petiole pale green; blade very beautiful green, with few irregular crimson spots. I.H. 5:185. B.M. 5263. Lowe, 46.

cc. *Shape of blade lanceolate-sagittate.*

48. *picturatum*, C. Koch. Petioles usually green, variegated below, elongated; blade lanceolate-sagittate, cuspidate and submucronate at the apex, the upper lobe nearly triangular, oblong or ovate-lanceolate, basal lobes over half as long, lanceolate subacute, connate one-sixth to one-fourth their length, separated by a triangular sinus; primary lateral veins 4-7, erect-spreading or spreading. Brazil.—Variable, furnishing many of the fancy-leaved caladiums.

(1) *Transparent white blade.*

49. Var. *Belleymei*, Engl. (*C. Belleymii*, Hort.). Fig. 733. Petiole greenish above, variegated violet beneath; blade slenderly hastate-sagittate, white, translucent except the green veins and nerves, with small green spots along the margin; basal lobes 1-5, or rarely one-fourth or one-third connate. Para. I.H. 7:252. A.F. 8:127. G. 2:89.

(2) *Pale green blade.*

(a) *With transparent blotches.*

50. Var. *hastatum*, Engl. (*C. hastatum*, Lem.). Petiole long, stout, white, violet-spotted; blade hastate-sagittate, slightly contracted above the lobes; dull, pale green, very irregularly marked with transparent blotches; basal lobe one-fourth connate, crimson margined in the sinus. Para.

(aa) *Opaque.*

51. Var. *albostriatulum*, Engl. Blade greenish white along the midrib and veins, white-striped and dotted between the nerves.

52. Var. *Osyànum*, C. Koch. Blade white along the midrib and primary veins, with purple spots between the veins.

53. Var. *porphyronëuron*, Engl. (*C. porphyronëuron*, C. Koch. *C. cypreum*, Hort. *Alocasia porphyronëura*, Lem.). Petiole pale reddish, variegated with dull violet; blade broadly hastate-sagittate, dull, pale green, slightly reddish on the veins, opaque basal lobes one-sixth to one-third connate. Peru and Brazil. I.H. 8:297.

(3) Dark green blade.

54. Var. *élegans*, Engl. Petiole rosy, greenish below, variegated; blade narrowly hastate-sagittate, slightly contracted above the lobes, dark green above, broadly red or purple next the midrib and primary lateral veins; basal lobes one-fifth connate.

55. Var. *Lemaireanum*, Engl. (*C. Lemaireanum*, Barr. *C. picturatum albinëvium*, C. Koch. *C. picturatum viridissimum*, C. Koch.). Blade shaped like preceding, dark green; midrib and primary veins pale green or white. S. Amer., 1861. I.H. 9:311.

56. Var. *Troubetskoyi*, Engl. (*C. Troubetskoyi*, Chantin. *C. Appunianum*, Hort.). Petiole red, variegated; blade very narrowly hastate-sagittate, slightly contracted above the lobes, dark green above, broadly marked with pale red along the midrib and primary veins, and with scattered, transparent, small white or rose spots. F.S. 13:1379.

ccc. Shape of blade oblong-ovate, or oblong: plant small.

57. *Humboldtii*, Schott. (*C. argyrites*, Lem.). Fig. 734. Petiole slender, variegated, 2 to 3 times longer than the blade; sheath slender, narrow; blade oblong-ovate, or oblong, green along the margin, midrib and primary veins, with many large and small transparent spots between; shortly and very acutely acuminate, the apical lobe oblong-ovate, twice as long as the oblong or ovate-triangular, obtuse basal ones; basal lobes one-third connate, separated by an obtuse triangular sinus, the 3-4 primary veins of the apical lobe uniting in a collective nerve remote from the margin. Brazil. I.H. 5:185. F.S. 13:1345. Gng. 3:279. A.F. 10:197. Lowe, 22. C.L.A. 19:343. G. 14:501.

58. Var. *myriostigma*, Engl. (*C. myriostigma*, C. Koch.). Blade marked everywhere with small white spots.

The following names are in the trade, or occur in the lists of dealers and fanciers, but are not identified botanically:—*albanense*, *Barratii*, *candidum*, *Endlicherianum*, *Fenzlianum*, *Orgiesii*, *Petschkanii*, *Rodeckii*, *speciosum*, *Thelemannii*, *venosum*.

*C. esculéntum*=*Colocasia antiquorum esculenta*.—*C. odoratum*, Lodd.=*Alocasia macrorrhiza*.—*C. pubescens*, N.E.Br. A new species, distinct from those already in cult. by being pubescent. Peru. B.M. 8402.

JARED G. SMITH.  
GEO. V. NASH.†

**CALAMAGRÓSTIS** (Greek, *calamos*, a reed, and *agrostis*, a grass). Syn. *Deyeuxia*. *Gramineæ*. Usually tall or reed-like perennials bearing rootstocks. Including hay grasses and a few more or less ornamental species.

Spikelets 1-flid., the rachilla prolonged behind the palea as a usually hairy pedicel; lemma hairy on the callus, awned from the back.—Species about 120, distributed throughout the world in temperate and arctic regions, usually in damp or swampy soil. The species are often valuable native forage grasses. One species, *C. canadensis*, Beauv., is a source of an excellent quality of native hay in the northwestern states, where it is called blue-joint. Another species, *C. stricta*, Beauv., native of the northern states, is sometimes cult. in a variegated form as an ornamental.

*C. brevipilis*=*Calamovilfa brevipilis*. A. S. HITCHCOCK.

**CALAMINT, CALAMINTHA**. *Satureia*.

**CALAMOVÍLFA** (Greek, *calamos*, a reed, and *vilfa*, a kind of grass). *Gramineæ*. PURPLE BENT-GRASS. A group differing from *Calamagrostis* in having awnless

spikelets and no prolongation of the rachilla. Species 3, in S. E. U. S. *C. brevipilis*, Hack., is cult. as an ornamental grass. This is a stout, tufted grass, 2-4 ft., with short, horizontal rootstocks, pyramidal purplish panicle 4-8 in. Sandy swamps in pine-barrens, N. J. to N. C. Dept. Agric., Div. Ágros. 7:156; 20:84.

A. S. HITCHCOCK.

734. *Caladium Humboldtii*. (No. 57.)

**CALÁMPELIS**: *Eccremocarpus*

**CÁLAMUS** (Greek for reed). *Palmáceæ*, tribe *Lepidocarpeæ*. A group of interesting, usually climbing pinnate palms of the Old World tropics, not much known to the trade although over thirty species are in the European catalogues.

Stems very slender, always more or less prickly, usually climbing and never bearing a terminal infl.: lvs. alternate, pinnate, often ending in a terminal sometimes elongated cirrus, by which they are attached to their support; lfts. narrow, with 1-5 nerves; lf.-sheaths at first completely inclosing the internodes, sometimes split and open: spadix laterally attached at the summit of the lf.-sheaths, often elongate and slender and frequently ending in a tail-like appendage (flagellum) which is thorny; spathes long and narrow, hardly if at all split, differing from *Dæmonorops* which has a readily opening spathe; fls. dioecious, paniculate or branched 2 or 3 times; corolla coriaceous, longer than the calyx in male fls., as long as the calyx in the female: fr. globose, ovoid or ellipsoid, topped by a short permanent style.—There are more than 200 species, most of which inhabit India. See Beccari's excellent monograph Ann. Royal. Bot. Gard. Calcutta 11, 1908.

*Calamus* is an easily grown group of palms, very ornamental, even in a young state. Some of the species have stems several hundred feet long, which enable them to unfold their leaves at the tops of the tallest trees. The leaves are peculiarly well adapted to assist the plant in climbing, having numerous hook-like processes arranged on a long continuation of the midrib of the leaf. When accommodations can be given, these plants should be selected, as their growth is rapid, and they are capable of furnishing a large conservatory quickly. Numerous suckers are produced, so that when the main stem ascends the lower part is clothed in foliage. *Calamus tenuis* (or *C. Royleanus*) and *C. Rotang* furnish the rattan canes. Malacca canes are furnished by *C. Scipionum*.—Young plants thrive best in a rooting medium containing a considerable quantity of leaf-mold. Older plants need soil of a more lasting nature; a quantity of ground bone and charcoal in the soil may

be used to advantage. Old well-furnished plants need enormous quantities of water. All of them require stove temperature. (G. W. Oliver.)

**ciliàris**, Blume. St. slender, climbing by means of long axillary leafless branches, covered with short hooked spines: lvs.  $1\frac{1}{2}$ – $2\frac{1}{2}$  ft. long, 6 in. wide; lfts. 40–50 on each side, hairy; petiole 2 in. long with few hooked spines: spadix of female and male fls. finely hairy-hispid on the spathe: fr. globose, about  $\frac{1}{2}$  in. diam. Java and Sumatra. F.R. 1:607. G.C. III. 21:86.—Intro. into cult. in 1869. To be grown in tropical house.

**aspèrrimus**, Blume. St. slender, climbing by the prickly cirrus of the lvs. and the prickly branches: lvs. without stalks, about 18 in. long, bearing not more than 8–10 thin, papery, irregularly placed lfts. on each side of the rachis: spadix simply decompound, about 7 ft. long, terminating in a slender prickly appendage. Mts. of Java.—Can be grown in a cooler house than the preceding.

*C. Andreadum*, Hort., Pill & Mitterb=(?).—*C. calicàrpus*, Griff.=*Demonorops calicarpus*, Mart.—*C. dealbatus*, Hort.=*Acanthophoenix rubra*, Wendl.—*C. Lewisianus*, Griff.=*Demonorops Lewisianus*, Mart.

N. TAYLOR.

**CÁLAMUS** or **SWEET FLAG**: *Acorus Calamus*.

**CALÁNCHOË**: *Kalanchoë*.

**CALANDRÌNIA** (J. L. Calandrini, Genevan botanist, who wrote an important thesis in 1734). *Portulacacææ*. Fleshy, spreading or nearly trailing plants, sometimes cult. in borders and rockeries, or used for edgings in sunny places.

Flowers red or pink or rose-color, of short duration; petals 3–7; sepals 2; stamens 5 (or 3) to 12; style with 3 branches: lvs. alternate, narrow.—About 60 species, Brit. Col. to S. Amer. and in Austral. Annuals and perennials, but the latter mostly treated as annuals; not much grown in gardens.

A. Fls. in a short umbel-like cluster.

**umbellàta**, DC. Perennial, 4–6 in.: lvs. linear and hairy: fls. in a corymb, or umbel-like terminal cluster, bright crimson. Peru. R.H. 1853:5.—The *C. umbellata* of gardens is hardy in many parts of the U. S.; in New York it should be planted in a well-sheltered position, or provided with ample protection in winter; sometimes it acts like the biennials, but, as seeds are produced very freely, young seedlings spring up constantly between the old plants, and one does not miss the few which may decay during the second year; the plant forms a very neat, slightly spreading tuft; fls. are produced in many-fld. umbels, terminal, numerous, and large, glowing crimson-magenta, saucer-shaped, very showy. June to Nov. Full exposure to sun, and light sandy soil, are needed to bring out the rare beauty of these plants. The fls. close up when evening comes, like the annual portulacas, but they reopen on the following day. In the sunny sloping part of a rockery, even when quite dry, or among other low plants in a bed or border, they are highly satisfactory. Although perennial, it may also be treated like the annuals, as it flowers the first summer as freely as afterwards. Can be prop. by cuttings.

AA. Fls. in longer clusters, pedicels often more or less drooping.

**díscolor**, Schrad. (*C. elegans*, Hort.). Perennial, 1– $2\frac{1}{2}$  ft.: lvs. fleshy, spatulate to obovate, purple beneath, gray-green above, blunt: fls. bright light purple, 2 in. across, with yellow stamens. Chile. B.M. 3357.

**Ménziesii**, Torr. & Gray (*C. speciosa*, Lindl.). RED MAIDS. Annual: 3–12 in. high, with green herbage, glabrous, or nearly so: lvs. linear, or spatulate-oblongate: fls. rose-red or purple, rather large and long-peduncled (petals  $\frac{1}{2}$  in. long). Calif., N. B.R. 1598.—Variable. There is a white-fld. variety advertised.

**grandiflòra**, Lindl. Perennial, 1–3 ft.: much like *C. discolor*, but lvs. oval and pointed, narrowed to petiole, green, 4–8 in. long: fls. somewhat smaller, light purple. Chile.

**spectàbilis**, Otto. & Dietr. Perennial, 2 ft.: lvs. lance-spatulate or rhomboid,  $1\frac{1}{2}$  in. long, somewhat pointed: fls. bright purple, 2 in. across. Chile.—Said to produce seed seldom; prop. by cuttings.

**Bùridgii**, Hort. Annual, 1 ft.: lvs. linear-lanceolate, smooth: fls. many, small, copper-rose or brick-red, in leafy clusters. S. Amer.

**chromántha**, Griseb. One ft., loosely branched: lvs. rather large: fls. and buds rose-colored: fr. orange-yellow, persisting. Argentina.

*C. oppositifolia*, Wats.=*Lewisia oppositifolia*.

J. B. KELLER.

L. H. B.

**CALÁNTHE** (Greek for beautiful flower). *Orchidacææ*. Sub-epiphytal or terrestrial hothouse orchids found in the eastern hemisphere, and sparingly in the western hemisphere.

Scapes erect, many-fld.: lvs. broad, plaited: fls. white or rose-colored, rarely yellow: pseudobulbs angulate, with grayish green sheaths in the Vestitæ section, but absent in the Veratrifoliæ section.—Forty to 50 species in tropics of both hemispheres.

Most of the species and the numerous varieties grown are deciduous, losing the foliage about the time of flowering, and, at this season, water is given sparingly until the flowers are cut; then the bulbs are kept in a dry warm place until signs of growth in spring. All calanthes are terrestrial and should be potted each year in fibrous loam, with a small portion of old manure and sand mixed in. Use plenty of drainage as for other orchids, and about 2 inches of soil; secure the bulbs firmly by means of part of the old wiry roots; water very sparingly until active root-action takes place; but, when in full growth, weak manure-water may be given at each watering. The young foliage is very sensitive to sun, and must be shaded as soon as it develops; keep the plants near the glass and give all light possible, and the warmest treatment permitted in orchid culture. They enjoy a little heat, even in summertime, from the pipes at night. The best place to grow calanthes is a sunken, well-heated pit facing south, lowering the plant as the foliage nears the glass. *Calanthe veratrifolia* is an evergreen species and may be treated similarly to the Phaius. Calanthes are easily increased by separation of the bulbs at the time of repotting. Young bulbs are often produced from the apex of old ones; old ones will start again the second year and make increase. (E. O. Orpet.)

**vestita**, Lindl. (*C. oculàta*, Hort.). Lvs. broadly lanceolate, nearly 2 ft. long, from grayish green pseudobulbs: fls. nearly 3 in. across, numerous, in racemes; petals and sepals whitish, all more or less overlapping, the former oval-oblong, the latter obovate-oblong; labellum flat, large, 3-lobed, the mid-lobe cleft; a yellow or crimson blotch in front of the short column; scapes from 2–3 ft. high, hairy. Blooms in winter. Malaya. B.M. 4671. F.E. 9:325. A.F. 6:655. F.S. 8:816.—A most popular orchid. There are many forms, of which the following are the most important: Var. **gigantèa**, Hort. Larger in all parts: fls. white, with red eye. Var. **nivàlis**, Hort. Fls. pure white. Var. **Tùrneri**, Hort. (*C. Tùrneri*, Reichb. f.). Fls. more numerous, labellum with a crimson blotch; blooms later in the season than the next. Var. **rùbro-oculàta**, Hort. Labellum with a crimson-purple blotch. Oct.–Feb. G. 10:629. Var. **lùteo-oculàta**, Hort. Yellow-blotched. Var. **Regnièri**, Hort. (*C. Regnièri*, Reichb. f. *C. Stevensiana*, Regnier). Pseudobulbs more elongated, with a depression above the middle: labellum rose-colored, with a purple blotch in front of column, less deeply

lobed than in the type. A.F. 6:655. Var. **Regniéri Williamsii**, Hort. (*C. Williamsii*, Hort.). Sepals white, sometimes shaded pink; petals white, rose-bordered; lip deep rose.

**veratrifolia**, R. Br. Lvs. oblong-lanceolate, about 2 ft. long, from a creeping rhizome; fls. white, in dense corymbose racemes; petals obovate-spatulate; sepals obovate-oblong; labellum 4-parted, the anterior lobes usually broader than the posterior or basal lobes. Blooms May–July. Malaya. B.M. 2615.

**Veitchii**, Lindl. Fig. 735. A hybrid between *C. rosea* and *C. vestita*: fls. rose-colored; labellum with white spot near the base. Winter-flowering. There is also a white variety. This hybrid was raised by Veitch, in 1856. B.M. 5375. Gng. 14:134. A.F. 25:1093. Forms of this are var. **bélla**, Hort., with pink fls.; var. **nigro-oculata gigantæa**, Hort., with stout sts., the fls. white with an eye of reddish crimson; var. **Sandhurstiana**, Hort., with crimson fls.; var. **Sedenii**, Hort., with deep rose fls.; var. **supérba**, Hort., has richer color.

**Masûca**, Lindl. Scape 2 ft. long, with large, many-ribbed, dark lvs.: fls. 1 in. across, the segms. overlapping, deep violet, fading to lilac, the lip deep violet-purple. Summer and autumn. N. India. B.M. 4541. Var. **grandiflora**, Hort., is of greater size throughout.

*C. burmanica*, Rolfe. Fls. mauve-purple, with yellow crest. Burma.—*C. Clute*, Hort. (*C. Veitchii* × ?).—*C. Cooksonii*, Hort. (*C. Veitchii* × *C. vestita luteo-oculata*). Fls. pure white, except a blotch of yellow in the throat and a few lemon-yellow lines on lip.—*C. Cornelius Vanderbilti*, Hort. (*C. vestita rubro-oculata* × *C. Veitchii*).—*C. discolor*, Lindl. Sts. leafy: fls. with claret sepals and petals and a 3-lobed white lip flushed rose. Japan. G.C. III. 35: 389. B.R. 26:55.—*C. Eijermannii*, Hort. (*C. vestita rubro-oculata* × *C. Veitchii*). Racemes shorter than in *C. Veitchii*, with larger, more spreading white fls. with a reddish blotch at the base of the lip. G.F. 4:17.—*C. gigas*, Hort. (*C. grandiflora* × *C. Regniéri*). Fls. nearly 3 in. across, borne on a st. over 5 ft. tall; sepals and petals milk-white, the latter tinged rose at base and apex; lip 4-lobed, bright rose, striated with pale rose or white, a reddish crimson blotch at the base.—*C. Hennisii*, Loher. Similar to *C. vestita*. Philippines. G.C. III. 46:34, desc.—*C. madagascariensis*, Rolfe. Sepal and petals rosy mauve; lip dull magenta with white spot at base. G.C. III. 28: 335, desc.—*C. McWilliamsii*, Hort. = (?).—*C. Orpetiana*, Hort.—*C. sumatense*, Hort.—*C. Wárpuri*, Rolfe. Sepals white; petals much narrower, white; lobed lip dull purple, changing finally to orange. Madagascar.

GEO. V. NASH.†

**CALATHËA** (Greek for *basket*, the application not apparent). *Marantaceæ*. Perennial foliage plants of warmhouses, with maranta-like leaves arising in a tuft from the crown.

Sepals 3, free and equal; corolla tubular, with 3 spreading lobes; stamens 3, petal-like, 2 sterile, and 1 bearing an anther on its side (compare *Canna*). From *Maranta* the genus differs chiefly in technical characters. In *Maranta* the fr. is 1-seeded, in *Calathea* usually 3-seeded; in the former the fl.-clusters are branched and few-fld., in *Calathea* usually capitate or cone-like.—Of *calatheas* there are more than 100 species, mostly of Trop. Amer., but a few of trop. Afr. The lvs., for which the plant is grown, are variously marked with shades of green, red, brown, yellow, and white. They spring from the very base of the short st., just above the rhizome, the rhizomes themselves more or less tuberiferous (Fig. 736). Monogr. by Schumann in Engler's *Pflanzenreich*, hft. 11 (1902).

All the *calatheas* thrive in a moist tropical house in a temperature that does not go below 65° F., with a rise during the day to 90° or 95° F. For general purposes, the best compost in which to grow them is made of equal parts of good turfy loam, leaf-mold and sand. Some of the more delicate species are best grown in leaf-mold and sand only. Stagnation of the soil must be particularly avoided by abundance of drainage, as they require to be kept rather moister at the roots than most stove plants. The close moist atmospherical conditions that these plants require can be secured

only by constant syringing and damping down amongst the plants; therefore the need for abundance of drainage is apparent, whether they are grown in pots or planted out in a border. It is only by planting them out with a free root-run that *calatheas* may be had in their full beauty; and when so grown a collection of these plants forms one of the most beautiful examples of tropical foliage. Particular attention should be given to protecting them from all strong sunshine, the thin texture of their leaves rendering them specially liable to damage from this cause. Most of the species are of easy culture providing the above conditions are followed. Many of them spread rapidly and make quick growth; therefore they require to be potted or overhauled every spring, but when once well established, they may be fed with liquid manure once a week.—Propagation is by dividing the crowns, or by cuttings

735.  
*Calathea Veitchii*.  
(× 1/2)

in those kinds that make secondary growths, these cuttings being taken just below the nodes. In spring, just before growth begins, is a good time for this work. Tubers may be used, if produced.

In Florida, *calatheas* grow exceedingly well in shady lath plant-houses. The soil should be leaf-mold and very old cow-manure added to the original natural soil. Commercial fertilizer should never be used. In very cold weather they should be covered with pine branches and leaves or pine-needles. All the kinds soon form very beautiful clumps. All of them need much water while they are growing, but not in the winter if they are planted out in beds. Each spring they must be replanted in fresh soil. Then the clumps may be divided, or if large specimen plants are desired, they may be left intact. (Nehrling.)

The *calatheas* are a confusing group to the horticulturist, because the differences that he knows lie mostly in characters of leaf and habit and these are variable. The size of leaf and plant depends much on the treatment, and in some species the juvenile leaves are different from the mature ones. The coloration of the foliage depends much on the age, and the way in which the plants are grown. However, we may roughly throw the species into two groups,—the small

leaved and the large-leaved, although it is a question where to place such intermediate kinds as *C. Veitchiana*, *C. insignis*, *C. leopardina*, *C. Sanderiana*, *C. nigricans*, and some others; or we may arrange them in two groups by the red-marked kinds (of foliage), and by the green-, gray- and white-marked kinds, but this would not account for the juvenile and adult stages of *C. leopardina*, *C. imperialis*, *C. Chantrieri*, *C. ornata*, and others. The botanical classification by floral characters would be of little use to the general horticulturist. Some plants known in collections as calatheas are likely to be marantas, phryniums, monotagmas, ctenanthe, or others. The radical tufted leaves and capitate inflorescence of Calathea, and the zigzag stems and branched inflorescence and small flowers of Maranta are general characters of separation between these two genera. In the present account, the attempt has been made to draw the characters as much as possible from cultivated specimens apparently authentically named.

A. Markings of lf. (upper surface) in red or brown, at least in part.

1. *ròseo-pícta*, Regel (*C. ròseo-lineata*, Hort.? *Maránta ròseo-pícta*, Lind. *M. Wágneri*, Hort.). Dwarf: lvs. nearly orbicular, purple beneath, the upper side dark green, the midrib red, and an irregular red zone (sometimes two zones) two-thirds of the distance from the midrib toward the margin. Amazon. F.S. 16:1675-6. Gn. 2, p. 3.

2. *Pavòni*, Kørn. (*C. tubispatha*, Hook. f.). Two feet or less high: lvs. obovate-elliptic, short-acuminate or cuspidate, thin, greenish beneath, lively green above, and marked midway between the rib and the margin with lighter green and squarish patches of brown. Peru. B.M. 5542.

3. *angustifòlia*, Kørn. (*Maránta discolor*, Hort.). Habit loose, erect, only slightly spreading at apex: growths bearing 1-4 lvs. from 1-5 ft. high; blade lanceolate, unequilateral,  $\frac{3}{4}$ -2 ft. long, rich light green with fine lines of purple-red above, rich shining red beneath; petiole erect, stout, 1-3 ft. high, rich dark red, heavily marked with light green tuberculate spots; sheath extending from one-third to one-half its length: in the juvenile form the whole of the plant is densely covered with reddish brown hairs, but in the adult plant, the blade is almost entirely glabrous. Cent. Amer. B.M. 8149.

AA. Markings of lf. mostly on the order of green or white (exceptions in juvenile stages of Nos. 35, 36, 37 and others).

E. Lf.-blades small or short, usually less than 12 in. long.

C. Under side of lvs. green, grayish, or yellowish (violet in forms of No. 14).

4. *micans*, Kørn. (*Maránta micans*, Math. *Phrynium pumilum*, Klotzsch). Very small: lvs. 2-3 in.

long, and 1 in. wide, oblong-lanceolate, somewhat acuminate, green and shining above, the rib in a feathered white stripe, paler beneath. Brazil.—Probably the smallest cult. Calathea.

5. *chimboraensis*, Lind. Dwarf: lvs. oblong-ovate, 8-12 in. long, acuminate, green above and below, with a very dark green white-margined band running lengthwise the blade midway between the rib and each margin. Neighborhood of Mt. Chimborazo. I.H. 17:6.

6. *Wiotiana*, Makoy (*Maránta Wiotii*, Morr.). Habit dwarf, spreading: rhizomes branching freely: growths bearing only a single lf. each; blade linear-lanceolate, slightly oblique, 4-12 in. long, undulate, acute,

736. Tuber of calathea.

( $\times \frac{1}{2}$ )

upper side silvery gray with a narrow band of light green around the margin; midrib green, with a row arranged pinnately, along either side of the midrib, of dark olive-green blotches or stripes; under side dull grayish green finely striated all over between the principal veins with patches of light yellowish green; petiole 3-15 in. long, erect or spreading, light green, terete sheath entirely absent. Probably Brazil.—A most beautiful species; thrives best in leaf-mold and sand.

7. *trifasciata*, Kørn. (*Phrynium propinquum*, Poepp. & Endl.). Habit dwarf, spreading, with short free-branching rhizomes: growths bearing 1 lf. only; blade cordate-ovate, unequilateral, 3-12 in. long, apex acute, and half twisted around, upper side silvery gray shading to green at the margins and with a row on either side of the midrib of dark green stripes arranged pinnately, under side light green, prominently striated on both upper and lower sides with a network of fine veins connecting all the principal lateral veins; midrib pale yellowish brown on the under side and covered with dark brown hairs in the lower half and extending for an inch or more on the apex of the petiole; petiole 3-12 in. long, light green, glabrous except in the upper inch or so; scale lvs. reddish brown. Guiana.—A companion plant to *C. Wiotiana*, to which it is closely allied, but differs in the broader and paler color of the lvs. Of easy cult.

8. *fasciata*, Regel & Kørn. Habit dwarf, compact: lvs. 10-18 in. long, reflexed; growths bearing 1-3 lvs.; blade broadly ovate or orbicular, acute or obtuse, glabrous 5-10 in. long, slightly undulate; upper side rich dark olive-green alternately marked by transverse bars of silvery white; under side dull grayish green; petiole 4-8 in. long, spreading, dull green, covered with short and minute brownish hairs; sheath extending up to one-half the length of the petiole, upper part terete. Brazil. Gn. 2, p. 3.—Considered by some to be a variety of *C. rotundifolia*, Kørn. *C. farinosa* and *C. ovalifolia* are probably stages in the development of this plant or perhaps slight varieties.

9. *Luciana*, Hort. Habit medium to strong, compact, more or less tufted: growths with 2-5 lvs., usually with 3, arching over at the tips and  $\frac{1}{2}$ -3 ft. high; blade elliptic, oblique, glabrous, acute, slightly undulate, 3-12 in. long, upper side light pea-green feathered along the midrib with pale greenish white and with a concentric zone of the same shade near the margin of the lf., under side dull grayish green; petiole erect, slender, rigid, pale green, glabrous or nearly so; sheath extending from one-half to nearly the entire length of the petiole, upper part oval, slightly flattened on each side; infl. a short few-fl. spike; peduncle 1-3 in. long; bracts spreading or erect, ovate, light reddish brown,  $1\frac{1}{2}$  in. long; fls. in pairs, yellow; sepals thin, linear, one-third the length of the tube; corolla yellow; petals elliptic,  $\frac{2}{3}$  in. long, spreading, acute; the 2 petaloid aborted stamens obovate,  $\frac{1}{2}$  in. long, bright yellow,

and striped or blotched with bright red; style curved,  $\frac{1}{2}$  in. long, yellow. Trop. Amer.

10. *flavescens*, Lindl. Habit tufted, glabrous in all parts: growths with 3-5 lvs., 1-2 $\frac{1}{2}$  ft. high; blade elliptic, slightly oblique, 6-12 in. long, acute, light green above, soft grayish green below; petiole 12-18 in. long, pale yellowish green finely spotted with darker green; sheath one-third to one-half the length of the petiole, upper part oval: infl. a dense globose short raceme; peduncle less than an inch; bracts large, elliptic, outer ones 2 in. long, bracteoles smaller, linear or lanceolate; fls. in pairs, sessile or nearly so, an inch diam.; sepal primrose, equal, lanceolate; petals large, bilobed, obovate, bright yellow. Brazil. B.R. 932.—Perhaps to be referred to *C. grandiflora*, Schum.

11. *Sagoreana*, Hort. (*Maránta Sagoreana*, Hort.). Habit dwarf and compact: growth bearing 2-4 lvs., usually with 3, and from 6-18 in. high, erect at first, arching towards the apex; blade lanceolate, unequilateral, 4-9 in. long, pale yellowish green with a row on either side of the midrib of arrowhead-shaped blotches of dark green which give this plant a distinct and pretty appearance, the under side in plain yellowish green; petiole slender, erect, 6-12 in. long; sheath extending only to about a quarter of its length, upper part terete.

12. *vittata*, Kœrn. (*C. albo-lineata*, Hort. *C. ornata* var. *albo-lineata* and *Maránta albo-lineata*, Hort.). Habit dwarf, compact,  $\frac{1}{2}$ -2 ft. high: growths with 2-5 lvs.; blade elliptic-lanceolate, slightly oblique, 3-12 in. long, glabrous, acute, upper side light green, pinnately striped with white from apex to base, underside pale dull green shaded between the veins with slightly lighter yellowish green; petiole slender, erect or spreading, 3-15 in. high, light green, glabrous; sheath extending from one-third to one-half its length, upper part terete. Probably Colombia.

13. *Wálisii*, Regel (*Maránta Wálisii*, Lind.). Habit strong, but neat and graceful, branching and forming numerous growths: growths bearing from 2-7 lvs., and 1-4 ft. high; blade broadly ovate, acute or obtuse, 6-12 in. long, rich light velvety green along the margin and midrib and with a row on either side of the midrib of dark irregular blotches of olive-green, under side soft grayish green; petiole erect, slender; sheath, extending to half the length of the petiole, and covered with soft hairs, upper part terete: with the exception of the sheathing lower half of the lf.-stalks, the whole plant is glabrous. Peru.—One of the commonest species in cult. and of very easy culture. A useful and decorative pot-plant.

14. *virginális*, Lind. Lvs. soft-hairy below, broad-oval, rather blunt, 7-9 in. long, 4-6 in. broad, upper surface light green, and below, in the common form, whitish green and lighter zones shown, as on the upper surface,—or in another form, which has been distributed in gardens as *C. (Maránta) Marcellii*, under side shaded a light violet and without zones. Brazil. A.F. 7:611.—Allied to *C. Veitchiana*, but has bracts with indurated tips rather than membranaceous.

cc. Under side of lvs. violet, purple, or suffused with red.

15. *Álbertii*, Hort. (*Maránta Álbertii*, Pynaert & Van Geert). Habit dwarf, spreading, less than a foot high: growths bearing 2-5 lvs., erect or spreading; blade oblique, elliptic, undulate, acute, 4-9 in. long, glabrous, upper side dark green feathered on either side of the midrib with a band of pale yellowish green, under side dull green suffused with light purple-red: infl. a few-fl. terminal spike; peduncle 3-4 in. long, pale green; floral bracts half reflexed outwards, orbicular or broadly ovate,  $\frac{3}{4}$  in. long; bracteoles 4-6, white, scarious; fls. in pairs, pure white; sepals half the length of the tube; petals lanceolate,  $\frac{1}{2}$  in. long, tube  $\frac{3}{8}$  in. long; 2 petaloid stamens slightly longer than the

petals, obovate, fertile stamen hooded and curved over the stigma; style and stigma short curved, white.

16. *Makoyana*, Nichols. (*Maránta Makoyana*, Morr. *M. olivaris*, Hort.). One to 4 ft.: lvs. broad-oblong, obtuse or somewhat short-pointed, the stalks red, the lf. olive-green or cream-colored above but marked against the midrib with outspreading, dark green blotches of oblong, oval or pyriform shape, the under surface similarly marked, but in red. Brazil. F.S. 20:2048-9. G.C. 1872:1589. Gn. 4, p. 87.

17. *nitens*, Bull. Habit dwarf; blade elliptic, acute, glabrous, upper side bright green, with oblong acute bars of dark olive-green, alternate long and short, on either side of the midrib, under side dull green tinted with dull red. Brazil.—Distinct and pretty.

18. *crocata*, Morr. & Joris. Whole plant 12 in. high: lvs. sub-distichous; petiole 2-3 in. long, sheathing most of its length; blade 4-5 in. long, erect, ovate-lanceolate, acuminate, somewhat undulate, dark green and veined above, rose-purple beneath: spike short, the bracts bright saffron-yellow. Brazil. B.M. 7820. G.C. III. 28:113. G.M. 53:265. J.H. III. 60:329. G. 32:263. F.W. 1876:161.—A free bloomer and showy when in flower.

19. *Veitchiana*, Hook. f. Fig. 737. Habit strong, loose, and spreading, 1-4 ft. high: growths with 2-8 lvs., usually with 3; blade ovate or elliptic-ovate, oblique, acute, undulate, glabrous, 4-12 in. long, upper side rich dark glossy green, feathered along either side of the midrib with an irregular band of pale green and with an inner zone of dark olive-green blotches and an outer one of pale yellowish green (often shading to white) between the midrib and margin; under side similarly blotched, but in shades of purple-red and rosy red; petiole  $\frac{1}{2}$ -3 ft. long, stout, green and glabrous above, tinted with reddish brown and hairy in lower part; sheath extending from one-third to one-half the length of the petiole, upper part terete: infl.

737. *Calathea Veitchiana*

on erect densely fld. spike on peduncle 4-6 in. long; spike 2-3 in. long, with a rosette 2 in. diam., of large green foliolose erect or capped spreading bracts; floral bracts erect, spreading at the tips, ovate, an inch long, outer ones covered in lower part with brown hairs; fls. in pairs, primrose-white, tube  $\frac{3}{4}$  in. long, slender; sepals erect,  $\frac{1}{2}$  in. long, lanceolate; petals elliptic  $\frac{1}{2}$  in. long, reflexed; fertile stamen hooded, small, 2 aborted petaloid ones longer than the petals, obovate, bilobed, with a bright violet blotch on the front; style and stigma small, curved. Peru. B.M. 5535. G.C. 1870:924. Gn. 2, p. 545. F.S. 16:1655-8.—A dwarf var. *F6xii*, Raffall, has recently been intro. into cult. from Venezuela. It differs from the type in its dwarf habit, rarely exceeding 10-12 in. high: lvs. broader, more reflexed, and with a bright rose or red midrib; the color of the markings of the lf. are darker and of a slightly different shape, the dark inner zone of green being more broken in outline, and running into the midrib: infl. smaller, but the fls. in size and color are the same as in the type.

20. *illústris*, Nichols. (*Maránta illústris*, Lindl.). Habit dwarf and compact, 6-9 in. high: lvs. spreading, growths bearing 2-5 lvs. 6-9 in. long; blade oblique, ovate, acute, undulate, 4-6 in. long, 2-5 in. broad, upper side rich dark shining olive-green, with a bluish metallic luster over the whole, the midrib being feathered on either side with dull silvery white and an irregular zone of the same color running the complete circle of the blade, under side dull purplish red; petiole 2-3 in. long, spreading, dull greenish brown; sheath extending to one-half the length of the petiole, upper part terete; petioles, lf.-scales and under side of the midrib covered with minute brown hairs: infl. an erect, capitate, few-fld. spike, on slender peduncle 4-6 in. long; bracts of two kinds, the upper 3 or 4 green, foliolose ovate, spreading over the floral bracts, and curving upward at the tips; lower bracts scarious, orbicular, light brown and shading to bright red at the point of attachment to the rachis, bracteoles 2-4, lanceolate, shorter than the bract: fls. in pairs; sepals white, two-thirds length of the tube, tube  $\frac{2}{3}$  in. long; petals lanceolate, white, spreading,  $\frac{1}{2}$  in. long; 2 aborted petaloid stamens larger than the petals, obovate, lower one heavily blotched with purple; stamen hooded; style and stigma white, curved,  $\frac{1}{2}$  in. long; ovary minute, white. Ecuador. F.S. 16:1691-2.—By some regarded as derived from *C. roseo-picta*.

21. *Louisæ*, Chancier (*Maránta Louisæ*, Hort.). Habit tufted, 2-3 ft. high: growths with 2-5 lvs.; blade elliptic, only slightly oblique, glabrous, acute margins plain or slightly undulate, 6-12 in. long, upper side light pea-green, feathered along the midrib with white, changing with age to a soft greenish white; under side light green tinted with pale purple-red; petiole  $\frac{1}{2}$ -2 $\frac{1}{2}$  ft. long, slender, erect, green, covered with soft minute brown hairs; sheath extending from one-third to one-half the length of the petiole, upper part terete: infl. an erect spike, elliptic in outline, on a leafy peduncle 4-12 in. long; bracts creamy white, reniform, obtuse or acute, bracteoles numerous, white, scarious; fls. in pairs; sepals linear, cream, half the length of the tube, tube  $\frac{3}{4}$  in. long; petals lanceolate, reflexed; lip elliptic, with bright yellow disk reflexed with scarious margins; column white or cream, linear curved towards the lip.

22. *Vándenheckei*, Regel (*Maránta* and *C. Goulétii*, Hort.). Habit dense and tufted, 1-2 $\frac{1}{2}$  ft. high: growths with 1-3 lvs., usually 2; blade oblique, elliptic or elliptic-ovate, 3-9 in. long, acute, upper side glabrous, rich dark green, marbled with silvery white along the midrib and an irregular undulating line of the same color running the complete circle of the blade, the intervening tissue in some cases will be also entirely composed of this silvery white colored tissue and the

green part reduced to a marginal ring  $\frac{1}{2}$  in. diam.; these two strikingly distinct forms of lvs. will often be found on a single plant in adjoining growths; in this case it is not that either of them represent the adult stage, as both are of frequent occurrence on the same plant and both produce infls.; under side, dull purple-red; petiole erect or spreading, dull reddish brown; sheath reaching from one-third to one-half its length, upper part terete or oval: infl. an erect narrow spike, sometimes sessile but more commonly on a peduncle 3-15 in. high; bracts erect, ovate, green tinted with brown, closely adpressed and forming a narrow cone-like mass some 3-5 in. long, the upper pair of bracts always being enlarged and spreading outwards like 2 small elliptic lvs.: fls. in pairs, white; sepals half the length of the tube; tube  $\frac{3}{4}$  in. long; petals elliptic spreading; column curved, white with brown stripe.—A fine stove plant for large or small pots, and on account of its tufted habit is of great use for decoration. Of very easy cult.

23. *Liétzei*, E. Morr. (*Maránta conspicua*, Bull. M. Neübertii, Hort.). Habit dwarf, spreading by means of runners: growths bearing from 1-7 lvs.  $\frac{1}{2}$ -2 ft. high; blade obliquely elliptic, acute, undulate, glabrous, 3-9 in. long, upper side soft velvety green, striped along the principal veins with dark olive-green and feathered between the veins with splashes of yellowish green, lower side dull purple-red, midrib brown; petiole 3-15 in. long, softly tomentose in lower part; sheath extending from one-half to nearly the entire length of the petiole: infl. borne upon long slender leafy sts., which later become swollen and root at the nodes and change to runners, thus forming an easy means of prop: few-fld., bracts green, ovate; fls. in pairs in axil of each bract, pure white,  $\frac{1}{2}$  in. diam.; sepals linear; petals obovate. Brazil. B.H. 25:273.

24. *picta*, Hook. f. (*Maránta picta*, Hort.). Habit dense and compact, covered in all parts with soft velvety hairs: growths with 4-10 lvs. and  $\frac{1}{2}$ -3 ft. high; blade elliptic, undulate, acute, 6-15 in. long, upper side rich velvety olive-green, feathered on either side of the midrib, pale yellowish green; under side rich purple-red; petiole 3-18 in. long, dull red; sheath extending nearly the entire length of the petiole, the upper inch or two being terete, and rather brighter in color than the lower part: infl. a dense cone-like spike, borne on long slender terete sts. 1-3 ft. long and bearing 1 or more lvs. which change into runners after the fls. are over, becoming fleshy and rooting at the nodes, forming a ready means of prop.; bracts 1-2 in. long, erect, elliptic or ovate, pale primrose tinted with rose or violet; fls. in pairs, 1 in. diam., primrose tinted with violet. Brazil. B.M. 7674. G.C. III. 22:293.

25. *noctiflora*, Hort. (*Maránta noctiflora*, Regel & Körn. *M. grácilis*, Hort.). Habit loose and spreading, 1-2 $\frac{1}{2}$  ft. high: growths with 2 or 3 lvs.; blade elliptic or elliptic-ovate, 6-12 in. long, pendulous or horizontal, upper side pale yellowish green, pinnately striped with rich dark green bars along the principal veins, lower side light green faintly suffused with dull red, the principal veins being more strongly marked with a deeper shade of red; petiole erect, rigid, 6-18 in. long; sheath, extending to half its length, upper part terete, green. Probably Brazil.—Perhaps a true *Maránta*.

26. *exímia*, Körn. (*Phrynium exímium*, Koch). Habit loose and spreading: growths bearing 1-3 lvs., usually 2, and from 1-3 ft. long; blade elliptic or elliptic-ovate, acute, 6-15 in. long, upper surface alternately striped with rich olive-green and light silver tissue, and arranged in the form of a feather, midrib channeled pale yellowish green, under side rich dark wine-red, glabrous above, softly tomentose with brown hairs beneath; petiole spreading, stout, 1-2 ft. long, lower part light green, reddish brown above, beneath extending from one-third to nearly the entire length of

the petiole, upper part oval or terete. Cent. Amer. Gt. 686.—One of the finest and most beautiful members of the genus.

27. *rufibárba*, Fenzl. Habit erect, densely tufted: growths with 3-7 lvs.  $1\frac{1}{2}$ -4 ft. long; blades linear-lanceolate, 6-12 in. long, rich shining green, suffused with purplish red below, undulate, acute; petiole  $\frac{3}{4}$ -2½ ft. long, terete above the sheath; sheath extending from 2-10 in. of the base of the lf., dull red heavily spotted with green. Probably Brazil. B.M. 7560.—Densely hairy in all its parts.

28. *Lindeniana*, Wallis (*C. Lindenii*, Wallis & André). Lvs. elliptic-oblong, short-acuminate (12 in. or less long), deep green above with an olive-green zone either side of the midrib, and beyond which is a darker zone of green, the under side counterfeiting the upper side, but with purplish zones. Brazil. I.H. 18:82.—By some considered to be a form of *C. roseo-picta*.

29. *princeps*, Regel (*Maránta princeps*, Lind.). Lf. elongated or elliptical-lanceolate, 7-10 in. long, 3-3½ in. broad, light green above, with broad black-green, flaming, broken band along the middle nerve, violet-purple below. Amazon.

30. *Legrelliana*, Regel. Lf. elliptical, pointed, 5-6 in. long, 2-3½ in. broad, above shining green, with broad, white, flaming, broken middle band along the middle nerve and numerous broken white linear small bands between the side nerves; lower surface whitish green and marked with red and green. Colombia, Ecuador.—A neat species.

BB. Lf.-blades larger, mostly upwards of 12 in. long.

C. Under side of lvs. green (red in juvenile states of Nos. 34 and others and in No. 37 and perhaps No. 45).

31. *crotalífera*, Wats. RATTLESNAKE PLANT. Lvs. oval, abruptly acute at each end,  $1\frac{1}{2}$ -2 ft. long, and 10-12 in. broad, yellowish green, with a white-margined midrib, paler underneath; petiole 2-3 ft. long, curved, sheathing; peduncles 1 or 2, 8-10 in. high, bearing distichous yellow-fld. spikes. Guatemala.—Offered in Fla. The spikes suggest the rattle of a rattlesnake (*Crotalus*) whence the specific name.

32. *Alluia*, Lindl. Habit erect: growths bearing 4-10 lvs. 2-4 ft. long; blade 1-2 ft. long, elliptic, arching in upper half, light green above, pale silvery gray below, margins slightly undulate; petiole erect, often as much as 2 ft. long, green, striped with dull red on each side, the sheath extending up to within 2-3 in. of the apex, where it becomes terete. W. Indies.—*Alluia* is a native Carib name.

33. *leopardina*, Regel (*Maránta leopardina*, Bull). Habit strong and vigorous, quickly forming a large and fine specimen: growths bearing 3-7 erect or spreading lvs., often as much as 5 ft. high, and arching over at the tip; blade to 20 in. long, elliptic, slightly oblique, acute, slightly undulate, and glabrous in all parts, upper side rich green in the adult stage; in the juvenile stage the lvs. are dark olive-green in the center, with an irregular outer band of paler green, forming a complete zone between the dark green center and margin; under side light green; petiole 1-4 ft. high, rigid, erect; sheath extending from one-third to one-half the length of the petiole, upper part terete, glabrous, shining light green. Brazil.—A near ally of *C. Chantrieri*, but not so brightly colored in the markings of the lf.

34. *Chantrieri*, Hort. (*Maránta Chantrieri*, André). Habit strong and vigorous, erect, spreading and arching above: growths bearing 3-4 lvs. and reaching as much as 6 or 7 ft. high in the adult stage; blade elliptic, glabrous; in the juvenile stage the larger part of the upper side of the lf. is a pale yellowish green with a dark green irregular band running around the margins and along the midrib, the under side is rich purplish red, in the adult stage the color on both sides of the lf. is all lost and becomes a rich dark green, the intermediate stages of development are marked by a gradual loss of the light yellowish green on the upper side and purple-red of the lower and the gradual encroachment of the dark green color which predominates in the adult stage; petiole  $1\frac{1}{2}$ -5 ft. long, downy when young, glabrous when old, spreading outward; sheath extending from one-half to three-fourths of its length, upper part terete. Brazil.—A near ally, if not a variety of the older *C. leopardina*, Regel.

cc. Under side of lvs. in shades of purple or red (or perhaps green in No. 45).

35. *ornata*, Koern. (*Maránta ornata*, Lind. *M. regalis*, Hort.). Habit vigorous, erect, spreading with age: growths bearing 1-4 lvs.; blade elliptic or elliptic-cordate, acute, 1-3 ft. long, rich shining green above (in the adult stage), dull purple-red below, the lvs. in the juvenile stage all beautifully striped between the principal veins with rose or pink, which in the intermediate stage changes to white and disappears entirely in the adult; petiole erect spreading with age,

often as much as 4 ft. long and thick in proportion; sheath extending from one-third to one-half its length, upper part terete, slightly downy, especially in the lower part. Guiana to Ecuador. F.S. 4:413-14.—The forms this plant assumes during the different stages of its development have been distinguished by some nurserymen who have distributed them under separate names, *C. regalis*, *C. majestica*, and *C. roseo-striata* all being stages of the one plant. To add to the confusion they are also known in the trade under the generic name of *Maranta*. The plant known as *C. albo-lineata* or *Maranta albo-lineata*, has been referred by some authors to this species, but it has no near affinity and is a different plant from *C. ornata*, *C. imperialis* or *C. Sanderiana*.

36. *imperialis*, Hort. (*Maránta imperialis*, Hort.). Habit vigorous, erect, spreading in the adult stage: growths with 2-7 lvs. 6 in. to 5 ft. long; blade as much as 2 ft. long when adult, elliptic-ovate, acute, entire, shiny green above, rich purple-red below; petiole stout, erect or spreading, dull green; sheath developed about half its length, upper part terete.—One of the best species for decorative effect. This species presents a striking dissimilarity between the juvenile and adult stages of growth. The juvenile stage is much the better for horticultural purposes as the lvs. are then striped with bright rose or pink between the principal lateral veins. This color gradually changes as the plant grows stronger and becomes vigorous, the stripes on the lower lvs. first becoming white and gradually disappearing on the lvs. that are developed after the plant reaches the adult stage, until a stage is reached when all the color and stripes on the upper side of the lvs. are lost and the lvs. are a rich shining green color. The high color is again developed as soon as the plant is disturbed at the roots either for prop. or by injury.

738. *Calathea zebrina*.

37. *Sanderiàna*, Hort. (*Maránta Sanderiàna*). A species closely allied to *C. imperialis* but differing in the broader and shorter lf.-blades, darker color of the under sides of the lvs., transverse striation between the veins, the hairy character of the petioles and under side of the lvs. Habit erect, spreading with age; growths bearing 1-4 lvs.; blades ovate, or elliptic-ovate, up to as much as 2 ft. long when adult, acute, green above (in the adult stage), rich plum-red below; lvs. in the juvenile stage are striped with bright rose which become white in the intermediate stage and entirely disappear in the adult; petiole erect, stout; sheath extending from one-third to one-half its length, upper part terete; lf.-scales, petioles and under sides of the lvs. slightly pubescent. Brazil.—*C. ornata*, *C. imperialis* and *C. Sanderiana* are probably all forms of one very variable species.

38. *insignis*, Bull. Habit tufted, dwarf and compact: growths bearing 2-3 lvs. and from  $\frac{1}{2}$ -3 ft. high; blade linear-lanceolate, 3-18 in. long, undulate, acute, glabrous, upper side highly glabrous, pale yellowish green shading to rich olive green at the edges, and with a row on either side of the midrib arranged pinnately of alternate long and short blotches of dark olive-green, giving the plant a most distinct and striking effect; under side a rich dark maroon-red; petiole 3-20 in. long, rigid, slender; sheath only developed near the base, upper part terete, green. Brazil. J.H. III. 45:218.—One of the most beautiful foliage plants in cult. and one which thrives well in a hot moist stove in a mixture of leaf-mold and sand.

39. *argyrophylla*, Hort. A garden hybrid. Habit spreading: growths with 2-5 lvs. 1-3½ ft. long, 12-20 in. long, elliptic, silvery white, feathered with pale green above and rich reddish brown below; petiole 12-20 in. long, pale green, striped along the back with red; sheath extending up to within 4-8 in. of the lf.-blade, upper part terete and slightly channeled on upper side, glabrous in all parts.

40. *nigricans*, Gagnep. Habit loose, light and elegant, erect at first, spreading with age: growths bearing 2-3 lvs., 2-5 ft. high; blade elliptic, occasionally lanceolate, acute, undulate, 12-20 in. long, rich dark velvety green above, dull red below; petiole 1-4 ft. long, erect; sheath extending to one-third the length of the petiole, upper two-thirds terete, dull green in color: infl. arising from center of the growth of the lvs., an erect globose spike with large foliose bracts: fls. 2-3 in the axil of each bract, 1 in. diam., primrose in color, petals shaded with purple; tube 1 in. long; bracts green, reflexed, upper ones forming an umbrella-like mass under which the fls. are developed in the axils of the lower bracts. Trop. Amer. R.H. 1904, p. 576.

41. *Sôphia*, Hort. Habit medium to strong: growths with 3-7 lvs. and 1-3 ft. high; blade elliptic, acute, undulate, 12-18 in. long, rich bright velvety green with a bright yellowish green channeled midrib above, light red below; petiole erect, rigid, covered with soft tomentum; sheath extending from one-third to one-half the length of the petiole, upper part terete.—Closely allied to *C. nigricans*.

42. *zebrina*, Lindl. (*Maránta zebrina*, Sims). ZEBRA PLANT. Fig. 738. Habit compact, 1-3 ft. high: growths bearing from 6-20 spreading lvs.; blade elliptic, obtuse or acute, slightly undulate,  $\frac{3}{4}$ -2 ft. long, upper side rich velvety green, with alternating bars of pale yellowish green and dark olive-green, under side light purple-red in the adult stage, and pale grayish green in the young stage; petiole  $\frac{1}{2}$ -2 ft. long, pale green; sheath large, canalliculate, and extending nearly the whole length of the petiole; scape short. Variable. Brazil. B.M. 1926. L.B.C. 5:494. R.H. 1865, p. 90. S.H. 1:164. Lowe, 1.—The commonest species, occurring in nearly all collections of warm greenhouse plants.

Var. *Binôti*, Hort., is a stronger-growing variety with darker colored foliage, with lvs. as much as 4½ ft. long.—One of the finest and best stove foliage plants in cult., of easy culture and one that should be in all collections.

43. *pulchella*, Kœrn. (*Maránta tigrina*, Bull). Weaker grower than *C. zebrina*, the lvs. lighter colored, with two series (large and small) of broad green bars. Brazil.—By some considered to be a form of *C. zebrina*.

44. *Warscewiczii*, Kœrn. Rather large: lvs. 2-5 in. long, oblong-lanceolate, acuminate, purple beneath, dark, velvety green above, but the midrib broadly feathered with yellow-green. Costa Rica. F.S. 9 339-40. Gn. 17:560. Lowe, 17.—One of the best.

45. *Bachemiàna*, Morr. Lvs. unequilateral, cordate at the base, ovate-lanceolate or rarely oblong, at enuata-actuminate, smooth, silvery green above, finely striate, with parallel greenish or whitish markings along the primary nerves, purplish or greenish beneath. Brazil.

*C. argyræa*, Kœrn. Lvs. very short, unequal, oblong-lanceolate, short-acuminate, above deep green and ash-colored, beneath purple. Country unknown.—*C. arrecta*, Lind. & André. Tall: lvs. oblong, red beneath, green above, with the nerves all prominent. Ecuador. I.H. 18:77.—*C. bambusaæa*, Poepp. & Endl.—Ischnosiphon.—*C. Baraquinii*, Regel. Lvs. oval-lanceolate, green, with bands of white. Brazil.—*C. fascinator*, Hort. Dwarf: lvs. broad-ovate-oblong, purplish beneath, green above and with blotches of lighter color and transverse narrow bars of red. Brazil. I.H. 41:104 (as *Maranta Fascinator*).—*C. giga*, Gagnep. Eight ft.: lf.-blade lanceolate, 2 ft. long, 8-10 in. broad, violet-purple when young but becoming green; petioles 5 ft. long: spike cylindrical, about 4 in. long, bearing 8 pairs of yellow-and-white fls. Trop. Amer.—*C. hieroglyphica*, Lind. & André. Dwarf: lvs. short-ovate, short-pointed, purplish beneath, green above and marked by many oblique bands or bars of silvery white. Colombia. I.H. 20:122-3.—*C. Kerchovæana*, Hort.—*Maranta bicolor* var.—*C. Lageriàna*, Hort. Lvs. large, dark red beneath, the prominent veins rich bronze.—*C. major*, Hort.—Ischnosiphon.—*C. Massangæana*, Hort.—*Maranta bicolor* var. *Massangæana*.—*C. medio-picta*, Makoy (*Maranta prasina*, Bull). Lvs. oval-lanceolate and tapering to both ends, dark green, with the rib feathered with white from base to summit. Brazil.—*C. musaica*, Hort. (*Maranta musaica*, Bull). A dwarf-growing species with obliquely cordate ovate lvs. 4-6 in. long, glabrous, acute, upper side pale shining green marked with numerous close set transverse veins of a lighter shade; petiole 3-6 in. long. Brazil.—*C. Oppenheimiàna*, Morr.—*Ctenanthe*.—*C. pardina*, Planch. & Lind.—*C. villosa*.—*C. smaragdina*, Lind. & André—*Monotagma*.—*C. splendens* and *splendida*, Hort.—*Maranta splendida*.—*C. villosa*, Lindl. Large: lvs. 10-20 in. long, oblong-ovate, pale green, with dark brown angular blotches: fls. yellow. S. Amer. F.S. 11:1101-2 (as *C. pardina*); also, Lowe, 32.

L. H. B.

C. P. RAFFILL.

**CALCEOLARIA** (Latin *calceolus*, a slipper, alluding to the saccate flower; these plants are sometimes called lady-slippers, but the name is best used for *Cypripedium*). *Scrophulariaceæ*. Showy-flowered herbs and shrubs, grown both in the greenhouse and in the open.

Leaves mostly opposite, usually hairy and rugose, entire or incised or pinnatifid; corolla 2-parted nearly to the base, the lower part or lip deflexed and inflated slipper-like, the upper lip smaller and ascending, but usually saccate; stamens 2 or rarely 3, and no rudiments (A, Fig. 739): fr. a many-seeded caps.—About 200 species, mostly from the Andes of Peru and Chile, but extending north to Mex.; also 2 in New Zealand. Monogr. by Kränzlin, Engler's Pflanzenreich, hft. 28 (1907).

Many species of *Calceolaria* have been cultivated at one time or another, but the number now grown is few, most of the garden kinds apparently being hybrids or marked variations from specific types. The genus falls into two horticultural sections, the herbaceous kinds, and the shrubby kinds. The former are the only ones generally known in this country, being treated more or less as annuals. The herbaceous garden forms Rodigas considers to be offshoots chiefly of *C. arachnoidea* and *C. crenatiflora*, and he has called this race *C. arachnoideo-crenatiflora* (see I.H. 31:528, 536; 35:54). In this work, however, the more inclusive terms *C. herbeohybrida* of Voss is employed (Fig. 739); and also the corresponding *C. fruticoybrida* for the shrubby

derivatives. *C. crenatiflora* seems to have left its impress most distinctly on the greenhouse forms. The calceolarias are grown for the variously colored and often spotted slipper-like flowers. The shrubby forms, grown much in England, do not thrive in the heat of the American summer.

The cultivation of the herbaceous and the shrubby kinds of calceolarias is about the same, with the difference that the herbaceous kinds are nearly always grown from seeds, while the shrubby varieties are oftener grown from cuttings.—Seeds may be sown from the end of March until the first of September, according to the size of the plant required. Those sown early are more easily carried through the hot months than any that are propagated in the end of May or in the month of June. Sow the seeds in shallow pans with good drainage in a compost of equal parts of sand and of

739. *Calceolaria herbeohybrida*.

the peat which is shaken out of fern-root that is to be used for potting orchids, adding about one-fourth of charcoal. All this should be sifted through a fine sieve. This material should be well mixed and placed an inch in depth in the receptacle that the seeds are to be sown in. The surface should be made as level as possible, and the seeds, after being thinly scattered over the same, may be pressed gently into the compost, covering them very lightly with sphagnum moss sifted through a very fine sieve. Water by dipping the pan in a tank of water, allowing it to soak through the holes in the bottom of the pan. This mode of watering is not so liable to disturb the small seeds, as an overhead watering with a fine rose on the watering-pot. A temperature of 60° will cause calceolaria seeds to germinate, but the sun should not strike them until the cool of autumn comes. A greenhouse with a northern aspect is best for them until the end of September, giving all the air possible day and night. From the first of October until the end of March, the plants will stand the full sun, and should then be grown in a night temperature of 40°, allowing 10° or 15° of rise during

the day. For a first potting (which may be to 2-inch pots) the same mixture in which the seeds were sown is the best, and the seedlings should be big enough to be easily held between the finger and thumb; and as the plants are moved along into larger pots, equal parts of fibrous loam, fern-root, leaf-mold, sand and dried cow-manure may be used, always having this compost in as lumpy a state as can be equally and conveniently packed around the plant. When the plants are well rooted in their flowering pots, they may be watered with manure water. An ordinary handfull of green cow-manure to about three gallons of water may be used, and if any of the commonly used fertilizers are to be employed for a change, the same amount of fertilizer to an equal amount of water is about right; but always water with clean water twice between these applications.—If cuttings are to be used for the propagation of calceolarias, they should be rooted in a temperature of 45° to 50°, kept shaded from the sun. Cuttings may be procured from the plants that are trimmed into shape during their growing period (in August or September) and should have two leaves attached and another joint to go in the sand. When rooted, treat them as described above for the seedlings. The varieties of the rugosa section are largely used for bedding plants in Europe.—Calceolarias are very subject to attacks of green- and white-fly; the best means of keeping these pests in check is by fumigation with hydrocyanic gas. In the evening is the best time to fumigate, and the foliage of the plants should be perfectly dry; in fact, it is better if possible to use no water at all in the greenhouse the day they are to be treated. In the hot months of summer, a cool evening should be selected and one-quarter of an ounce of cyanide of potassium, one ounce of sulfuric acid and two ounces of water to every 1,000 cubic feet contained in the greenhouse may be used. (See *Fumigation*.) The house at this season of the year should be opened up in forty-five minutes after the cyanide has been dropped into the liquid. Repeat at intervals of about three weeks. In winter the quantity may be doubled to the same cubic feet of space, and the house may be kept closed until morning. When opening the ventilators after fumigating in this manner, do not breathe in the greenhouse until the air has changed, say about half an hour after, as the gas is deadly to human beings. Fumigating with tobacco will kill the green-fly, but it has no effect on the white-fly. (Geo. F. Stewart.)

A. *Herbaceous calceolarias, some of them parents of the florists' varieties of this country.*

B. *Lvs. simple.*

C. *Fls. essentially yellow.*

1. *crenatiflora*, Cav. (*C. pendula*, Sweet. *C. mirabilis*, Knowl. & Wesc.). One to 2 ft., the st. soft-hairy, terete: radical lvs ovate and long-petioled (the petioles winged at top), undulate and dentate, sometimes obscurely lobed, rugose and pubescent, paler beneath, often purplish toward the tip; st.-lvs. shorter-petioled and becoming sessile above: fls. in a forking corymb, the slipper large, oblong or oblong-obovate, furrowed or crenate, hanging, yellow, with orange-brown dots. Chile. B.M. 3255.—From this species we appear to have derived the spots of calceolaria fls.

2. *corymbosa*, Ruiz & Pav. (*C. Wheeleri*, Sweet). One to 3 ft. high, the st. 4-angled: radical lvs. ovate and sometimes cordate, obtuse or nearly so, doubly crenate, rugose and hairy, whitish beneath: st.-lvs. smaller and narrower, somewhat clasping, opposite: fls. small (about half as large as in *C. crenatiflora*), in a broad, somewhat loose corymb, the slipper somewhat short-oblong, clear yellow outside and marked with red lines inside. Chile. B.M. 2418.

3. *biflora*, Lam. (*C. plantaginea*, Smith. *C. suberecta*, Hort. *C. Morrisonii*, Don). Herbaceous, stemless:

lvs. ovate-spatulate, toothed at top: scapes many, few-fl.; fls. large, yellow, lower lip large and the upper one small and notched, the under side of the slipper dotted with red. Chile, Argentina. B.M. 2805. L.B.C. 15:1402. F.S.R. 2:312.

4. *Pavonii*, Benth. An erect, strong-growing, herbaceous, or half shrubby species: st. terete, green, stout: lvs. perfoliate, on short winged petioles, ovate or elliptic, coarsely serrate, 5-9 in. long (in a vigorous plant), and a rich light green in color: sts. and lvs. densely hairy;

infl. paniculate, terminal, large and handsome; fls. rich golden-yellow and marked in throat with brown, and about 1 in. diam. Peru. B.M. 4525. G. 27:663. J.H. III. 50:489. J.F. I, pl. 32.—One of the parents of several handsome hybrids.

5. *Burbidgei*, Hort. (*C. hybrida* var. *Burbidgei*, Gumbel). A garden hybrid raised at Trinity College, Dublin, by Burbidge between *C. Pavonii* on the one side and *C. deflexa* (*C. fuchsifolia*) or possibly *C. amplexicaulis* on the other: plant erect: sts. hairy, terete: lvs. light green, lanceolate, 5-9 in. long, serrate, winged along the petiole: infl. large, in terminal free-branching panicles; fls. 1 in. diam., rich golden yellow. G. 25:547. Gn. 47:306.—One of the finest of cool greenhouse kinds and valuable also as a bedding plant as it grows into a fine large specimen as much as 6 ft. high and branches freely from the base. Readily prop. by cuttings.

cc. Fls. purple.

6. *purpurea*, Graham (*C. Herbertiana*, Lindl.). Sts. erect, pubescent, 1-2 ft.: radical lvs. spatulate and acutish, with a strong midrib, sparsely hairy, rugose, dentate; st.-lvs. broad-cordate and clasping, less toothed: fls. in loose corymbs, small, purplish or reddish violet, the slipper somewhat furrowed. Chile. B.M. 2775. B.R. 1313.—Supposed to have entered largely into purple-fl. varieties.

7. *arachnoidea*, Graham. St. a foot or two high, terete, branchy, woolly, with appressed hairs: lvs. oblong or lingulate, narrowing into long-winged petioles, clasping, obscurely toothed, rugose, woolly

on both sides: peduncles in pairs, forking: fls. small, dull purple, the slipper nearly globular and furrowed. Chile. B.M. 2874. L.B.C. 16:1557.

BB. Lvs. compound, or essentially so.

8. *scabiosæfolia*, Sims (*C. pinnata*, Ruiz & Pav. *C. heterophylla*, Willd.). Often 2 ft., the st. terete, hairy, and leafy: lvs. opposite, with clasping petioles, cut nearly or completely to the midrib; lfts. varying from lanceolate to broad-oval, acuminate, ciliate, dentate: fls. very small, in small hairy corymbs, pale yellow, the slipper nearly orbicular in outline. Chile, Peru, Ecuador. B.M. 2405.—This is sold by seedsmen as an annual bedding plant.

9. *pinnata*, Linn. Often reaches 3 ft. or more: lvs. pinnatifid or completely compound, the divisions short and nearly entire, obtuse or nearly so: fls. small, sulfur-yellow. Chile, Peru, Bolivia. B.M. 41.—The first known garden species, still sold as an annual.

10. *herbeohýbrida*, Voss (*C. hybrida*, *C. herbacea*, *C. Yoüngii*, Hort., and others). Derivatives of the herbaceous calceolarias: mostly dwarf or small (2 ft. or less), in many colors, usually with well-inflated slippers.

AA. Shrubby calceolarias.

B. Fls. yellow.

11. *integrifolia*, Murr. (*C. rugosa*, Ruiz & Pav. *C. salviaefolia*, Pers.). Two to 6 ft. high, branchy and bushy: lvs. glabrous, oval-lanceolate, crisped and dentate, the short petioles winged: fls. in terminal clusters, small, yellow. Chile. L.B.C. 10:942. B.R. 744, 1083.—Variable. Probably the chief source of shrubby calceolarias. Var. *viscosissima*, Hort. (Fig. 740), is a sticky-hairy form with sessile lvs. and showy fls.

12. *thyrsiflora*, Graham. More shrubby: lvs. linear and clustered, toothed, sessile, not hairy: fls. small, yellow, in a close, terminal cluster. Chile. B.M. 2915.

13. *amplexicaulis*, HBK. A foot or two high: lvs. cordate-ovate to ovate-lanceolate, long-acuminate, pubescent, woolly beneath and deep-rugose above, clasping: fls. small, in an upright corymb, pale yellow and spotless, the slipper hoof-shaped. Ecuador, Peru.

BB. Fls. white.

14. *álba*, Ruiz & Pav. Shrubby, erect, branched, the branches opposite: lvs. linear, toothed above, with fascicles of fls. in axils: fls. small, white, of 2 very unequal lips, the upper one being very small, the throat equal. Chile. B.M. 4157. G.C. III. 22:141. Gn. 51:60; 75, p. 6. J.H. III. 61:419.—A most beautiful species in England when planted out in a soil rich in humus, but should be shaded from hot sun. The plant dislikes pot culture. This species has recently been used by the hybridist in order to secure a race with white fls. The new hybrid *C. Veitchii* is likely to prove a great acquisition to gardens, and is partly derived from this species.

15. *fruticohýbrida*, Voss (*C. ascendens*, Hort., not Lindl. *C. dentata*, and *C. integrifolia*, Hort., for the most part). Here may be grouped the shrubby garden calceolarias that are derivatives of most other species. They are marked by the prevailing under-color of yellow, orange or orange-red; sometimes they are yellowish white or dull red.

*C. andina*, Benth. (*C. Herbertiana* var. *pallidiflora*, Lindl.). Shrubby, glandular-pubescent: lvs. orbicular-ovate, thick, rugose, hairy: fls. small, yellow, the slipper crenate. Chile. B.M. 7326. B.R. 1576.—*C. bicolor*, Ruiz & Pav. Shrubby: lvs. ovate, dentate: fls. small, the slipper sulfur-yellow above and white below. Peru. B.M. 3036. L.B.C. 18:1783.—*C. cana*, Cav. Herbaceous, tufted, scape, 1-1½ ft.: lvs. radical, oblong-lanceolate, spatulate or obovate: fls. white with small purple or rose-colored lines and blotches. Chile. B.M. 8416.—*C. Chiránii*, Hort.—*C. profusa*, F.E. 28:143.—*C. deflexa*, Ruiz & Pav. (*C. fuchsifolia*, Hemsl.). Shrubby: lvs. lanceolate: fls. yellow, panicled, the upper lip very large. Peru. B.M. 6431. G.C. II. 15:269. Gn. 15:258.—*C. flexuosa*, Ruiz & Pav. Shrubby at base: lvs. large-ovate, coarsely crenate-dentate: fls. rather large, clear yellow, with very large

740. *Calceolaria integrifolia* var. *viscosissima*. (X 1/2)

green calices. Peru. B.M. 5154. F.S. 22:2331.—*C. Forstii*, Skan. Undershrub, 1-1½ ft., slender: lvs. ovate, obtuse or somewhat acute, serrate: fls. small, pale yellow with a large reddish brown blotch inside the lower lip. Peru. B.M. 8436.—*C. fuchsiaefolia*, Hemsl.—*C. deflexa*.—*C. Hénnici*, Hook. f. Shrubby, evergreen: lvs. willow-like, small-toothed: fls. panicle, clear yellow, the upper lip large. Peru. B.M. 5772.—*C. hyssopifolia*, HBK. Shrubby: lvs. crowded, small, lanceolate and toothed, or at top of st. linear and entire, margins revolute: fls. rather large, in many-fld. corymbs, pale sulfur-yellow, the slipper obovate-orbicular and crenate. Ecuador.—*C. Jeffreyi*, Hort., is a hybrid group between herbaceous greenhouse kinds and *C. integrifolia*, produced about 10 years ago in England: 2-6 ft., with branching panicles bearing fls. about 1 in. across of few colors.—*C. kewensis*, Hort. Cross of *C. Jeffreyi* with herbaceous varieties: more compact and larger-fld. than *C. Jeffreyi*; colors of wide range: plant 1-2½ ft. high and about as broad when in good bloom. G.C. III. 39:390.—*C. lobata*, Cav. Herbaceous: lvs. triangular-ovate, palmately 5-7-lobed, dentate: fls. in terminal clusters, clear, pale yellow, and spotted on the up-curved slipper. Peru, Bolivia. B.M. 4525, 6330.—*C. mexicana*, Benth., is a small-fld., pale yellow species hardy in England: annual: lower lvs. 3-parted or -lobed, the upper ones pinnatisect. Mts., Mex., Costa Rica.—*C. petiolaris*, Cav. (*C. floribunda*, Lindl.). Herbaceous: lvs. ovate, the lower ones wing-petioled, toothed, rugose: fls. yellow in loose panicles, the lips connivent. Chile.—*C. piscumensis*, Meyen. Shrubby: lvs. ovate-cordate, nearly or quite obtuse nearly sessile, irregularly crenate, margins reflexed: fls. large, orange varying to red, the slipper up-curved. Peru. B.M. 5677.—*C. polyrrhiza*, Cav. A dwarf and tufted species from Patagonia, with dark yellow purple-spotted fls.: herbaceous, caespitose: lvs. crowded, lanceolate. S. Chile, Patagonia. For rockwork.—*C. profusa*, Hort. (*C. Clibranii*, Hort.). On the order of *C. Burbidgei*. A garden form of free-flowering habit.—*C. Sinclairii*, Hook. Herbaceous, half-hardy: lvs. oblong-ovate, stalked, crenate-dentate, hairy: fls. small, lilac or flesh-colored, spotted within, the 2 lips nearly equal, not saccate. New Zeal. B.M. 6597. Now referred to *Jovellana* (*J. Sinclairii*, Kränzl.).—*C. tenella*, Poepp. & Endl. Herbaceous, half-hardy, 6 in. high: lvs. ovate or orbicular, small (½ in. long), nearly or quite sessile: fls. yellow, spotted within. Chile. B.M. 6231.—*C. Veitchii*, Hort. Hybrid of *C. alba* and a garden variety: 3-5 ft., erect and branched: fls. many, rather small, pale lemon-yellow. G.C. III. 51, Suppl. June 1. Gn. 76, p. 271. (See No. 14.)—*C. violacea*, Cav. (*Jovellana violacea*, Don). Shrubby: lvs. small, ovate-cordate, deep-toothed, stalked: fls. yellow-salmon, spotted within and without, the two lips not saccate. Chile. B.M. 4929.—*C. virgata*, Ruiz & Pav. Bushy, 1-1½ ft.: lvs. ovate, short-stalked: fls. rather small, numerous, white. Peru, Bolivia. G.C. III. 51:50.

L. H. B.

**CALÉNDULA** (Latin, *calendæ* or *calends*: throughout the months). *Compósitæ*. Flower-garden plants.

Small herbs, the common cult. species annual, others perennial, with alternate simple lvs., mostly large heads with yellow or orange rays, glabrous incurved achenes, plane naked receptacle, pappus none, and involucre broad, with scales in one or two series, their margin usually scarious.—Some 15 species from Canary Isls. to Persia.

*officinalis*, Linn. POT MARIGOLD. Fig. 741. Annual: 1-2 ft. high, more or less hairy: lvs. oblong and more or less clasping, entire, thickish: heads solitary, on stout stalks, large with flat spreading rays, showy, closing at night. S. Eu. B.M. 3204. V. 5:44; 16:165.—One of the most universal garden fls., running into many vars., distinguished by size, color, and degree of doubling. The color varies from white-yellow to deep orange. This is the marygold of Shakespeare's time. The fl.-heads are sometimes used in cookery, to flavor soups and stews. The calendula is of the easiest culture in any warm, loose soil. The seeds are usually sown where the plants are to stand, but they may be sown indoors or in a frame and the plants transplanted. The achenes are large and germinate quickly. The plant blooms the whole season, particularly if the fls. are picked. It is a hardy annual, and in the southern states will bloom most of the year. In the N. it blooms up to the first frosts, sometimes beyond. Sown in summer or autumn, it makes a good winter bloomer. Florets are used in medicine as a vulnerary and anti-emetic. The flowering plant was formerly used for removing warts.

741. *Calendula officinalis*, double-flowered. (× ½)

*suffruticōsa*, Vahl (*C. Noëana*, Boiss.). More diffuse, annual: lvs. sessile, lanceolate, somewhat dentate: heads bright yellow, not doubled, very numerous, on long peduncles. W. Medit. region.—Seeds are sold by American dealers.

*C. Pöngelii*, Hort., and *C. pluviialis*, Linn., will be found under *Dimorphotheca*.

L. H. B.

**CALICO BUSH:** *Kalmia*.

**CALIFORNIA POPPY:** *Eschscholtzia*.

**CALIFORNIA YELLOW BELLS:** *Emmenanthe penduliflora*.

**CALÍMERIS** (Greek, *beautiful arrangement*). *Compósitæ*. Good daisy-like border plants.

Calimeris comprises about 10 Asian herbs, now mostly united with *Aster*, but horticulturally distinct, and differing from that genus in the hemispherical involucre of few nearly equal scarious-margined bracts, and broad convex receptacle: achene flat and hairy. Hardy perennials of low growth, suited to the border in front of stronger plants. *C. tatarica* is described in the genus *Heteropappus*.

*incisa*, DC. (*C. incisafolia*, Hort.? *Aster incisus*, Fisch.). One to 2 ft., erect, corymbose at the summit: lvs. lanceolate, remotely incise-dentate; scales of involucre red-margined: fls. large, purple-rayed or almost white, and yellow-centered.—Of easy cult. in any good soil, making a display throughout July and Aug. The commonest species in cult.

*altáica*, Nees (*Aster altáicus*, Willd.). Lower, pubescent or hispid: lvs. linear-lanceolate and entire: scales of involucre pubescent and white-margined; rays narrow, blue.

L. H. B.

**CALIPHRÛRIA:** *Calliphuria*.

**CÁLLA** (ancient name, of obscure meaning). *Aráceæ*. A monotypic genus, containing a native bog-plant with a white spathe.

Herb, with creeping rhizomes and 2-ranked lvs. Differs from *Orontium* in the parallel secondary and tertiary veins of the lf.-blade, as well as in having a prominent more or less fleshy persistent spathe enveloping the spadix, and in the absence of perianth; lower fls. perfect, upper staminate; fr. a red berry. See *Zantedeschia* for *C. æthiopica*, *C. albo-maculata*, and others. The calla of florists, or calla lily, is *Richardia* of recent books, but is properly *Zantedeschia*, where it is described and the culture given in this work.

*palústris*, Linn. WATER ARUM. Fig. 742. Rhizome bearing many distichous lvs. one year, the next only 2 lvs. and the peduncle: petioles cylindrical, long-sheathed; blade cordate: spathe elliptical, or ovate-lanceolate, white. Eu., N.

Asia, and E. N. Amer. V. 2:197; 14:244. B.M. 1831.  
—An interesting little perennial plant, useful for outdoor ponds.

JARED G. SMITH.

**CALLIÁNDRA** (Greek, *beautiful stamens*). *Leguminosæ*. Evergreen shrubs and trees of greenhouse culture, planted in the open far south.

Leaves bipinnate; fls. numerous; fls. usually in globose heads or clusters; corolla small, obscured by the numerous, long, silky, purple or white stamens.—About 120 species, widely distributed in tropics. Distinguished from *Acacia* by the presence of a thickened margin on the pod.

Propagation is by cuttings placed in sand over bottom heat. Keep in warm-house, with the exception of those from Mexico.

**Lambertiána**,

Benth. (*Acacia Lambertiána*, D. Don.) Unarmed; branches terete; lvs. puberulous-villous; pinnae 2-3-yoked; fls. 9-12-yoked, oval-oblong, obtuse at both ends; peduncles 3-5, racemose, heads roundish; stamens 20-25, pink. Mex. B.R. 721.

**tetragóna**, Benth. (*Acacia tetragóna*, Willd.). Unarmed; branches tetragonal; pinnae 5-6-yoked; fls. 16-29-yoked, linear, acute, the outer larger; heads pedunculate, axillary; fls. white. Trop. Amer.

**portoricénsis**, Benth. (*Acacia portoricénsis*, Willd.). Unarmed shrub or small tree; pinnae 2-4-yoked; fls. 15-25-yoked, linear, obtuse, closing at evening; branchlets pubescent; heads globose, pedunculate, axillary, the white fls. opening as lvs. close; calyx ciliate on the margin; stamens 20-25; filaments long, white; pod straight, linear, tapering at base. W. Indies.—Endures temperatures as low as 24° F. in Calif. Var. *majior*, a splendid form, is known abroad. B.M. 8129.

**Twoëdyi**, Benth. Unarmed shrub, lightly pubescent; pinnae 3-4-yoked; fls. 20-30-yoked, linear, obtuse, shining; peduncles axillary, 1-2 in. long, from large scaly buds; calyx and corolla silky, lobes erect; stamens long, numerous, purple. Brazil. B.M. 4188.

*C. californica*, Benth. A stiff, hairy, much-branched shrub cult. in Calif. It is native near Magdalena Bay and is the most northerly known representative of the genus.—*C. caracasana*, Benth. (*Mimosa caracasana*, Jacq.) differs from *C. portoricénsis* in having purple stamens, but is probably not distinct.—*C. grandiflora*, Benth. Not over 10 ft.; foliage glaucous; fls. scarlet. Intro. by Franceschi.—*Mimosa grandiflora*, L'Her. (?)—*C. Samán*, Griseb., = *Pithecolobium Samán*.

HARVEY MONROE HALL.

**CALLIANTHEMUM** (Greek, *beautiful flower*). *Ranunculáceæ*. Two or 3 little herbs of the mountains of Eu. and Cent. Asia, allied to *Anemone*, sometimes mentioned for outdoor planting. Lvs. radical (very small or none on the st.), compound; fls. terminal, white or rose-color; sepals 5, deciduous; petals 5-15, showy, with nectaries at the base. The species apparently intergrade. *C. anemonoides*, Endl. Three to 10 in. high, blooming in spring; lvs. as broad as long, triangular in outline, bipinnatifid; fls. 1½ in. or less across; sepals broad; petals narrow; rhizome somewhat fleshy. Tyrol. Useful in rockwork.

**CALLICÁRPA** (Greek, *beauty and fruit*). *Verbénacææ*. Ornamental woody plants cultivated chiefly for their brightly colored berry-like fruit appearing late in autumn; also for the attractive flowers which appear in summer.

Flowers perfect; calyx short-campanulate, truncate or slightly 4-toothed, rarely 4-parted; corolla with short tube, 4-lobed; stamens 4, of equal length; ovary 4-celled, cells 1-ovuled; fr. a subglobose berry-like drupe with 2-4 stones.—More than 30 species in tropical and subtropical regions of Asia, Austral., N. and Cent. Amer.

*Callicarpas* are shrubs or trees, often with stellate hairs, with opposite, usually serrate, deciduous leaves and small pink, bluish or whitish flowers in axillary clusters, followed in autumn by small berry-like lilac, violet or red, rarely white fruits. The hardiest are *C. dichótoma*, *C. japonica* and *C. Giraldii*, which may be grown even North in sheltered positions, if somewhat protected during the winter. If killed to the ground, young shoots spring up vigorously, and will produce flowers and fruit in the same season. If grown in the greenhouse, they require a sandy compost of loam and peat, and plenty of light and air. Propagation is readily effected by greenwood cuttings in spring or summer under glass; also by hardwood cuttings, layers and seeds.

A. Lvs. tomentose beneath.

**americana**, Linn. Shrub, 3-6 ft., with scurfy, downy tomentum: lvs. cuneate, elliptic-ovate, acuminate, obtusely serrate, 3-6 in. long; cymes short-stalked; corolla bluish, glabrous; fr. violet. July, Aug. Woods and rich soil. Va. to Texas and W. Indies.—One of the handsomest in fr., but more tender than the Japanese species. Var. *álba*, Hort., has white fr.; very conspicuous in fall and early winter.

AA. Lvs. not or slightly pubescent below and glandular: corolla glandular outside.

B. Peduncles longer than petioles: lvs. glabrous or nearly so below.

**japonica**, Thunb. (*C. Mimurazaki*, Sieb.). Fig. 743. Shrub, 2-5 ft.: lvs. cuneate, elliptic or ovate-lanceolate, long-acuminate, serrulate, 2½-5 in. long; cymes peduncled, many-fl.; fls. pink or whitish; fr. violet. Aug. Japan. S.I.F. 1:70. G.C. 1871:173. P. F.G. 2, p. 165. H.F. 1861:12. Var. *leucocarpa*, Sieb. With white fr.

**dichótoma**, Koch (*C. grácilis*, Sieb. & Zucc. *C. purpurea*, Juss.). Shrub, 1-4 ft.: lvs. cuneate, elliptic or obovate, crenately serrate above the middle, entire toward the base, 1½-3 in. long;

743. *Callicarpa japonica*. (×¼)

742. *Calla paustris*.

cymes peduncled, few- or many-fl'd.; fls. pink; fr. lilac-violet. Aug. Japan, China. Gn. 23:540.—Closely allied to the former, but smaller in every part.

BB. *Peduncles shorter than petioles.*

**Girálzii**, Hesse. Shrub: lvs. broadly elliptic or elliptic-ovate to elliptic-lanceolate, 2–4 in. long, dentate, glandular beneath, and sparingly stellate-pubescent; petioles slender,  $\frac{1}{3}$ – $\frac{1}{2}$  in. long; fls. pink in dense cymes on pubescent stalks shorter than the petioles; fr. violet. W. China.

*C. cina*, Linn. Shrub: lvs. broadly elliptic, shining above and whitish-tomentose beneath; fr. deep purple. E. India, China, Philippine Isls. B.M. 2107.—*C. longifolia*, Lam. Shrub: lvs. oblong-lanceolate or lanceolate, narrowed at both ends, 3–5 in. long, stellate pubescent and glandular beneath; cymes short-peduncled; fls. pink or purple; fr. white. Himalayas, China. B.R. 10:864. H.E. 2:133.—*C. mollis*, Sieb. & Zucc. Shrub, to 4 ft.; lvs. oblong-lanceolate, rounded at the base, tomentose beneath; fls. and fr. pink. Japan. S.I.F. 1:70.—*C. pedunculata*, R.Br. (*C. lanata*, Schau., not Linn.) Shrub: lvs. oblong-ovate, nearly sessile, and rounded at the base, green and slightly tomentose beneath; cymes slender-peduncled. E. Indies. Austral. Sieb. Flor. d. Jard. 4:97.—*C. rubella*, Lindl. (*C. dichotoma*, Hort., not Juss.) Shrub or small tree, to 20 ft.; lvs. cordate-oblong, tomentose beneath; fr. purple. Himalayas, China. B.R. 11:883. F.S. 13:1359. I.H. 6:202. G.C. 1859:96. R.H. 1859, p. 106, 107.

ALFRED REHDER.

**CALLICHRÒA**: *Layia*.

**CALLIÓPSIS**: *Coreopsis*.

**CALLIPHURIA** (Greek, *beautiful prison*; referring to the spathe inclosing the flowers). Written also *Caliphuria*. *Amaryllidaceæ*. Tender bulbs.

Distinguished from *Eucharis* by the stamens, the filaments being petaloid, with 3 large linear teeth on top, the middle one bearing the anther. The fls. appear with the lvs.; perianth funnel-shaped, spreading upward; stamens inserted at the throat of the tube; caps. tardily splitting.—Three species from Colombia.

Calliphurias are warmhouse plants and should be grown in a rich soil of loam, peat or leaf-mold and sand. Propagated by offsets.

**Hartwegiana**, Herb. Bulb ovoid, 1 in. thick, stoloniferous, with brown membranous tunics: lvs. bright green, firmer and more closely veined than in *Eucharis*, with an oblong-acute blade 4–5 in. long, 2 in. broad, narrowed into a petiole, which is flat above and round beneath; scape slender, 1 ft. long; fls. 6–8, in an umbel, white; perianth 1 in. long and wide. Andes of Bogota.—B.M. 6259. B.R. 30, p. 87, desc. Intro. in 1889 by Reasoner.

*C. subdentata*, Baker=*Eucharis subdentata*.

N. TAYLOR.†

**CALLIPRÒRA**: *Brodiaea*.

**CALLIPSÏCHE** (Greek, *beautiful* and *butterfly*). *Amaryllidaceæ*. Three bulbous plants from Ecuador and Peru, the lvs. produced after the yellow or greenish yellow fls., probably not in the horticultural trade. Leaves thin, oblong and stalked: fls. many in an umbel on a hollow peduncle or scape; perianth funnelliform with short tube, the segms. all equal and oblanceolate to oblong; stamens 6, much exserted, attached at the throat; fr. a deeply 3-lobed caps., with many seeds. They require the general treatment given amaryllis. *C. mirabilis*, Baker, has an oblong bulb 2 in. diam.: lvs. 1 or 2, blade 5 or 6 in. broad: peduncle 2–3 ft.; fls. greenish yellow, about 30 in a dense umbel; stamens three times as long as perianth and widely spreading. July, Aug. *C. aurantiaca*, Baker, has an ovoid bulb 1 in. diam.: lvs. few: peduncle  $1\frac{1}{2}$ –2 ft.; fls. bright yellow, 6–8 in the umbel; stamens green, twice the length of perianth. Autumn and winter. B.M. 6841.

L. H. B.

**CALLÍPTERIS** (Greek, *beautiful fern*). *Polypodiaceæ*. Ferns allied to *Asplenium* and *Diplazium*, with elongate sori formed on both sides of the veins, and the veins uniting to form meshes or areoles.—Some 15 species are known from the warmer parts of both hemispheres.

The following is the only one in cult. Culture the same as for tropical aspleniums.

**prolifera**, Bory (*Asplenium decussatum*, Swartz). Lvs. 3–6 ft. long, the stalks 1–2 ft. long, the pinnæ numerous, 6–12 in. long, 1–2 in. wide, with deeply crenate margins and frequently with bulblets in the axils; veins pinnate, with the branches of contiguous veins uniting. Polynesia and Malaya.

L. M. UNDERWOOD.

**CALLÍRHOË** (Greek mythological name). Written also *Callirrhoë*. *Malvaceæ*. Hardy showy herbs, for outdoor planting.

Perennials or annuals: lvs. alternate, with lobed or cleft blades or more finely dissected: fls. showy, axillary or sometimes in terminal racemes, the petals irregularly cut at the apex or truncate, differing in this from the notched petals of *Malva*; involucrel of 1–3 bracts, or wanting.—Nine species, native.

The callirhoës are of the easiest culture, and deserving of a much greater popularity. They are chiefly propagated by seeds, but the perennial species may also be propagated by cuttings.

744. *Callirhoe pedata*.

A. Annual: involucrel absent.

**pedata**, Gray. Fig. 744. Height 1–3 ft.: st. erect, leafy: radical and lower lvs. round-cordate, palmately or pedately 5–7-lobed or -parted, the lobes coarsely toothed or incised, upper 3–5-cleft or -parted, usually into narrow divisions: fls. red-purple, cherry-red, varying to lilac. On plains and in sand, S. U. S., spring and summer. R.H. 1857, p. 430.

AA. Perennial: involucrel present.

**involucrâta**, Gray. Height 9–12 in., plant hirsute or even hispid: root large, napiform: sts. procumbent: lvs. of rounded outline, palmately or pedately 5–7-parted or -cleft, the divisions mostly wedge-shaped, incised, the lobes oblong to lanceolate: fls. crimson-purple, cherry-red or paler. All summer. Minn. to Texas. R.H. 1862:171 (as *C. verticillata*).

Var. **lineariloba**, Gray (*C. lineariloba*, Gray). Less hirsute than the type: sts. ascending: lvs. smaller, 1–2 in. across, the upper or all dissected into linear lobes: fls. lilac or pinkish. Texas and adjacent Mex.—An excellent trailer, especially for rockeries. Thrives even in very dry soils, the root penetrating to a great depth. A sunny position is preferable.

*C. Papaver*, Gray. A perennial decumbent or ascending plant with 3–5-lobed or -parted lvs. and involucrel purple-red fls. S.U.S.—Useful for very dry sandy places.

N. TAYLOR.†

CALLISTA: *Dendrobium*.

**CALLISTÈMON** (Greek, *kallos*, beauty; *stemon*, a stamen; in most of the species the stamens are of a beautiful scarlet or crimson color). *Myrtaceæ*. BOTTLE-BRUSH. Ornamental shrubs, thriving without irrigation in California, where they are hardy and much used; also planted to some extent elsewhere in warm climates and occasionally seen under glass. Page 3566.

Leaves alternate, entire, lanceolate or linear, mostly with oil- or resin-dots and fragrant when crushed: fls. in dense cylindric spikes, at first terminal but the axis growing out as a leafy shoot; calyx-teeth 5; petals 5, deciduous; stamens indefinite in number, not united; anthers versatile, the cells parallel and bursting longitudinally; ovary inferior, maturing into a caps. which persists for several years.—About 25 species, natives of Austral., where they inhabit arid districts. Distinguished from *Melaleuca* only by the stamens, which in that genus are united into bundles. Hall, Univ. Calif. Pub. Bot. 4:22.

The showy flower-clusters, resembling bottle-brushes in shape, and so giving the common name to the genus, are highly colored and render these shrubs very ornamental. The quantity of bloom may be much increased by judicious autumn pruning. The various species are recommended for parks, depot-grounds, school-yards, and also for smaller yards if kept well pruned. Hardy only in warm-temperate districts but enduring temperatures less than 20° F.

Propagation from seeds is satisfactory: these are gathered during the summer months by allowing the capsules to open in boxes or on sheets of paper kept in a warm place; sow in early spring in finely sifted mixture of sand, leaf-mold, and loam, and cover very lightly; the ordinary cool greenhouse is warm enough. Some nurserymen state that plants from cuttings of ripened wood or of wood which is getting firm at the base will blossom earlier than seedlings; others find no advantage in this method. Although adapted to nearly every variety of soil, these plants make but slow growth in heavy clay.

A. Stamens  $\frac{3}{4}$ –1 in. long.

**lanceolatus**, DC. (*Metrosideros semperflorens*, Lodd.). Fig. 745. Height 6–12 ft.: lvs. lanceolate,  $1\frac{1}{4}$ – $2\frac{1}{2}$  in. long, about  $\frac{1}{4}$  in. wide, acute, reddish when young; midrib and lateral veins prominent: spikes 2–4 in. long, bright red, less dense than in the following species: fr. ovoid, contracted at summit. Jan.–June. B.M. 260

745. *Callistemon lanceolatus*. ( $\times \frac{3}{4}$ )

(as *M. citrina*). Maiden, Fl. Pl. and Ferns of New S. Wales, 8.—Attains 30 ft. in Austral. where the hard and heavy wood is used for wheelwrights' work and for mallets. Garden hybrids between this and other species have been developed, especially in Eu.

**speciosus**, DC. Large shrub: lvs. narrowly lanceolate, obtuse or acute,  $1\frac{1}{2}$ –4 in. long, about  $\frac{1}{4}$  in. broad; midrib prominent but lateral veins obscure: spikes 2–6 in. long, bright red, very dense; fr. nearly globose, the summit scarcely contracted. March–June. B.M. 1761.—The most highly colored callistemon, the golden anthers contrasting well with the dark red filaments. There are many garden forms varying in color, habit, and size.

**viminális**, Cheel. Tall slender tree of pendulous habit: lvs. linear-oblong: stamens slightly shorter: rim of fr. thinner.—A handsome, graceful tree, very showy when in full bloom. Grown at Santa Barbara, Calif. (Formerly referred to *C. speciosus*, of which this may be a form.)

**rigidus**, R. Br. (*C. linearifolius*, DC.). Lvs. narrowly linear, rigid, sharp-pointed, 2–5 in. long, about  $\frac{1}{4}$  in. wide; midrib and marginal ribs prominent; cross-nerve often hidden by oil-dots: spikes deep red, large, dense. March–July. B.R. 393.—Stiffly branched shrub, the branches inclined to become rangy; best form and bloom secured by means of autumn pruning. In order to have fine specimen plants, cult. well and now and then give an application of commercial fertilizer.

**linearis**, DC. Scarcely more than an extreme form of *C. rigidus* with very narrow lvs. channeled above, the midvein quite obscure: fr. more globular and contracted at opening.

AA. Stamens  $\frac{1}{2}$  in. or less long.

**salignus**, DC. Tall shrub or small tree: lvs. lanceolate, acute,  $1\frac{1}{2}$ –3 in. long,  $\frac{1}{4}$ – $\frac{3}{4}$  in. wide (much narrower in one variety), very distinctly penniveined: spikes yellow or light pink, 1–2 in. long; fr. nearly globose, with rather large opening. Apr., May. B.M. 1821. Var. *viridiflorus*, Fr. v. M. Lvs. only 1–2 in. long, thicker, rigid; veins obscure: fls. greenish yellow. B.M. 2602.

**brachyandrus**, Lindl. Slender shrub, young shoots soft-hairy or whole plant gray with a soft pubescence: lvs. rigid, nearly terete,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long: spike 2–3 in. long, the filaments dark red but nearly obscured by the golden yellow anthers.—The slender habit, gray foliage, and golden bloom render this shrub very desirable for ornamental planting.

HARVEY MONROE HALL.

**CALLISTEPHUS** (Greek words for *beautiful crown*, said to be in allusion to character of fruit). *Compositæ*. CHINA ASTER. (See page 419, Vol. 1.) One species in China and Japan. The genus *Callistemma*, also erected by Cassini, is older than *Callistephus*, but the latter is one of the "nomina conservanda" of the Vienna code, retained because accepted and in general use for fifty years following its publication. Under both these generic names, Cassini described the China aster as *C. hortensis*. It was first named by Linnaeus, however, as *Aster chinensis*, and Nees subsequently transferred this name to *Callistephus*, so that the plant now would better bear the name *Callistephus chinensis*, Nees.

*Callistephus* is closely allied to *Aster*, from which it differs, among other things, in its pappus, which is minute and forming a crown in the outer series, and of slender longer barbellate and caducous bristles in the inner series: annual, erect, hispid-hairy branching herbs, with showy terminal fl.-heads. lvs. alternate,

XXII. Carnations.—Types of the American winter-flowering varieties. (Half size.)

broadly ovate or triangular-ovate and deeply and irregularly toothed; blade decurrent into a petiole, those on the upper parts becoming spatulate or narrower: heads in wild plant heterogamous and radiate, the ray-florets in 1-2 series and pistillate, the disk-florets perfect and fertile; involucre hemispherical, the bracts imbricated in many series and the outer ones large and green: fr. a compressed achene. The rays become much multiplied under cult., and they are also variable in size, shape and color. The colors are violet, purple, blue and white, the rays never being true yellow. Widely variable under cult., and one of the best of the garden annuals, growing from 6 in. to 2½ ft. high. It is the Reine-marguerite of the French and the Sommeraster of the Germans.

L. H. B.

**CALLÍTRIS** (from the Greek for *beautiful*). Including *Frenêla* and *Widdringtonia*. *Pináceæ*. Evergreen trees or shrubs, not quite hardy in the open in England, but thriving well in the southernmost parts of the United States; allied to Thuja.

Leaves scale-like or awl-like, in whorls of 3 or 4 on jointed branches, or sometimes alternate: monœcious; sterile catkins cylindrical or ovoid, the stamens in whorls of 3 or 4, the scales broad and sometimes peltate; fertile cones of 4-8 scales, and borne on short and thick peduncles, either solitary or clustered, usually ripening the second year and often persisting after the seeds have fallen.—About 15 species in Austral., New Caledonia and Afr. Little known in cult. here.

A. Cone 6-valved.

**robústa**, R. Br. (*Frenêla robústa*, Cunn.). *CYPRESS PINE*. Ranging from a shrub to a tree 90 ft. high: branchlets crowded, short and erect: sterile catkins ¼ in. or less long, solitary or in 3's: cones solitary or few-clustered, nearly globular, about 1 in. diam.; seeds usually 2-winged. Austral.—Trees about 30 years old are said to be growing at Santa Barbara. In S. Fla. it makes good specimens, in 5 years becoming 10-12 ft. high. The tree somewhat resembles red cedar, and is reported as useful for tall hedges and windbreaks. This is one of the "pines" of Austral., the wood being used in building and for the making of furniture.

**rhombóidea**, R. Br. (*Frenêla rhombóidea*, Endl.). Smaller, reaching 25-50 ft.: branches somewhat slender and often drooping, angled when young: cones usually only one-half the diam. of those of *C. robusta*, globular, the 6 valves alternately larger and smaller, the larger valves having a broadly rhomboidal apex with a protuberance at the center. Austral. and Tasmania.—Timber used for telegraph poles and in construction.

AA. Cone 4-valved.

**quadriválvis**, Vent. (*Thûja articulâta*, Vahl). *ARAR-TREE*. *SANDARACH*. *GUM TREE*. Small tree, with fragrant hard durable wood: branches jointed and spreading: lvs. very small, flattened, distichous, reduced to scales at the nodes: cone 4-sided, small, the valves oval and with a protuberance near the tip. N. Afr., in the mts. L.B.C. 9:844.—Furnishes varnish resin (gum sandarach).

**Whýtèi**, Engler (*Widdringtonia Whýtèi*, M. Wood). The wood is dull reddish white, strongly aromatic, and locally used for furniture and for doors and windows. Tree attaining a maximum height of 140 ft., with a diam. of 5½ ft. at a point 6 ft. above the ground, the trunk being clear for 90 ft.: lvs. on ultimate branchlets, deltoid and closely appressed opposite; on other branchlets usually linear-lanceolate, spreading at the tips, alternate: in seedling stage linear, spreading and about 1 in. long: cones 4-6 together, about ¾ in. long and ¾-1 in. wide when open. S. E. Afr.—It grows at an altitude of 5,000-7,000 ft. on Mt. Milanji in Nyassaland and is known as the Milanji cypress or cedar. Apparently hardy in parts of Cent. Calif.

L. H. B.

**CALLÓPSIS** (*Calla*-like). *Aráceæ*. A single species from German E. Afr.: *C. Vólkensis*, Engler. Spathe like that of a little calla, snow-white, 1½ in. long by 1 in. broad, the spadix partly united to it (and yellow): lvs. crowded, cordate-ovate, 5 in. long, shining, the petiole about 2 in. long; semi-epiphytic, with creeping rhizome. Probably cult. only in botanic gardens or other collections.

**CALLŪNA** (Greek, *to sweep*; the branches are sometimes used for making brooms). *Ericáceæ*. *HEATHER*. Low evergreen shrubs cultivated chiefly for their bright rosy pink, rarely white flowers appearing in great profusion late in summer.

Leaves scale-like, opposite, in 4 rows, the branchlets therefore quadrangular: fls. in terminal, 1-sided spikes; corolla campanulate, 4-parted, shorter than the 4-parted colored calyx; stamens 8, with 2 reflexed appendages: fr. a septicidal, 4-celled, few-seeded caps.—One species in W. and N. Eu., also in Asia Minor; in E. N. Amer. in some localities naturalized. The genus differs from the closely related *Erica* in its deeply 4-parted colored calyx, longer than the 4-parted corolla. For culture, see *Erica*.

*vulgâris*, Salisb.(*Erica vulgâris*,

Linn.). Fig. 746.

From ½-3 ft.: lvs.

oblong-linear, ob-

tuse, sagittate at

the base, glabrous

or pubescent: fls.

small, in long, erect,

rather dense rac-

emes, rosy pink,

sometimes white.

Aug., Sept.—Some

of the most distinct

of the numerous named varieties are the following: Var.

*álba*, Don (and var. *álba Hammondii*), with white fls.;var. *Alpörtii*, Kirchn., of more vigorous growth, with rosycarmine fls.; var. *cárnea*, Hort., with flesh-colored fls.;var. *plêna*, Regel, with double rose-colored fls.; var.*hirsûta*, Gray (var. *tomentôsa*, Don), the branchletsand lvs. with grayish tomentum; var. *nâna*, Kirchn.(var. *pýgmæa*, Hort.), forming low moss-like tufts;var. *rûbra*, Kirchn., with deep rosy carmine fls.; var.*prostrâta*, Kirchn., with the branches spreading andpartly prostrate, fls. pink; var. *Sêarleii*, Hort. (var.*álba Sêarleii*, Hort.), fls. white, appearing late in autumn.

—The heather is a very handsome small shrub, well

adapted for borders of evergreen shrubberies, or for

dry slopes and sandy banks and preferring sunny posi-

tions; it is also found growing well in swamps and in

partly shaded situations. Cut branches keep their

life-like appearance for many months.

ALFRED REHDER.

**CALOCHÓRTUS** (Greek for *beautiful* and *grass*).*Liliáceæ*. Incl. *Cyclobôthra*. *MARIPOSA LILY*. *STAR**TULIP*. *GLOBE TULIP*. West American cormous plants,

the occidental representatives of Tulipa, useful as border

plants and to some extent for indoor culture.

Stem usually branched, and from a coated corm,

more or less leafy: perianth of unequal segms., the outer

ones the smaller and more or less sepal-like, the 3 inner

ones large and showy and bearing glands and hairs;

stigmas 3, sessile and recurved; stamens 6; fls. showy,

shallow-cupped on the inner segms., arching.—From

40-50 species, mostly on the Pacific side of the con-

746. *Calluna vulgaris*. (Plant  $\times \frac{1}{2}$ )

tinant from Wash. to Mex., and some of them in the interior country. Nearly all the species are in cult. Monogr. by J. G. Baker, Journ. Linn. Soc. 14:302-10 (1875); and by S. Watson, Proc. Amer. Acad. Arts and Sci. 14:262-8 (1879). See also *Calochorti* in the Sierra Nevada, by George Hansen, Erythra, 7:13-15; A. Davidson, Erythra, 2:1-2, 27-30; Mallett. Gn. 1901, 60:412, vol. 61, pp. 185, 203, 220; Carl Purdy, Proc. Calif. Acad. Sci., 3d ser., vol. 2, No. 4 (1901).

*Calochortus* extends into British America, and a few, belonging to a peculiar group, are found in Mexico; the remainder are natives of the United States, from Nebraska to the Pacific Ocean. While the generic characteristics are unmistakable, the species and even varieties have the most variable inclinations as to soil, exposure and climate. The Colorado Desert and the summits

of the Sierra Nevada, the heavy clay lands of Californian valleys, the volcanic soils of the foothills and the meadows of the Northwest, each has its own representatives of this beautiful tribe. The character of the genus can be treated better under the various groups. Nearly every known species is in cultivation to some extent. Some are readily grown, others present considerable cultural difficulties; but while there are some that probably will always be difficult to cultivate, there are many species—and the number includes the very best—that can be grown successfully by anyone who is willing to give a little special care to them; and there are a few that possess such vigor and hardiness as to be adapted to extensive cultivation.

All *calochortus* are hardy in the sense of withstanding extreme cold, but they will not endure alternate thawing and freezing nearly so well; and thus there is the paradox of their going safely through severe eastern or European winters and suffering the loss of foliage in mild ones. They should be planted in the fall, and it is better to plant late, so that leaf-growth is delayed until spring. Diverse as are their natural habitats, one soil will answer the needs of all. A light loam, made lighter with sand or sawdust, powdered charcoal, or spent tan-bark, is best. Excellent results have been secured with a mixture of equal parts of a good light loam and spent tan-bark, with a little broken charcoal. Wallace, one of the most successful English growers, recommends making a bed sloping to the south, composed of leaf-mold and road grit in equal parts, with a smaller proportion of sharp sand. The idea is to have a light and porous, not too stimulating soil, with perfect drainage. Wallace recommends covering the beds with reeds to throw off the heavy rains. The same end may be attained by such thorough drainage that the rains pass through quickly. In New York, they have been carried through the winter safely under a covering put on before the ground freezes hard. It is well to keep a few leaves about the shoots for a time and to have extra leaves at hand to be used when frost threatens. It is better to lift the bulbs as soon as

they ripen, and replant in the fall. Water sparingly at all times. Under suitable conditions they are hardy and tenacious of life, but excessive moisture, either in air or ground, is not to their liking after the flowering season arrives. Theoretically, all *calochortus* of Section A (star and globe tulips) should have shade, and all *mariposas* (AA) sunshine; but the light shade of a lath-house suits all alike, giving much finer bloom in the *mariposas*. The flowering season extends over three months, according to species.

They take well to pot culture with similar soils and treatment. While not to be forced rapidly, they considerably anticipate their out-of-door season. The same treatment can be used in coldframe culture, but they must not be coddled too much.

A. Blossoms or fr. more or less nodding (unless No. 4): inner perianth-segms. strongly arched: lvs. long and glossy, not channeled. (*Eucalochortus*.)

B. Fls. subglobose, nodding: st. usually tall and branching. GLOBE TULIPS.—These have a single long and narrow shining lf. from the base, and slender, flexuous, leafy sts., the perfection of grace in outline. The fls. are exquisite in delicacy of tints. Woodland plants.

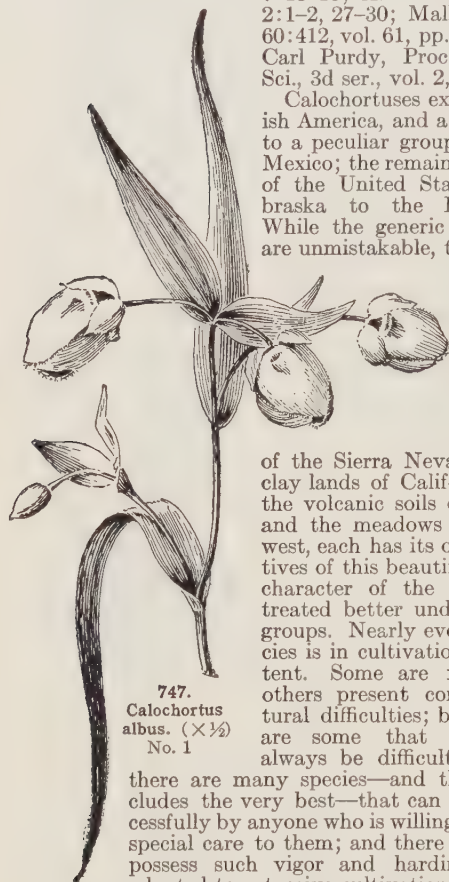

1. *álbus*, Douglas (*Cyclobóthra álba*, Benth.). Fig. 747. Strong, 1-2 ft. high, glaucous: fls. globular, pendent, 1 in. across, of a satiny texture, delicately fringed with hairs, very strongly inarched or practically closed. Calif. B.R. 1661. F.S. 11:1171.—Chaste and delicate. The form from the Coast Range is the Pearl *calochortus* of gardens; the form from the Sierras with fls. less strongly inarched and at length opening slightly is the *C. albus* of horticulture.

Var. *amœnus*, Hort. (*C. amœnus*, Greene). Like *C. albus*, but rose-colored, lower and more slender: fls. opening in full bloom. Fresno and Tulare Co., Calif.

2. *pulchellus*, Douglas (*Cyclobóthra pulchella*, Benth.). Stout, glaucous, 8-16 in., usually branching: fls. yellow, strongly inarched but parts not overlapping; sepals shorter than petals, ovate-acuminate, yellow tinged with brown on the back; petals ovate, obtuse, 1 in. or less long, canary-yellow, with long silky hairs above the gland. Cent. Calif. B.R. 1662.

3. *amabilis*, Purdy. Habit like *C. albus*: sts. stout, usually branching in pairs: petals clear yellow, very strongly inarched so that the tips overlap each other much like a child's pin-wheel; gland lined with stiff hairs that cross each other; petals margined with a line of stiff hairs. Cent. and N. Calif.

4. *Góldyi*, Watkins. Possibly *C. Benthamii* × *C. amabilis*. Sts. several, freely branched, bearing 15-20 fls.: lvs. narrow-lanceolate: fls. erect, 1 in. across, straw-yellow, inner surfaces covered with long silky sulfur-tinted hairs and a few shorter crimson hairs deep down in the cup; petals rounded and very hooded. Apparently of garden origin.

747.  
*Calochortus*  
*albus*. (× 1/2)  
No. 1

**BB.** *Fls. bell-shaped, erect when open, mostly lined with hairs, the pedicels becoming recurved: st. mostly low, and fls. often more or less umbellate.* **STAR TULIPS** proper.—Like the globe tulip, but smaller as a rule, and the fls. dainty open cups. All of the species resemble each other, and were first included under the name *C. elegans*.

5. **Maweanus**, Leichtl. Plant low (3–10 in.), very slender, usually branched: fls. white, purplish at the base, filled with silky hairs, the gland covered by a broad semi-circular scale: caps. long-elliptic. Calif., north. B.M. 5976 (as *C. elegans*).—Variable. Var. **majör**, Hort. Twice as large in all its parts: fls. lighter colored. Var. **röseus**, Hort. Fls. tinged rose.

6. **Bénthamii**, Baker. Sts. 7 in. high, very flexuose, dividing into pairs: lvs. linear-lanceolate: fls. nearly erect, yellow, the segms.  $\frac{1}{2}$  in. long and brown at the base. Sierra Nevada, in Calif. B.M. 6475. J.H. III. 30:549. Var. **Wallacei** (*C. Wallacei*, Hort.). Claw of the petal dark red or nearly black.

7. **cæruleus**, Wats. Similar to small plants of *C. Maweanus*, but lined and dotted with blue: low, 2–5-fl., the pedicels very slender; perianth ciliate inside: caps. nearly or quite orbicular. Calif., in the Sierras. Not variable.

8. **élegans**, Pursh. Similar to the last: petals greenish white and purplish at base, bearded, little or not at all ciliate: gland covered by a deeply fringed scale. Ore., Idaho.

Var. **nānus**, Wood (*C. Lyallii*, Baker). Subalpine, dwarf and very slender: petals delicate cream-color, narrow and usually more acute, more hairy and ciliate. Mts. Calif., N.

9. **Löbbii**, Purdy (*C. elegans* var. *Löbbii*, Baker). St. 3–5 in. high: petals white tinged green, broadly rhombic-ovate, very deeply pitted and with the pit showing as a prominent knob on back of petal. Mt. Jefferson, Ore.

10. **umbellātus**, Wood (*C. collinus*, Lemm.). Low and branching, 3–15 in., flexuose: fls. 5–10, white; petals broadly fan-shaped, nude excepting for many white hairs just above the scale. In open grassy places around San Francisco Bay.

**BBB.** *Fls. bell-shaped: like BB, but tall (1 ft. or more), and stoutly erect, with several fine, erect cups, similar to C. Maweanus.* **GIANT STAR TULIPS**.—In this splendid group the very dainty silky fls. and handsome glossy lvs. of the star tulip are shown with a stout st. a foot or two high, and large fls. Unlike the others, they grow naturally in open places, and have a vigor and health which are a high recommendation.

11. **Tölmiei**, Hook. & Arn. Stout, a foot high, generally branched: petals often more than an inch long, tinged lilac, with purple and white hairs: gland without a scale: caps. broad-elliptic, acutish. Mt. Shasta, N.—Remains a long time in bloom.

12. **apiculātus**, Baker. Taller and stouter, 12–18 in., with umbellate straw-colored fls. N. Idaho.

13. **Pürdyi**, East. Glabrous and glaucous, 8–16 in., rather stout, branching, 2- to many-fl.: fls. creamy white or purple-tinged, filled with blue hairs, gland absent. S. Ore. G.C. III. 23:395.—Very handsome.

**BBBB.** *Fls. bell-shaped, the petals naked or hairy only at the base: low: lf. solitary.* **MEADOW TULIPS**.—These calochortuses are natives of wet meadows. *C. uniflorus* and *C. Vesta* grow well in all soils so long as well drained, and, as garden plants, thrive everywhere. In habit they are low, flexuose and leafy. The cups are open, erect and numerous, an inch or so in diam.

14. **nūdus**, Wats. Low, 2–4 in., delicate: lf. solitary: fls. 1–6, umbellate, small, greenish white or pale lilac,

nude except for a tuft of 2 or 3 short hairs at each extremity of scale, denticulate. Calif., in the Sierras.

15. **uniflorus**, Hook. & Arn. (*C. lilacinus*, Kell.). Handsome species, 4–8 in. high: fls. 4–10, on long pedicels, clear lilac, hairy only at base: caps. elliptic, obtuse. B.M. 5804.—Grows naturally in wet meadows, and makes offsets very freely. Often seen in a depauperate starved form, but responds at once to good treatment.

**AA.** *Blossoms on stout, erect pedicels, the sts. stout and strict: fls. open-bell-shaped.* **MARIPOSA TULIPS**.—Excepting in B, the mariposa or butterfly tulips have slender, grassy, radical lvs., stiff, erect sts. bearing cup-shaped fls., and sparingly leafy and with an erect caps. Bulbs small.

**B.** *Caps. oblong, acute-angled or winged: fls. lilac or white.* These are hardy species, growing in the meadows from Ore. to Mont., where they endure much cold. They form a connecting link between the giant star tulips and the true mariposas. Their lvs. are like those of the star tulips—long, broad and glossy. Like the star tulips, also, the seed-pod is handsome, 3-cornered and winged. The sts. are stiffly erect: the fls. cup-shaped, not so brilliant as the true mariposas, but very delicate: the plants are hardy, healthy and vigorous, and are to be highly recommended for cold climates.

16. **nītīdus**, Douglas. Scape erect, but not stiff: lf. solitary, glossy, narrow: fls. 1–3, large and showy, lilac, yellowish, or white, with a deep indigo blotch in the center, lined with yellow hairs. Meadows, E. Ore. to Mont. and N. E. Nev. Specimens from Yellowstone Lake are yellow.—Very beautiful and showy.

17. **Greēnei**, Wats. St. stout and branching, 1 ft., 2–5-fl.: sepals with a yellowish hairy spot; petals lilac barred with yellow below, and somewhat purplish, loose-hairy, not ciliate: caps. beaked. Calif. and Ore.

18. **longebarbātus**, Wats. Slender, about 1 ft. high, bulb-bearing near the base, with 1 or 2 narrow radical lvs., 2-branched and usually 2-fl.: fls. erect or nearly so, lilac with yellow at base, scarcely hairy except the long-bearded gland. Wash.

19. **Höwellii**, Wats. St. erect, 1 ft. or more, 1–2-fl.: lvs. very narrow: sepals ovate, short-acuminate; petals yellowish white, 1 in. long, denticulate, slightly ciliate near the base, brown-hairy inside, the gland yellow-hairy. Ore.

**BB.** *Caps. oblong, obtuse-angled.*

**c.** *Color yellow or orange or orange-red, more or less marked with brown and purple (except in forms of C. luteus): in cult. forms running into other colors.*

20. **Weēdii**, Wood. Radical lf. single, glossy, broad: st. tall, leafy, bearing large orange-colored fls. dotted with purple: petals triangular, square-topped: gland small, hairy: bulb heavily coated with fiber. S. Calif. B.M. 6200 (as *C. citrinus*). G.C. III. 16:183.—Varies to white.

Var. **purpurāscens**, Wats. (*C. Plummeræ*, Greene). Similar, but lilac or purple and very showy. Calif. G.C. III. 16:133. J.H. III. 29:289. Gn. 47:80.—A fine form with fl. of large size and full outline, lined with long, silky yellow hairs.

Var. **vēstus**, Purdy. Petals much more truncated and curiously fringed with brown hairs; reddish brown. Santa Barbara.

Var. **obispoēnsis**, Purdy (*C. obispoēnsis*, Lemm.). Fig. 748. Tall and slender, branching, very floriferous: petals yellow, verging to red at the tip and less than half the length of the orange-brown sepals. Calif. G.F. 2:161 (adapted in Fig. 748).—Odd and bizarre.

21. *Kennedyi*, Porter. Bulb small and ovoid: st. very low, 1-4 in.: lvs. linear, tufted from the branching of the st.: fls. 2-4, in an umbel; sepals broad with a purple spot; petals red-orange to vermilion, not ciliate nor prominently hairy, purple-spotted at the center. Desert species of S. Calif. B.M. 7264. Gn. 43:108.—Brilliant and desirable, but difficult to grow.

22. *aureus*, Wats. Low, 4-6 in., with a single carinate leaf: petals yellow, not hairy, the hairy gland purple-bordered. S. Utah.

748. *Calochortus obispoensis*. No. 20 var. (X 1/2)

23. *clavatus*, Wats. Petals yellow lined with brown, the lower part bearing club-shaped (clavate) hairs, the gland deep and circular; anthers purple. Calif.—In this excellent sort we have the largest-fl. and stoutest-stemmed of all mariposas. The bulb is very large, the single bare lf. 1 or 2 ft. long: the st. is heavy, stout and zigzag. The fls. are shaped like a broad-based bowl, sometimes 5 or 6 in. across. The color is a deep, rich yellow, and the lower half is covered thickly with stiff yellow hairs, each tipped with a round translucent knob, and in the light look like tiny icicles. There are various strains: Eldorado, the largest, not so deep yellow; Ventura, very stout, deep yellow; Obispo, like the last, but the upper half of the back of each petal is olive-brown, which shows through the deep yellow of the inside, giving changeable shades.

24. *cóncolor*, Purdy (*C. luteus* var. *cóncolor*, Baker). Bulb large reddish: lvs. narrow, glaucous: st. 1-2 ft., umbellate, if more than 1-fl.; not zigzag; petals a rich deep yellow, tending toward orange, lower third densely hairy with long yellow hairs above an oblong gland. A desert species of S. Calif. Much like *C. clavatus* in general aspect.

25. *luteus*, Douglas. BUTTERFLY TULIP. St. 1-10 fld., bulb-bearing near the base: lvs. very narrow: sepals narrow-lanceolate, with a brown spot; petals 2 in. or less long, yellow or orange, brown-lined, slightly hairy below the middle, the gland densely hairy. Calif. B.R. 1567.—Variable. Some of the forms are sold as *C. venustus*.

Var. *citrinus*, Wats. (*C. venustus* var. *citrinus*, Baker). Petals lemon-yellow, with a central brown spot.

Var. *oculatus*, Wats. (*C. venustus* var. *oculatus*, Hort.). Petals pale or white, lilac or yellowish, with a dark spot.

Var. *robustus*, Purdy (*C. venustus* var. *robustus*, Hort.). A very bulbiferous form having white fls. luridly tinged in browns and purples. Very beautiful and also one of the hardiest.

26. *Vésta*, Purdy. BUTTERFLY TULIP. Tall and large-fl. with petals more narrowly cuneate than in *C. luteus* var. *oculatus*, and the gland narrow and doubly lunate, color from white tinged through lilac to pink and lilac-purple; fl. often lacinately gashed, above the gland bearing rich maroon pencilings and markings. N. W. Calif. in adobe soil.—One of the largest-fl., showiest and most easily grown of mariposa tulips. Named by its author in compliment to his wife.

cc. Color prevailing white or lilac, but sometimes running into yellows.

27. *venustus*, Benth. BUTTERFLY TULIP. Stout, 6-36 in.: petals white or pale lilac, with a reddish spot at top, a brown-yellow center, and brown base: gland large and oblong, usually densely hairy: caps. 1-2½ in. long. Calif. B.R. 1669. F.S. 2:104. Gn. 46, p. 395.—Very variable. The yellow forms (as var. *sulphureus*, Hort.) are often treated as forms of *C. luteus*. To this group of calochortuses is properly applied the Spanish name mariposa (butterfly), for their brilliantly colored fls., with eye-like spots on each petal and sepal, and other delicate markings with dots, lines and hairs, which are strongly suggestive of the wings of a brilliantly colored butterfly. Botanists have variously divided this great group of allied forms between *C. luteus* and *C. venustus*. Botanically all may be considered as either strains of one variable species or as a number of closely allied species.

Var. *Eldorado*, Purdy. The finest strain of *C. venustus* in cult. It occurs naturally in a wonderfully varied mixture, in color from pure white through pink, to deep glowing reds and through lilac to deep purples. In one locality a few may vary to light yellow. Some of these forms have been named var. *pictus* for the white form, var. *sanguineus* for the blood-red. The purple forms are entirely distinct from *C. venustus* var. *purpurascens*. Sierran foothills from Eldorado County to the far South. Altogether these plants comprise the loveliest group of the mariposa tulips.

Var. *purpurascens*, Wats. Petals deep lilac or purplish, darker at center, the fl. fully 3 in. across. Coast Range. Strong grower. Gn. 46:394.

Var. *roseus*, Hort. (*C. roseus*, Hort.). Creamy white or lilac, with an eye midway and a rose-colored blotch at apex. Gn. 46:394.

Var. *sulphureus*, Purdy. Taller than the type: petals light warm yellow with eye, and with a rose-colored blotch at top. Lower part of San Joaquin Valley, Calif.

28. *spléndens*, Douglas. Tall and slender, 1-2 ft.: fls. 1-1½ in. across, deep purple with a dark spot on the claw and with or without a gland covered with matted hairs. San Diego Co., Calif. Known in horticulture as *C. splendens* var. *atroviolaceus*.

Var. *major*, Purdy. Strong and tall, 1-2 ft.: fls. 2-3 in. across; petals large, clear lilac, paler below, with a

darker claw and scattered long white hairs below the middle. Coast Ranges, Monterey Co., Calif.

Var. *montānus*, Purdy. More slender than the type, often bulbiferous: lilac to salmon-pink, densely hairy with short yellow hairs about the gland. High mts., S. Calif.

Var. *rūbra*, Purdy. Large, with deep-seated reddish bulb, 1-3 ft.: fls. reddish lilac, pink or purple; petals quite hairy, with short hairs on the lower third. Lake Co., Calif.

29. *flexuosus*, Wats. Related to *C. splendens*, but with sts. so weak as almost to be said to creep. The fls. are large and very brilliant, a dazzling purple, with a darker purple eye, and yellow hairs below. S. Utah.—Intro. by Purdy in 1897.

30. *Pálmeri*, Wats. St. 1-2 ft., very slender and flexuous, 1-7-fld., bulb-bearing near the base: sepals with long, narrow, recurved tips, spotted; petals 1 in. or less long, white (or yellowish below), with a brownish claw and bearing scattered hairs about the gland: caps. very narrow. S. Calif.—The *C. Palmeri* of dealers is sometimes *C. splendens* var. *montanus*.

31. *catalinæ*, Wats. (*C. Lyonii*, Wats.). Habit of *C. splendens*: st. 1-2 ft., branching: fls. white to lilac, or deep lilac, very large and handsome, a large round black spot at base of each petal.—A lovely species between *C. splendens* and *C. venustus*. Remarkable for blooming with the star tulip section, fully a month before other mariposas. Native to Santa Catalina Isl., off S. Calif.; also to Calif. coast.

32. *Núttallii*, Torr. & Gray. SEGO LILY. St. erect and stiff, 1-2 ft., bulb-bearing at base, usually with only 1 cauline lf., 1-5-fld.: sepals ovate-lanceolate, often dark-spotted; petals 1-2 in. long, white tinged with greenish yellow or lilac, with a purplish spot or band above the yellow base and hairy about the gland; anthers obtuse. Dak. and Neb. to Calif. and New Mex., having the widest range of any calochortus.—There are no more exquisitely beautiful fls. than these sego lilies (the Mormon name) of the Great Basin. Most of them are plants of the sage-brush deserts. The lvs. are an ashy green, the foliage scant, but the great fls. are wonderful in tintings. There are shades in blue, pink, lilac, and yellowish; also white. The sego lily is the State flower of Utah.

33. *Leichtlinii*, Hook. f. Slender alpine species (5-6 in. high), by some regarded as a form of *C. Nuttallii*: fls. smoky white, banded with green and marked with dark brown. Sierra Nevada. B.M. 5862. F.S. 20:2116.

34. *Gúnnisonii*, Wats. Fig. 749. Much like *C. Nuttallii*: anthers acuminate: fls. light blue or almost white, delicate yellowish green below the middle, purple-banded at the base, and bearing a band of green hairs across each petal. Rocky Mts., Wyo. to New Mex.

35. *macrocarpus*, Douglas. GREEN-BANDED MARIPOSA LILY. St. stiff, the cauline lvs. 3-5: fls. 1 or 2; sepals acuminate, sometimes spotted; petals 2 in. or less, acute, lilac with a greenish midvein, somewhat hairy. B.R. 1152. N. Calif. to Wash. and Idaho.—This fine species forms a group by itself. It has a very large bulb, a stout almost leafless st.; and a large fl. of an exquisite pale lavender, banded down the back with green. Petals long, narrow and pointed.

BBB. Caps. linear, not winged or prominently angled.

36. *flāvus*, Schult. f. (*Cyclobóthra fláva*, Lindl.). St. slender, 1-2 ft., forked: lvs. 2 or 3 below the

fork, linear, long-acuminate: fls. yellow, upright; petals and sepals acute, rhombic-oblong, with a darker somewhat hairy gland, the petals hairy and usually denticulate. Mex.

37. *Bonplandiānus*, Schult. f. (*C. purpureus*, Baker. *Cyclobóthra purpurea*, Sweet). Rather stout, 3 ft.: st.-lvs. short, acuminate-lanceolate: fls. yellow and purple: the sepals with a purple pit and the petals purple outside: gland naked. Mex.

CARL PURDY.  
L. H. B.

749. *Calochortus Gunnisonii*. (× 1/2)

**CALODÉNDRUM** (Greek, *beautiful tree*). *Pallásia*, Houtt, which is the older name. *Rutæcæ*. One of the handsomest deciduous trees at the Cape of Good Hope; cultivated in northern greenhouses, and outdoors in southern California and southern Florida.

The great panicles of white or flesh-colored fls. are sometimes 7 in. across and 6 in. deep. It is a symmetrical tree, with attractive evergreen foliage and many interesting features. Called "wild chestnut" in Afr. Prop. by cuttings of half-ripened wood under glass in heat. A monotypic genus.

*capensis*, Thunb. CAPE CHESTNUT. Height in Afr. 70 ft.: branches opposite, or in 3's: lvs. simple, decussate, ovate, obtuse retuse or acute, parallel-nerved, 4-5 in. long, studded with oil-cysts, which look like translucent spots when held to the light: panicles terminal; peduncles usually trichotomous; calyx deciduous; petals 5, linear-oblong, 1 1/2 in. long, 2 lines wide, sprinkled with purple glands; stamens 10, 5 alternate, sterile, and petaloid: seeds 2 in each cell, larger than a hazelnut, black and shining. G.C. II. 19:217. Also written *Calodendron capense*.

**CALONYCTION** (Greek, referring to the beauty of the flower, and the night-blooming habit). *Convolvulæcæ*. MOONFLOWER. Twining perennial herbs with large night-blooming flowers.

Flowers white or purple, fragrant, showy; sepals 5, the outer ones with horn-like tips; corolla salverform, the limb more or less flat, the tube very long and not dilated at the throat; stamens 5, exserted; style capitate and obscurely 2-lobed; ovules 4: lvs. broad, alternate.—Three species in Trop. Amer., two of which are widely cult. By some, the genus is united with *Ipomœa*, but it is well distinguished by the salverform rather than funnelform or bell-shaped corolla, by the exserted stamens and style, and by the night-blooming habit.

*aculeatum*, House (*C. speciosum*, Choisy. *Ipomœa Bona-nox*, Linn.). MOONFLOWER. Fig. 750. St. 10-20 ft. high, with milky juice: lvs. 3-8 in. long, cordate to hastate, angular or 3-lobed, acute, glabrous: peduncles 2-6 in. long, 1-7-fld., equaling the petioles; corolla 3-6 in. long, 3-6 in. wide, trumpet-shaped, white, sometimes with greenish plaits; fls. fragrant, usually closing in the morning, sometimes remaining open till noon. Aug., Sept. B.M. 752. B.R. 11:889, 917 (as *Ipomœa latiflora*). Gn. 21, p. 259; 27, p. 473. V. 10:359. Known in gardens chiefly as *Ipomœa Bona-nox* var. *grandiflora*, Hort. (*I. grandiflora*, Roxbg. and Hort., not Lam.), which does not differ materially from the type. Most of the large-fld. and very fragrant forms in cult. may be referred here. Var. *grandiflorum*, Hort., is sold under the following names: *Ipomœa Childsii*,

750. Moonflower—*Calonyction aculeatum*. (× 1/2)

*I. noctiphyton*, *I. noctiflora*, *I. mexicana grandiflora*, *I. mexicana grandiflora alba*, *I. mexicana grandiflora vera*. These trade names represent strains of varying excellence. (*C. grandiflorum*, Choisy, is *Ipomœa Tuba*.) A form with variegated lvs. is offered. Var. *heterophyllum*, has lvs. 3-5-lobed and subhastate.—The moonflower is most popular as a garden plant, but it also does well trained along the roof of a low house or against a pillar. It is excellent for cut-fls. in the evening. Little grown in the open N. because it does not mature in the short seasons. It grows wild in swamps and thickets in peninsular Fla., and is probably indigenous there. Widespread in tropics of both hemispheres.

*muricatum*, G. Don. (*Convolvulus muricatus*, Linn. *Ipomœa muricata*, Jacq. *Calonyction speciosum* var. *muricatum*, Choisy). Fls. purple, smaller than those of *C. speciosum*, the tube very slender and the expanded part of the tubenot over 3 in. broad.—Tropical regions; extensively cult. in Japan and India, and often seen in American conservatories.

*C. latense*, House (*Ipomœa latense*, Brandeg.), is the third species of *Calonyction*. It is native to Lower Calif., and not in cult. *C. grandiflorum*, Choisy, = *Ipomœa Tuba*. L. H. B.

**CALOPHACA** (Greek, *kalos*, beautiful, and *phaka*, lentil). *Leguminosæ*. Ornamental plants cultivated chiefly for their bright yellow flowers appearing in summer.

Deciduous shrubs or herbs, with alternate, odd-pinnate, pubescent, and often glandular lvs.: stipules scarious or herabaceous, adnate to the petiole: fls. papilionaceous, solitary or in racemes; calyx tubular with 5 nearly equal teeth; standard upright; wings oblong, free, as long as keel; ovary sessile with many ovules: pod pubescent and glandular, cylindrical.—About 10 species from S. Russia to E. India.

The two cultivated species are low, prostrate shrubs, with grayish green foliage, and rather large yellow flowers in erect axillary racemes, followed by decorative reddish pods. They prefer a well-drained soil and sunny position, and are well adapted for borders of shrubberies and sandy or rocky slopes. Propagated by seeds sown in spring; the young seedlings should have plenty of light and air, as they are very liable to damp-off if kept too moist and shady. Sometimes grafted high on *Caragana* or *Laburnum*, forming a very attractive small standard tree with pendulous branches.

*wolgàrica*, Fisch. Fig. 751. Two to 3 ft.: pubescent and glandular: lfts. 11-17, roundish-ovate or oval,  $\frac{1}{3}$ - $\frac{1}{2}$  in. long: racemes long-peduncled, with 4-7 fls.; corolla over  $\frac{3}{4}$  in. long. June, July. S. Russia, Turkes-

tan. *C. grandiflora*, Regel, is similar, but lfts. 17-25: racemes 10-16-flid.; corolla 1 in. long. S. Russia. Gt. 35:1231.

ALFRED REHDER.

**CALOPHYLLUM** (Greek, *beautiful-leaved*). *Guttiferæ*. Woody plants of the Old World and American tropics, with shining leathery leaves, sometimes planted South.

Leaves parallel-veined at right angles to the midrib: fls. polygamous in many axillary or terminal clusters; sepals and petals 4-12, in 2-3 series; stamens very numerous: fr. a drupe with a single erect seed.—Sixty species. Closely related to *Garcinia*, which, however, has only 4-8 sepals.

In India, several species are of considerable economic importance, especially *C. ionophyllum*, which is the source of a gum, and the seeds of which contain the well-known domba oil used extensively for lighting purposes. They must be grown in a warmhouse and in a rich well-aërated soil.

*Calàba*, Jacq. **CALABA TREE**. A tree, to 60 ft.: lvs. variable, dark glossy green, 3-10 in long.: fls. in axillary racemes, white, rarely produced in cult., the petals about 3 lines long: fr. about 1 in. diam. W. Indies, perhaps intro. from the Old World. Timber and oil.

*ionophyllum*, Linn. A medium-sized tree, with gray smooth bark: lvs. 4-8 in. long, 3-4 in. wide, shining on both surfaces: racemes in the upper axils, the fls. about  $\frac{3}{4}$  in. diam. and pure white; inner sepals petal-like: fr. about 1 in. diam., yellow, smooth, almost fleshy. Trop. Asia. N. TAYLOR.

**CALOPOGON** (Greek, *beautiful beard*, in allusion to the fringed or bearded lip). *Orchidææ*. A very attractive native orchid, sometimes planted in bog-gardens and rock-gardens.

Flowers magenta-crimson, varying to white, in a loose raceme on a naked scape; sepals and petals all distinct and spreading, the lip narrow at base but broader and hairy above; column winged at summit, not attached to other parts; pollinia 2 in each anther cell.—One species, in bogs and moist meadows, Newfoundland to Fla. and westward. *Cathea* is an older name, but, because of its general acceptance, *Calopogon* is retained in the "nomina conservanda" of the Vienna code.

A moist and shaded position and very porous soil are most suitable for this pretty plant, although it may do admirably in a rock-garden only slightly shaded at midday if the plants are watered very freely every day during hot or dry weather. Propagated by offsets, separated from the old tubers, but the old established plants should not be disturbed very often. Collected clumps of many native orchids are offered at very reasonable figures, and these give immediate results, while the small offsets would not be strong enough to flower for several years, and require much attention during the first year, or perhaps longer (J. B. Keller).

*pulchellus*, R. Br. (*Limodorum tuberòsum*, Linn., in part). Height 12-18 in., from a solid bulb or corm, bearing a single grass-like lf. at the base: scape 2-12-flid.; lip bearded with white, yellow, and purple club-shaped hairs; pretty. G.F. 10:505. J.H. III. 35:45. B.M. 116.

L. H. B.†

**CALOSCÓRDUM**: *Nothoscordum*.

**CALOTHAMNUS** (Greek, *beautiful bush*). *Myrtidææ*. Australian shrubs (more than twenty species) somewhat similar to *Callistemon* but more graceful in habit; evergreen greenhouse subjects, and hardy out-of-doors in California.

Leaves long, alternate: fls. showy, usually red, in lateral clusters; stamens united in bundles opposite the petals; anthers erect, attached by the base, oblong or linear; cells parallel, turned inwards, opening by longitudinal slits. For cult., see *Callistemon*.

**quadrifidus**, R. Br. Height 2-4 ft.: lvs. narrow, terete or slightly flattened, heath-like, glandular-dotted: fls. rich crimson, 4-merous; calyx 2-lobed in fr.; staminal bundles nearly equal, of 15-20 or more filaments. W. Austral. B.M. 1506.

*C. rupéstris*, Schau. Evergreen shrub, the branches densely covered with needle-like small lvs.: fls. in small clusters on previous year's growth; stamens with crimson filaments and yellow anthers. B.M. 7906.

J. BURTT DAVY.

**CALÓTROPIS** (from Greek words referring to the beauty of parts of the flower). *Asclepiadaceæ*. Milkweed-like shrubs, or small trees, grown in the American tropics and one species offered in southern California.

Branching, glabrous or tomentose-canescens: lvs. opposite, subsessile, broad: fls. with 5-parted calyx glandular inside; corolla bell-shaped or somewhat rotate, 5-parted with broad lobes; crown of 5 narrow fleshy scales adnate to the staminal tube and free and recurved at the base; pollinia solitary in each cell, obovate-oblong and compressed, hanging from the apex; fr. short horned gibbous acuminate pods mostly in pairs; seeds with silky hairs.—Three species in Trop. Asia and Afr., sometimes grown under glass in collections but in this country practically confined to the tropics. The bark of *C. gigantea* produces a strong úber, and the acrid milky juice dries into a substance like gutta-percha. The silk on the seeds is used in fabrics by natives; that of *C. procera* is said to be exported from the Cape Verde Isls. as kapok (kapok is usually from the ceiba or silk-cotton tree).

**gigantea**, R. Br. (*Asclépias gigantea*, Willd.). GIANT MILKWEED. Tree-like, 8-15 ft., with pale bark and woolly shoots: lvs. obovate to broad wedge-shaped, entire, woolly beneath: fls. rose and purple, in simple or compound umbels with involucre scales, the corolla-segms. bent downwards and twisted with age: fr. 3-4 in. long; seeds broadly ovate. B.R. 58. India, and planted or escaped in W. Indies.

**procera**, Dry. (*Asclépias procera*, Ait.). Shrub or bush, to 15 ft.: lvs. more oblong and acute than those of *C. gigantea*, grayish: fls. white and purple in long-peduncled cottony umbels; corolla-lobes erect: fr. 4-5 in. long, recurved; seeds ovoid. B.R. 1792. India.—Offered in S. Calif., and said to be known in Porto Rico as Algodon de seda.

L. H. B.

**CALPÚRNIA** (after Calpurnius, an imitator of Virgil, because these plants are allied to Virgilia). *Leguminosæ*. Trees and shrubs from tropical and southern Africa, cultivated out-of-doors in southern California and other subtropical regions.

Leaves odd-pinnate with numerous lfts.: racemes long, axillary and terminal, the peduncles often paniculate, giving rise to a splendid showy infl.; fls. yellow, the calyx bell-shaped; petals pea-like: pods membranous-winged on one side, often flattish.—Ten species.

**sylvática**, Mey. Shrub, 6-10 ft. high: lvs. 2-6 in. long; lfts. in 3-10 pairs, membranous, obovate-elliptical, retuse or obtuse: fls. ½ in. long; ovary glabrous. Caffraria.—Also rarely cult. N. as a greenhouse shrub.

**lasiogyne**, Mey. (*C. aurea*, Benth.). A taller shrub, very rarely tree-like, with larger evergreen lvs., more coriaceous, more pubescent, and exactly elliptical or oblong lfts: fls. racemose, much like Laburnum, appearing in winter, as do the fls. of most S. African plants. The silky ovary at once distinguishes it. Natal.

N. TAYLOR.†

**CÁLTHA** (Latin name of the marigold). *Ranunculaceæ*. Beautiful hardy blooming marsh plants, the largest and best of which are used about water-gardens and moist parts of borders.

Succulent perennial herbs, glabrous, with a fascicle of strong, fibrous roots: lvs. simple, rather rounded-cordate at base: fls. yellow, white or pink; sepals large,

deciduous, petal-like; petals none; stamens numerous: carpels sessile, becoming follicles, with 2 rows of seeds.—About 10 species of temperate and frigid regions. Monogr. by G. Beck, in Kaiserlich-Königliche Zool. Bot. Gesellschaft (Vienna, 1886), 36:347-363; E. Huth, Monogr. in Helios 9:69-74.

*Caltha* flourish best in wet places near running water. Though naturally bog-plants, they succeed admirably well in an ordinary border in rather rich soil. They should be introduced more liberally into the flower-garden, where they bloom very freely year after year, and usually mature a second quite abundant crop of bloom in the fall. The flowers last a long time in water, and sell readily in the cut-flower market.

The propagation is naturally accomplished by roots and by seed. The roots divide easily and several of the species send out rootstalks. The divisions may be made best in late fall or mild winter weather. If seeds are used, they must be fresh and given a moist, cool place in partial shade.

**biflora**, DC. No true st.: scape slender, usually 2-fld.: lvs. as in *C. palustris*: sepals 6-9, nearly white or sometimes bluish: follicles at maturity distinctly stalked. Spring. Calif. to Alaska.

**leptosepala**, DC. Stout scape, 8-12 in.: lvs. all basal or barely 1 on st.; nerves at base nearly parallel, otherwise like those of *C. biflora*: sepals 7-10, oblong, becoming narrower, white: fls. solitary: follicles scarcely stalked. May, June. Alaska to Wash. and Colo. Gn. 30:340.

**palustris**, Linn. MARSH MARIGOLD. St. hollow, 1-2 ft., branching, several-fld.: lvs. cordate or reniform, dentate, crenate or entire: fls. bright yellow, 1-2 in. broad; sepals 5 or 6, rarely 7: follicles compressed, ½ in. long. Apr.-June. Wet ground. Carolinas to Canada and westward. Gt. 47, p. 630. Gn. 59, p. 166.—Used before flowering in the spring as "cowslip greens." Var. **monströsa-pleno**, Hort. (var. *flöre-pleno*, Hort.). An improvement on the above: fls. larger, of greater substance, and often much doubled. Very beautiful. Var. **Tyermanii**, Hort. A dwarf form with golden fls. G.M. 52:415.

**polypétala**, Hochst. Two ft. high: lvs. 10-12 in. across: fls. 3 in. across. Caucasus and Asia Minor.—The plant spreads rapidly by stolons and may thus be easily prop. Gn. 69, p. 269.

*C. elata*, Duthie. Fls. smaller than in *C. palustris*, golden yellow with orange-colored filaments and black anthers. Himalaya. Gn.W. 21:666, desc.

K. C. DAVIS.

**CALTROPS**: *Trapa*.

**CALVÔA** (apparently a personal name). *Melastomaceæ*. A half-dozen or more herbs and shrubs in Trop. Afr., often succulent, with terete or 4-angled branches, enlarged nodes, long-petioled ovate 3-5-nerved lvs., and red, rosy or violet fls. in scorpioid cymes. None of them is likely to be in commerce for cult., although *C. orientalis*, Taub., is known in botanic gardens. It is a small shrub with 4-angled sts. producing aërial roots: lvs. nearly ovate, shining green and veined red at the base, the petioles red: fls. red, becoming violet, less than ¾ in. across.

**CALYCÁNTHUS** (*Kalyx* and *anthos*, flower; the calyx is large and conspicuous). Syn. *Butneria*. *Calycanthaceæ*. CAROLINA ALLSPICE. SWEET-SCENTED SHRUB. Ornamental shrubs, cultivated chiefly for their fragrant flowers.

Winter-buds small, without bud-scales, hidden by the base of petiole before the lvs. fall: lvs. opposite, petioled, entire: fls. with numerous imbricate sepals and no distinct petals; stamens many, short with innate anthers; pistils many, inclosed in a hollow receptacle: fr. caps.-like, formed like the rose-hip by the calyx-tube and containing numerous achenes.—Four species in N. Amer.

These are deciduous shrubs of aromatic fragrance, with opposite rather large leaves usually rough above and brown or brownish usually fragrant flowers, terminal on leafy branchlets followed by a large capsule-like dry fruit. Except *C. occidentalis*, the species are hardy or nearly hardy North. They grow in almost

752. *Calycanthus floridus*.

any well-drained and somewhat rich soil, and succeed as well in shady as in sunny positions. Propagated by seeds sown in spring; also increased by layers put down in summer, and by suckers or division of older plants.

*A. Lvs. densely pubescent beneath.*

**flořidus**, Linn. Fig. 752. Three to 6 ft.: lvs. oval or broad-ovate, acuminate, dark green above, pale or grayish green beneath,  $1\frac{1}{2}$ –3 in. long; fls. dark reddish brown, fragrant, about 2 in. broad. Va. to Fla. B.M. 503. Gn. 21, p. 184; 33, p. 392.—This species is much cult. for its very fragrant fls. and is the hardiest of all. Var. *ovatus*, Lav. (*C. ovatus*, Ait.). Lvs. ovate to ovate-oblong, rounded or subcordate at the base. L.I. 24.

**AA. Lvs. glabrous beneath or nearly so; fls. slightly or not fragrant.**

**fertilis**, Walt. (*C. ferox*, Michx. *C. lævigatus*, Willd. *C. nana*, Loisel.). Three to 6 ft.: lvs. usually elliptic or oblong, acute or acuminate, green beneath,  $2\frac{1}{2}$ – $5\frac{1}{2}$  in. long; fls. reddish brown,  $1\frac{1}{2}$  in. broad; anthers oblong; fr. ovoid, contracted at the mouth as in the preceding species. Alleghanies; from Ga. to N. C. and Ala. B.R. 6:481.—Roots, lvs. and bark used for their antiperiodic properties. Fr. said to be poisonous to sheep. Var. **glaućus**, Schneid. (*C. glaućus*, Willd.). Fig. 753. Lvs. usually ovate or oblong-ovate, acuminate, glaucous beneath; fls. paler. B.R. 5:404. Var. **oblongifolius**, Nutt., with oblong-lanceolate lvs. glaucous beneath.

**occidentalis**, Hook. & Arn. (*C. macrophyllus*, Hort.). To 12 ft.: lvs. usually rounded at the base, ovate or oblong-ovate, green beneath and sometimes slightly pubescent, 4–6 in. long; fls. light brown, 3 in. broad; anthers linear; fr. campanulate, not contracted at the mouth. Calif. B.M. 4808. F.S. 11:1113. R.H. 1854: 341. Gn. 33, p. 392.

*C. Mōhrri*, Small. Shrub, 2–6 ft.: lvs. ovate to oblong-ovate at the base, rounded to subcordate or broadly cuneate, densely pubescent beneath, 2–7 in. long; fls. purple, fragrant, more than 2 in. across. Tenn. and Ala. Little-known species, very similar to *C. floridus* var. *ovatus*, but the fr. campanulate and not contracted at the mouth. It has proved hardy at the Arnold Arboretum.—*C. præcox*, Linn.=*Meratia præcox*.

ALFRED REHDER.

**CALYCOCARPUM** (Greek, *cup-fruit*, alluding to the stone). *Menispermaceæ*. A tall-climbing vine: genus monotypic. *C. Lyonii*, Nutt., in rich woods, Ky. to Kans. and south: woody twiner: lvs. large and broad, simple, deeply palmately 3–5-lobed, the lobes pointed; fls. small, greenish, in long racemose panicles, in May and June: fr. a globular drupe, the stone or pit hollowed out on one side, ripe in Aug.

**CALYCOTOME** (*Kalyx*, and *tome*, a section or cut; *ealyx* looks as if cut off). *Leguminosæ*. Ornamental shrubs chiefly grown for their profusely produced yellow flowers; also used for low hedges.

Leaves 3-foliolate, without stipules: fls. papilionaceous; calyx turbinate, truncate, colored; standard upright; keel obtuse, curved, shorter than standard; stamens 10 with the filaments connate; ovary sessile, many-ovuled: pod linear-oblong, along the upper suture winged or strongly thickened, 2-valved.—Five species in the Medit. region.

Calycotomes are low spiny shrubs with small 3-foliolate deciduous leaves and fascicled or solitary yellow papilionaceous flowers. Hardy only in warmer temperate regions. They prefer a sunny position and well-drained soil. For propagation, see *Cytisus*.

**villōsa**, Link. Two to 4 ft.: branchlets grayish tomentose: lfts. obovate to oblong-obovate, densely silky beneath, under  $\frac{1}{2}$  in. long; fls.  $\frac{1}{2}$  in. long, 3 or more, fascicled: pod villous. May, June.—It is excellent for dense low hedges.

**spinōsa**, Link. Closely allied, but somewhat larger in every part, and with glabrous branchlets and pods: fls. solitary or few. B.R. 32:55. ALFRED REHDER.

**CALÝPSO** (from the Greek goddess, whose name signifies concealment; referring to its rarity and beauty). *Orchidaceæ*. One of the rarest and most prized native orchids.

A delicate bog-plant, 3–4 in. high, with a small bulb, 1 roundish or ovate striated lf., and 1 pink fl. with a spotted sac. For culture, see *Calopogon*; but more difficult to grow than that plant. A monotypic genus.

**bulbōsa**, Oakes. Fig. 754. Lf. an inch wide and long: scape 3–4 in. high, with about 3 sheaths; sepals and petals similar, ascending, lanceolate, acuminate, pink; lip larger than the rest of the fl., with brown spots in lines and purple and yellow markings, woolly-hairy

753. *Calycanthus terřilis* var. *glaućus*. ( $\times \frac{1}{4}$ )

within; column petal-like, ovate, bearing the lid-like anther just below the apex. Maine to Minn. and N.; also Eu. Abundant in parts of Ore. and Wash. B.M. 2763. G.C. II. 16:656.

**CALYPTRÓGYNE** (from *calyptra*, hidden, and *gyne*, woman; in allusion to the half-hidden gynæcium). *Palmaceæ*, tribe *Geonomeæ*. Short, almost completely stemless and unarmed palms with unequally pinnate terminal leaves.

Stems frequently stoloniferous, when present, ringed below: lvs. numerous, often with the pinnate segms. joined together, in extreme youth 4-parted instead of bi-partite as in most related genera; lfts. somewhat irregularly disposed on the rachis, broadly or narrowly scythe-shaped, running at the tip to an abrupt point, at the base revolute; petiole very short or practically none: spadix simple or sometimes branched at the base, long-stalked; spathes 2; fls. a little unequal, with 3 sepals, 3 petals and 6 stamens, the style half immersed in the spadix: fr. oblong or obovoid, 1-seeded.—About 4 species, all from Trop. N. Amer. From *Geonoma*, a near relative and horticulturally a much more important genus, *Calyptrogyne* is distinguished only by the almost stemless habit, and the purely technical character of having prominently arrow-shaped anthers. In *Geonoma* the anthers are pendulous, but not sagittate.

*Calyptrgyne*s are handsome palms, seldom seen outside of large collections. Special care must be given to the soil so that it will be sweet and porous, especially after the plants leave the seed-pan. Well-drained pots and a little charcoal mixed with the soil, and the plants kept in a uniformly moist state, are conditions essential to the healthy growth of the plants. In this genus, *C. Ghiesbreghtiana* is the most widely known species, another garden name for which is *Geonoma Verschaffeltii*. These are shade-loving palms, having leaves of comparatively thin texture, and consequently are subject to attacks of red spider unless properly cared for in regard to moisture. *Calyptrgyne*s are most useful in a small state, old plants in general being rather leggy and poorly furnished. (G. W. Oliver and W. H. Taplin.)

754. *Calypso borealis*.

*glauca*, H. Wendl. (*Geonoma glauca*, Oerst.). Practically stemless: lvs. 4–5 ft. long, the sheathing petiole brownish, about 1 ft. long; lfts. numerous, about 2–3 in. apart, with 4 principal nerves, and scarcely any secondary ones: spadix simple, differing from the following species in which the spadix is often branched, 2–3 ft. long, the pistillate fls. half hidden in tiny pits. Cent. Amer. G.C. III. 30:179.—Not a common species, but young plants are specially attractive.

**Ghiesbreghtiana**, H. Wendl. (*Geonoma Ghiesbreghtiana*, Lindl. & H. Wendl. *G. magnifica* and *G. Verschaffeltii*, Hort.). St. short or almost none: petiole 5 ft. long; lvs. elongate-oval; segms. in 6 pairs, unequal, almost opposite, rather remote, lanceolate, very long-acuminate, falcate, the 2 uppermost on each side very wide: spadix often branched below, the fls. half hidden in tiny pits. Chiapas, Mex. B.M. 5782.

*C. sarapiguensis*, H. Wendl. St. short: lvs. 6 ft. long. Costa Rica. G.C. III. 29:217, desc.—*C. spicigera*, H. Wendl. St. evident: lvs. irregularly pinnate, 3 ft. or less long, the stalks flat on upper side. Guatemala.—*C. Suartzii*, Hort., is a *Geonoma*. N. TAYLOR.

**CALYPTROSTIGMA**. *Diervilla Middendorffiana*.

**CALYSTËGIA**: *Convolvulus*.

**CAMARÔTIS** (a *vault*, in reference to the cavity in the apex of the lip). *Orchidaceæ*. Epiphytic hothouse orchids.

Stems elongated, with short lvs., and many-fld. racemes: sepals and petals similar, spreading; lip spurred, 3-lobed; rostellum and anther beaked; pollinia 2, upon long thin stipes.—Species 2, in E. India.

*rostrata*, Reichb. (*C. purpurea*, Lindl. *Sarchochilus purpureus*, Benth.). Fig. 755. Sts. 2–3 ft. long, climbing: lvs. oblong-linear, bifid at apex, 3–4 in. long: racemes longer than lvs.; fls. crowded, about 1 in. diam., rose-purple, the lip somewhat darker. India. P.M. 7:25.—A scarce plant, now offered in American lists. Free-growing plant with aerial roots similar to some epidendrums. The treatment accorded to the vandas and saccolabiums with similar roots will suit the *camarotis*.

GEORGE V. NASH.

**CAMÁSSIA** (*Quamash* or *Camass* is the Indian name). Sometimes written *Quamasia*. *Liliaceæ*. CAMASS. West American spring-flowering bulbs.

Leaves all radical, long-lance-shaped, sheathing, from a true bulb that is pointed and with a rounded rather flattened base: sts. erect, 2–3 ft., bearing many bracted blossoms that open from the bottom of the raceme upward, in long succession: fls. blue, purple, white or cream, with 6 spreading 3–7-nerved segms.,

755. *Camarotis rostrata*.

6 thread-like filaments, filiform style, and 3-angled, 3-valved, several-seeded caps.—Five or 6 species in the temperate regions of W. N. Amer. from Cent. Calif. to Brit. Col. and east to Texas and Ark. They have resemblances to *Scilla*, but are much handsomer. The bulbs produce no offsets unless wounded. All the

756. *Camassia cusickii*. (fls.  $\times \frac{1}{2}$ )

species vary greatly in width of lvs., size and number of fls., so that definite figures mean little. The large bulb and broad bluish lvs. of *C. cusickii*, the heavy st., regular fls., and twisted old segms. of *C. leitchlinii*, the irregular fl. and drooping segms. of *C. quamash*, and the time of flowering of *C. howellii*, are good general characters to distinguish them.

Camassias are natives of rich meadows, very wet in winter and spring but dry in summer. Water often stands on the surface at flowering time. While the very best success can perhaps be attained by giving them a rather heavy soil with abundant moisture in the early season, they are most amenable to cultivation and thrive in any loam (only avoiding too rank manures), and they are perfectly hardy. They have been thoroughly tested throughout the region from Illinois east. Plant in early fall, from 3 to 4 inches apart and 3 to 6 inches deep, and do not disturb thereafter. As cut-flowers, they are excellent as they open in long succession. Seeds grow readily, but from three to four years are required to make flowering plants.

*Cusickii*, Wats. Fig. 756. Bulbs very large (weighing 4–8 ozs.); lvs. numerous, broad, glaucous, somewhat undulate (15 in. long by  $1\frac{1}{2}$  in. wide); st. often 3 ft. high; fls. 30–100, very pale delicately blue; segms. spreading, crinkled at base, faintly 3–5-nerved. Ore. G.F. 1:174 (adapted in Fig. 756).—The very large bulb and broader and more numerous lvs. easily distinguish this species. Very easily grown.

**Quámash**, Greene (*C. esculénta*, Lindl.). **COMMON** CAMASS. Fig. 757. This species varies greatly; some forms are low and slender, others 2–3 ft. high, stout and many-fl.; it can be distinguished by the irregular perianth in which 5 segms. are more or less on one side and 1 on the other: lvs.  $\frac{3}{4}$  in. broad or less; fls. 10–40, varying from almost white to intense ultramarine in the varieties; segms. 3–5-nerved and a little longer than the stamens, narrow and channeled at the base; pedicels not exceeding the fls.: caps. ovate-oblong, obtuse, transversely veined. Calif. to Utah and north to Brit. Col. B.R. 1486. F.S. 3:275. Gn. 46:338 and p. 339.—Bulb cooked and eaten by the Indians. The fls. vary to white. The large ultramarine form is the one in the trade. The withered segments fall down about the pedicel irregularly.

**Leitchlinii**, Wats. Stout, often 3 ft. or even more in height; fls. white, cream-colored, blue or purple, nearly regular; stamens and style ascending; segms. broad and flattened at the base, usually 5–7-nerved; caps. oblong-ovate, emarginate, obliquely veined. The withered segms. of the perianth twist about the caps. like bonbons; this is an infallible distinctive mark of the species. *C. Leitchlinii* is not common, but is distributed from Mendocino Co., Calif., to Brit. Col. B.M. 6287 (as *C. esculénta* var. *Leitchlinii*, Baker).—In Mendocino Co., a clear blue form grows rarely in mountain meadows. In the Umpqua Valley, Ore., the type is clear cream approaching white. In the same region and farther north, a very large deep blue or purple form is found, while in Brit. Col., the cream-colored form again appears but is rare. At their best, the sts. are stiff and heavy, the fls. large and many, and the masses of bloom approach the *Eremurus* in beauty and are even finer in separate fls. *C. Leitchlinii* is the finest of all camassias. Several color forms are described, as var. *atroviolácea*, deep purple, and others.

**Howellii**, Wats. Bulb rather small: lvs. few, 1 ft. long and less than  $\frac{1}{2}$  in. wide; st. often 2 ft. high, many-fl., with spreading pedicels twice or more the length of the linear bracts: fls. pale purple, opening in the afternoon, the segms.  $\frac{1}{2}$  in. long, 3–5-nerved; pedicels longer than the fls.: caps. small, broadly ovate and very obtuse. S. Ore. Intro. by Pilkington & Co., 1892.

**esculénta**, Robins. (*C. Fraseri*, Torr.). Scape 12–18 in. high: lvs. keeled: fls. light blue, smaller than in *C. quamash*; segms. 3-nerved; pedicels mostly longer than fls. Pa., west and south. B.M. 1574 (as *Scilla esculénta*).

**Var. angústa** (*C. angústa*, Hort.). Very slender, and lvs. narrower ( $\frac{1}{4}$  in. wide): fls. smaller,  $\frac{1}{3}$  or  $\frac{1}{4}$  in. long. La. and Ark. to Texas.

CARL PURDY.

757. *Camassia quamash*. ( $\times \frac{1}{2}$ )

**CAMELLIA** (after George Joseph Kamel or Camellus, a Moravian Jesuit, who traveled in Asia in the seventeenth century). *Ternstroemiaceæ*. **CAMELLIA**. Woody plants, chiefly grown for their showy white or red flowers and also for their handsome evergreen foliage.

Evergreen trees or shrubs with alternate short-petioled serrate lvs. and large terminal or axillary white or

red fls. followed by subglobose woody caps.: fls. sessile, upright; sepals many, imbricate, deciduous; petals 5 or more; stamens numerous, more or less connate; ovary 3-5-celled, with slender styles connate, at least be-

758. *Camellia japonica*—Abby Wilder.

759. *Camellia japonica*—Lucida.

low: fr. a dehiscent caps., with few large subglobose seeds.—About 10 species in tropical and subtropical Asia. Often united with *Thea*, which differs in its nodding and stalked fls. with a persistent calyx consisting of 5 nearly equal sepals. There is a monograph of this genus by Seemann in *Trans. Linn. Soc.* 22:337-352 (1859) and by Kochs in *Engler Bot. Jahrb.* 27:577-634 (1900). Illustrated monographs of the horticultural varieties are: Curtis, *Monogr. of the genus Camellia* (1819); Baumann, *Bollweiler Camelliensammlung* (1828); Chandler, *Camelliæ* (1831); Berlèse, *Monogr. du genre Camellia* a (1839); Verschaffelt, *Nouvelle Monographie du Camellia* (1848-1860): the last with 576 and the previous one with 300 colored plates.

Camellias grow like natives on sandy lands and even on high pine land in central Florida, but they flower best in half-shady somewhat moist places. The half-double varieties of *Camellia japonica* do best, while the very double kinds often drop their buds entirely. The flowers suffer very much from the sun and cannot be grown much farther south than central Florida. *Camellia Sasanqua*, single, half-double and double kinds, grow much more satisfactorily than the varieties of *C. japonica*. They begin to flower late in October and early November, and the double white *C. Sasanqua* is a mass of pure white usually at Christmas time. All the varieties of *C. Sasanqua* have somewhat fragrant flowers. *C. reticulata* does equally well in Florida. It is very distinct in foliage from the two former species which have glossy leaves, while the leaves of *C. reticulata* are dull green. All the camellias are extremely slow growers if not carefully cultivated and fertilized. A mulch of old cow-manure, now and then a little commercial fertilizer, and thorough watering during the dry season several times a week start the bushes into a vigorous and healthy growth. They are so extremely beautiful when in flower that all the care given them is well repaid. (H. Nehrling.)

A. Ovary and lvs. perfectly glabrous.

*japonica*, Linn. (*Thea japonica*, Nois.). Fls. 758-761. Shrub or tree, sometimes to 40 ft., glabrous: lvs

very shining and dark green above, ovate or elliptic, acuminate, sharply serrate, 2-4 in. long: fls. red in the type, 3-5 in. across; petals 5-7, roundish. China, Japan. B.M. 42. S.Z. 82. F.S. 20:2121. S.I.F. 1:73. Gn. 24, p. 411; 28, p. 203; 36, p. 241. Var. *alba*, Lodd Fls. white. L.B.C. 7:636. Gn. 54, p. 243. J.H. III. 54:227; 64:397. Var. *alba-plena*, Lodd. Fls. white, double. L.B.C. 3:269. Gn. 53, p. 244. Var. *anemoniflora*, Curtis. Fls. red, with 5 large petals, the stamens changed into numerous smaller and narrow petals; the whole fl. resembling that of a double anemone. L.B.C. 537. B.M. 1654. Gn. 44, p. 329. Var. *magnoliæflora*, Hort. Fls. pale rose, semi-double, with 12-15 petals rather narrow and half upright. Gn. 76, p. 31. Var. *apucæformis*, Rehd. (*C. apucæformis*, Jacob-Mackoy). Lvs. bifid at the apex.—For the numerous other garden forms, see the above-mentioned monographs; also, *Flore des Serres*, *L'illustration Horticole*, and other older horticultural publications contain a large number of varieties with illustrations.

AA. Ovary and lvs. on the midrib above pubescent.

*reticulata*, Lindl. (*Thea reticulata*, Pierre). Large shrub, glabrous: lvs. dull green, not shining above, reticulate, flat, elliptic-oblong, acuminate, serrate, 3-5 in. long: fls. 5-7 in. across, purplish rose; petals 15-20, obovate, loosely arranged. China. B.R. 13:1078. B.M. 2784. P.M. 3:101. G.M. 35: suppl. Apr. 2. F.W. 1880:321. G. 25:59. Var. *plena*, Hort. Fls. with twice as many petals, and more regularly arranged. B.M. 4976. F.S. 12: 1279-80.

**Sasánqua**, Thunb. (*Thea Sasánqua*, Nois.). Shrub of loose, straggling habit, and with the branches pubescent when young: lvs. elliptic to oblong-ovate, bluntly pointed at the apex, crenate-

760. *Camellia japonica*—H. A. Downing.

serrate, shining, dark green and hairy on the midrib above, 1-2 in. long: fls. 1½-2 in. across, white; petals 5 or more, obovate or oblong. China, Japan. Gn. 54:142. S.Z. 83 (except the red vars.). S.I.F. 2:52. J.H. III. 43: 131. G.M. 36:51.

Runs into many forms. Var. *semi-plena*, Hort. Fls. semi-double, white. B.R. 1:12; 13:1091. Var. *anemoniflora*, Seem. Fls. large, double, outer petals white, inner ones much smaller, yellow. B.M. 5152. Var. *oleösa*, Rehd. (*Thea Sasánqua* var. *oleösa*, Pierre. *C. oleifera*, Lindl.). Of more robust habit, with lvs. and the single white fls. larger than in the type. B.R. 11: 942. L.B.C. 11:1065. Var. *Kissi*, Rehd. (*Thea Sasánqua* var. *Kissi*, Pierre. *C. Kissi*, Wall.). Lvs. oval-oblong to ovate, long-acuminate, to 3½ in. long. Himalayas.

761. *Camellia japonica*—President Clark.

*C. azillaris*, Roxb.=*Gordonia anomala*.—*C. cuspidata*, Hort.=*Thea cuspidata*.—*C. drupifera*, Lour. Shrub. to 8 ft.: lvs. elliptic, long-acuminate: fls.  $1\frac{1}{2}$  in. wide, fragrant, white, petals obovate. Himalayas, India. L.B.C. 19:1815.—*C. euryoides*, Lindl.=*Thea euryoides*.—*C. euryoides*, Hort.=*Thea maliflora*.—*C. hongkongensis*, Seem. (*Thea hongkongensis*, Pierre). Tree with glabrous branches: lvs. ovate-lanceolate to lanceolate, indistinctly serrate, lustrous above, coriaceous, 3-4 in. long; fls. red, 2 in. across; petals slightly emarginate; ovary pubescent. Hongkong. Trans. Linn. Soc. 22:60.—*C. maliflora*, Lindl.=*Thea maliflora*.—*C. rosiflora*, Hook.=*Thea maliflora*.—*C. sinensis*, Kuntze=*Thea sinensis*.—*C. spectabilis*, Champ.=*Tutcheria spectabilis*.—*C. Thea*, Link=*Thea sinensis*.

ALFRED REHDER.

**CAMOËNSIA** (Louis Camoens, Portuguese poet). *Leguminosæ*. Two species of climbing shrubs from W. Trop. Afr., with digitately 3-foliolate lvs., and large papilionaceous fls. Calyx top-shaped; petals with long claws, the standard orbicular or nearly so; stamens free; ovary stipitate, with many ovules, the stigma small and capitate; fr. a broad-linear flattened 2-valved pod. *C. máxima*, Welw., has recently been offered by an English firm. Described by Baker as "a magnificent species" and by Bull as "one of the most gorgeously beautiful of tropical climbers." lfts. obovate-oblong, 5-6 in. long, cuspidate: fls. milk-white tinged with gold and frilled on the edges of the petals, in short-stalked 6-8-fld. axillary racemes; standard projecting 4 in. beyond the calyx, 3-4 in. broad; other petals shorter and not more than 1 in. broad: pod 6-8 in. long. Trans. Linn. Soc. 25:36. B.M. 7572. G.C. III. 20:597.

L. H. B.

**CAMPÁNULA** (Latin, *little bell*, from the shape of the corolla in some species). *Campanulaceæ*. BELL-FLOWER. HAREBELL. BLUEBELL. A large group of attractively flowering herbs, containing some of the most popular garden plants, especially of hardy herbaceous perennials.

Annual, biennial or perennial, mostly the last, often small and tufted: root-lvs. usually larger than the stem-lvs., and often of different shape and more or less transitory: fls. blue, violet or white, sometimes yellow; calyx 5-fid; corolla 5-lobed or 5-fid; stamens 5, free; filaments wide at the base, membranaceous; stigmas 3 or 5, filiform: caps. 3-5-valved, dehiscent on the sides or (as in Fig. 762) at the base by 3-5 small valves; seeds ovate, complanate or ovoid.—Probably 250 species, nearly all in the northern hemisphere with the center of distribution in the Medit. region; about a dozen species are N. American. The species mostly inhabit swamps or moist ground, or alpine and boreal regions. Allied genera of garden value are *Adenophora*, *Jasione*, *Lightfootia*, *Michauxia*, *Ostrowskia*, *Phyteuma*, *Platycodon*, *Specularia*, *Symphyandra*, *Trachelium*, and *Wahlenbergia*, in which genera many species originally described as campanulas may be sought. Of these, perhaps the two best known cases are *Platycodon grandiflorum*, the "balloon flower," with its characteristic inflated buds, dark green, glossy, leathery lvs.; and *Specularia perfoliata* (*C. Speculum*), "Venus' looking-glass," a pretty annual, which grows in the grain fields of S. Eu., and is cult. for its violet fls. with a white eye. The calyx-tube of *Specularia* is relatively much longer than in any campanula. The most prominent campanulas now in cult. seem to be the forms of *C. Medium*, *C. carpatica*, *C. persicifolia*, *C. pyramidalis*, *C. punctata*, *C. pusilla* (*cæspitosa*), *C. rotundifolia*.

Botanically, campanulas fall into two important groups, based on the presence or absence of calyx appendages. The subgenus *Medium* has the appendages, and *Eucodon* lacks them. These appendages are often small and disguised. The genus may also be

thrown into two broad groups based on the dehiscence, —the subgenus *Medium* with capsule opening near the base, and *Rapunculus* with the openings near the top. For the horticulturist, the most serviceable classification is based on the use that he makes of the plants, —whether as a garden vegetable, as border plants, or as rock-garden or alpine subjects; and this is the division attempted here. In cultivation, campanulas tend to become taller and more robust, less hairy, more branched, and more floriferous. Blue is the prevailing color in the genus. A very few have white or yellowish flowers, with no blue or violet forms. Any blue or violet-flowered form is likely to have white varieties, and double and semi-double forms are common in three or four of the most popular species. All flowers tend to become larger and more numerous on a stem. In cultivation, the three-celled species are likely to have five stigmas instead of three, and five-celled capsules, often along with normally constructed flowers on the same plant. The height is the most variable feature of all, and in the scheme below *C. carpatica*, *C. punctata* and forms of *C. glomerata* especially will seem wrongly placed to many. But the characters used by botanists are well-nigh useless to the gardener, and nothing but a distinction of height can bring out the two important cultural groups of campanulas. For a recent garden monography of dwarf campanulas, see Correvon, "The Garden," 59 (1901) pp. 276, 450; 60, pp. 51, 64, 111, 161, 218.

*Cultivation*.—The genus *Campanula* is extraordinarily rich in flowering garden plants of merit. The alpine section is distinguished by a charming grace both in character of growth and size and bearing of flowers. The peach-leaved class (*C. persicifolia*) is characterized by the noble and beautiful form of single and semi-double blossoms carried by thin erect stems 2-3 feet high. The luster and clearness of tints of the bushy biennial *Medium* and calycanthema type are remarkable, while the rambling habit and the marvelous floriferousness of the varieties *C. isophylla* and its descendant *C. Mayii*, indicate the wide range of ornamental usefulness of bellflowers. Considering the good lasting qualities in a cut state and the great popularity of the flowers of long-stemmed sorts for indoor decoration, it is safe to say that campanulas will steadily gain in importance as material upon the florists' counter as well as for garden planting. The greatest curiosities are *C. punctata*, *C. macrostyla*, *C. Zoysii* and *C. rotundifolia* var. *soldanellaeflora*. For exhibition and for pot culture and also for large single specimens, *C. pyramidalis* is most used. For edgings, *C. carpatica* is perhaps the favorite. Of all wild forms, the best known is certainly *C. rotundifolia*, the true harebell, or "blue bells of Scotland." It is native in North America as well as in Europe, on rocky banks and shores.—Wherever rock-gardens are planned, alpine campanulas have become indispensable. The greater part of typical mountain inhabitants chiefly available for this purpose being spring-flowering plants, the summer flowers of campanulas are especially welcome. One of the best bellflowers for rock-gardens is *C. carpatica*, blue and white, with its var. *compacta* also in blue and white, var. *cælestina*, sky blue, var. *pelvisiformis*, light blue, and var. *Riverslea* with large dark-blue bells; but there are a number of other very handsome species possessing commercial value that deserve the attention of progressive growers. The demand is for a plant material easy to handle, resistant and free-flowering. As such may be recommended for rockeries, *C. garganica* and *C. garganica* var. *hirsuta*, both 4 inches high, flowers light blue. *C. pusilla*, in white and blue, is regarded as the hardiest low-growing alpine bellflower. Excellent effect may be secured from a number of the garden hybrids, when rightly employed; plantations of *C. Wilsonii*, cross between *C. pulla* and *C. turbinata*, dark blue, 6 inches tall, and *C. Fergusonii* and *C. Hen-*

762. Capsule of *Campanula* with basal dehiscence.

*derosonii*, 12 to 18 inches, all blooming freely from late in June to early August, are good examples. *Campanula glomerata* var. *acaulis*, a clustered-flowering low-growing form, violet-blue, June and July, answers the same purpose, while *C. glomerata* var. *dahurica*, 12 to 18 inches, dark violet-blue and white, very free-flowering, is valuable also as a border plant. Other good rocky kinds are *C. fragilis* (which needs protection, but makes a good pot-plant), *C. pulla* in sheltered position, *C. Portenschlagiana*, and *C. rotundifolia*. Many of the larger-growing kinds are also good for the rock-garden. —The best two representatives of the biennial class, are *C. Medium* and *C. calycanthemata*, both standard garden flowers. In the northern states, especially, they do exceedingly well. When used for mass effects, their full bloom becomes a prominent feature of June. The delicate shades of pink and pale lavender, the purity of the white, and the rich tints in purple and blue are a revelation. They transplant very easily, even in an advanced state of growth, and readily respond to mild forcing under glass in spring. In a cut state, they show remarkably good lasting qualities and are of excellent value as material for filling vases. A few other good biennials are *C. sibirica*, *C. primulaefolia*, *C. spicata*, (p. 650), *C. thyrsoides*. —The peach-leaved section comprises the most perfect forms of the bellflower family, although *C. persicifolia* has been surpassed in popular favor by the more vigorous *C. grandiflora* varieties in white and blue, which are really platycodons. *C. isophylla*, native of Italy, is not hardy in Maine and must be overwintered under glass. It is a very effective basket- and balcony-box plant, its long hanging vines being covered with large and attractive flowers in July and August. The color is a delicate light blue, while the bells of its garden descendant *C. Mayii*, have a deeper shade. For the South, both are valuable acquisitions for rockeries. —Of the perennial species, according to Robert Cameron, the best border plants are the following: *C. carpatica* and vars. *alba* and *turbinata*; *C. glomerata*, especially var. *dahurica*; *C. lactiflora*; *C. latifolia*, especially its vars. *eriocarpa* and *macrantha*; *C. nobilis* (about 2 ft. in height); *C. persicifolia* and its numerous vars., especially the white kinds; *C. punctata* (about 1½ ft.); *C. pyramidalis*, a very showy plant when well grown, but not quite reliable in the eastern states as to hardiness, making a good pot-plant for the cool greenhouse; *C. rapunculoides*, which spreads rapidly and must be so placed that it will not crowd out the other plants that are near it; *C. rotundifolia*; *C. Trachelium*; *C. Van Houttei*, a hybrid, and one of the best bellflowers. —Campanulas are raised from seed and also by division or cuttings. Seeds should be started early under glass. Cover very shallow, and place the shallow seed-pans near the light in an average temperature of 60°. Shade at midday while in process of germinating; avoid over-watering and "sticky" atmosphere. Transplant seedlings into flats as soon as they can be handled. Harden young plants gradually and transfer them to the open ground in May. *C. Medium*, *C. calycanthemata*, and all the *C. persicifolia* varieties, when grown for the cut-flower trade, should be placed on beds where they are intended to be flowered and cropped the next season. They thrive best in a rather light well-manured garden soil. Some of the alpine species require a sandy humus with additions of fine limestone material. When grown for floral garden effect, the open sunny position is preferable throughout the North, while for the South half-shade at midday is likely to prolong the flowering season. Seedlings of single varieties come true to color to a high percentage. Of the semi-double and double *C. persicifolia* sorts, propagation is usually by division in September. *C. isophylla* and *C. Mayii* are shy seeders and are propagated by cuttings in spring. For winter protection, a light covering of straw, leaves or evergreen boughs is sufficient south of New York. In more

northern parts, hardy campanulas require a uniform layer of leaves 2 to 3 inches thick. The annuals can be raised in the border by seeds sown late in April or May, or raised in the greenhouse and then transferred to the border. The best of the annuals are *C. ramosissima* and var. *alba*, *C. drabifolia*, *C. Erinus*, *C. macrostyla*, and *C. americana*. (Richard Rothe.)

*C. primulaefolia* and *C. spicata* will be found in the supplementary list, p. 650.

GROUP I. Kitchen-garden vegetable: roots radish-like: a salad plant.

1. *Rapunculus*, Linn. (*Rapunculus verus*, Fourr.). RAMPION. Fig. 763. Biennial or perennial, 2-3 ft.: root spindle- or long-radish-shaped, ½ in. thick, white; st. erect sulcate: lower lvs. obovate, short-petioled, somewhat crenate; st.-lvs. linear-lanceolate, entire: fis. calyx-tube obconical, lobes lilac, in a spike or raceme; glabrous or bristly, erect, awl-shaped, a half shorter than or nearly equal to the funnel-shaped corolla. Eu., Orient, N. Asia, N. Afr.—The roots and lvs. are eaten as a salad. The seeds, which are very small, are sown in the open ground in early May either broadcast or in drills. A little sand mixed with the seed gives an even sowing. Press firmly, and water carefully. Thin out the seedlings if necessary. Water freely in hot weather. A fresh sowing may be made in June, as early-sown plants may run to seed. Roots are gathered in Oct. and may be stored in sand for winter use. "Rapunculus" means a little turnip.

763. Root of rampion—*Campanula Rapunculus*.

GROUP II. Tall or border campanulas, characteristically a foot or 15 in. or more high. Nos. 2-23.

A. Calyx with an appendage at the base of each sinus.

B. Caps. 5-celled and stigmas 5 (variable in No. 3).

C. Style excessively long, the stigma an inch or more long.

2. *macröstyla*, Boiss. & Heldr. Annual, 1-2 ft., branched from the base, hispid with rigid spreading scattered bristles; branches stout; lvs. scattered, small for the size of the plant, sessile, bristly on both surfaces; lower ones ovate-oblong, acute; upper ovate-lanceolate, recurved, cordate, eared at the base; calyx-tube hidden by the bladderly appendages, small, broader than long; fls. solitary; on stout peduncles, 2-2½ in.

broad; corolla very broad and open, pale purple without, dull purple within, marked with violet, and hairy toward the bottom; lobes very broad, short and acute. Mt. Taurus in Anatolia. Gn. 15: 356 and 12, p. 209. B.M. 6394. —The very long exerted style is brown and spindle-shaped before spreading open. Self-sown seeds sometimes remain a year before sprouting.

cc. Style not excessively long.

3. *longéstyla*, Fomine. Perennial, 1½-2½ ft., more or less hairy: basal lvs. lance-oval, lobed, the st. lvs. oblong and sessile; fls. blue-purple, drooping; calyx-lobes lanceolate-pointed, the appendages reflexed on the peduncle; corolla

almost urn-shaped, dilated below the middle; style exerted with 3, 4 or 5 stigmas; caps. 3-5-celled. Caucasus. Gn. W. 23:671. Var. *parviflora*, Bois. Fls. smaller. R.H. 1911:548; p. 549.

4. *Médium*, Linn. (*Médium grandiflorum*, Spach). CANTERBURY BELLS. Fig. 764. Biennial, 1-4 ft.; plant pilose: st. erect; lvs. sessile, ovate-lanceolate or lanceolate, crenate-dentate: raceme lax, many-fl.; fls. violet-blue, varying to several shades and to white, 2 in. long; calyx-lobes ovate-acuminate, the appendages half as long as the ample ovate obtuse lobes; corolla bell-shaped, inflated. S. Eu. Gn. M. 14:9. Two forms (aside from the single-fl.) occur: the double, Fig. 764a, with 1-3 extra corollas, and the var. *calycánthema*, Hort., Fig. 764b, with an enlarged spreading and petal-like outer part sometimes deeply divided and sometimes little lobed or nearly entire (varying on the same plant). The var. *calycánthema* is the CUP-AND-SAUCER form (the

name hose-in-hose, sometimes applied in Campanula, would better be retained for *Primula elatior*); a fair percentage come true from seed; usually a stronger plant than the common *C. Medium*. G.C. III. 24:65. R.H. 1896, p. 301; 1897, p. 238. Gng. 5:88. Gn. 48, p. 295. F.S. 19, p. 152. G.W. 3, p. 291. G.Z. 17: 113. Var. *Wiëgandii*, Hort. Lvs. golden yellow; fls. blue. Var. *imperialis*, Hort., is a very floriferous form or possibly a hybrid. —Canterbury bells are most commonly treated as hardy biennials, the seed being sown in the open border, but they do not flower the first year. They can also be treated as tender annuals, the seed being sown indoors in early spring and the plants set out May 1-15. They will then flower well the first season, but always better the second year. Sowings may also be made in April, May or later, in pots, boxes or beds, and plants then be transferred into some sheltered place where they can be slightly protected during the winter, and then transplanted in spring to their permanent places into good rich soil, where they will make a great show if they have had the right treatment. Let them stand 18-24 in. apart. Seedlings potted up in autumn may be brought into bloom readily indoors in spring; and even blooming plants, if not spent, may be potted direct from the garden and used in the house in autumn.

BB. Caps. 3-celled: stigmas 3.

5. *alliarifolia*, Willd. (*C. lamiifolia*, Bieb. *C. macrophylla*, Sims). Perennial, 1½-2 ft.: st. erect, striate, woolly, branched only at the top: root-lvs. large, heart-shaped, crenate, tomentose; st. lvs. on petioles which gradually shorten upward, the highest being sessile: fls. white, nodding, on short stalks, borne singly in the axils of the floral lvs. as in *C. sarmatica*, but the floral lvs. larger and broader; calyx a third or a fourth shorter than the corolla, with margins rolled back, and appendages less minute than in *C. sarmatica*; corolla always white, 2 in. long, ciliated at the margin, and with characteristic tooth-like processes at the base of each sinus. Caucasus, Asia Minor. B.M. 912. Gn. M. 14:9.

6. *sarmatica*, Ker-Gawl. Perennial, 1-2 ft.: st. simple, striate, pubescent; lvs. remarkable for their gray color, harsh, leathery, wrinkled, tomentose, oblong-cordate, crenate, the lower long-petioled, the upper sessile: calyx with minute reflexed appendages, and a short, densely hairy tuft: fls. about 6 on a st., nodding; corolla about 1 in. long, and 1½ in. across, pale blue, marked with 5 hairy lines. Caucasus, in subalpine places. B.M. 2019. L.B.C. 6:581.

7. *Grössekii*, Heuff. Has the habit and infl. of *C. Trachelium*, but the calyx is appendaged; perennial, 2½ ft., branching from the base, angled, pilose: lvs. hispid, the lower cordate, unequally petioled, doubly crenate-serrate, the uppermost ovate-acute, narrowed into a petiole: calyx setose-ciliate, lobes spreading, reflexed at the apex, appendages lanceolate, a third shorter than the lobes; corolla hispid, 2 or 3 times longer than the calyx-lobes; fls. large, bell-shaped, violet, in a long raceme. Hungary. Gt. 35, p. 477. G. 27:459.

8. *mirábilis*, Alboff. Biennial or short-lived perennial, 1 ft. or more; whole plant forms a broad dense cone with such a profusion of bloom as almost to hide the foliage: lower lvs. 4-6 in. long, obovate or spatulate, obtuse, coarsely toothed, petiole winged; fls. pale lilac, erect, broadly campanulate, 2 in. across, the corolla hairy on margins and back. Caucasus. B.M. 7714. G.C. III. 24:33; 42:144-5. Gt. 47, p. 192. Gn. 54, p. 454; 60, p. 58. G.W. 12, p. 445. —A very beautiful and remarkable plant.

AA. Calyx without an appendage at the base of each sinus.

B. Fls. rotate or wheel-shaped.

9. *americana*, Linn. Annual and biennial, 3-6 ft.: st. erect, simple; lvs. thin, serrate, somewhat pilose;

764. *Campanula Medium*, the Canterbury Bell. Modified forms are shown.

root-lvs. ovate-acute, subcordate, petiolate; st.-lvs. ovate-lanceolate, acuminate at both ends: calyx-tube long, obconical, the teeth linear-acuminate, almost entire, spreading, shorter than the 5-fid, wheel-shaped corolla; fls. light blue, 1 in. broad, in long spikes, solitary or in 3's; corolla shallow, lobes pilose outside and at the apex; style long, strongly declined and upwardly curved; caps. cylindrical, grooved. Shaded low ground Canada to Iowa, south to Fla. and Ark.—Rarely cult. It is possible that *Phyteuma canescens* is still cult. as *C. americana*.

BB. Fls. saucer-shaped or broadly bell-shaped, i. e., the tube shallower and the limbs more widely spreading than the bell-shaped.

c. St.-lvs. linear-lanceolate, crenulate.

10. *persicifolia*, Linn. Fig. 765. Perennial, 2-3 ft.: st. erect; lvs. glabrous, rigid, crenulate; root-lvs. lanceolate-obovate; st.-lvs. linear-lanceolate or spatulate, often 3 in. long; calyx-lobes acuminate, wide at the base, entire, half as long as the broadly bell-shaped corolla: fls. blue or white, pedicelled, solitary, terminal and axillary, often  $1\frac{1}{2}$  in. long, 2 in. broad: caps. ovoid, 3-grooved. Eu. B.M. 397. G.C. III. 43:384. Gn. 75, p. 30. G. 6:297. Gn. M. 14:9. G.W. 3, p. 292. C.L.A. 13:478; the white form in G. 13:71 and Gn. W. 23:Suppl. Jan. 27; the double white in G.C. III. 27:409 and G. 3:563. One of the best of all perennial campanulas. Var. *macrantha* is a large-fl. form with fls. all along the st. Gt. 44, p. 148. Gn. 48, p. 306. A.F. 6:383. S.H. 1:131. Var. *alba grandiflora* and var. *Bäckhousei* are among the popular white-fl. forms. There are double and semi-double forms in blue and white. The double white is useful for cutting. For portraits of var. *grandiflora*, see G. 27:458; 28:553, 673; G.W. 12, p. 433. Var. *coronata*, Hort., is a semi-double white form. F.S. 7:699. The pictures in B.M. and F.S. show distinctly saucer-shaped fls. Var. *Moerheimeii*, Hort. White-fl., double, 2-3 in. diam.: excellent. G.C. III. 27:414. G.M. 49:535. G.W. 6, p. 545; 12, p. 434. A.G. 23:497. Var. *marginata*, Hort., has white fls. tinted blue on the borders. R.B. 32, p. 252. This species occasionally runs wild, especially in England. The lvs. are very characteristic, and, once seen, are never forgotten.

cc. St.-lvs. wider and coarsely toothed.

11. *latifolia*, DC. (*C. grandis*, Fisch. & Mey.) Perennial, 1-1½ ft., glabrous: st. erect, simple, terete: st.-lvs. 3-5 in. long, 4-6 lines wide, lanceolate, narrowed at both ends, crenate-serrate: calyx-lobes ovate-acute, broad, entire, erect, one-half shorter than the broadly bell-shaped corolla: fls. blue, often 2 in. wide, sessile, solitary or somewhat clustered, sometimes equaling the ovate-acute, dentate bracts. Mt. Olympus. P.M. 10:31. H.U. 3, p. 137. Gt. 7:202.—Fls. like *C. persicifolia*. Quickly forms a dense carpet. Variable in color. Var. *alba*, Hort. White fls. G. 19:440.

BBB. Fls. bell-shaped or tubular, not saucer-shaped.

c. Infl. a dense roundish head.

12. *glomerata*, Linn. One of the most variable: perennial, 1-2 ft., typically pubescent: st. erect, simple, terete: lvs. serrulate, lower ones rough with very short, stiff hairs,  $1\frac{1}{2}$ -3 in. long, 1-2 in. wide, with a cordate, ovate-oblong blade shorter than the petiole; upper ones sessile, ovate, acute: fls. violet-blue to white, in dense heads or glomes, 15-20 in the terminal heads, fewer in axillary ones. Eu., Armenia, Persia, Siberia; sometimes escaped in this country. Gn.M. 14:9. B.M. 2649 is var. *speciosa*, which has the largest fls. L.B.C. 6:505 is var. *sparsiflora*, with much smaller clusters.—This is one of the earliest flowering and easiest of cult. Fls. typically dark purple, running into lighter varieties. Var. *dahurica*, Hort., is probably the commonest form: terminal clusters 3 in. or more thick, a very characteristic infl. The fl. has a longer tube than

*C. lactiflora* and *C. thyrsoides*. G. 26:305. Var. *acaulis*, Hort., is an almost stemless form with very large fls.: sts. only 3-5 in. high. G.W. 9, p. 272. Var. *superba*, Hort., is a cross of the dwarf variety with var. *dahurica*: large heads of deep violet fls.

cc. Infl. a spike or raceme, dense or loose.

D. Color of fls. normally white or yellowish.

E. Corolla small, short-tubed.

13. *lactiflora*, Bieb. Perennial, 2½-6 ft.: st. erect, branching: lvs. sessile, ovate-lanceolate, acutely serrate: calyx-lobes very broad, acute, serrulate, one-half shorter than the broadly bell-shaped corolla: fls. in a loose or dense panicle, which may be 3½ in. long and thick; corolla white or pale blue, 1 in. long, nearly 1½ in. broad: caps. ovoid, erect. Caucasus, Siberia. B.M. 1973. G.C. III. 50:438. Gn. 61, p. 29; 63, p. 90; 71, p. 418; 75, p. 89. G.M. 46:168; 48:545. Gn. W. 23:623. The normally milk-white blue-tinged fls. are characteristic. Var. *coerulea*, Hort., has light blue fls.—*C. celtidifolia*, Boiss., referred to the above, may be a strongly marked variety. *C. biserrata*, Koch, is also referred here.

14. *thyrsoides*, Linn. Biennial, 1-1½ ft.; st. grooved: lvs. all covered with long hairs at the margin; root-lvs. sessile, spatulate or obtusely lanceolate, 2½ in. long, ¾ in. wide, in a dense rosette, lying on the ground; upper lvs. more narrow and acute: fls. 40-50, sulfur or creamy yellow, in a dense thyrselike spike, which may be 6 in. long and 2½ in. broad; style exserted. Alps and Jura, 3,000-6,000 ft. B.M. 1290. L.B.C. 17:1644.—Intermingled with the fls. in the spike are lvs. which are longer than the fls., which is not true of *C. lactiflora*. Should not be confounded with *C. thyrsoides*, Lapeyr., which = *C. speciosa*, (see supplementary list). Apparently no blue or purple forms are known. The picture in B.M. shows a characteristic red-tipped calyx. Garden hybrids are reported with *C. spicata* (see Kew Bull. 1910, p. 322).

765. A narrow-flowered form of *Campanula persicifolia*.

EE. Corolla large, long-tubed.

15. *Vidalii*, H. C. Wats. Perennial, 1-2 ft.: st. branching from the base: some branches short, sterile, others tall, floriferous, all grooved, clammy, glossy: lvs. 3-4 in. long, oblong-spatulate, coarsely serrate, thick, fleshy, firm, viscid, the upper ones gradually becoming bracts: fls. 2 in. long, nodding, about 9 in a loose terminal raceme; calyx-lobes triangular, thick, one-fourth shorter than the corolla; corolla tubular, swelled below, constricted above, white with a yellow base. Azores. B.M. 4748. F.S. 7:729. A.F. 3:116. G.C. III. 18:95; 34:330-1. Gn. 54, p. 299; 63, p. 297; 74, p. 402; 75, p. 410. J.F. 3, pl. 274.—Very distinct.

DD. Color of fls. normally blue or purple (with white varieties).

E. Size of fls. large.

F. Raceme pyramidal or long-conical, usually dense.

16. *pyramidalis*, Linn. CHIMNEY CAMPANULA. Fig. 766. Glabrous perennial, 4-5 ft.: lvs. glandular-den-

tate, lower petiolate, ovate-oblong, subcordate; st.-lvs. sessile, ovate-lanceolate: calyx-lobes acuminate, spreading, half as long as the broadly bell-shaped corolla: fls. numerous, in pyramidal racemes, pale blue varying to white and darker at the base. G.C. III. 32:388. Gn. 45, p. 67; 48, p. 306; 51, p. 221 (a staked pot plant); 47, p. 86 (with extensive cultural notes); 53, p. 535; 62, p. 254; 64, p. 96; 68, p. 137; 69, p. 4; 74, p. 548. R.H. 1897, p. 238. G.M. 46:612; 53: 811. G.W. 1, p. 39; 7, p. 7; 11, p. 137; 13, p. 571.

Var. *alba*, Hort., has white fls. Gn. 74, p. 645. J.H. III. 51:257. Var. *compacta*, Hort. Dwarfier: fls. larger and of better substance. The compact variety is very floriferous and convenient for conservatory, but lacks the characteristic erect, pyramidal habit. Gn. 73, p. 54. G. 18:64. S.H. 2:97. *C. Fergusonii*, Hort., is a hybrid of *C. pyramidalis* and *C. carpatica*, resembling a dwarf form of the former in growth, 18 in.: petals more pointed than those of the latter: fls. bright lilac. Gn. 66, p. 276.

Hybrids between *C. pyramidalis* and *C. versicolor* are reported.

FF. Raceme not pyramidal, usually looser.

17. *latifolia*, Linn. Perennial, 3-4 ft.: lvs. large, doubly serrate; root-lvs. sometimes 6 in. long, petiolate, cordate, covered with soft hairs; st.-lvs. sessile, more acuminate: peduncle 1-fl.; calyx-lobes long-acuminate, one-third shorter than the corolla; fls. 6-15 in a loose spike or raceme about 8 in. long, erect, very large, 2½ in. long, purple or dark blue, hairy. Eu., Persia. G.W. 8, p. 445. Var. *macrantha*, Sims (*C. macrantha*, Fisch.) is commoner in cult. than the type, a little hairier, with a glabrous calyx and very large fls. B.M. 2553, 3347. R.H. 1897, p. 239. J.H. III. 60:263. Var. *ericarpa*, DC., has the st. and lvs. pilose and more pallid, and a hispid calyx-tube. There is a white-fl. form. It is native to England, and is easily naturalized there in wild gardens. The st.-lvs. are probably the largest of any of the garden kinds, often 3½ in. long and 2 in. wide.

EE. Size of fls. small, less than 1 in. long.

18. *bononiensis*, Linn. Perennial, 2-2½ ft.; scabrous: st. simple: lvs. serrulate, ovate-acuminate, pallid beneath; root-lvs. cordate-petiolate; upper lvs. clasping: calyx-lobes acuminate, one-fourth shorter than the funnel-shaped corolla: fls. normally purplish, in a long, loose, pyramidal spike, which may be 2 ft. long, with 60-100 small fls.; corolla ¾ in. long and broad. E. Eu., W. Siberia, and Caucasus. Var. *ruthénica* (*C. ruthénica*, Bieb.), has lvs. wider and tomentose beneath. Caucasus and Tauria. B.M. 2653. There is a white-fl. form. The fls. are much smaller than in *C. latifolia*, and the raceme is much larger.

19. *rhomboidalis*, Linn. Perennial, 1 ft., sometimes 2 ft.: st. simple, erect: lvs. sessile, ovate-acute, serrate:

calyx-lobes awl-shaped, one-half shorter than the bell-shaped corolla; fls. 8-10 in an almost corymbose raceme, the lower pedicels of which may be 3 in. long, the uppermost 1 in. or less; corolla purplish blue, 1 in. long, and a little wider. Mts. of Eu. B.M. 551 (as *C. azurea*). J.H. III. 50:541. Var. *alba*, Hort., has white fls. G.W. 3, p. 14.—It flowers in July and August, after which the sts. and lvs. die down quickly.

20. *Trachelium*, Linn. THROATWORT. Fig. 767. Perennial, 2-3 ft.: st. angular, somewhat bristly (as also the fls.): lvs. rough, acuminate, coarsely crenate-dentate; root-lvs. cordate, ovate, short-stalked: calyx-lobes erect, triangular-acuminate, one-third shorter than the bell-shaped blue or white corolla: peduncle 1-3-fl.; fls. erect at first, at length tending to droop in a loose raceme, which may be 12-18 in. long: caps. nodding. Eu., Caucasus, Siberia, Japan, and run wild in parts of N. Amer. R.H. 1897, p. 239. There is a double-fl. form and variations in color.—One of the commonest and hardiest of the border plants, often running out the other campanulas, and passing under many names, especially as *C. urticifolia*.

21. *rapunculoides*, Linn. Fig. 768. Perennial, 2-4 ft.: st. indistinctly pubescent or almost smooth: lvs. rough, ovate-acuminate; root-lvs. petiolate, cordate, crenulate; st.-lvs. serrulate: calyx a little rougher than in *C. Trachelium*, the lobes linear-lanceolate, at length reflexed, one-fourth length of the oblong-campanulate bright blue corolla; fls. soon declined or nodding, in long mostly 1-sided racemes or spikes, bright blue. Eu., Caucasus, Siberia, and common in patches on old roadsides and about yards. Summer. Gn. M. 14:9.

22. *versicolor*, Sibth. & Smith. Perennial, 3-4 ft.; plant glabrous: st. ascending: lvs. serrate; root-lvs. long-petioled, ovate-acute, subcordate; st.-lvs. short-petioled, ovate-lanceolate, acuminate: calyx-teeth acuminate, spreading, at length reflexed, one-half as long as the corolla: fls. in long, spicate racemes; style exserted: caps. spheroid. Greece.

ccc. Infl. an open, compound panicle.

23. *divaricata*, Michx. Glabrous perennial, 1-3 ft.: st. erect, slender, paniculate above: branches slender, divergent: lvs. sparse, subsessile, ovate-lanceolate, acuminate at both ends, coarsely serrate: calyx-lobes awl-shaped, one-half shorter than the tubular, bell-shaped corolla; fls. small, nodding, pale blue, in a very open and compound panicle; style straight, exserted. Alleghanies, from Va. to Ga.—Rare in gardens.

GROUP III. Low-growing or rock-garden campanulas, mostly less than a foot or 15 in. high. Nos. 24-49.

A. Calyx with an appendage at the base of each sinus, often minute or disguised in form.

B. Throat of corolla spotted violet.

24. *punctata*, Lam. (*C. nobilis*, Lindl.). Named from the spotted whitish corolla, the purplish spots being inside and showing through faintly in the fresh fl. but

766. *Campanula pyramidalis*.

767. *Campanula Trachelium*. (×½)

more plainly in the dried specimen: like *C. alliariaefolia*. Perennial, 1 ft., with long and loose hairs: upper lvs. nearly sessile, and more sharply toothed than the lower: calyx-lobes one-third as long as the corolla, longer, looser and hairier than in *C. alliariaefolia*, and the margins much more recurved: peduncle 1-4-fld.; fls. nodding; corolla cylindrical,  $2\frac{1}{4}$  in. long, white, spotted within, strongly ribbed. Siberia, Japan. G.C. III. 38, supp. Aug. 26; 42:96. Gn. 73, p. 423; 75, p. 458. G.M. 51:781. G. 29:595.—*C. nobilis* has been considered distinct. In F.S. 3:247 the corolla is dark violet without, the limb hairy, while in B.M. 1723 (*C. punctata*) the corolla is white outside and not bearded. In F. S. 6:563 (*C. nobilis* var. *alba*) the limb is not bearded and the st. is red, and not hairy. The three pictures show great differences in foliage, pubescence and appendages. This is one of the most interesting of all campanulas, and is, unfortunately, usually considered more quaint than beautiful. The spotted throat readily separates it from other campanulas.

BB. Throat of corolla not spotted.

c. Sts. commonly 1-fld.

25. *Van Houttei*, Carr. Perennial, 2 ft.: root-lvs. long-petioled, roundish cordate, more or less lobed; st.-lvs. sessile, oval-lanceolate, irregularly bi-dentate,  $2\frac{1}{2}$ -4 in. long, more or less villous, strongly nerved: fls. usually solitary, nodding at the end of a small branchlet, 2 in. long, half as broad, indigo-blue, or violet; calyx-lobes linear, spreading, 1 in. long.—A garden hybrid resembling *C. punctata*. Intro. into France 1878 by Thibaut and Keteleer. Var. *pallida*, Hort., has pale lavender fls.

26. *Allionii*, Vill. Perennial, 3-5 in.: rootstock slender, creeping underground, sending up sts. at intervals of  $\frac{1}{2}$ -1 in.: lvs. few, about 7 on a st., 1-2 in. long, linear-lanceolate, sessile, slightly hairy, entire, midrib distinct, lower ones in a whorl of about 5, upper ones similar but more erect: calyx-lobes lanceolate, half as long as the corolla, the appendages ovate, reflexed, one-third the length of the calyx-lobes; fls. purple, with a rare white variety, only one on a st., inclined or nodding,  $1\frac{1}{2}$  in. long, and as broad across the mouth, probably the largest for the size of the plant of any campanula. A very local species, found only in the western Alps. B.M. 6588. G.C. III. 52:52. Gn. 60, p. 51.

cc. Sts. usually several-fld.

d. Margin of corolla bearded.

27. *barbata*, Linn. Perennial, 6-9 in.: st. pilose: lvs. villous, entire or nearly so; root-lvs. tufted, lanceolate; st.-lvs. few, ligulate (?): raceme loose, 3-4-fld.; fls. nodding, pale blue; calyx appendage ovate, obtuse, half as long as the lobes; corolla bell-shaped, shorter than in *C. Allionii*, and with a bearded mouth. Alps. L.B.C. 8:788. G.C. III. 48:388. Gn. 48, p. 297. G.W. 12, p. 447.—There is a white-fld. form, but apparently no purple. Readily distinguished from *C. Allionii* by the different colored, bearded and smaller fls., which are rarely borne singly, and by the dense, soft hairs of the st. Alps, 2,400-6,000 ft., widely distributed; mts. of Norway, and the Carpathians. Becomes coarse when grown in rich ground.

dd. Margin of corolla not bearded.

E. Fls. erect.

28. *mollis*, Linn. Perennial, velvety gray, 6-8 in.: sts. procumbent, about 2-fld.: root-lvs. tufted, obovate or spatulate; st.-lvs. ovate or rotund: fls. loosely panicled; calyx-lobes lanceolate, erect, half shorter than the glabrous, bell-shaped corolla; appendages minute, shorter than the calyx-tube; corolla erect, dark purplish blue or lavender, with a white throat, the tube long, segms. short, broad, spreading, acute. Spain, Crete. B.M. 404.—Rock or border plant.

EE. Fls. nodding.

29. *alpina*, Jacq. Perennial, 3-8 in.: st. furrowed: lvs. smaller than in *C. barbata*, more narrowly lanceolate, entire, hairy: fls. typically deep blue, bell-shaped, with broader and shorter segms. than in *C. barbata*; calyx-lobes proportionately very long, surpassing the fl.-bud, and nearly as long as the flower, but widely spreading. Alps of Austria, Lombardy and Transylvania, 6,000-7,000 ft. altitude. B.M. 957. J.H. III. 29:5.—There is a white-fld. var. The plant has a characteristic shaggy appearance from the hairy lvs. Easy of cult.

768. *Campanula rapunculoides*. ( $\times \frac{5}{8}$ )

30. *sibirica*, Linn. (*C. Höhenackeri*, Fisch.). Biennial or perennial, setaceous-pilose: st. erect, simple, panicled above: lvs. crenulate; root-lvs. petioled, obovate, obtuse; st.-lvs. lanceolate-acuminate: calyx hairy, the lobes long-acuminate, a third shorter than the corolla; calyx appendages like the lobes but half shorter and reflexed; fls. 25 or more, violet, with a longer and narrower tube than in *C. alpina*, and longer divisions of the limb. N. Asia, Caucasus, W. Eu. B.M. 659. R.H. 1861:431.—The type is rare, but var. *eximia*, Hort., is somewhat commoner: it is dwarfer, much branched, with long, scabrous lvs. and pale bluish to violet fls. Var. *divergens*, Willd., has larger fls. and broader lvs. than the type. G.C. III. 16:597. *C. sibirica* usually does best when treated as a biennial.

AA. Calyx without appendages.

B. Fls. very wide-spreading, i.e., rotate, wheel-shaped, almost flat.

c. Blossoms all erect.

31. *Waldsteiniäna*, Roem. & Schult. Perennial, 4-6 in.: sts. rigid, glabrous: lvs. fleshy, sessile, gray-green,

lanceolate, slightly serrate-dentate, the lower obtuse, the upper long-acuminate: calyx-lobes awl-shaped, spreading or recurved, one-fourth shorter than the corolla: fls. 5-9 in a corymbose raceme  $1\frac{1}{4}$  in. long,  $\frac{3}{4}$  in. wide, pale purplish blue; corolla rotate, almost starlike, with a dark spot in the throat; pistil large, white, twice the length of the corolla, with a yellow stigma. S. Austria. Gn. 8, p. 173. G. 18:81. G.W. 12, pp. 446, 710. *C. Tommasiniana*, Hort., is an allied plant, with very wiry growth and pendent pale blue fls. *C. Stansfeldii*, Hort., is a supposed hybrid, perhaps between *C. Waldsteiniana* and *C. carpatica*.

32. *ramosissima*, Sibth. & Smith (*C. Lorei*, Poll.). Annual, 1 ft. or less, branching: lower lvs. obovate and crenate; upper lvs. narrow, entire: fls. violet with white base and blue intermediate parts, erect on long simple pedicels. Eu. B.M. 2581. Var. *alba*, Hort. Fls. white.

cc. Blossoms not all erect.

d. Habit trailing or pendulous.

33. *fragilis*, Cyrill. Perennial, 4-6 in.: st. diffuse, trailing: root-lvs. long-petioled, roundish-cordate, obtusely dentate, or crenately lobed; st.-lvs. smaller, scattered, the uppermost ovate-lanceolate: fls. pale purplish blue with a white center,  $1\frac{1}{2}$  in. wide, in loose corymbs; calyx-lobes linear-lanceolate, acuminate, erect, almost equaling the corolla; style exserted: caps. ovoid. Italy B.M. 6504. P.M. 11:25. G.C. III. 43:378. Gn. 8, p. 174; 47, p. 278; 63, p. 53. G. 18:120. G.W. 2, p. 381. Var. *hirsuta*, DC., is a hairier form.—This is the best species for hanging-baskets, window- and veranda-boxes, and for covering large stones in the rockery. Prop. by cuttings in spring, the roots being too fragile to divide well. Not so hardy as *C. garganica*.

769. *Campanula carpatica*. ( $\times \frac{3}{8}$ )

cuttings in spring, the roots being too fragile to divide well. Not so hardy as *C. garganica*.

34. *garganica*, Tenore. Perennial, 3-6 in.: st. diffuse, with pendent branches: lower lvs. reniform-cordate, crenate-dentate; upper lvs. ovate-acute, dentate: raceme lax; peduncles 1-2-flid.; calyx-tube spheroid, the lobes spreading, a third or fourth shorter than the glabrous blue rotate corolla. Mt. Gargano in Italy, and elsewhere. B.R. 1768. Gn. 48, p. 295; 43, p. 25. G.M. 54:664. G.W. 4, p. 255. Var. *hirsuta*, Hort., is a hairier form. Gn. 46, p. 253; 48, p. 297.—Half-shaded position. Prop. by cuttings or by division.

DD. *laevi* not trailing or pendulous.

35. *Elatines*, Linn. Perennial, more or less pubescent, 5-6 in.: lvs. cordate, coarsely and acutely dentate, lower rotund, others ovate-acute: raceme lax; calyx-tube spherical, the lobes spreading, linear-lanceolate, somewhat unequal, a half shorter than the rotate purplish corolla; style exserted. Piedmont. Gn. 60, p. 64.—Rare rock-plant for light, stony soil.

36. *Portenschlagiana*, Roem. & Schult. (*C. muralis*, Port.). Perennial, 6-9 in.: sts. somewhat erect: lvs. all

alike petiolate, cordate, roundish, acutely angular-dentate; calyx-tube spheroid, lobes erect, acuminate, a third shorter than the infundibuliform blue-purple corolla: fls. racemose. Dalmatia.—Allied to *C. garganica*, but the corolla not so deeply 5-cut. Gn. 61, p. 225; 72, p. 469. Var. *major*, Hort. Fls. nearly twice larger than in the type,  $1\frac{1}{2}$  in. across, making a large mound of purple-blue. G.C. III. 48:58. Gn. 30, p. 111; 63, p. 110. G.W. 3, p. 13.

BB. Fls. broadly bell-shaped, less widely spreading than in B, wider than in BBB (except perhaps in No. 40).

c. Height 2-3 in.

37. *Räinerii*, Perpent. Perennial, 2-3 in.: sts suberect, branching: branches 1-3-flid.: lvs. subsessile, ovate, distantly serrate, the lower smaller and obovate: calyx-tube obconical, the lobes long-acuminate, erect, half shorter than the broadly infundibuliform corolla: fls. large, solitary, erect, dark purplish blue; style short, not exserted: caps. obovate. Mts. N. Italy. F.S. 18:1908. Gn. 60, p. 163.—One of the choicest rock-plants, but somewhat rare. Several forms of the hybrid *C. Wilsonii* are often cult. under this name, but their lvs. are lighter green and less tomentose than *C. Räinerii*. Thrives in a well-drained, sunny position.

cc. Height more than 2-3 in.

d. Style not exserted.

38. *Tenorii*, Moretti. Perennial, 8-12 in., glabrous: st. ascending or prostrate: lvs. leathery; root-lvs. long-petioled, ovate, subcordate, irregularly serrate; st.-lvs. petiolate, ovate-acute, coarsely serrate: calyx-lobes linear-lanceolate, spreading, half as long as the broadly bell-shaped corolla: fls. racemose, blue: caps. spherical. Apennines, near Naples.—This is referred by botanists to the Grecian species *C. versicolor*, which is typically taller, but is kept distinct by Correvon and others. In the garden, *C. Tenorii* resembles *C. pyramidalis* in foliage and fl., but is shorter.

39. *carpatica*, Jacq. Fig. 769. Perennial, 9-18 in., glabrous: st. branching: lower lvs. thin, long-petioled, ovate-rotund, cordate, coarsely dentate, undulate; upper ones shorter petioled, ovate-acuminate: peduncles long, terminal and axillary, 1-flid.; fls. large, often  $1\frac{1}{2}$  in. wide, bright deep blue; calyx-tube obconical, the lobes acute, wide at the base, subdentate-erect, a third or half as long as the broadly bell-shaped corolla; style not exserted: caps. ovoid-cylindrical. Carpathian Mts. of Austria. B.M. 117. G.C. III. 46:412. G.W. 12, p. 436. Gn. 48, p. 297; 62, p. 326. Var. *coelestina*, Hort. Fls. sky-blue. Var. *alba*, Hort. Fls. white. G.M. 55:615. Var. *turbinata*, Hort. (*C. turbinata*, Schott), is dwarfier, more compact, with fls. more bell- or top-shaped, and often 2 in. across, purplish blue. It also has larger lvs. and more decumbent habit. Gn. 45, p. 171; 68, p. 179; 75, p. 201. G.W. 12, p. 446. F.E. 17:15. A form

770. *Campanula pulla*. (Detail  $\times \frac{2}{3}$ )

with pallid fls. is rarer. Var. *Wilsonii*, Hort. (*C. Wilsonii*, Hort.), is a hybrid of var. *turbinata* and *C. pulla*, with the large fls. of the former and the handsome dark foliage of the latter: it is compact, dwarf, and small, ovate, very hairy lvs., with crenate-serrate margin. Gn. 60, p. 219. Var. *haylodgensis*, Hort. (*C. haylodgensis*, Hort.), is a garden hybrid, probably between *C. carpatica* and *C. caespitosa*. Raised by Anderson Henry, Hay Lodge, Edinburgh. Height 6-9 in.: root-lvs. tufted, roundish cordate, slightly dentate; st.-lvs. light green, ovate-cordate, conspicuously toothed: fls. light blue, bell-shaped, few, at the ends of sts. Var. *pelviformis*, Hort., from Crete, has very large, pale lilac, almost saucer-shaped fls. R.H. 1882, p. 509. G.C. III. 44:64. Var. *Hendersonii*, Hort., is often referred to var. *turbinata*, but is more robust; there is doubt as to its origin, *C. pyramidalis* or *C. alkarizifolia* possibly having played some part in it: lvs. ovate and ovate-cordate,  $1\frac{1}{2}$  in. long,  $\frac{3}{4}$  in. broad, slightly hairy on both sides, folded upwards, serrate; petioles 1- $1\frac{1}{2}$  in. long: fls. dark blue,  $1\frac{1}{2}$ -2 in. wide, in short, 6-9-fl. racemes. G.W. 8, p. 65; 14, p. 581. Var. *riversleae*, Hort. Fls. dark blue, 2-3 in. across: sts. 12-15 in. long but spreading; parts of corolla often 6 or 7. G.M. 43:627. Var. *compacta*, Hort., is a condensed dwarf form. *C. Stansfieldii*, Hort., is supposed to be a hybrid between *C. carpatica* and *C. Waldsteiniana* (No. 31).—This species is very variable in height and in shape of fls.

DD. Style exserted.

40. *isophylla*, Moretti (*C. floribunda*, Viv.). Perennial: st. suberect: lvs. all of same form, petiolate, roundish cordate, crenate-dentate: calyx-lobes acuminate, half shorter than the broadly bell-shaped or saucer-shaped corolla; fls. pale blue, 1 in. or more wide, corymbose; style exserted: caps. ovoid. Italy. B.M. 5745. Gn. 49, p. 483; 48, p. 297.—A desirable basket or rock plant in sun or half shade. The white form, Var.

*alba*, is most excellent: free-flowering. *C. Mayii*, Hort., is supposed to be a derivative of this species: lvs. soft and woolly. Choice.

BBB. Fls. bell-shaped.

C. Style exserted.

41. *Scutleri*, Hook. Perennial, 3-12 in.: st. simple or branched: lvs. acutely serrate, somewhat hirsute; lower ones ovate-acute, petioled; middle ones ovate-lanceolate; upper linear-lanceolate, sessile; calyx-lobes awl-shaped, erect, one-third shorter than the corolla: fls. pale blue, racemose, or more or less paniced; style exserted: caps. ovoid. N. Calif. to Puget Sound.—The capsular valves are a little above the middle, while

771. *Campanula rotundifolia*. (X1)

in *C. carpatica* and *C. persicifolia* they are near the apex.

CC. Style not exserted.

D. Color dark purple.

42. *pulla*, Linn. Fig. 770. Perennial, 3-8 in., tufted or in clumps, showy: st. normally 1-fl.: lvs. glabrous,

crenulate-dentate; lower ones short-petioled, ovate-rotund; upper sessile, ovate-acute: calyx-lobes long-acuminate, erect, a half shorter than the bell-shaped, nodding corolla. Mts. of Austria, 4,000-6,000 ft. In B.M. 2492 the calyx-lobes are short-acuminate, a sixth as long as the corolla. L. B.C. 6:554. Gn. 63, p. 440. *C. pulloides*, Hort., is a supposed hybrid between *C. pulla* and *C. turbinata*, with habit of former: 5 in.: fls. glistening purple-blue. Gn. 66, p. 203.

DD. Color not dark purple, but violet or blue (varying to white.)

43. *drabifolia*, Sibth. & Smith (*C. attica*, Boiss.). Annual, hispid, 3-4 in.: lower lvs. oblong or elliptic, dentate, tapering into a petiole: fls. large, blue and lighter on the tube, bell-shaped, on forking sts. Greece.

44. *rotundifolia*, Linn. HAREBELL. HAIRBELL. BLUE BELLS OF SCOTLAND. Fig. 771. Perennial, 6-12 in.: root-lvs. petiolate, orbicular or cordate, crenate-dentate: st.-lvs. linear or lanceolate, usually entire: calyx-lobes awl-shaped, erect, a third shorter than the bell-shaped bright blue corolla; fl.-buds erect. Eu., Siberia, N. Amer. Gn. 53:42; 62, p. 59. Gn. M. 14:10.—This is one of the most cosmopolitan of all campanulas, and the true harebell or bluebell of literature. In the wild it is usually slenderer and taller than in the garden. In shady woods it often grows 2 ft. high. The type has a white-fl. variety which is much less popular, but G.C. 1861:698 shows an excellent pot-plant of it. Var. *alaskana*, Gray. Dwarfier, leafy to the top: radical lvs. cordate, lowest st.-lvs. ovate and the upper ones becoming lanceolate: calyx-lobes attenuate, becoming deflexed; corolla  $\frac{1}{2}$ - $1\frac{1}{2}$  in. long. Alaska. Var. *arctica*, Lange. Rigid, 1- to few-fl.: corolla 1 in. long, the calyx-lobes very slender and soon spreading or deflexing. Canada north. Var. *velutina*, DC. Herbage whitish pubescent. Var. *Höstii*, Hort. (*C. Höstii*, Baumg.), has larger fls. than the type and stouter sts. The lower st.-lvs. are lanceolate, remotely dentate, the upper linear entire: calyx-lobes longer than in the type, a half shorter than the corolla. The white-fl. form is not so vigorous. G. 5:207. The most pronounced variant is var. *soldanelliflora*, Hort. (*C. soldanella*, Hort.). Fig. 772. With semi-double blue fls. split to the base into about 25 divisions. F.S. 18:1880. Gn. 60, p. 162. This curious variation is unique in the genus. The alpine soldanellas are famous among travelers for melting their way through the ice. They have fringed blue fls.—The name *C. rotundifolia* seems singularly inappropriate until one finds the root-lvs. in early spring. *C. stenocodon*, Boiss. & Reut., by some referred to *C. rotundifolia*, is more slender and with narrower st.-lvs.: fls. long and narrow, tubular, rich lilac-purple. Alps.

45. *Scheuchzeri*, Vill. (*C. linifolia*, Willd.). Perennial, 4-12 in.: st. 1-4-fl., usually 1-fl.: root-lvs. roundish, ovate, or cordate; st.-lvs. linear or narrowly lanceolate, sessile, denticulate, the lowest st.-lvs. spatulate: calyx-lobes slender, linear-awl-shaped, nearly as long as the bell-shaped dark blue corolla. Alpine and subarctic regions of Newfoundland, Labrador, Alaska, and Rocky Mts. to Colo., also in Eu. and N. Asia. F.S. 21:2205, not L.B.C. 5:485, which DeCandolle states is *C. rotundifolia*. Var. *alba*, Hort. Fls. white. Gn. 60, p. 164. The st.-lvs. of *C. Scheuch-*

772. *Campanula rotundifolia* var. *soldanelliflora*. (X $\frac{3}{4}$ )

*zeri* are distinctly serrate, while in *C. rotundifolia* they are entire; the fl.-buds nod in the former, but are erect in the latter. The calyx-lobes are relatively longer in *C. Scheuchzeri*, and perhaps the bell is deeper.

46. *cæspitosa*, Scop. (*C. pumila*, Curt. *C. pusilla*, Hank.). Perennial, 4-6 in.: root-lvs. tufted, short-petioled, ovate, glandular-dentate, shining; calyx-lobes linear, erect, a third shorter than the bell-shaped corolla: fls. nodding, blue; pollen violet-colored. B.M. 512. Gn. 43:24; 48, p. 297; 60, p. 161. G. 25:307. R.H. 1908, p. 223.—Dwarfer than *C. rotundifolia*, with root-lvs. never reniform, shorter-petioled, and lasting until after fls. have gone. Perennial, quickly forms a dense mat, and blooming from June till Oct. The European trade catalogues usually offer *C. cæspitosa* and *C. pusilla* separately, and doubtless plants of distinct horticultural value are passing under these names, but there seem to be no sufficient botanical characters to distinguish them. Correvon says that *C. pusilla* differs from *C. cæspitosa* only by its less stoloniferous character. Var. *alba*, Hort., has white fls. G.C. III, 48:96. Gn. 72, p. 143; 75, p. 368. G.M. 54:466. Var. *pallida*, Hort., has pale blue fls. G.M. 53:612.

47. *excisa*, Schleich. Perennial, glabrous, height 4-5 in.: sts. slender, 1-fld.: root-lvs. spatulate; upper lvs. linear; calyx-lobes bristly, spreading, at length reflexed, a third shorter than the bell-shaped corolla: fls. pale blue, divided to about half their depth, with a round hole at the base of each sinus, which easily distinguishes it from *C. pulla* and all other campanulas. Rare in Alps. B.M. 7358. L.B.C. 6:561. Gn. 60, p. 64.—A rare rock-plant. Likes cool, moist air, and not too full exposure to sun.

BBBB. *Fls. tubular, often long and narrow.*

48. *Zöysii*, Wulf. Perennial, 3-4 in.: plant tufted, glabrous: sts. few-fld.: root-lvs. entire, crowded, petioled, ovate-obovate, obtuse; st.-lvs. obovate-lanceolate and linear: peduncles 1-fld., terminal, rarely axillary; fls. azure-blue, large for the plant, terminated by a stellar process before expansion; calyx-lobes linear, awl-shaped, spreading, a fourth shorter than the corolla; corolla long-cylindrical, constricted at the apex, wider at the base, sharply angled, pale blue. Austrian Alps, 6,000-8,000 ft. Gn. 8, p. 173. G.C. III, 20:183; 38:228.—A rare and abnormal species.

49. *Erinus*, Linn. Annual: plant hispid: height 3-9 in.: lvs. small, glossy,  $\frac{1}{4}$ - $\frac{3}{4}$  in. broad, cordate, deeply cut, the pointed lobes conspicuous: fls. sessile, pale blue with a light center, tubular,  $\frac{1}{2}$  in. broad, with acute narrow lobes; style long, conspicuous, colored like corolla: racemes long, semi-prostrate, 10-12-fld. Medit.—Rare, short-lived rock-plant; also for edgings and pots.

*C. abietina*, Griseb. Rare tufted rockery plant, with slender, wiry sts. 9-15 in. high: fls. light blue, in loose branching spikes. July, Aug. E. Eu.—*C. acutangula*, Ler. & Lev. Dwarf, with trailing sts. from a rosette of ivy-like lvs.: st.-lvs. small, rounded and toothed: fls. solitary on each st., rather large and star-like, purple-blue. N. Spain. G.C. III, 50:220.—*C. ambilis*, Leicht.—*C. phytidocalyx*.—*C. Beeverdiana*, Fomine. Slender, to 2 ft., glabrous or finely hairy: lower lvs. oblong-ovate to broadly ovate, obtuse, crenate-serrate: fls. few or solitary, slender-pedicelled, blue,  $\frac{1}{4}$  in. across. B.M. 8299. Caucasus.—*C. calycanthema*, Hort.—*C. Medium* var. *calycanthema*.—*C. centisia*, Linn. A rare rock-plant from Mt. Cenis and other mts. of the Alps, with solitary deep blue fls. on sts. 2 in. high. Root-lvs. obovate, obtuse; st.-lvs. ovate-oblong; all lvs. sessile-entire: calyx hirsute, the lobes linear-lanceolate, a half shorter than the deeply 5-cut, spreading corolla.—*C. grandiflora*, Jacq.—*Platycodon*.—*C. hederacea*, Linn.—*Wahlenbergia*.—*C. imeretina*, Rupr. Dwarf, branching, resembling *C. sibirica*: lvs. small: fls. violet-blue, Caucasus.—*C. incurva*, Aucher.—*C. Leutweinii*.—*C. kolenatiána*, Mey. Perennial, 9 in. or less: lvs. mostly radical ovate, about 1 in. long: fls. in long-stalked raceme, bluish violet, 1 in. long, inside hairy. Caucasus.—*C. laciniata*, Linn. Robust much-branched biennial, 2 ft., somewhat pubescent: lower lvs. 8 in. long by  $2\frac{1}{2}$  in. broad, deeply cut: fls. about 2 in. across, upwards of 1 in. long, pale blue. Greece. G.C. III, 40:165.—*C. Leutweinii*, Heldr. (*C. incurva*, Aucher). Perennial, simple, 1 ft. or more: lvs. cordate, white-downy, crenate, rounded at apex: fls. pale blue,  $1\frac{1}{2}$  in. long. Greece.—*C. Mariesii*, Hort.—*Platycodon*.—*C. michauxoides*, Boiss. Tall-growing: fls. bluish white,

the segms. recurved. Asia Minor.—*C. Lamarckii*, D. Dietr.—*Adenophora* Lamarckii.—*C. nitida*, Ait.—*C. planiflora*.—*C. petraea*, Linn. Biennial, with ascending st., hairy, 6-12 in.: lower lvs. lance-oblong, narrowed to the base, toothed; upper lvs. ovate and sessile: fls. small, pale yellow, in dense terminal and axillary heads. N. Italy.—*C. phytidocalyx*, Boiss. & Noé (*C. amabilis*, Leicht.). Like *C. Rapunculus* in habit, 2-2½ ft.: lvs. lanceolate or cordate: fls. 10-12 in raceme, dark blue with black styles, resembling those of *C. persicifolia*. Armenia.—*C. planiflora*, Lam. (*C. nitida*, Ait.). Glabrous: height 3-9 in.: st. simple: lvs. sessile, leathery, shining; root-lvs. crowded in a dense rosette, ovate or obovate-obtuse, crenulate,  $1\frac{1}{2}$  in. long; st.-lvs. linear-lanceolate, acute, nearly entire: fls. blue or white, with double varieties, in spicate racemes; calyx-lobes ovate, acute, broad, erect, a third shorter than the broadly bell-shaped or saucer-shaped corolla. Not American, though commonly so stated. Habitat unknown. J.H. III, 33:283.—Rock-plant, for sunny position.—*C. primulaefolia*, Brot. St. hairy, simple, 1-3 ft.: lowest lvs. lanceolate, st.-lvs. oblong: fls. blue, downy at bottom, nearly rotate. Portugal. B.M. 14879.—*C. Raddeana*, Trautv. Perennial, glabrous, 1 ft.: lvs. cordate, long-stalked: fls. large, dark purple. Caucasus.—*C. speciosa*, Pourr., is a rare species. Most of the plants passing under this name are likely to be *C. glomerata*. B.M. 2649 is *C. glomerata* var. *speciosa*. *C. thyrsoidea*, Lapeyr., is referred here.—*C. Speculum*, Linn.—*Specularia*.—*C. spicata*, Linn. Biennial, 1-2 ft.: lvs. very narrow, nearly or quite entire: fls. 1-3, sessile, in a long interrupted spike, blue. Eu. J.H. III, 47:267.—*C. sulphurea*, Boiss. Annual: fls. size of those of *C. rotundifolia*, pale straw-color outside and sulfur-yellow inside. Palestine.—*C. urticifolia*. This name is now abandoned. Plants are likely to be *C. Trachelium*.

WILHELM MILLER.

L. H. B.†

**CAMPANUMÆA** (variant of Campanula). *Campanulacæ*. Twining or loose-growing perennial herbs, with rhizomes or tubers, rarely grown in greenhouses. Lvs. mostly opposite, simple and often cordate, petioled: fls. yellowish or greenish, broadly bell-shaped, 4-6-lobed: fr. a berry.—Five species occur in the Himalayan and E. Asian region and the Malay Archipelago. *C. javanica*, Blume, and *C. inflata*, Clarke, both with yellowish brown-veined fls. are mentioned in gardening literature: the fls. are about  $1\frac{1}{4}$  in.; in the former the calyx is nearly free from the berry, which is hemispherical; in the latter the calyx is adnate to the berry, which is ellipsoidal; both are twiners. *C. gracilis*, Hort., is of the genus *Leptocodon*, and *C. lanceolata*, Sieb. & Zucc., is a *Codonopsis*.

**CAMPHORA**: *Cinnamomum*.

**CAMPION**: *Silene*.

**CAMPSIDIUM** (alluding to its similarity to *Campsis*). *Bignoniacæ*. Ornamental vines grown for their bright orange flowers and also for their handsome evergreen finely pinnate foliage.

Evergreen shrubs, high-climbing, without tendrils and without rootlets, with odd-pinnate, opposite lvs. and tubular, orange, slender-pedicelled fls. in terminal, loose and short racemes: calyx turbinate, 5-toothed, glandless; corolla tubular, slightly ventricose, straight, with 5 short equal lobes; stamens, 4, the 2 longer with the anthers exserted; anther-sacs parallel; disk cupular, flat: fr. a narrow caps. with many winged seeds.—Two species in Chile and in the Fiji Isls.

They are adapted only for subtropical regions and do not seem to bloom readily, but even without flowers they are worth planting for their foliage alone. In Old World gardens, they are sometimes cultivated as stove plants, but *C. valdivianum*, judging from its habitat, might do better in the cool greenhouse. Propagated by greenwood cuttings under glass. For further culture, see *Campsis*.

*Campsidium filicifolium*, from the Fiji Islands, has never flowered in the writer's garden (in Florida) and is cut down by frost almost every winter, but it is a strong grower and worth planting for the foliage alone. *C. valdivianum* has proved to be a very poor grower and is very difficult to keep in health for any length of time. (H. Nehrling.)

*valdivianum*, Seem. (*C. chilense*, Reissek & Seem. *Tecoma valdiviana*, Phil.). Climbing, to 50 ft.: branches angular, glabrous: lvs. glabrous, 4-6 in. long; lfts. usually 11-13, sessile, elliptic-oblong,  $\frac{3}{4}$ - $1\frac{1}{2}$  in. long, serrate near the apex or almost entire: racemes pendulous, 6-10-fld.;

fls. about  $1\frac{1}{2}$  in. long, orange: caps. 3-4 in. long, narrowly elliptic-oblong. Chile. G.C. 1870:1182. B.M. 6111. F.S. 20:2142.

**filicifolium**, Van Geert (*Tecoma filicifolia*, Nichols.). Climbing evergreen shrub: lvs. odd-pinnate, 5 in. long; lfts. 19-25, ovate, with 2 or 3 lobes on each side, the larger lobes sometimes dentate. Fiji Isls. F. 1874:280.

ALFRED REEDER.

**CAMPSIS** (Greek *kampsis*, curve, referring to the curved stamens). *Bignoniaceæ*. TRUMPET-CREEPER. Ornamental vines cultivated for their striking scarlet or orange flowers.

Deciduous woody plants, climbing by aerial rootlets, with opposite, odd pinnate lvs., large orange or scarlet fls. in terminal clusters or panicles, followed by large elongated caps.: calyx tubular - campanulate,

773. Trumpet-vine—*Campsis radicans*. ( $\times \frac{1}{2}$ )

leathery, unequally 5-toothed; corolla funnelform-campanulate, enlarged above the calyx, 5-lobed, with spreading lobes, slightly 2-lipped; stamens 4, 2 longer and 2 shorter with diverging anthers; ovary 2-loculed, surrounded at the base by a large disk: fr. an elongated caps., loculicidally dehiscent, with the 2 valves separating from the septum to which the seeds

are attached; seeds numerous, compressed, with 2 large translucent wings.—One species in N. Amer. and one in China and Japan. By some botanists, *Bignonia* is considered the correct name for this genus, because the original description was chiefly based on *C. radicans*, while *Tecoma* is the proper name for the genus known as *Stenolobium*.

The hardest species is *C. radicans*, which may be grown as far north as Massachusetts, at least in sheltered positions, while *C. chinensis* is more tender; the hybrid is intermediate between the two in hardiness. *C. chinensis* and *C. hybrida*, as well as *C. radicans* var. *speciosa*, can be grown as bushy specimens and will bloom freely on the young shoots, even if cut back almost to the ground by frost. Such plants can be easily protected during the winter by laying them down and covering them with earth. *C. radicans* is particularly adapted for covering walls and rocks, as it climbs with aerial rootlets and clings firmly to its support. The species of *campsis* prefer rich rather moist soil and sunny positions. Propagated by seeds, by greenwood cuttings under glass, or by hardwood and also by root-cuttings and layers.

**Trumpet-vines in the South.**—The trumpet-vines are very successfully cultivated in Florida, being well adapted to the soil and climate, but to do their best need to be planted from the start in rich soil; and in addition they should be well fertilized at least once a year. They prefer a fertilizer rich in nitrogen; and a heavy mulch will also prove very beneficial. They should be grown on posts and tall stumps, or they may be trained over small oaks, persimmon trees or catalpas. Other bignoniads of similar culture are *Tecomaria capensis*, a half-climbing species with scarlet flowers effec-

tively used for decoration of the veranda, and *Tecoma stans*. That and *Campsis chinensis* are the two showiest bignoniads cultivated in Florida, the latter being a climber, flowering abundantly in May and June, while the first one is a large-growing bushy species opening its immense corymbs of vivid yellow flowers the latter part of November and early in December. The Chinese trumpet creeper, *C. chinensis*, is the most floriferous and gorgeous. In the writer's garden a large pine stump, about 16 feet high, in May and June is completely covered with masses of brilliant fiery orange-scarlet flowers which can be seen at a distance of half a mile. The flowers are much larger, more brilliant and much more abundantly produced than those of the native *C. radicans*. It is sometimes infested by a voracious caterpillar, which devours the leaves greedily. The lubber grasshoppers also attack the lower foliage. *C. chinensis* grows well in the poor sandy soil, perfecting luxuriant shoots 25 to 30 feet long in one season if well fertilized. The native trumpet creeper, *C. radicans*, is very common in the southern woodlands and fields. There is a great variety in the brilliancy of the blossoms. This is an excellent plant for covering the bare trunks of palmettos. (H. Nehrling.)

**radicans**, Seem. (*Tecoma radicans*, JUSS. *Bignonia radicans*, Linn.). TRUMPET-CREEPER. TRUMPET-VINE.

TRUMPET-HONEYSUCKLE. Figs. 773, 774. High-climbing shrub, clinging with rootlets: lvs. odd-pinnate; lfts. 9-11, oval to ovate-oblong, acuminate, serrate, dark green above, pale and pubescent beneath, at least along the midrib,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. long; fls. in terminal racemes; corolla tubular-funnelform, about 3 in. long, with 5 spreading lobes, usually orange with scarlet limb, tube almost thrice as long as the short-toothed calyx: fr. cylindric-oblong, keeled along the sutures, stalked and with a beak at the apex, 3-5 in. long. July-Sept. Pa. and Ill. to Fla. and Texas. B.M. 485. Gn. 22, p. 339. F. 1873, p. 220. A.F. 12:34. Mn. 2:9. Var. *atropurpurea*, Voss (var. *grandiflora atropurpurea*, Hort.). With large, deep scarlet fls. Var. *speciosa*, Voss. Scarcely climbing, usually forming a bush with long and slender branches: lfts. small, oval, abruptly narrowed into a slender point often  $\frac{3}{4}$  in. long; fls. orange-red, with rather straight tube; limb about  $1\frac{1}{4}$  in. across. Var. *præcox*, Schneid. Large scarlet fls. in June. Var. *aurea*, Hort. Fls. yellow.

**chinensis**, Voss (*Tecoma grandiflora*, Delaun. *T. chinensis*, C. Koch. *Bignonia chinensis*, Lam. *C. adrepens*, Lour.). CHINESE TRUMPET-CREEPER. Fig. 775 (adapted from Gardening). Climbing shrub, with few or no aerial rootlets: lvs. odd-pinnate;

774. The Trumpet-creeper climbs by means of aerial roots.—*Campsis radicans*.

fls. usually 7-9, ovate to ovate-lanceolate, serrate, glabrous beneath,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. long; fls. in terminal racemes; corolla funnelform-campanulate, shorter and broader than that of the preceding species, scarlet, about 2 in. across; calyx 5-lobed to the middle, about

775. *Campsis chinensis* on a clothes-post.

as long as the tube of the corolla: fr. obtuse at the apex. Aug., Sept. China, Japan. B.M. 1398; 3011. F.S. 11:1124-5. Gn. 27, p. 94; 33, p. 348; 47, p. 373. G.F. 3:393. F.R. 2:27. Gng. 4:195.—Less high-growing and sometimes shrubby; blooms when quite small and can be grown as a pot-plant, also suited for forcing. Var. *Thunbergii*, Voss (*Tecoma Thunbergii*, Sieb.). Fls. bright scarlet, with very short tube and reflexed lobes. Often a var. of *C. radicans* is cult. under the name *C. Thunbergii*. Var. *Princei*, Voss (*Tecoma grandiflora* var. *Princei*, Dipp.), probably belongs to the following hybrid.

*hýbrida*, Schneid. (*Tecoma hýbrida*, Jouin. T.

*intermedia*, Schelle. *T. radicans grandiflora atropurpurea*, Hort. *T. Princei grandiflora*, Hort. *T. chinensis aurantiaca*, Hort.). Hybrid between the two preceding species: somewhat climbing, often forming a bush with straggling branches: fls. 7-11, ovate to elliptic-ovate, usually pubescent along the veins beneath: fls. in terminal loose panicles; calyx divided for about one-third into ovate long-acuminate lobes much shorter than the corolla-tube; corolla funnelform-campanulate with orange-yellow tube and scarlet limb, about 2 in. across and 3 in. long. July-Sept. Garden origin. S.T.S. 1:47. M.D.G. 1904:123.—The fls. are almost as large and showy as those of *C. chinensis* and the plant is hardier.

ALFRED REHDER.

**CAMPTOSÔRUS** (Greek, *bent sorti*, alluding to the irregular arrangement). *Polypodiaceæ*. Two species of hardy ferns, with simple pointed lvs., which take root at the apex, and are hence known as "walking-leaf ferns." A single species is native mostly on lime-bearing rocks, and an allied species is known from Japan and N. Asia.

*rhizophýllus*, Link. Fig. 776. Lvs. evergreen, simple, tapering from a heart-shaped base, 4-12 in. long; veins forming meshes near the midrib; sori irregularly scattered, linear, straight or bent. Canada to Ala.—Sometimes grown in rockeries and wild gardens.

L. M. UNDERWOOD.

**CAMPYLOBÔTRYS:** *Hoffmannia*.

**CAMPYLONEÛRON:** *Polypodium*.

**CANADA:** *British North America*.

**CANAIGRE:** *Rumex hymenosepalus*.

**CANÁNGA:** *Canangium*.

776. *Camptosorus rhizophyllus*. ( $\times \frac{1}{3}$ )

**CANÁNGIUM** (Makassar, *kananga*; Malay, *kenanga*). *Annonaceæ*. Perfume-yielding tropical trees.

Closely allied to *Desmos* but differing in having the apex of the connectives of the stamens prolonged into a point, instead of being broadened into a hood-like covering for the pollen-sacs: sepals 3; petals 6 in 2 series, valvate, nearly equal, flat, linear; stamens many, closely crowded on the convex torus, the connective produced into a long tapering point; carpels indefinite,

777. *Canangium odoratum*. a, flowering branch; b, stamens; c, longitudinal section of fruit; d, fruit cluster.

clustered in the center of the mass of stamens; ovules in 2 columns or apparently in a single column; style linear or linear-oblong, terminating in an obtuse swelling; ripe carpels (fr.) several, pedicelled, ovoid or oblong and more or less constricted between the seeds. The name *Cananga*, usually applied to this genus, was used by Aublet in 1775 for an entirely different genus, and cannot therefore be valid for the present one. Baillon recognized this fact, and proposed the name *Canangium*, without, however, coupling it with specific names. It was taken up by Sir George King in his *Annonaceæ of British India*, 1893, and was applied by him to the celebrated ylangylang tree, *Canangium odoratum*.

*odoratum*, King (*Uvária odorata*, Lam. *Unóna odorata*, Dunal. *Cananga odorata*, Hook. f. & Thoms.). YLANGYLANG. ILANGILANG. ALANGILANG. MOSO'OI. MOTO-OI. Fig. 777. A tree bearing a profusion of greenish yellow fragrant fls. with long narrow petals, from which the celebrated ilangilang is made. The tree is found in S. India, Java, the Philippines, the Malay Archipelago, and many islands of the tropical Pacific. It occurs spontaneously as well as in cult., and its seeds are widely scattered by fruit-pigeons and other birds. In the Samoan Isls. it is much beloved by the natives, who make garlands of "moso'oi" with which to adorn themselves, and they celebrate its fragrance in their songs. The fls. yield a fragrant volatile oil known in commerce as the oil of ilangilang, usually obtained by steam distillation. The natives use a much simpler process in securing oil for anointing their heads and bodies. Fls. are put into coconut oil and, after remaining a short time, are replaced by fresh ones,

the oil being subjected to a gentle heat. "Macassar oil" is prepared in this way, fls. of *Michelia Champaca* being often added to those of the ylangylang.

**Brandisānum**, Safford (*Unōna Brandisāna*, Pierre. *Unōna latifolia*, Hook. f. & Thoms., not Dunal). A tree endemic in the forests of lower Cochin China and Cambodia, with very fragrant fls. resembling those of *C. odoratum* but with the petals relatively broader, constricted at the base, and thicker, and the lvs. usually cordate at the base and tomentose beneath, instead of rounded at the base and pubescent beneath: the fr. resembles that of the preceding species but with fewer seeds arranged almost in a single row, but on close inspection seen to be biseriate. The fls. yield a perfume similar to that of the true ylangylang of commerce.

W. E. SAFFORD.

**CANARĪNA** (from the Canary Islands). *Campanulacæ*. Cool-house tuberous-rooted herb closely allied to *Campanula*, but with the tubes of the calyx and corolla grown together, and the floral parts in 6's.—Three species. **C. Campānula**, Lam., is a tender perennial from the Canaries, about 6–8 ft. tall, with drooping, inflated buds and solitary, bell-shaped fls. more than 1 in. long and  $1\frac{1}{2}$  in. wide, dull yellow, flushed and veined with dull purplish brown: the lobes of the corolla strongly reflexed: lvs. hastate, coarsely repand-dentate: fr. a fleshy berry. B.M. 444.—Intro. by Franceschi in 1895.

CANARY-BIRD FLOWER: *Tropæolum*.

CANARY GRASS: *Phalaris*.

**CANAVĀLIA** (an aboriginal name). Including *Malôchia*, *Leguminosæ*. Bean-like plants, some of them producing edible seeds and some more or less grown for ornament.

Prostrate trailing or twining herbs, with pinnately 3-foliate lvs.: fls. in axillary racemes or fascicles, often large, violet, rose or white, with bell-shaped, 2-lipped calyx, papilionaceous corolla, 5 stamens united and 1 free for all or part of its length: pods large and ribbed on edges.—A dozen species, widely distributed in warm countries.

**ensifórmis**, DC. (*C. gladiata* var. *ensifórmis*, DC.). JACK BEAN. CHICKASAW LIMA. Figs. 485 (Vol. I), 778. Glabrous or nearly so: lfts. ovate-oblong or ovate, mucronate: upper lip of calyx longer than the tube, recurved and notched; keel blunt, curved: seeds white, with a dark raphe.

778. Seeds of *Canavalia ensiformis*.  
( $\times 1$ )

Tropics of both hemispheres.—B. M. 4027. A.G. 14: 84.—Grown in the southern states for stock, but the pods make passable snap beans when not more than 4–6 in. long. In warm countries it is a bushy plant, with little tendency to climb. The pods reach a length of 10–14 in., the walls being very hard and dense when ripe; the halves of the pod, when split apart, roll up spirally often into an almost perfect cylinder. The large white turgid beans, bearing a very prominent brown seed-scar, are packed crosswise the pod, imbedded in a very thin white papery lining. The fls. are small and light purple, resembling those of the cowpea (but larger) and of various species of *Dolichos*. The lfts. are large and broad (5–8 in. long and half or three-fifths as broad), strongly veined and dull, dark green, abruptly pointed and smooth. Beans said to be used as a coffee substitute.

*C. bonariensis*, Lindl. Twining: lfts. ovate, with the long apex obtuse: fls. purple in drooping racemes that exceed the lvs., the standard large broad and notched. Uruguay and S. Brazil. B.R. 1199. H.U. 4, p. 129.—*C. obtusifolia*, DC. Prostrate or climbing: lfts. nearly orbicular to oval or obovate, rounded or cuneate at base: fls. pink, in racemes exceeding the lvs.: seed brown, oblong. Fla. and Texas south. Known as "mato de la playa" in Porto Rico.—*C. rustispérma*, Urban. Large and tall, ascending highest forest trees: seeds red. Known as "Mato colorado." W. Indies.

L. H. B.

CANDELILLO: *Euphorbia antispythitica*.

CANDLEBERRY, CANDLENUT: *Aleurites*.

**CANDÔLLEA** (A. P. DeCandolle, 1778–1841, famous botanist of Geneva, Switzerland). *Candolleacæ*; formerly referred to *Dilleniaceæ*. Herbs or woody plants sometimes grown under glass or in the open far South for the mostly yellow flowers.

Shrubs or undershrubs or herbs, mostly glabrous: lvs. simple, mostly narrow, sometimes with margins revolute: fls. few or solitary at the ends of the branches; sepals and petals 5; stamens many, united into 5 bundles or sets, each set bearing several anthers; carpels 2–3–5, with 1–3 ovules in each.—As now understood, probably 80–90 species, mostly W. Australian, but 1 in Trop. Asia and S. China and 1 in the E. Indies. Little known in cult., but the following Australian species are now offered.

**tetrándra**, Lindl. Shrub, with branches angular, pubescent: lvs. narrow-oblong to oblong-ovate, obtuse or short-acuminate,  $2\frac{1}{2}$  in. or less long, clasping, margins not revolute: fls. much larger, paler yellow, the petals 1 in. long and the acute sepals  $\frac{3}{4}$  in. long: fr. with orange aril. B.R. 29:50.—Offered as a green-house plant.

**cuneifórmis**, Labill. Erect shrub, 6 ft. and more, with short crowded branches that are somewhat hairy when young: lvs. oblong-cuneate to obovate, truncate or few-toothed at apex, 1 in. long: fls. bright sulfur-yellow, sessile in the crowded floral lvs.; sepals about  $\frac{1}{2}$  in., and the notched petals somewhat longer. B.M. 2711.—Offered in S. Calif., where it blooms March–June.

L. H. B.

CANDYTUFT: *Iberis*.

CANE-BRAKE: Species of *Arundinaria* (treated under Bamboo).

**CANÍSTRUM** (Greek, a basket). *Bromeliacæ*. Epiphytic or terrestrial hothouse plants, requiring the treatment of billbergias.

Leaves in a dense tuft, acute, spinulose on the margin: infl. compound, in a cup of lvs., on a very short st. as in *Nidularium*, or on a longer exserted st.; fls. usually green, rarely golden or blue.—A genus of about 10 species, natives of Brazil. They are sometimes referred to *Nidularium*.

**Lindenii**, Mez (*Æchmèa ebúrnea*, Baker. *Guzmânia frágans*, Hort. *Nidularium Lindenii*, Regel). Lvs. about 20, in a dense rosette, tomentose, green-spotted, the bract-lvs. cream-white: fls. white or greenish.

**amazónicum**, Mez (*Karátas amazónica*, Baker. *Nidularium amazonicum*, Lind. & André. *Æchmèa amazónica*, Hort.). Lvs. 15–20, 10–20 in. long, and rather wide at the middle, greenish brown above and light brown beneath, not spotted or scurfy, the bract-lvs. greenish brown: fls. white, with a green tube, in a dense head.

*C. aurantiacum*, E. Morr. (*Æchmea aurantiaca*, Baker). Plant vigorous: lvs. expanded in the middle: fls. yellow, 2 in. long. S. Amer. B. H. 1873: 15.

GEORGE V. NASH.†

**CÁNNA** (name of oriental origin, of no application). *Cannacæ*. Popular tall ornamental plants, prized for their stately habit, strong foliage and showy flowers; much used for bedding.

Stout, unbranched: fls. mostly red or yellow, in a terminal raceme or panicle, very irregular: caps. 3-lobed and several- to many-seeded (Fig. 779, p.); sepals

(s) 3 and small and usually green; petals (ccc) 3, mostly narrow and pointed, green or colored; style (e) single and long; the stamens are commonly petal-like, oblongate bodies or staminodia (aaab), 2 or 3 of which are usually much produced and broadened, and one is deflexed and narrower and forms the lip of the fl. (b); the pollen is borne in a single-loculed anther (f), borne on the side of a narrow and more or less coiled staminodium.—In the latest monograph, 1912 (Kränzlin, in Engler's *Pflanzenreich*, hft. 56), 51 species of *Canna* are described from subtropical and tropical Amer. and Asia.

779. The parts of the *Canna* flower.

A generation or two ago, cannas were grown for their foliage or mass-effect. They were tall and long-jointed, with small and late flowers (Fig. 780). An old-time garden race of tall cannas was *C. Annæi*, raised by M. Année, of France, from seeds of the true *C. nepalensis*, sown in 1848. The flowers from which the seeds were taken probably had been pollinated by some other species, most likely with *C. glauca*. In 1863, a new race appeared, as the result of the union of *C. iridiflora* with *C. Warscewiczii*. This hybrid was known as *C. Ehemanni* (and *C. iridiflora hybrida*). This was of intermediate stature, with showy foliage and better drooping flowers. Under this name plants are still sold, but they may not be identical with the original *C. Ehemanni*. This race has been variously crossed with other species and forms, and from innumerable seedlings there have been selected the dwarf and large-flowered cannas (Figs. 781, 782), which have now practically driven out

the old tall small-flowered forms. These dwarf cannas are often known as French cannas, from the country of their origin; also, as Crozy cannas, from a renowned breeder of them. Within recent years, another race of cannas has arisen from the amalgamation of our native *C. flaccida* with the garden forms and with *C. iridiflora*. These have come mostly from Italy and are known as Italian cannas; also as orchid-flowered cannas. The flowers are characterized by soft and flowing iris-like outlines, but they are short-lived. Of this class are the varieties Italia (Fig. 783), Austria, Bavaria, Burgundia, America, Pandora, Burbank and others. For a sketch of the evolution of the garden cannas, see J. G. Baker, *Journ. Roy. Hort. Soc.*, Jan., 1894; also, for the history of the Italian race, *Revue Horticole*, 1895, 516, and *Gardeners' Chronicle*, Dec. 14, 1895; Kränzlin, cited above.

780. Old-time *Canna*.

The culture of cannas is simple and easy. They demand a warm, friable, rich and moist soil. They are injured by frost, and therefore should not be planted out until the weather is thoroughly settled. For dense mass effects, set the plants not more than 1 foot apart each way, but if it is desired to show individual plants and their flowers at the best, give three times that amount of room to a single plant. Pick the flowers as soon as they wilt, to prevent the formation of seeds (which causes the plant to lessen flowering), and keep the plants in tidy condition. Give the soil and treatment that produce the best results with Indian corn.

New varieties are raised from seeds. The seeds usually germinate slowly, and sometimes not at all, unless the integument is cut or filed, or is softened by soaking in water; these precautions taken, they germinate quickly. Sow late in winter, in rather strong bottom heat, in flats or pots. Prick out, and give plenty of room. They should make blooming plants the first year.

Commonly, cannas are propagated by dividing the rootstock. This rootstock is a branchy mass, with many large buds. If stock is not abundant, as many plants

may be made from a rootstock as there are buds, although the weak buds produce weak plants. Leave as much tissue as possible with each bud. These one-bud parts usually give best results if started in pots, so that the plant is 6 to 12 inches high at planting time. The commercial *Canna* plants are grown mostly in pots. If one has sufficient roots, however, it is better not to cut so close, but to leave several strong buds on each piece (as shown in Fig. 784). These pieces may be planted directly in the ground, although more certain results are to be secured by starting them in the house in boxes or pots. If strong effects are desired, particularly in shrub borders, it is well to plant the entire stool. In the fall, when the plants are killed by frost and the tops have dried a few days, dig the roots, and let them dry, retaining some of the earth on them. Then store them on shelves in a cellar that will keep Irish or round potatoes well. Take care that the roots do not become too warm, particularly before cold weather sets in; nor too moist. Well-cured roots from matured plants usually keep without much difficulty. If they do not hold much earth, it is well to throw a thin covering of light soil over them, particularly if they are the highly improved kinds.

Cannas are commonly used only in formal beds, but most excellent effects may be secured by scattering them singly or in very small clumps in the hardy border or amongst shrubbery. Against a heavy background of green, the gaudy flowers show to their best, and the ragged effect of the dying flowers is not noticed. They also make excellent centerpieces for formal beds. The tall-growing cannas, with small and late flowers, have given way almost wholly to the modern race of Crozy or French dwarf cannas, which usually remain under 4 feet high, and give an abundance of large early flowers. The *Canna* always must be used for bold planting effects, because the flowers

781. Modern flowering *Canna*.

have not sufficient durability to be very useful as cut-flowers. As individual blooms, the flowers are not usually attractive, but they are showy and interesting in the mass and at a distance. The new race of Italian or Flaccida cannas has more attractive flowers, but even these are most useful when on the plant.

It is impossible for the gardener to determine species of canna in the common garden forms. In fact, the species are little known except in herbaria and as wild plants growing in their original habitats. The monographers do not agree as to the definitions of what have been described as original or wild species. The following account of species is included more for the purpose of showing the range within the genus and of making a catalogue of leading botanical names than to set specific limits or to indicate what species-forms are in cultivation. The Crozy experiments began with crossing *C. Warscewiczii* with a variety of *C. nepalensis* of gardens (*C. flaccida*?) having large yellow flowers and very long creeping tubers; and some of the progeny was crossed with *C. aureo-picta* (a garden form). The recent attractive orchid-flowered cannas spring largely from the *C. flaccida* forms.

## A. Petal-like staminodia none.

1. *paniculata*, Ruiz & Pav. (*C. excelsa*, Lodd.). St. very tall, slender, glabrous: lvs. oblong or ovate and acute, green and glabrous above and pubescent beneath: racemes lax, disposed in a squarrose panicle, the fls. in 2's; sepals lanceolate,  $\frac{4}{5}$  in. long, obtuse; petals lanceolate, yellow-green, 2-3 in. long; lip rather longer than the petals, crimson. Subequatorial Andes.

## AA. Petal-like staminodia 2.

B. Plant woolly-pubescent on the sheaths and sometimes on the lf.-blades.

2. *compacta*, Roscoe. St. tall, stout, and green: lvs. many, oblong to ovate and acute: raceme simple and densely many-fld., the rachis 3-angled; sepals ovate, acute,  $\frac{1}{2}$  in. long; petals unequal, narrowly lanceolate and long-acuminate,  $1\frac{1}{2}$  in. long, red-yellow; staminodia oblanceolate, slightly emarginate,  $1\frac{1}{2}$ -2 in. long, scarlet or deep orange-red; lip broad-linear, emarginate, red-yellow. S. Amer.

3. *lanuginosa*, Roscoe (*C. Achiras*, Litt.). St. green, woolly, 4-6 ft., densely lvd.: lvs. ovate-oblong, acute, green: raceme long and contracted, many-fld., simple,

the bracts obtuse, small and green; sepals ovate-lanceolate, greenish red,  $\frac{1}{2}$  in. or less long; petals long-lanceolate,  $1\frac{1}{2}$  in. long, tinged with red; staminodia entire, red or red-yellow; lip the same color, and revolute. Brazil, Peru. B.R. 1358.

4. *lagunensis*, Lindl. Differs from *C. lanuginosa* in having long pale yellows fls., by some referred to *C. lutea*: plant of medium size, lightly lanate on the sheaths: lf.-blades ovate-oblong, short-acute and apiculate, pale-margined: petals linear-lanceolate and acuminate: lip strongly revolute, red-spotted. Mex., Cent. Amer. B.R. 1311, 1358. Aug.-Nov.

5. *pallida*, Roscoe (*C. Moritziana*, Bouché). Plant medium height: lf.-blade elongate-elliptic, acuminate and filamentous at end, sometimes white-margined: raceme simple and narrow, the bracts broadly oblong-cuneate; sepals ovate and obtuse, green; petals lanceolate and acuminate, greenish-sulfur-color; lip linear, 2-tipped, revolute, pale yellow, spotted. W. Indies and N. S. Amer.

BB. Plant glabrous on sheaths and lf.-blades.

c. Lvs. of 2 colors.

6. *discolor*, Lindl. (*C. rotundifolia*, André). St. stout, 6-10 ft., purple and glabrous: lvs. very broad-oblong, acute, the lower ones sometimes 3 ft. long, dark green and purple-margined, red-purple beneath: fls. in a deeply forked panicle of lax racemes, the bracts small and oblong; sepals lanceolate, obtuse,  $\frac{1}{2}$  in. long, green, tinted with purple; petals lanceolate, acuminate,  $1\frac{1}{2}$  in. long, pale green tinted with rose; staminodia entire,  $2\frac{1}{2}$  in. long, bright red, exterior yellow; lip lanceolate and emarginate, brick-red. Cent. and S. Amer. B.R. 1231. *C. concinna*, Bouché, is a related species with lanceolate lvs. narrowed at both ends. S. Amer.

cc. Lvs. unicolored, green.

d. Fls. narrow, the parts connivent.

7. *lutea*, Miller (*C. commutata*, *C. floribunda* and *C. densifolia*, Bouché. *C. maculata*, Link. *C. sulphurea*, Hort.). St. slender and green, 3-4 ft., distantly foliated: lvs. oblong or broad-lanceolate, acute: raceme lax, simple or rarely forked, the small green bracts oblong and obtuse; sepals oblong,  $\frac{1}{2}$  in., green, white-margined; petals lanceolate, pale yellowish white,  $1\frac{1}{4}$  in. long; staminodia pale yellow, often emarginate,  $1\frac{1}{2}$ -2 in. long; lip linear, pale yellow, emarginate. Mex. to Brazil. B.M. 2085. L.B.C. 7:646. *C. Tinei*, Tod., perhaps a hybrid, apparently is to be associated with this species.

Var. *aurantiaca*, Kränzl. Fls. orange; lip yellow.

8. *variabilis*, Willd. (*C. carnea*, Roscoe). St. green, 3-6 ft.: lvs. broad-lanceolate or elliptic, acute, bright green: raceme simple and lax, the small bracts oblong and obtuse; sepals lanceolate, green,  $\frac{1}{2}$  in. long; petals lanceolate, acuminate, concave,  $1\frac{1}{2}$  in. long, pale flesh-color; staminodia 2, spatulate-linear, mostly entire, variable in color but mostly orange or rose; lip linear or ligulate and entire: caps. small, globose. S. Brazil, the particular place unknown.

782.  
Flowering or  
French canna  
—Prince  
Hohenlohe.

DD. *Fls. ringent or gaping, or open-sprcading.*

E. *Infl. simple or only moderately branched.*

9. *humilis*, Bouché (*C. exigua*, Bouché). Low, 3 ft. or less, slender: lvs. short-petioled, the blade oblong, acute or short-acuminate, glabrous above and below, 10-16 in. long: raceme sub-simple (rarely paniculate), bearing fls. large for size of plant (about 3 in. long); sepals very unequal, ovate-oblong; petals long-lanceolate, concave, connate at base into a tube, scarlet; staminodia spatulate, more or less 2-lobed at apex; lip rather narrow, about  $2\frac{1}{4}$  in. long. Farther India, China, etc. *C. cinnabarina*, Bouché (*C. fulgida*, Bouché), is a related species but larger and with yellow and scarlet rather smaller fls. Mex., Cent. Amer., W. Indies.

10. *speciosa*, Roscoe (*C. leptochila* and *C. saturata-rubra*, Bouché. *C. polymorpha*, Loud. *C. sanguinea*, Hort.). Large: st. green, 5-6 ft.: lvs. broad-oblong, acute: fls. in an elongated raceme or sometimes paniculate; sepals lanceolate,  $\frac{3}{4}$  in. long, pale purple; petals linear-lanceolate,  $1\frac{1}{2}$  in. long, erect, pale purple; staminodia 3 in. long, emarginate, bright red; lip emarginate, yellow. Himalayas. B.M. 2317. B.R. 1276. *C. chinensis*, Willd. (*C. nepalensis*, Wall.), differs in having reflexed petals.

11. *orientalis*, Roscoe (*C. flavescens*, Link). St. slender, glabrous, 3-4 ft.: lvs. ovate-oblong, a foot or more long: raceme lax, simple or forked, the bracts oblong; sepals oblong-lanceolate, obtuse,  $\frac{1}{2}$  in. or less long, pale green and rose-tinted; petals lanceolate, acuminate,  $1\frac{1}{2}$  in. long, pale rose; upper staminodia  $2\frac{1}{2}$  in. or less long, bright red, often emarginate; lip red-yellow: caps. globose and very small. Malaysian tropics.

EE. *Infl. much-branched; fls. purple.*

12. *polyclada*, Wawra (*C. eximia*, Bouché. *C. cearensis*, Huber). St. tall and very slender: lvs. ovate or ovate-lanceolate, acute: fls. (often in pairs) in a long, much-branched panicle, the bracts nearly orbicular; sepals lanceolate,  $\frac{1}{2}$  in. long; petals long-lanceolate and unequal, acuminate, the longest about  $2\frac{1}{2}$  in., purple; staminodia acute, scarcely longer than the petals; lip oblanceolate, scarlet-spotted. Brazil.

AAA. *Petal-like staminodia 3 (exception in No. 18).*

B. *Lvs. lanceolate: fls. mostly yellow or orange.*

c. *Petals deflexed.*

13. *flaccida*, Salisb. (*C. glauca* and *C. angustifolia*, Walt.). St. green and glabrous, 4-6 ft., very leafy below: lvs. ovate-lanceolate to narrowly elliptic, acute, green: raceme simple, lax and few-fl., the bracts very small; sepals lanceolate or oblong, acuminate, 1 in. long, green; petals broadly linear-lanceolate to obovate and reflexed, to 3 in. long (as is also the tube); staminodia obovate, sulfur-yellow, 2-3 in. long by  $1\frac{1}{2}$  in. broad; lip large, yellow. Swamps S. C. to Fla., near the coast. L.B.C. 6:562. G.W. 12, p. 253.—Useful for its good habit and iris-like fls. *C. Reëvesii*, Lindl., of India and the Philippines, has the outside staminodia acute rather than all obtuse or emarginate as in *C. flaccida*, and fls. less than 4 in. across rather than about 6 in. across. B.R. 2004.

14. *Fintelmannii*, Bouché. St. green and glaucous, 4-5 ft.: lvs. oblong or ovate-elliptic and acute, bright green: raceme few-fl. and rather dense, the bracts green and oblong; sepals oblong,  $\frac{1}{3}$  in., green; petals

lanceolate, acuminate, greenish yellow,  $1\frac{1}{2}$ -2 in.; staminodia obtuse and entire (or 2-lobed at apex), 2-3 in., yellow; lip linear, strongly reflexed, yellow, mottled red: caps. large. Mex. and Cent. Amer.

15. *pedunculata*, Sims (*C. Buëkii*, Weinm. *C. reflexa*, Nees). St. tall, slender, green and glaucous, 5-6 ft.: lvs. oblong-lanceolate, green and glaucous, 1-2 ft. long and 3-4 in. broad: fls. in a many-fl. long raceme, with a hairy rachis and long-spreading pedicels, the bracts small, oblong and obtuse; sepals oblong, small and green; petals linear-lanceolate, greenish yellow, reflexed, 2 in. long; staminodia emarginate, about 2 in. long, pale yellow; lip oblanceolate, yellow: caps. globose, small. W. Indies, S. Amer. B.M. 2323. L.B.C. 7:622.

cc. *Petals erect.*

16. *glauca*, Linn. (*C. Schlechtendaliæna*, Bouché. *C. Annæi*, André. *C. mexicana*, and *C. stolonifera*, Bouché. *C. lanceolata*, Lodd.). St. green and glaucous, 5-6 ft., from a long and stoloniferous rhizome: lvs. green and glaucous, oblong-lanceolate and very acute, tapering both ways (the middle of the blade 4-6 in. wide), white-margined: raceme lax, simple or forked; sepals ovate-obtuse, green,  $\frac{1}{2}$  in. long; petals linear-lanceolate, yellow-green,  $1\frac{1}{2}$ -2 in.; staminodia entire,  $2\frac{1}{2}$ -3 in., yellow, not spotted; lip linear or obovate-oblong, emarginate, pale yellow: caps. oblong,  $1\frac{1}{2}$ -2 in. long. W. Indies, S. Amer. Var. *rubro-lutea*, Hort., has fls. deep yellow tinted red, or in some portraits represented as deep purple. B.M. 3437. *C. longifolia*, Bouché, from Mex. and Cent. Amer., has the petals all free, whereas they are united in a tube in *C. glauca*, and with curved sulfur-yellow fls. *C. leucocarpa*, Bouché, S. Amer., has petals united into a short tube, the fls. small, pale orange with broad leafy style. *C. violacea*, Bouché, habitat unknown, has petals united in short tube, fls. violet, strongly gaping, plant deciduous-woolly above.

BB. *Lvs. broadly oblong or elliptic: rhizome tuberous.*

c. *Plant low or medium in height (mostly 5 ft. or less).*

D. *Staminodia entire at apex.*

17. *indica*, Linn. (*C. patens*, Roscoe. *C. crœcea*, Hort. *C. tenuiflora* and *C. spectabilis*, Bouché. *C. coccinea*, Link). INDIAN SHOT. St. slender, glabrous, green, 3-5 ft.: lvs. oblong and acute, green, not glaucous, half as broad as long (1- $1\frac{1}{2}$  ft. long): racemes simple or very nearly so and lax, some of the fls. in pairs, the bracts green and nearly orbicular; fls. small; sepals oblong and green,  $\frac{1}{4}$  in. long; petals lanceolate, pale green, about  $1\frac{1}{2}$  in. long; upper staminodia bright red, entire, 2 in. long but narrow; lip linear, red-yellow, minutely spotted with red: caps. globose, 1 in. diam. W. Indies, Cent. and S. Amer. Naturalized in parts of southern states. B.M. 454. B.R. 776. L.B.C. 17:1693.

18. *coccinea*, Miller (*C. rubra*, Willd.). St. slender, green, 4-5 or sometimes 6 ft.: lvs. oblong, or oblong-lanceolate, and acute: raceme simple and lax, with small green, orbicular bracts; sepals lanceolate,  $\frac{1}{2}$  in. or less

783.

Italia canna.

long, green tinged with red; petals lanceolate, acuminate,  $1\frac{1}{2}$  in. long, pale scarlet; staminodia 2, long and narrow, mostly emarginate; lip yellow-spotted; caps. globose and small. W. Indies, Cent. and S. Amer. *C. formosa*, Bouché, Brazil, has 3 unlike staminodia.

DD. *Staminodia 2-lobed.*

19. *syvestris*, Roscoe (*C. portoricensis*, Bouché). Plant stout, 4–5 or 6 ft.: lvs. long-oblong or oblong-lanceolate, acuminate, bright green, to  $2\frac{1}{2}$  ft. long and one-third as wide; raceme slender, usually squarrose, rarely simple; fls. narrow and elongated, red; sepals lanceolate and acute,  $\frac{1}{2}$  in. long; petals much longer, lanceolate and very acuminate; staminodia sub-equal, narrow-spatulate; lip narrow, strongly revolute. W. Indies, Cent. Amer. *C. limbata*, Roscoe (*C. patens*, Hook. *C. aureo-vittata*, Lodd. *C. floribunda*, *C. variegata*, *C. recurvata*, *C. læta* and *C. ventricosa*, Bouché), of S. Brazil, has unlike staminodia, the largest being 2-lobed, the medium one emarginate, the other entire, all red with yellow margins. B.R. 771. L.B.C. 449.

CC. *Plant tall, often up to 17 ft. (No. 21 perhaps excepted).*

D. *Staminodia of medium length (3 in. or less).*

E. *The staminodia not united.*

20. *edulis*, Ker (*C. esculenta*, Lodd. *C. rubricaulis*, Link.). Rootstock thick and edible: st. stout, 8–12 ft., purple; lvs. large, oblong, or ovate-oblong, green or bronze, 1–2 ft. long; raceme lax, forked or simple; fls. red or brick-red, usually in pairs, the bracts orbicular or oblong; sepals oblong-lanceolate,  $\frac{1}{2}$  in. long, tinged with red; petals oblong-lanceolate,  $1\frac{1}{2}$  in.; staminodia entire or emarginate,  $2\frac{1}{2}$  in. long, bright red or orange; lip bright red or yellow-red; caps. large. W. Indies, S. Amer. B.M. 2498. B.R. 775.—Starch is procured from the roots, and for this purpose the plant is widely cult. in the tropics.

21. *Warszewiczii*, Dietr. (*C. sanguinea*, Warsc.). St. claret-purple and glaucous, 3–4 ft.: lvs. oblong and acute, more or less claret- or bronze-tinged,  $\frac{1}{2}$  ft. long and nearly one-half as broad; raceme simple and rather dense, with ovate, brown, glaucous bracts; sepals lanceolate,  $\frac{1}{2}$  in., glaucous purple; petals lanceolate, acuminate, nearly 2 in. long, reddish and glaucous; staminodia oblanceolate, entire,  $2\frac{1}{2}$ –3 in. long, bright scarlet; lip oblanceolate, emarginate, bright scarlet. Costa Rica, Brazil. B.M. 4854. C. Sellöi, Hort. (*C. patens*, Baker), of S. Brazil, is tomentose: sepals ovate; petals oblong-lanceolate, united into a tube; staminodia strongly reflexed, one 2-parted.

EE. *The staminodia united into a tube, or at least connate at base.*

22. *Lambertii*, Lindl. (*C. Péppigii*, Bouché). St. stout, very tall (to 10 or 11 ft.): green and glabrous, 12–14 ft.: lvs. oblong-lanceolate to elliptic, green, acute; raceme simple or forked, lax and few-flid., the bracts large and oblong, green; sepals lanceolate, pale purple or lilac,  $\frac{1}{2}$  in. long; petals lanceolate, acuminate,  $1\frac{1}{2}$  in. long, purple; staminodia unlike, obovate, entire, scarcely longer than the petals, connate at base, bright crimson; lip bright crimson-purple; caps. oblong, large. W. Indies, S. Amer. B.R. 470.

23. *latifolia*, Miller (*C. gigantea*, Desf. *C. macrophylla*, Hort. *C. neglecta*, Weinm. *C. gemella*, Nees. *C. Altensteinii*, Bouché). St. stout, very tall (10–16 ft.) pubescent: lvs. ovate or ovate-oblong, acute, green, but purple-margined when young, the lower ones often 3–4 ft. long; fls. in several racemes forming a panicle, the bracts oblong or the lower ones becoming several inches long; sepals oblong and green,  $\frac{1}{2}$  in. long, very unequal, petals lanceolate, acuminate, 2 in. long, scarlet; staminodia united into a tube, entire at apex or one of them 2-lobed, somewhat twisted, brick-red; lip brick-red; caps. large. S. Amer. L.B.C. 7:634.

—*C. heliconiifolia*, Bouché, Texas to Venezuela, has the staminodia more or less connivent: fls. orange-red: lvs. long-petioled, more or less woolly, oblong-acuminate; plant 7–8 ft. Var. *xalapensis*, Kränzl (*C. xalapensis*, Bouché), has narrower lvs. and smaller stature.

DD. *Staminodia large (5 in. or less long), united into a tube.*

E. *Fls. pendulous, rose-colored.*

24. *iridiflora*, Ruiz & Pav. St. green, 6–12 ft.: lvs. broad-oblong, bright green, slightly pubescent beneath: racemes paniculate, drooping; fls. large, beautiful rose-color; tube of corolla and staminodia as long as the blade; sepals lanceolate, 1 in. long; corolla-lobes lanceolate,  $2\frac{1}{2}$  in. long; 3 upper staminodia somewhat longer than the corolla-lobes, obovate, nearly or quite 1 in. broad, rose-crimson; lip narrow, deeply emarginate, rose-crimson. Andes of Peru. B.M. 1968. B.R. 609. L.B.C. 10:905. R.H. 1861:110.

784. Stool of canna, showing how it may be divided.

EE. *Fls. erect-spreading, white and red.*

25. *liliflora*, Warsc. St. robust, green, 8–10 ft.: lvs. many, oblong, green, 3–4 ft. long, spreading from the st. at a right angle; fls. in a corymbose panicle; sepals linear, as long as the tube of the corolla; corolla-lobes lanceolate, 2–3 in. long, pale green, the tube of equal length; 3 upper staminodia white, united into a tube for half their length, the blade obovate and spreading; lip oblanceolate, as long as the staminodia. Colombia. R.H. 1884:132. F.S. 10:1055–6.—A fine species. The white fls. finally become tinged with brown; lonicera-scented. L. H. B.

**CÁNNABIS** (the ancient Greek name). *Moraceæ*. HEMP. A widely cultivated fiber plant, and also used occasionally as an ornamental subject, being grown from seeds and treated as a half-hardy annual.

Hemp is dioecious: staminate fls. in axillary panicles, with 5 sepals and 5 drooping stamens and no petals; pistillate fls. in short spikes, with 1 sepal folding about the ovary: lvs. digitate, with 5–7 nearly linear, coarse-toothed lfts.: fr. a hard and brittle achene. *C. sativa*, Linn., probably native in Cent. Asia, is now escaped in many parts of the world: tall, rough and strong-smelling, 8–12 ft.: lfts. 5–11, linear-lanceolate, toothed, the upper lvs. alternate and the others more or less opposite. Only one species, but various forms have received specific names. In gardens, the form known as *C. gigantea* is commonest; this reaches a height of 10 ft. and more. The seeds are usually sown where the

plants are to stand; but if quick effects are wanted, they may be started indoors in pots or boxes. Hemp makes excellent screens in remote places. It thrives best in a rich rather moist soil. For field cult. for fiber (which is derived from the inner bark), see *Cyclo. Amer. Agric.*, Vol. II, p. 377.

L. H. B.

CANTELOUPE: *Muskmelon*.

CANTERBURY BELL: *Campanula Medium*.

CÁNTUA (from Cantu, Peruvian name). *Polemoniaceæ*. Showy flowering shrubs, with variable foliage, in greenhouses, and out-of-doors far South.

785. *Capparis spinosa*.  
( $\times \frac{1}{2}$ )

Flowers corymbose; calyx campanulate, of 5 (rarely 3) sepals, which are much shorter than the long tubular corolla; stamens inserted at the base of the corolla, but exceeding it in length.—Six species in S. Amer. One kind is recommended in Eu. as a coolhouse shrub. No tenderer than fuchsias. Prop. by cuttings in sand under a bell-jar.

*buxifolia*, Juss. (*C. dépendens*, Pers.). Much-branched shrub, about 4 ft. high; branches more or less downy: lvs. very variable, generally oblong-ovate, acute, tapering at the base, entire or serrate, downy or glabrous: fls. 5–8, drooping vertically, in a kind of leafy, terminal corymb; calyx pale, membranous, green-streaked, 5-toothed, a fourth shorter than the corolla-tube; corolla long-funnel-shaped, the tube  $2\frac{1}{2}$  in. long, red, usually streaked; limb of fringed, obcordate, crimson lobes which are much shorter than the tube; stamens included. Peru. Apr., May. B.M. 4582. F.S. 7:650. R.H. 1858, p. 294. R.B. 27:181.—One of the choicest of European greenhouse plants. Very liable to red spider.

*C. bicolor*, Lem. Distinguished from the above by the entire lvs. which are shorter, about 1 in. long, and the solitary fls. with a short, yellow tube, the limb not fringed. The fls. droop, but not vertically. Peru. B.M. 4729. F.S. 4:343. Probably less desirable than the above.—*C. pyrifolia*, Juss. Lvs. generally broader and more toothed than in *C. bicolor*: fls. as many as 17, in an erect, terminal, compound corymb; calyx red-tipped, nearly half as long as the yellow corolla-tube; corolla about  $1\frac{1}{4}$  in. long, with a white limb; stamens long, exserted. Peru. B.M. 4386. F.S. 4:383.

WILHELM MILLER.  
N. TAYLOR.†

CAOUTCHOUC TREE: *Hura*, *Manihot*, *Ficus elastica*, *Castilloa*, *Hevea*, *Landolphia*, and others, not treated here.

CAPE BULBS. A name applied to bulbous and bulb-like plants native to South Africa. They are dry-region plants, and often bloom with us in summer and autumn. Some of the leading genera are *Amaryllis*, *Brunsvigia*, *Nerine*, *Ixia*, *Tritonia*, *Watsonia*. See *Bulbs*.

CAPE CHESTNUT: *Calodendrum capensis*.

CAPE GOOSEBERRY: *Physalis*.

CAPE JESSAMINE: *Gardenia*.

CAPER: *Capparis*.

CAPE-SPURGE: *Euphorbia Lathyris*.

CÁPPARIS (Greek, *caper*, said by some to have been derived from the Arabic name of the plant). *Capparidaceæ*. CAPER-BUSH, or CAPER-TREE. Greenhouse plants North, and suited to the open in Florida and California.

Trees and shrubs, with simple lvs.: sepals 4, rarely 5; petals usually 4; stamens usually many, inserted on the receptacle, the filaments thread-like and free; ovary long-stalked, 1–4-celled, with many ovules.—More than 150 species distributed throughout the warm regions of the earth. Differing from *Cleome* and most other cult. genera of the family in having baccate, not capsular, fr.

Capers are pickles made by preserving the flower-buds of *C. spinosa*, a straggling shrub which grows out of old walls, rocks, and rubbish in Mediterranean regions and India. Also rarely cultivated as a greenhouse flowering shrub. Propagation is by cuttings of ripe wood, under a bell-jar, in greenhouses, and by seeds South.

*spinosa*, Linn. Fig. 785. Spiny shrub, 3 ft. high, often straggling and vine-like: lvs. roundish or ovate, deciduous: fls. borne singly, alternately, and fading before noon; sepals 4; petals 4, oblong, clawed, wavy, white,  $1\frac{1}{2}$  in. long; stamens 40–50; filaments purple above, perhaps the chief beauty of the plant. B.M. 291.—What seems to be the long style with a short unopened stigma, is really the elongated peduncle or torus topped by the pistil, which has no style and a minute stigma. Var. *rupéstris* (*C. rupéstris*, Sibth. & Smith) is a spineless form.

*Mitchellii*, Lindl. A much-branched shrub, usually very spiny, and more or less densely tomentose: lvs. ovate-oblong, 1– $1\frac{1}{2}$  in. long, narrowed into a short petiole: fls. few, axillary, white or yellowish, followed by a tomentose globular berry 2 in. diam. Sand plains of Austral.—Suitable for dry places outdoors in S. Calif.

*C. acuminata*, Lindl. St. shrubby, with flexuose, smooth branches: lvs. petiolate ovate-lanceolate, acuminate: fls. large, solitary, white, the conspicuous stamens 3–4 times as long as the petals. China. B.R. 1325.

WILHELM MILLER.  
N. TAYLOR.†

CAPRIFOLIUM: *Lonicera*.

CAPRIOLA: *Cynodon*.

CÁPSICUM (name of uncertain origin, perhaps from *kapto*, to bite, on account of the pungency of the seed or pericarp; or from *capsa*, a chest, having reference to the form of fruit). *Solanaceæ*. RED PEPPER. CAYENNE PEPPER. Herbs or shrubs, originally from tropical America, but escaped from cultivation in Old World tropics, where it was once supposed to be indigenous.

Stem branchy, 1–6 ft. high, glabrous or nearly so: lvs. ovate or subelliptical, entire, acuminate: fls. white or greenish white, rarely violaceous, solitary or sometimes in 2's or 3's; corolla rotate, usually 5-lobed; stamens 5, rarely 6 or 7, with bluish anthers dehiscing longitudinally; ovary originally 2–3-loculed: fr. a juiceless berry or pod, extremely variable in form and size, many-seeded, and with more or less pungency about the seeds and pericarp. Fig. 786. The fr. becomes many-

786. Normal 2-loculed fruit of *Capsicum*, in cross-section.

loculed and monstrous in cult.—About 90 species have been named, most of which are now considered forms of one or two species. Monogr. by Irish, 9th Ann. Rept. Mo. Bot. Gard. For cult., see *Pepper*.

A. *Plant annual or biennial.*

**annuum**, Linn. Fig. 787. Herbaceous or suffrutescent, grown as annuals in temperate climates, but in warmer latitudes often treated as biennials. All of the leading commercial varieties in the U. S. readily find classification within the types or botanical varieties. The species has never been found wild. It is the pimento of Trop. Amer.

B. *Fr. oblong-linear.*

c. *Calyx usually embracing base of fr.*

**Var. conoides**, Irish (*C. conoides*, Mill.). Suffrutescent: lvs. numerous, rather small, 2–3 in. long,  $\frac{3}{4}$ –2 in. wide: peduncles slender, straight, erect; fls. small; calyx obconical or cup-shaped, usually embracing base of fr.; corolla greenish white, spreading,  $\frac{3}{8}$ – $\frac{5}{8}$  in.: fr. erect, subconical or oblong-cylindrical, about  $1\frac{1}{4}$  in. long or less, usually shorter than the peduncles and mostly borne above the lvs., very acrid. Coral Gem, Tabasco. Gn. 66, p. 381.

**Var. fasciculatum**, Irish (*C. fasciculatum*, Sturt.). RED CLUSTER PEPPER. Fig. 788. St. herbaceous, round or nearly so: branches few: lvs. clustered or crowded in bunches about the summit, elliptical-lanceolate, pointed at both ends: fr. also clustered, erect, slender, about 3 in. long by  $\frac{1}{4}$  in. diam., very acrid.

**Var. acuminatum**, Fingh. (*C. chilense*, Hort.). LONG CAYENNE. Herbaceous, very branching, about  $2\frac{1}{2}$  ft. high, bearing a dense mass of foliage: fl. medium size, spread  $\frac{1}{2}$ – $\frac{3}{4}$  in.: fr. larger than the preceding, either erect or pendent. Chile.

cc. *Calyx not usually embracing base of fr.*

**Var. longum**, Sendt. (*C. annuum*, Linn. *C. longum*, DC.). Plant herbaceous, about  $2\frac{1}{2}$  ft. high, with comparatively few branches: lvs. large, often 4 in. long by  $2\frac{1}{2}$  in. wide: fl. large; corolla spreading,  $\frac{1}{8}$ – $1\frac{1}{4}$  in., dingy white; calyx usually pateriform or funnelform, rarely embracing base of fr.: fr. often a foot long by 2 in. diam. at base; flesh thick and in some varieties very mild. Garden varieties are: Black Nubian, County Fair, Elephant's Trunk, Ivory Tusk.

787. A form of *Capsicum annuum*.

BB. *Fr. of various shapes, but not oblong-linear.*

**Var. grössum**, Sendt. (*C. grössum*, Linn.). Herbaceous, about 2 ft. high, with few branches: lvs. very large, often 3 by 5 in., sometimes coriaceous, lower ones usually pendent; petioles deeply channeled: peduncles stout, about 1 in. long; corolla large, spreading,  $\frac{7}{8}$ – $1\frac{1}{4}$  in.: fr. large, oblate, oblong, or truncated, 3–4 lobed, usually with basal depression, more or less sulcate and rugose; flesh thick, firm, and of a mild flavor. Emperor, Monstrous, Bell, Sweet Mountain, Golden Dawn, Ruby King, Golden King, Brazilian Upright, Golden Upright, Squash, and others, are garden varieties.

**Var. abbreviatum**, Fingh. (*C. umbilicatum*, Vell. *C. luteum*, Lam.). Suffrutescent: lvs. broadly ovate, 2–4 in. long; peduncles slender, straight or curved, as long as or longer than the berry: fr. about 2 in. long or less, varying much in the different horticultural varieties, in general ovate, quite rugose, except in one variety, sometimes turbinate. While this variety is used to some extent for pickling, it is noted more as an ornamental plant. Some garden forms are: Celestial, Etna, Kaleidoscope, Red Wrinkled, Yellow Wrinkled.

788. *Capsicum annuum* var. *fasciculatum*.

**Var. cerasiforme**, Irish (*C. cerasiforme*, Mill.). Suffrutescent: lvs. medium size, ovate or oblong-acuminate, about  $1\frac{1}{4}$ – $3\frac{1}{2}$  in.: calyx seated on base of fr.; corolla large, spreading,  $\frac{7}{8}$ – $1\frac{1}{2}$  in.: fr. spherical, subcordate, oblate, or occasionally obscurely pointed or slightly elongated, smooth or rarely minutely rugose or sulcate; flesh firm,  $\frac{1}{2}$ – $\frac{1}{8}$  in. thick, extremely pungent. Garden forms are: Cherry, Yellow Cherry, Oxheart.

AA. *Plant perennial.*

**frutescens**, Linn. Fig. 789. Shrubby perennial, 3–6 ft. high, with prominently angled or somewhat channeled st. and branches: branches loosely spreading or trailing: lvs. broadly ovate-acuminate, 3–6 in. long, 2– $3\frac{1}{2}$  in. wide: peduncles slender, 1–2 in. long, often in pairs, usually longer than the fr.; calyx cup-shaped, embracing base of fr.; corolla often with ochereous markings in the throat: fr. red, obtuse or oblong-acuminate,  $\frac{3}{4}$ – $1\frac{1}{4}$  in. long,  $\frac{1}{4}$ – $\frac{3}{4}$  in. diam., very acrid.—Cult. only S., as the seasons in temperate latitudes are not long enough to mature fr.

**Var. baccatum**, Irish (*C. baccatum*, Linn.). Plants not so tall, but more erect than the species: branches slender, fastigiate, flexuose: corolla small, spreading, about  $\frac{1}{2}$  in.: fr. ovate or sub-round, about  $\frac{1}{4}$  in. diam.

H. C. IRISH.

**CARAGANA** (*Caragan*, its Mongolian name). *Leguminosæ*. PEA TREE. Ornamental shrubs chiefly grown for their bright yellow flowers; some species are also used for hedges.

Leaves abruptly pinnate, often with persistent spiny-pointed rachis; lfts. small, entire; stipules deciduous or persistent and spiny: fls. papilionaceous; standard upright, like the wings with long claws; keel obtuse and straight; stamens 10, 9 connate, 1 free; ovary scarcely stipitate: pod linear, terete, straight, 2-valved, with several seeds.—More than 50 species from S. Russia to China, most of them in Cent. Asia. Monograph by Komarov in Act. Hort. Petrop. 29:179–388 (1908), with 16 plates.

The caraganas are deciduous unarmed or spiny shrubs

789. *Capsicum frutescens*.

with yellow, rarely whitish or pinkish flowers axillary and solitary or fascicled, followed by linear pods. The cultivated species are quite hardy, except a few Himalayan species. They grow in almost any soil, but best in a sandy soil and sunny position, and are well adapted for shrubberies. *C. arborescens* is the only one which grows into a small tree, and is of upright habit, like *C. frutex*, which is about half as high and more graceful; most of the other species are low shrubs, of usually spreading habit. *C. arborescens* is one of the best hedge shrubs for the prairies of the Northwest.

Propagation is by seeds sown in fall or in spring; if kept dry during the winter, soaking in tepid water for two or three days before sowing will be of advantage; also increased by root-cuttings and layers, or by grafting on seedling stock of *C. arborescens* in spring.

A. *Lfts.* 12-18,  $\frac{1}{6}$ - $\frac{1}{2}$  in. long: *rachis* deciduous.

*microphylla*, Lam. (*C. Altagana*, Poir. *C. arborescens* var. *arenaria*, Hort.). Fig. 790. From 4-6 ft.: *lfts.* 12-18, obovate, pubescent when young, grayish green,  $\frac{1}{2}$  in. long or shorter: *fls.* 1 or 2, yellow,  $\frac{3}{4}$  in. long; pedicel about as long as the fl. Siberia, China. L.B. C. 11: 1064.—Under this name a dwarf form of *C. arborescens* is often cult. Var. *megalántha*, Schneid. *Lfts.* bright green,  $\frac{1}{2}$  or sometimes  $\frac{1}{2}$  in. long: *fls.*  $1\frac{1}{4}$  in. long.

AA. *Lfts.* 8-14,  $\frac{1}{2}$ -1 in. long: *rachis* deciduous.

*arborescens*, Lam. Shrub or small tree, to 20 ft.: *lfts.* 8-12, obovate or oblong, sparsely pubescent beneath or glabrous at length: *fls.* 2-4, pale or bright yellow,

$\frac{3}{4}$  in. long; pedicels usually longer than the *fls.*: pods about 2 in. long. May, June. Siberia, Manchuria. G.O. H. 67. Var. *péndula*, Dipp., with pendulous branches, is the most remarkable; it should be grafted high. M.D. G. 1897:425. Var. *Lorbergii*, Koehne. *Lfts.* linear to linear-oblongate, about 1 in. long. A very peculiar and striking form.

*fruticosa*, Bess. (*C. Redóvskii*, Fisch. *C. arborescens* var. *arenaria*, Sims). Shrub, to 6 ft., very similar to the preceding: *lfts.* 10-14, oblong-elliptic to obovate, cuneate at the base, rounded at the apex; stipules herbaceous or somewhat spiny; pedicels and calyx puberulous, calyx-teeth very short: pods about 1 in. long; seeds brown. Amurland, Korea. B.M. 1886 (not good).

AAA. *Lfts.* 2-4.

B. *Rachis* of the *lvs.* deciduous: pedicels as long as or longer than the *fls.*

*frutex*, Koch (*C. frutescens*, DC.). Fig. 791. From 6-10 ft.: *lfts.* 4, approximate, nearly digitate, cuneate, obovate or oblong, rounded or emarginate at the apex,

glabrous,  $\frac{1}{2}$ -1 in. long: *fls.* solitary,  $\frac{3}{4}$ -1 in. long, yellow. May. S. Russia to China. Gt. 10:348. S.B.F.G. 3:227. Var. *grandiflora*, Koehne. *Fls.* somewhat longer than 1 in.: *lfts.* usually large and broad. Var. *latifolia*, Schneid. (var. *obtusifolia*, Hort.). *Lfts.* more than an inch long and about  $\frac{1}{2}$  in. broad: *fls.* as in the type.

BB. *Rachis* persistent, spiny: pedicels shorter than the *fls.*

*Chámلاغu*, Lam. Shrub, 2-4 ft.: spines long: *lfts.* 4, in 2 somewhat remote pairs, chartaceous, obovate, emarginate or rounded at the apex, glabrous,  $\frac{1}{4}$ - $\frac{3}{4}$  in. long: *fls.* solitary, reddish yellow,  $1\frac{1}{4}$  in. long. May. N. China. G.O.H. 30.

*pygmæa*, DC. (*C. gracilis*, Hort.). One to 3 ft.: spines short,  $\frac{1}{4}$  in.: *lvs.* nearly sessile; *lfts.* 4, approximate and almost digitate, cuneate, linear-elliptic or linear-lanceolate, glabrous,  $\frac{1}{2}$ - $\frac{1}{2}$  in. long: *fls.* solitary,  $\frac{3}{4}$  in. long, golden yellow. Caucasus to Siberia and Thibet. B.R. 12:1021.—Grafted high on *C. arborescens*, it forms a graceful standard tree, with pendulous branches.

*C. Altagana*, Poir.=*C. microphylla*.—*C. arborescens* *arenaria*, Hort.=*C. microphylla*.—*C. arenaria*, Dipp.=*C. aurantiaca*, Koehne. —*C. aurantiaca*, Koehne. Allied to *C. pygmæa*. *Fls.* orange-yellow; calyx as long as broad; ovary glabrous. Siberia.—*C. Boissii*, Schneid. (*C. microphylla* var. *crasse-aculata*, Boiss). Allied to *C. arborescens*. Shrub to 6 ft.: *lfts.* 10-12, obovate or narrowly obovate, about  $\frac{1}{2}$  in. long, silky pubescent beneath at least when young, whitish beneath; stipules spiny: *fls.* solitary. W. China. V.P. 57.—*C. brevispina*, Royle (*C. triflora*, Lindl.). Spines 2-3 in. long: *lfts.* 12-16, pubescent: *fls.* 2-4, on a common peduncle. Himalayas. P.F.G. 2: 184.—*C. decorticans*, Hemsl. Allied to *C. microphylla*. Shrub or small tree, spiny: *lfts.* 8-12, oval, less than  $\frac{1}{2}$  in. long: *fls.* 1-2. Afghanistan. H.I. 18:1725.—*C. frutescens*, DC.=*C. frutex*.—*C. Gerardiana*, Royle. Spines  $1\frac{1}{2}$ -2 in. long; stipules large, scarious: *lfts.* 8-12, densely pubescent: *fls.* 1-2, short-pedicelled. Himalayas.—*C. gracilis*, Hort.=*C. pygmæa*.—*C. grandiflora*, DC. Allied to *C. pygmæa*. *Lfts.* cuneate-oblong, glabrous or pubescent: *fls.*  $1\frac{1}{4}$  in. long; calyx gibbous at the base. Caucasus.—The plant sometimes cult. under this name is a variety of *C. frutex*.—*C. subata*, Pall. Sparingly branched shrub with very thick, spiny and villous branches: stipules large, scarious: *lfts.* 8-14, linear-oblong, villous beneath: *fls.* whitish, 1 in. long, short-pedicelled. Siberia. F.S. 19:2013. L.B.C. 6:522. Gt. 10:331. A very distinct and curious-looking species: hardy.—*C. sophoræfolia*, Bess. (*C. arborescens*  $\times$  *C. microphylla*. *C. cuneifolia*, Dipp.). *Lfts.* usually 12, oblong to elliptic, cuneate, acute: pods  $\frac{3}{4}$  in. long. Garden origin.—*C. spinosa*, DC. Spines 1 in. long: *lfts.* 4, rarely more, approximate, cuneate-lanceolate, glabrous: *fls.* solitary, short-pedicelled. Siberia.—*C. spinosissima*, C. Koch=*C. spinosa*.—*C. tragacanthoides*, Poir. Spiny: *lfts.* 4-8, cuneate, oblong, pubescent: *fls.* solitary, short-pedicelled; calyx villous-pubescent. Himalayas.—*C. triflora*, Lindl.=*C. brevispina*.—*C. vulgaris*, Hort.=*C. arborescens*.

ALFRED REHDER.

**CARAGUATA.** By the latest monographer referred to *Guzmania*, which see.

**CARALLUMA** (aboriginal name). *Asclepiadaceæ*. Low succulents, sometimes seen in collections; about 40 species, from S. Spain and Afr. to Arabia and India. They resemble stapelias, and require similar treatment. The sts. are leafless, somewhat branched, erect, 4-sided and the angles toothed: *fls.* near the summit of the sts., more or less clustered, purple, brown and yellow, and other colors; corolla rotate and 5-parted: fr. long and slender follicles. The carallumas are probably not in the American trade. Some of the names that may be expected in collections are *C. adscendens*, R. Br.; *C. affinis*, Wildem.; *C. campanulata*, N. E. Br. (*Boucerosia campanulata*, Wight); *C. commutata*, Berger (sometimes grown as *C. Sprengeri*); *C. fimbriata*, Wall.; *C. inversa*, N. E. Br.; *C. Luntii*, N. E. Br.;

790. *Caragana microphylla*. ( $\times \frac{1}{2}$ )

791. *Caragana frutex*. ( $\times \frac{1}{2}$ )

*C. Sprengeri*, N. E. Br.; *C. Simonis*, Berger (*Boucerosia Simonis*, Hort.); *C. torta*, N. E. Br.

**CARAMBOLA:** *Averrhoa*.

**CARAWAY** (*Càrum Càrvi*, Linn.). *Umbelliferae*. A biennial or annual herb grown for its seeds, which are used in flavoring bread, cakes and cheese; also occasionally for the young shoots and leaves, which are eaten. It grows a foot or two high, has finely-cut, pinnately compound foliage, and small white flowers, in umbels. It is of the easiest culture. The seed is usually sown in spring and the crop of seed taken the following year. It thrives in any garden soil. The plant occasionally runs wild. See *Carum*.

**CARBÈNIA:** An incorrect or doubtful name for *Cnicus*, which see.

**CARDÁMINE** (Greek name of a cress). *Cruciferae*. Small mostly leafy-stemmed perennials (the annual species apparently not cultivated), growing in low rich land, blooming in spring or early summer.

Flowers sometimes large for size of plant, white or purple; petals obovate or spatulate; pods linear and straight, more or less flattened, the wingless seeds in 1 row, valves usually separating elastically from the base: lvs. simple or pinnate or lyrate: root often tuberous or rhizomatous.—About 50 species, largely in boreal or alpine regions. Of easy cult. Only *C. pratensis* is much known among growers.

*pratensis*, Linn. CUCKOO FLOWER. Fig. 792. Plant slender and usually glabrous, 12–20 in., somewhat branched: lvs. pinnately divided; lfts. of root-lvs. small and rounded ( $\frac{1}{2}$  in. or less across), those of the upper st.-lvs. oblong or even linear and entire or somewhat toothed: fls.  $\frac{1}{2}$  in. long, in a corymb, white or rose-color, pretty. Eu. and Amer., in the northern parts.—In the gardens it is chiefly known in the double-fl. form, which probably has been derived from European rather than American sources. There are other forms

792. *Cardamine pratensis*. Root-leaves not showing.

of it. It is an excellent little plant to grow in moist places, particularly along creeks and about springs. It is also useful in drier places, as in rockeries.

*trifolia*, Linn. Attractive spring bloomer, 6 in., creeping: lvs. ternate, the toothed parts or segms. irregularly roundish: fls. snow-white, on a naked scape. S. Eu. B.M. 452.

*angulata*, Hook. Erect, 1–2 ft. high: lvs. 3–5-foliate, the lfts. ovate or oblong, and the middle one usually coarsely toothed: fls. rather large, white, in short, few-fl. racemes. Mts. of Ore. and Wash.—Intro. 1881 by Gillett.

L. H. B.

**CARDAMON:** *Amomum* and *Elettaria*.

**CARDIÁNDRA** (Greek, *heart*, and *man* or *stamen*: alluding to the shape of the anthers). *Saxifragaceae*. Ornamental half-shrubby plants, rarely cultivated for their white, lilac or pink flowers.

Suffrutescent deciduous plants with alternate rather large lvs. and small pink, lilac or white fls. in terminal

793. Fruit of *Cardiospermum*. ( $\times \frac{1}{2}$ )

loose corymbs surrounded by large sterile fls.: calyx-tube cupulate, adnate to the ovary; petals 5; stamens numerous with filiform filaments and suborbicular anthers; ovary inferior, incompletely 3-celled; styles 3, short; sterile fls. with 3 large sepals: caps. loculicidal.—Three species in Japan and China. Tender plants, thriving in any good garden soil; best in a partly shaded and moist position. Prop. by greenwood cuttings under glass.

*alternifolia*, Sieb. & Zucc. One to 3 ft.: lvs. broadly elliptic to elliptic-lanceolate, tapering into a very short petiole, coarsely serrate, sparsely pilose, membranaceous, 3–7 in. long: fls. pink, lilac or white. Summer. S.Z. 66, 67. Gt. 14:486.

ALFRED REHDER.

**CARDINAL FLOWER:** *Lobelia cardinalis*.

**CARDIOSPÉRMUM**

(Greek, *heart-seed*, from the white heart-shaped spot on the round black seed; hence the plant was thought a cure for heart diseases). *Sapindaceae*. Tendril-climbing tropical herbs.

Leaves alternate, biterminate; lfts. coarsely serrate: fls. small, white, polygamous or dioecious, in axillary racemes or corymbs; sepals and petals 4, in pairs; stamens 8; ovary 3-celled, followed by a membranous caps.

—A dozen species widely distributed. The most popular is the interesting balloon-vine, which is a rapid-growing, woody perennial, behaving as an annual, curious for its inflated seed-vesicles. Fig. 793. Prop. by seeds.

**Halicacabum**,

Linn. Fig. 794.

**BALLOON-VINE.**

**HEART-SEED.**

**HEART-PEA.**

Height 10 ft.: st. and branches grooved: lvs. glabrous, oblong-acuminate, deeply dentate: balloons an inch or more thick. Trop. India, Afr., and Amer. B.M. 1049. —A general favorite, especially with children. Grown as a garden annual.

*hirsutum*, Willd. Creeping or ascending perennial vine with densely hairy grooved st. and lvs. as in the preceding, but usually hairy on the under surface: fls. not showy: fr. pointed, hirsute; the globular chocolate-brown seed is borne on the detaching parachute-like dissepiment. Afr.—A useful perennial in S. Calif. for covering arbors; evergreen and blooming continuously.

N. TAYLOR.†

**CARDOON** (*Cynara Cardunculus*, Linn.). A thistle-like plant of southern Europe, cultivated for the thick leaf-stalk and midrib.

It is thought to be of the same species as the artichoke, and to have been developed from it by long cultivation and selection. See *Cynara*. The plant has been

794. Balloon-Vine—*Cardiospermum Halicacabum*. ( $\times \frac{1}{4}$ )

introduced into South America, and has run wild extensively on the pampas. Darwin writes that "no cultivated plant has run wild on so enormous a scale as the cardoon." From the artichoke it differs in taller and more prickly growth and smaller heads. The cardoon is perennial, but it is not hardy, and is treated as an annual. Seeds are sown in spring, either in pots under glass or in the open where the plants are to stand. The later sowing is usually preferred. The plants are given

795. Leaf of Canada thistle.—*Carduus arvensis* or *Cirsium arvense*. ( $\times \frac{1}{2}$ )

rich soil and should have abundant moisture supply, for they must make continuous and strong growth. When the leaves are nearly full grown, they are tied together near the top, straw is piled around the head, and earth is banked against it. This is to blanch the plant, for it is inedible unless so treated. From two to four weeks is required for the blanching. The procedure is not very unlike that adopted for the blanching of celery or endive. If the plants are late, they may be dug just before frost and blanched in a storage pit. The plants are usually grown 2 to 3 feet apart, in rows which are 4 feet apart. They are sometimes grown in trenches, after the old way of growing celery. Cardoon is very little known as a vegetable in America except among foreigners.

L. H. B.

**CÁRDUUS** (the ancient Latin name of these plants). *Compósitæ*. THISTLE. Spiny-leaved annual, biennial or perennial herbs, sometimes grown in borders and rock-gardens for the interesting habit and the heads of purple or white flowers.

Carduus is sometimes united with *Cirsium*, but is here kept distinct, being separated chiefly by non-plumose or only indistinctly serrate pappus-bristles (see *Cirsium*). The common weedy thistles are referred either to *Carduus* or *Cirsium*, depending on the definition of the genus. Fig. 795 shows the spiny leaf of one of these. Under the restricted use of the name, *Carduus* comprises about 80 species, from the Canary Is. to Japan. For *C. benedictus*, see *Cnicus*.

*acanthoides*, Linn. A much-branched perennial about 18-24 in. high: lvs. bright green, pinnately parted, the nerves very prominent beneath, spinose margined: the solitary heads long-peduncled, the fls. purple and showy. S. Eu.—Scarcely known in Amer.

*C. Marianus*, Hort., is a *Silybum*, and *C. tabricum*, Hort., is a *Cirsium*. Both are advertised in England, but are unknown in Amer.

N. TAYLOR.†

**CÁREX** (name of obscure origin). *Cyperaceæ*. SEDGE. Grass-like perennials of very many kinds, a few of which are grown in bogs or as border plants.

Flowers unisexual, in spikes, the staminate naked and subtended by a bract or scale, the pistillate comprising a single pistil inclosed in a thin sac or perigynium; monœcious or rarely diœcious: sts. or culms solid, not jointed, mostly 3-angled: lvs. grass-like but 3-ranked. One large group has 2 styles and a lenticular achene, and the spikes are commonly androgynous or contain both sexes (Fig. 796); another division has 3 styles and a triangular achene, and the spikes are commonly unisexual, the staminate being above (Figs. 797, 798).

Carices are very abundant in cool temperate regions, both in species and in individual plants. There are more than 800 known species. Many of them grow

on dry land, but the largest species grow in low grounds and swales, and often form much of the bulk of bog hay. Carices cover great areas of marsh land in the upper Mississippi region and are employed in the manufacture of "grass carpets" or Crex fabrics. The species are difficult to distinguish because they are very similar, and the study of them is usually left to specialists. Some of our broad-leaved native species make excellent borders and interesting clumps in corners about buildings and along walls. Of such are *C. platyphylla*, *C. plantaginea*, *C. alburquina*. Many of the lowland species are excellent adjuncts to the pond of hardy aquatics. Others have very graceful forms, with drooping spikes and slender culms (Fig. 798). The following native species, and probably others, have been offered by collectors: *C. aurea*, *C. eburnea*, *C. flava*, *C. Grayi* (one of the best), *C. hystericina*, *C. lupulina* and its var. *pedunculata*, *C. lurida*, *C. paupercula*, *C. pennsylvanica*, *C. plantaginea*, *C. Pseudo-Cyperus*, *C. retrorsa*, *C. Richardsonii*, *C. riparia*, *C. Tuckermanii*, *C. utriculata*, *C. vulpinoidea*. The species present no difficulties in cultivation if the natural habitat is imitated. Propagated readily by seed sown in late fall (germinating in spring) or by division of the clumps.

**Môrowi**, Boott (*C. japonica*, Hort., not Thunb. *C. tenuissima*, Hort. *C. acutifolia*, Hort.). Fig. 799. Lvs. stiff and evergreen, long-pointed, in the common garden form with a white band near either margin: culm 1 ft. with a terminal staminate spike and 2 or 3 slender pistillate spikes (1 in. long) from sheaths: perigynium small and firm, somewhat excurved, 2-toothed, glabrous. Japan. G.C. III. 13:173. R.B. 20, p. 9.—A very handsome plant, suited for pots or the border. The stiff clean white-edged foliage keeps in condition for months, making the plant useful for decorations in which pot-plants are used. It is perfectly hardy in Cent. N. Y., holding its foliage all winter. A useful florists' plant.

796. *Carex* (*C. scoparia*), with androgynous spikes and lenticular achenes. ( $\times 1$ ). N. Amer.

797. *Carex* (*C. lurida*), with staminate terminal spikes and trigonous achenes. ( $\times \frac{1}{2}$ ). N. Amer.

*intumescens*, Rudge (*C. tenaria*, Hort. *C. tenera*, Hort.). Slender, but stiff, to 30 in.: lvs. narrow, rolling more or less when dry: staminate spikes long-stalked: pistillate spikes 1 or 2, short-stalked, short, with few large, turgid, tapering, shining perigynia and awl-like, rough-pointed scales. N. Amer.

cōmans, Berger (*C. Vilmorinii*, Mott. *C. Vilmoriniāna*, Hort.). Densely tufted, with many very narrow lvs., and filiform culms  $1\frac{1}{2}$  ft. or less high: spikes 5-7, the terminal staminate, linear and short-stalked, the lateral pistillate (or perhaps staminate at base), oblong, or cylindrical and dense-fld., about 1 in. long, and with aristate scales: perigynium 3-angled (stigma 3), lance-ovate, attenuate at base and with a 2-toothed scabrous beak. New Zeal.—A good hardy edging plant when a tufted grassy effect is desired.

**Buchánanii**, Berger (*C. lūida*, Boott, var. *Buchánanii*, Kuek.). Allied to the preceding: densely tufted: lvs. leathery, semi-terete, very narrow, brown-red: spikes 5-8, the terminal staminate and linear-cylindrical, long-stalked, the lateral pistillate and cylindrical,  $1\frac{1}{2}$  in. long, densely-fld.: perigynium plano-convex (stigma 2), produced into a long margined scabrous deeply bidentate beak. New Zeal.—Grown for its reddish foliage.

**Gaudichaudiāna**, Kunth (*C. vulgaris*, Fries, var. *Gaudichaudiāna*, Boott). Culms erect, 1-2 ft.: lvs. long and grass-like: staminate fls. in terminal spikes: pistillate fls. in 2-3 cylindrical, sessile or subsessile spikes: perigynium lenticular, small, very short-beaked, obscurely 2-toothed, finely nerved, longer than the narrow scale. Japan, Austral. New Zeal.—Useful for bog planting.

**Frāseri**, Andr. (*Cymophyllus Frāseri*, Mack.) Lvs. 1 in. or more broad, stiff, but with no midnerve, flat and thick, evergreen: culm 16 in. or less high-bearing at its summit a single whitish spike which is staminate at top: perigynium ovoid, thin and inflated. Rich mountain woods, Va. B.M. 1391 (as *C. Fraseriana*).—Rare, and a very remarkable plant.

*C. báccans*, Nees. Robust, with curving lvs. to 2 ft. long and  $\frac{1}{16}$  in. broad: fr. berry-like (whence the name), crimson or vermilion, in clustered spikes standing well above the lvs. India. G. 1:461. Useful for pots or for planting in a conservatory, for its ornamental fr., but probably not now in cult. commercially.—*C. gallica variegata* is offered abroad as a "very elegant, showy and charming" carex.—*C. riparia*, Curt., a rank-growing lowland species of wide distribution, is sometimes grown in a variegated-ld. form. The name has no botanical standing.—With the extension of wild gardening, and particularly of bog- and water-gardening, many other species of *Carex* may be expected to appear in the trade lists.

L. H. B.

**CÀRICA** (a geographical name). *Papayaceæ*. **PAPAYA**. Small, rapid-growing, unbranched trees, commonly grown in greenhouses as foliage plants and often bearing fruit under such conditions. Juice milky.

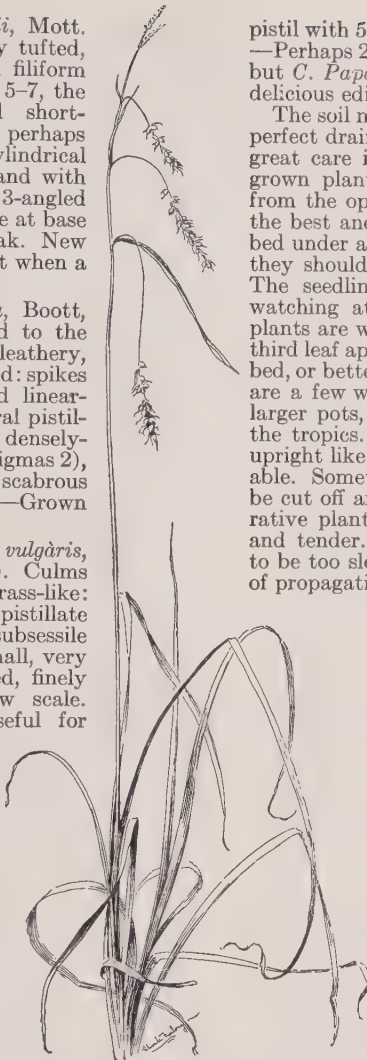

Leaves large, soft, long-stalked, in clusters at the top of the trunk: usually dioecious, the male fls. on long axillary peduncles, funnel-shaped, with 10 anthers in the throat, the pistillate fls. larger and with 5 distinct petals and a single

pistil with 5-rayed stigma, sessile in the axils of the lvs.—Perhaps 20 species, all native to the American tropics, but *C. Papaya* is cult. throughout the tropics for its delicious edible fruits. See *Papaya*.

The soil most suited for caricas is a rich loam, having perfect drainage. As the stem is succulent and tender, great care is necessary to avoid bruising, hence pot-grown plants are much to be preferred to seedlings from the open ground. Seeds should be selected from the best and largest fruits and sown in a well-worked bed under a slight shade. If seeds are quite dry or old, they should be soaked in warm water before sowing. The seedling plants are delicate, and require close watching at first to avoid damping-off. As soon as plants are well up remove the shading, and after the third leaf appears they may be pricked out into a larger bed, or better, potted off in fairly rich soil. After plants are a few weeks old, and have been shifted once into larger pots, they may be set permanently outdoors in the tropics. Caricas seldom branch, but usually grow upright like a palm, hence cuttings are not often available. Sometimes small branches form, and these may be cut off and as readily rooted as most tropical decorative plants, provided the cutting is not too young and tender. This method has been found in Florida to be too slow, and what is evidently a better method of propagation, by means of graftage, has been devised

by Edward Simmonds, of the Plant Introduction Field Station, Miami, Florida. Numerous shoots are formed by the buds at the leaf-scars when a papaya tree is topped, as many as fifty or more being produced. "One of these shoots is taken when a few inches long and about the diameter of a lead pencil, is sharpened to a wedge point, the leaf surface reduced, and inserted in a cleft in a young seedling which has been decapitated when 5 to 10 inches high, and split with an unusually sharp, thin grafting-knife. At this age the trunk of the young seedling has not yet formed the hollow space in the center. Seeds planted in the greenhouse in February produce young seedlings large enough to graft some time in March; these grafted trees, which can be grown in pots, when set out in the open ground in May or the latter part of April, make an astonishing growth and come into bearing in November or December; they continue bearing throughout the following spring and if it is advisable, can be left to bear fruit into the following autumn." Varieties of superior flavor and better size and shape for shipping, as well as

hermaphrodite varieties, may now be successfully maintained. For complete description of this method see "The Grafted Papaya as an Annual Fruit Tree," by David Fairchild and Edward Simmonds, Circular No. 119, Bureau of Plant Industry, 1913. In temperate climates, caricas have been found to be good decorative plants for both conservatory and summer bedding, the deeply cut, palmate leaves forming a striking contrast to ordinary vegetation. In bedding out, select open, sunny exposure, with perfect drainage, and make the soil rich and friable. Constant cultivation with a light hoe will cause a

798. *Carex (C. longirostris)*, with terminal staminate spikes and drooping pistillate spikes. ( $\times \frac{1}{2}$ ). N. Amer.

799. *Carex Morrowii*.

luxuriant growth under these conditions, and the planter will be amply repaid for his trouble by beautiful showy specimens as tropical-appearing as palms.

**Papaya**, Linn. (*Papaya Cárlica*, Gaertn.). **PAPAYA**. **PAWPAW**. The commonest species in cult., sometimes growing to a height of 20 ft., with large palmately 7-lobed lvs., sometime 2 ft. across, and fr. shaped like a roughly angled melon up to 12 in. long and half as thick, hanging, especially from the lower axils of the pistillate plant. B.M. 2898-9.—From the frs., which vary in size up to 15 lbs. and in number to the tree from 20-50, is extracted the papaya juice, which furnishes the papain of commerce. This is obtained by slashing the fr., and collecting the milky juice in porcelain-lined receptacles, where it is allowed to evaporate. When evaporated to a granular condition, it is ready for the market and brings from \$4-\$6 a lb. in the crude state. The papaya has of recent years become one of the commonest table frs. of the tropics. The flesh, which is usually of a salmon-pink or yellow color, is excellent when one becomes accustomed to its peculiar flavor, and resembles somewhat a most luscious muskmelon. From its large content of papain, it may be eaten without injury in considerable quantities and assists in the digestion of other foods. As the tree grows with great rapidity in tropical climates, it may be treated as an annual, the seeds being sown early in protected beds, well cared for and transplanted to their permanent places when well established. They will then bear fr. late in the succeeding autumn. The method of graftage described on p. 663 is preferable, however. The frs. have a considerable cavity, which, in the smaller rounded frs., is well filled with the small brownish or blackish seeds. The firm skin, the firmness of which may be increased by selection, will permit of shipping to a distance. The plant is sometimes polygamous, and from such plants in Hawaii there have been bred types which appear to have great promise as a shipping fr. The green frs. are frequently used as vegetables, and the lvs., if cooked with tough meat, are said to make it tender, due to the digestive principle.

**candamarcensis**, Hook. f. (*C. cundinamarcensis*, Lindl.). This is a more hardy ornamental species with numerous lvs., dark green above and pale beneath, rounded-heart-shaped, 1¼ ft. across, 5-lobed to the center with pinnatifid lobes; fls. green and pubescent; frs. small, pointed, 5-angled, golden yellow. B.M. 6198.—Hardy in S. Calif., but the frs. of no value as such.

**quercifolia**, Benth. & Hook. (*Vasconcellea quercifolia*, St. Hil.). Lvs. shaped like those of the English oak, palmately 3-lobed, and containing a greater percentage of papain than *C. Papaya*; frs. small.—Hardy in S. Calif.

**gracilis**, Solms. (*Papaya gracilis*, Regel). Habit of *C. Papaya*; trunk simple, 4-6 ft. high, slender, very glabrous; lvs. 5-digitate, the lobes sinuate-lobed, the middle one 3-lobed, the whole blade suborbicular in outline, petioled. Brazil. Gt. 1879:986.

S. C. STUNTZ.

**CARÍSSA** (aboriginal name). *Apocynaceæ*. Very branchy spinose shrubs of the tropics of the eastern hemisphere, cultivated for ornament or hedges, but here mainly for the edible berry-like fruits.

Flowers white, solitary or in cymes; lobes of calyx and corolla 5, the 5 stamens free and included in the throat, the ovary 2-loculed; lvs. opposite and thick, simple.—About 30 species. Used abroad as greenhouse plants but grown in this country only in S. Fla., and Calif. Prop. by seeds and cuttings of ripe wood.

**Carándas**, Linn. **CARAUNDA**. **CHRIST'S-THORN**. Evergreen shrub or small tree, with dark green ovate or elliptic mucronate entire lvs., strong axillary spines (which are often forked) and fragrant white fls. in clusters of 2-3, the corolla twisted to the left in the bud; fr. the size of

a cherry (1 in. diam.), reddish, pleasant-flavored. India. L.B.C. 7:663.—Reaches 20 ft. Half-hardy in Cent. Fla. The frs. are eaten from the hand or made into a jelly much like currants when ripe, and pickled when green.

**bispinosa**, Desf. (*C. arduina*, Lam.). **AMATUNGULU**. **MARITZGULA**. Spines strong, often 2 in. long; lvs. ovate and subcordate, mucronate, glabrous and entire; fls. white, the corolla twisted to the right in the bud. S. Afr.—A choice evergreen shrub, rather hardy, with thick camellia-like very glossy lvs.; fls. large, fragrant, white, and borne profusely and continuously; fr. dark red, size of a cherry, good. L.B.C. 4:387.—Closely resembles *C. grandiflora*, but fls. slightly smaller and frs. in clusters; seeds lanceolate.

**grandiflora**, DC. **NATAL PLUM**. Spiny shrub; lvs. ovate-acute, tapering to the base; fls. large, white, fragrant, solitary and terminal, twisted to the right, heterogonous; fr. red, 1-1½ in. long, resembling cranberries in flavor when cooked, and having a papery skin, milky juice and few small almost circular seeds. Sauce made from this fr. is almost indistinguishable in flavor from cranberry sauce, but the frs. ripen so irregularly, although almost continually, as to make the fr. suitable only for home-garden use unless handled on a large scale. Said to be the finest hedge plant in S. Afr. B.M. 6307.

**acuminata**, DC. Spines weak; lvs. smaller, ovate-acute, subcordate, mucronate; peduncles short, forked, axillary; fls. with lance-acuminate calyx-lobes, the corolla twisted to the right in the bud. S. Afr.—Perhaps not different from *C. bispinosa*.

*C. edulis*, Vahl. A straggling shrub with small purple edible fr. from Trop. Afr. Intro. from Abyssinia, but has not yet been thoroughly tested. The plant in the American trade under this name is described as much taller than *C. Carandas* and more vigorous; lvs. persistent, ovate-acuminate; fls. 10-25 in axillary clusters, white and pink, jasmine-scented; berries oval, red but turning black at maturity, 1-seeded.—*C. odata*, R. Br., from Austral., a more open shrub than any of the preceding, the small frs. of which are edible and used for jams, has been intro. by the Office of Foreign Seed and Plant Introduction as a possible stock for the more tender species, in the hope of extending the range of these frs.—*C. spinarum*, DC., a small edible-fruited evergreen shrub from India is said to be an important element in reforestation since it persists on the poorest and rockiest soils in spite of being greedily eaten by sheep and goats.

S. C. STUNTZ.†

**CARLINA** (said to have cured the army of Charlemagne [Carolinus] of the plague). *Compositæ*. Low rather coarse annuals, biennials or perennials, with thistle-like foliage, large white or purplish heads, a feathery pappus, and chaffy receptacle; outer involucreal bracts coriaceous, usually spiny, the inner ones colored or shiny and petal-like; fr. a silky-hairy achene.—Some 15 or 20 species in the Medit. region.

An open sunny place and ordinary garden soil are all they require. They are capital for the sunny part of a rockery. Propagated by cuttings or seeds.

**acaulis**, Linn. A very dwarf hardy perennial; height 3-6 in.; lvs. glossy, pinnatifid, divided, with spiny ends; fl. rising barely above the foliage, solitary, very interesting, the scales surrounding the fl.-head being long and narrow and ray- or petal-like, silky, shiny; head 6 in. across when expanded, white. June, July and late fall. G.C. II. 13:720-1. G.L. 19:178.

**acanthifolia**, Linn. A white-tomentose thick-lyd. biennial, the lvs. oblong, the upper pinnatifid and spiny; fl.-heads 4 in. wide, yellowish purple. S. Eu. July and later. G.C. III. 47:68.—Little known in U. S.

N. TAYLOR.†

**CARLUDOVICA** (Charles IV, and his Queen Louisa, of Spain). *Cyclanthaceæ*. Palm-like, sometimes merely herbaceous plants, of tropical America.

The plants are stemless, or sometimes with a lax creeping st., and usually have stalked, sometimes sessile, flabellate lvs.; fls. monocious, the two sexes being on the same spadix, which is included in a 4-lyd. spathe; staminate fls. with many stamens and many-

lobed calyx, 4 of them surrounding a pistillate fl.—the latter have a 4-sided ovary, 4 barren stamens, and 4-lobed calyx: fr. a 4-sided, many-seeded berry. The carludovicas are usually regarded and treated as stove palms by gardeners. They are useful for decoration. The family Cyclanthaceæ is exclusively tropical American, of about 45 species and 6 genera (*Stelestylis*, *Carludovica*, *Sarcinanthus*, *Ludovia*, *Evodianthus*, *Cyclanthus*); it is often united with the Pandanaceæ or screw-pine family.

The genus is an important economic one, as *C. palmata*, and perhaps other species, are the source of Panama hats. In making these, the leaves are cut young, the stiff veins removed, after which the leaves are slit into shreds, but not separated at the stalk end. It is said that hats of superior quality are plaited from a single leaf, without any joinings. U. S. Dept. Agric., Fiber Investigations. Rept. 9:112 (1897).

800. *Carludovica palmata*.

*Carludovica palmata* is the species most frequently met with under cultivation. Under favorable conditions it grows to a height of about 8 feet. All of the kinds need stove treatment during the winter months; in summer they may be used for subterranean bedding with good results. They have a certain palm-like appearance, but the leaves are of a softer texture than any of the palms. They may be propagated by division, choosing the early spring for the operation. *C. palmata* seeds freely. The fruit, when ripe, has an ornamental appearance for a short time after bursting open. The seeds are very small, and should be carefully washed free from the pulp, and sown on the surface of a pan of finely chopped sphagnum moss. Germination takes place in two weeks from sowing if kept in a brisk, moist heat. The species are not particular as to soil but the drainage must be perfect, as the plants require an abundance of water when growing. (G. W. Oliver.)

#### A. Lvs. 3-5-lobed.

*palmata*, Ruiz. & Pav. Fig. 800. No trunk: petioles 3-6 ft. long, glabrous, terete and unarmed; blades 4-lobed, the lobes again cut into narrow segms., dark green, gracefully spreading, and drooping at the margin. Peru. R.H. 1861, p. 36.—The common species, and a very useful plant.

*rotundifolia*, Wendl. Much like the last, but more compact under cult., owing to the shorter petioles, but growing much larger: petiole distinctly pubescent; lf.-blade large and orbicular, 3- or 4-lobed. Costa Rica. B.M. 7083.

*él-gans*, Williams. Blades with 4 or 5 lobes, which are very deeply cut into straight strap-like divisions. Probably of horticultural origin.

#### AA. Lvs. 2-lobed.

*atròvirens*, Wendl. Blades very deeply 2-lobed and very deep, rich green (whence the name, *dark green*), glabrous. Colombia.

*humilis*, Poepp. & Endl. Dwarf: blades angular, 2-lobed at the summit, the segms. more or less jagged but not divided, a foot or less broad. Colombia. R.H. 1869, p. 327.—One of the best.

*Plümerii*, Kunth (*C. palmifolia*, Sweet). Caudex erect: blades with 2 lanceolate and plicate divisions, bright green above and pale beneath: spadices pendulous. Martinique.

*imperiàlis*, Lind. & André. Caudex short and prostrate: blades with 2 ovate-lanceolate entire segms., with very prominent veins, the lobes about 5 in. wide and shining green; petiole purplish, canaliculate, tumid at the base. Ecuador. I.H. 21:166 (by error 165).

The following species are in cult. in this country but not as yet known to the trade: *C. funifera*, Kunth. Stemless or sometimes creeping and with a round, sparsely branched st.: lvs. alternate 1-2 ft. S. Amer.—*C. incisa*, Wendl. A much cut, low plant from Cent. Amer.—*C. macrospoda*, Klotzsch. St. scarcely 1 ft. long; lvs. faintly 3-nerved, deeply 2-parted, 1½-2 ft. Colombia.—*C. microcephala*, Hook. f. St. a few inches high: lvs. numerous, 10-18 in. long, split into 2-8-nerved segms.; petiole slender, purplish at base, Costa Rica. B.M. 7263.—*C. plicata*, Klotzsch. St. short: lvs. divided into 2-1-nerved segms.; petioles channeled: spadix about 6 in. long: the thick woody caudex may not rise more than 1 ft. Colombia.—*C. scandens*, Cowell. St. creeping, often 25 ft. long: lvs. several at the summit, about 18 in. long. St. Kitts.

N. TAYLOR.†

**CARMICHAELIA** (Capt. Dugald Carmichael, Scotch botanist, who wrote on the flora of the Cape and certain islands). *Leguminosæ*. Shrubs, leafless or usually becoming so, either erect or depressed, with reddish or purplish small fls., rarely cult. There are about 20 species in New Zeal., very difficult of delimitation. Lvs. 1- or 3-5-foliate, wanting or deciduous after the bloom has passed: fls. in lateral racemes; calyx cup-shaped or bell-shaped, 5-toothed; corolla papilionaceous, the standard orbicular and usually reflexed, the wings oblong and obtuse and somewhat falcate, the keel oblong and incurved and obtuse; upper stamen free: pod small, leathery, oblong to orbicular. *C. grandiflora*, Hook. f., is recently offered in S. Calif.: it is much-branched, to 6 ft. high, with compressed and grooved glabrous erect branches: lvs. pinnately 3-5-foliate, appearing in spring and early summer and then caducous, the lfts. glabrous and obcordate-cuneate: fls. about ¼ in. long, in drooping racemes of 5-12, white or lilac. *C. odorata*, Colenso, has pubescent drooping branches, and much smaller fls. in 10-20-fl. racemes: pod smaller (¼ in. or less long) and longer-beaked.

L. H. B.

**CARNATION** (*Dianthus Caryophyllus*, Linn.). *Caryophyllaceæ*. Choice and popular flower-garden and greenhouse plants of the pink tribe; in North America grown mostly under glass as florists' flowers. Pl. XXII.

The carnation is a half-hardy perennial, herbaceous, suffrutescent at base: height 2 ft.: st. branching, with tumid joints: lvs. linear, glaucous, opposite: fls. termi-

nal, mostly solitary; petals 5, flesh-colored, very broad, beardless, margins toothed; calyx cylindrical, with scaly bracts at base. June-Aug. S. Eu.; occasionally met in the wild state in England, where it was intro. through cult. A single-fl. and undeveloped carnation is shown in Fig. 801. A section of a single fl. is depicted in Fig. 802, showing the 2 styles and the 5 stamens; also the bracts at the bottom, in 2 series, beneath the calyx. In Fig. 803 some of the beginnings of doubling are shown.

*General development.* (By Geo. C. Butz.)

Theophrastus, who lived about 300 years B.C., gave the name *Dianthus* (Greek *dios*, divine; *anthos*, flower)

to the group, probably suggested by the delightful fragrance. The specific name *Caryophyllus* (Greek, *caryon*, nut; and *phylon*, leaf) has been applied to the clove-tree (*Caryophyllus aromaticus*), and because of the clove-like fragrance of the carnation this name was applied to it. The

name carnation (Latin, *carnatio*, from *caro*, *carnis*, flesh) has reference to the flesh-color of the flowers of the original type. This plant has been in cultivation more than 2,000 years, for Theophrastus (History of Plants, translation) says: "The Greeks cultivate roses, gillyflowers, violets, narcissi, and iris," gillyflower being the old English name for the carnation. It was not, however, until the beginning of the sixteenth century that the development of the carnation into numerous varieties made an impression upon its history. The original flesh-color of its flowers was already broken up into red and white. The gardeners of Italy, France, Germany, Holland and England, with their respective ideals of beauty in this flower, contributed so many varieties that in 1597 Gerard wrote that "to describe each new variety of carnation were to roll Sisyphus' stone or number the sands."

There have been many attempts at classification, but

most of them, like the varieties they serve, have disappeared. Two of them are as follows: A French scheme arranges all varieties into three classes: *Grenadins* (Fig. 801), including those with strong perfumes, flowers of medium size, either single or double, petals fringed, and of but one color; *Flamands*, including those with large flowers, round and double, rising in the center to form a convex surface, petals entire, either unicolored or striped with two or more colors; *Fancies*, including those with colors arranged in bands on light grounds, the petals toothed or not. The English classification of these varieties makes four categories: *Sels*, or those possessing only one color in the petals; *Flakes*, or those having a pure ground of white or yellow and flaked or striped with one color, as scarlet, purple or rose; *Bizarres*, or those having a pure ground marked as in the *Flakes*, but with two or three colors; and *Picotees* (Fig. 804), or those having a pure ground of

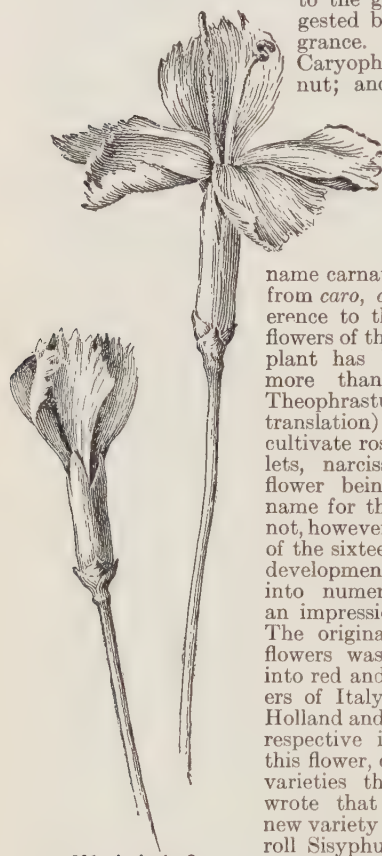

white or yellow, and each petal bordered with a band of color at the margin. This last class has been regarded with the distinction of a race.

In the early part of the nineteenth century, English gardeners exercised very great care in the growing of carnations to mature only perfect flowers. Imperfect and superfluous petals were extracted with forceps; petals appearing out of place were arranged in a perfect imbrication; the calyx-tube was cut partly down between the teeth, to prevent excessive splitting at one side and to give more freedom to the expansion of the flower. These and many more tedious details seem to have wrought the depreciation of this flower about the middle of the nineteenth century.

All the foregoing has reference to those types of carnations that are little known or grown in America at the present day; the varieties so common in Europe are usually kept in coldframes or coolhouses during the winter, and as spring approaches the plants are brought into their blooming quarters, for no flower is expected to appear until the month of July, when there is a great profusion of blossoms, but for a short season. Therefore, they can all be classed as a summer race. They are also grown permanently in the open.

*Development of the perpetual-flowering carnation (Remontant, Monthly, Forcing, or Tree).* Figs. 805-807.

The perpetual-flowering race of carnation, which has been brought to its highest state of perfection by American growers, and which is generally regarded as the "American carnation," really originated in France, and was grown in that country from its origin in 1840 until about the year 1856, before it was introduced to America. A French gardener, named M. Dalmais, obtained a constant-blooming carnation by crossing *Céillet de Mahon*, which bloomed in November, with pollen from *Céillet Biohon*, crossing again with the Flemish carnation, the first-named sort being disseminated under the name "Atim." By the year 1846 varieties in all colors had been secured and the type permanently fixed. These were taken up and improved upon in quality by other enthusiasts, among whom were M. Schmidt and M. Alphonse Alegatiere, of Lyons, France. The latter succeeded in securing varieties with rigid stems which in 1866 were given the name "tree-carnation." M. Schmidt's most prominent varieties were *Arc-en-ciel* and *Etoile Polaire*, which were grown for several years. But the strong rigid-stemmed varieties obtained by Alegatiere, which were termed tree-carnations in 1866, proved of greater value commercially, and became more generally cultivated. About the year 1852, a native of France who had settled near New York City, imported plants of this strain,

801. A single-flowered Grenadin carnation. ( $\times \frac{3}{4}$ )

802. Section of normal carnation flower.

803. The anthers are leafy, showing one process in doubling.

and cultivated several varieties for a number of years. About the year 1856 the firm of Dailledouze, Zeller & Gard imported plants of La Purité, a rose-colored variety, also Mont Blanc and Edwardsii, white, and Manteaux Royal, red-and-white variegated. These

were used for crossing, and the first variety produced in America, about the year 1858, proved to be a great improvement on existing varieties. It was named "Mrs. Degraw," and with another white variety named "Flatbush," was disseminated about the year 1864. Other varieties followed, and the work was taken up by other growers, among whom were M. Donati, who raised Astoria, a yellow which is conceded to be the ancestor of all the yellow varieties grown today; Rudolph Heintz, who raised Heintz's White in 1876; Chas. T. Starr, whose

804. Carnation, Picotee.

most famous variety was Buttercup, introduced in 1884; Jos. Tailby, whose Grace Wilder became and remained the standard rose-pink variety until the introduction of Wm. Scott in 1893; John Thorpe and W. P. Simmons, who introduced Portia, Tidal Wave, Silver Spray and Daybreak in the eighties; Sewal Fisher, whose Mrs. Fisher appeared in 1890 and became one of the leading whites; E. G. Hill, whose most notable productions were Flora Hill, the leading white for several years, and America, a scarlet; R. Witterstaetter, who obtained Estelle, Aristocrat, Afterglow and Pres. J. A. Valentine; John Hartje, who raised the scarlet Jubilee; Peter Fisher, whose Mrs. Thos. W. Lawson, Beacon, and Enchantress with its several sports, became leaders in their respective colors; C. W. Ward, who disseminated Governor Roosevelt, Harry Fenn and Mrs. C. W. Ward.

The late Frederick Dörner conducted the most systematic work in developing the carnation, and succeeded in producing a strain which is recognized as the highest development of the American carnation. His records, which cover a period of 22 years, contain a complete list of the many thousands of crosses made during that time. This strain is distinguished for its easy-growing habit, its freedom and steadiness in producing blooms, the diversity of colors and its adaptability to commercial growing. His labors produced such varieties as Wm. Scott, Mme. Diaz Albertini, White Cloud, Mrs. Geo. M. Bradt, G. H. Crane, Lady Bountiful, White Perfection, Pink Delight, White Wonder and Gloriosa, all leaders in their respective colors.

Through the rapid strides in its development, after being introduced in this country, the carnation established itself as one of the leading flowers for commercial growing and now stands second only to the rose in commercial importance. Not only does it share equally with the rose the bench space in most large growing establishments, but many large ranges are devoted entirely to the carnation. Growing methods have been perfected by the carnation specialists until the practices employed during its early history have been entirely superseded. Since its first arrival in America, over 1,200 varieties have been introduced, and the quality has been improved until the highest developed varieties produce blooms measuring  $4\frac{1}{2}$  inches in diameter and are carried on rigid stems 3 feet long.

In 1891 the American Carnation Society was organized to promote the interests of the carnation. By holding exhibitions annually it has assisted materially in popularizing the flower. A system of registering new varieties is in operation, which prevents confusion in nomenclature.

From this country, the improved strain of the perpetual-flowering carnation has returned to European countries, being grown in increased quantities each year and displacing all the older types of carnation for commercial growing.

*Culture of outdoor or flower-garden carnations.* Fig. 808.

Americans are not sufficiently aware of the excellence of some of the forms of the flower-garden or border carnation. While perennial, like the greenhouse carnation, many of them bloom profusely the first year from seed and are described as annuals. The Marguerite type is one of the most useful. These forms bloom by midsummer from early-sown seeds, and with some protection the plants will pass the winter in the open and bloom again the following spring. The Margaret strain, distinct from the Marguerite, bears double flowers, sulfur-yellow, and also blooms the first season from early-sown seed. The Chabaud strains behave similarly. The Grenadins (Fig. 801) bloom the first year from seed. They pro-

805. The modern florists' carnation. High-centered dark-colored bloom.

806. Modern florists' or forcing carnation.

duce fine singles, of simple form and strong fragrance, although more than half of any sowing from improved seed may produce various degrees of double bloom. Riviera Market and others bloom in autumn from spring-sown seeds. The culture of the hardy or flower-

garden carnations is very simple. Their profusion of summer bloom makes them desirable.

The Picotee class (Fig. 804) is little known in this country. It is a hardy perennial in England, and the fine strains are often propagated by layers (Fig. 809). They also do well from seeds, blooming freely the second year.

The Malmaison strain, which was the leading carnation in England before the advent of the Perpetual-flowering strain, has been found of little value in this country. On account of its large size it was used to some extent for breeding purposes, but with unsatisfactory results.

The border carnation is a more condensed and bushy plant than the long-stemmed few-flowered plant seen in the American greenhouses, although there are different families or groups of them as there are of phlox or snapdragons. Some forms are dwarf and some tall-growing.

807. Carnation,

*American methods of culture for indoor bloom.*

The modern method of propagating the carnation for commercial growing is by means of cuttings which are taken from either the blooming stock or from plants that are grown for cuttings alone. The old method of layering (Fig. 809) would prove too slow in increasing stock for present-day needs. Millions of cuttings are rooted each season for planting the houses for blooming purposes. So much depends on the quality of the cuttings in keeping up the vitality in the stock that expert growers have learned to discriminate in their selection. The best cuttings, if taken from the blooming stock, are those from near the middle of the flower-stems (Fig. 810). These will not only show greater vitality than those taken higher up or lower, but they will prove more floriferous. The tip cuttings are likely to give a flower-bud immediately and, if this is pinched out, develop into a weak plant. Those taken from the base develop a large spreading growth known as "grassy." The cuttings are severed by an outward pull

and are afterward trimmed of all surplus foliage before being inserted in the propagating sand. Have a sharp knife with which to trim and a pail of fresh water into which to throw the cuttings as they are trimmed. Make a smooth cut at the base, near the joint, so that the lower pair of leaves will peel off readily, leaving a half-inch of clear stem to go into the sand. Shorten those leaves which turn outward, leaving those which stand fairly upright. The removal of part of the foliage is to avoid crowding in the bench and also to prevent flagging while the cutting is giving off more moisture through its leaves than it is taking up through the stem. The cuttings are inserted in the sand about  $\frac{3}{4}$  inch deep in rows across the bench, placing the cuttings about  $\frac{3}{4}$  inch apart in the row and the rows about  $2\frac{1}{2}$  inches apart, according to the size of the cuttings. Use a putty knife for making the cut in the sand. The sand is kept constantly moist and the cuttings are protected from both the sun and drafts by means of muslin curtains. Frequent spraying should be avoided, though it must be resorted to at times to prevent flagging on warm windy days. The most favorable conditions for propagating are usually secured during the months of December, January, February and early March. During that period, ventilation is limited and a fairly even bottom-heat is easily maintained. Keep a bottom temperature of about  $60^{\circ}$ , while the overhead temperature should be about  $52^{\circ}$ . Any bench that can be protected from sun and drafts will prove satisfactory.

The bottom of the bench may be of wood or tile, the latter being preferred on account of more perfect drainage and a greater retention of warmth. The sand should be 3 inches deep after being packed down by means of a tool made from a 2-inch plank about 6 inches wide and

808. Flower-garden or outdoor carnation, showing the condensed bushy habit and short flower-stems.

12 inches long with an inverted V-shaped handle. In about four weeks the cuttings should be ready for potting (Fig. 811). Those that come out of the sand February 15 or earlier should be potted first into 2-inch pots and later on shifted into larger pots as needed. Those potted later may be placed directly into  $2\frac{1}{2}$ -inch

pots and left until planted out, the object being to keep the young plants growing steadily until they are planted in the field. Stunted, pot-bound plants will be slow in breaking and are likely to develop stem-rot in the field. Use a moderately light soil and only fairly rich.

When the young plants begin to run up to flower, they should be topped back to about four joints above the pot (Fig. 812). A low-branched plant will stand up better and will give less trouble in supporting later on. A second topping may be necessary before planting-out time, on early-propagated stock. A slight hardening-off of the young plants before planting out is beneficial, though not essential. This is usually done by placing the plants in coldframes about two weeks prior to planting them in the field. Late April or early May is the time for planting in the field, according to latitude and climate. A rich loam, inclined to sandiness, produces the finest plants in the shortest time. In a heavy soil the growth will be heavier, but slower and less branching. Set the plants about 8 inches apart in the rows, and if hand-power is to be employed in cultivating, space the rows about 16 inches apart. Space farther if horse-power is to be used.

When a large business is done in young plants or rooted cuttings, a part of the stock is grown especially for cuttings alone. These plants are benched the same as those for blooming, but are not allowed to

809. Layer of carnation. The parent stem was severed at s. This method is now employed only in special cases.

bloom. As the shoots begin to run up to flower, they are broken off a few joints higher up than is done when topping in the field. The young shoots which result from these breaks are taken off for cuttings, the very finest cuttings being secured in this way. These are trimmed and handled the same as those taken from the flower-stems.

When packing cuttings for shipping, moist sphagnum moss is used in which to pack the roots. Cut papers (newspapers are used mostly) into sheets about 10 by 18 inches. Lay a strip of moss about 3 inches wide across the middle of the paper lengthwise. Then lay the cuttings side by side with only the roots on the moss. When twenty-five have been laid on, begin to roll from one end until all the cuttings have been taken up. Then turn in the lower part of the paper and continue to roll until the end of the paper has been reached and tie around with any kind of cord. There is little difference in the returns from plants grown for cuttings and those grown for blooms, providing a fair market is found for each.

In shipping plants from the field, the soil is all shaken from the roots. The plants are then set upright in the shipping-cases with moist moss between the roots, a layer of damp moss having first been placed on the bottom.

Cultivate as soon as practicable after each rain, and in the absence of rain at least once each week. Shallow cultivating is recommended, just enough to maintain a loose mulch on the surface.

Do not water carnations in the field under any consideration. Cultivation will preserve moisture in the soil without causing soft growth. Keep topping back the young shoots as fast as they begin to run up, thus building up a shapely bushy plant.

If plants are to be placed inside during the summer, the benches should be refilled and made ready for planting as soon after May 1 as possible. It will be a great help to get the plants under way on the benches before hot weather sets in. Fill the benches the same as for field-grown plants and set the plants where they are to bloom. Indoor culture is practicable and profitable only when the benches can be spared by early May. If a good market can be found for the May and June cut, they will more than offset the slight advantage derived in the fall from indoor culture.

If the blooming plants have not made an exceedingly rank growth, they may be cut back sharp early in May, cleaned off, mulched with long manure and grown on for blooming the following year. This should not be attempted, however, unless the plants are free from disease or insects and in good condition to break freely from the lower part of the plant.

Carnations are grown successfully on both raised and solid benches. Perfect drainage is essential, and must be provided for, if solid beds are to be used. There will be no difference in the quality or the quantity if both are properly handled.

By the end of June the old blooming plants will become exhausted, and refilling the benches to receive the new plants from the field will be in order. Clean out the old soil, whitewash the inside of the benches with hot lime and allow to dry before refilling with the new earth. Four inches of soil is enough, and should be of equal depth all over the bench, especially along the edges. The soil should be fairly moist, but not wet when the plants are set, so that the roots may draw moisture from the soil rather than have the soil draw the moisture from the

810. a. Desirable cuttings. b. Weak cutting, too high up on stem. c. Too low on stem.

811. Strong cutting, well rooted.

roots. On the other hand, soil for potting or planting should never be handled while in a wet condition. If too dry at the time of filling the beds, water, and let stand long enough to dry to the proper state before planting.

Apply a light shade of lime or whiting to the glass, to break the fierceness of the summer sun until the plants become established. This shade should not be too heavy, nor intended to darken the house, else a softening and weakening of the growth will result. Lift the plants carefully by means of a spade and leave a ball of soil about the size of the fist on the roots. This ball of soil will greatly assist the plant in re-establishing itself in its new quarters. However, no serious harm will be done should all the soil crumble from the roots without breaking the roots to any considerable extent. Set the plants just about as deep into the soil as they stood in the field and space them about 9 by 12 inches, if plants are of ordinary size. Larger plants may need more, smaller plants less space. It should be borne in mind that the highest quality may be expected only when the plants are not crowded.

After setting a few hundred plants, water each plant individually, saturating the soil thoroughly around each plant, but do not soak the whole bed until the roots become active and the surface of the soil has been worked over and leveled off, which will be about ten days after planting. Spray the plants overhead several times during each day to prevent wilting. Keeping the walks wet will also help to maintain a humid atmosphere until the roots are able to supply the plants with moisture. This transplanting is an ordeal during which the plants are unable to draw on the roots for support until they have taken a new hold on the soil, and wilting must be prevented by artificial means during this time. To allow severe wilting means loss of foliage and a loss of vitality, which results in inferior quality in at least the early part of the season.

As soon as the soil has been leveled off, and most of the weeds gotten rid of, the supports should be put in place. Large growers use one of two styles of supports, or a combination of the two. Wires run lengthwise between the rows, with cotton strings crosswise, placing two or three tiers one above the other to suit the height of the plants is extensively used. Another device is the carnation support, consisting of a wire stake with wire rings to surround each plant.

*Yield of bloom.*—Plants that were benched in the latter part of July, or early August, which is the time to plant for best results, should begin to yield blooms early in September. If flowers are not desired so early, the stems may be broken off about the time the bud appears, but no

general topping should be done after the plants are housed, if a steady cut through the season is desired. Cut the blooms during the early part of the day. They are then fresh and retain their natural colors, much of which would be bleached out of the delicately colored sorts by the sun during a warm day. Place in water at once in a cool room as near 50° as possible. Sort the blooms in separate colors, making two or three grades of quality, tying them into bunches of twenty-five blooms. Cut the stems even at the bottom and replace in water. Avoid crowding the blooms while they are soaking up water, as they will increase 25 per cent in size during the first twenty-four hours in water.

During a season, running from September to the end of the following June, an average cut of twenty blooms per plant may be expected from most varieties. Varieties differ somewhat, according to the size of the blooms, the smaller-flowered sorts usually being the freer bloomers.

*The preparation of the soil for growing carnations is of the greatest importance.* Choose a piece of land which has not been tilled for some years, if possible. If covered with a heavy sod, all the better. The soil should be a loam of good substance, with an inclination toward sandiness. Break this sod in the fall and leave in a rough state during the winter. In the spring plow again and sow to cowpeas or some other leguminous crop. After plowing this under in the fall, manure heavily and leave until the following spring when it should be plowed again. This soil should be in first-

class condition for use the following summer. In working or handling soil, always bear in mind that to handle it while it is wet is to ruin it for immediate use. Only freezing will restore it again. If it will crumble readily, it is safe to handle. Soil which has been prepared in this manner will be rich enough to carry the plants until after the first of the year, when light feeding may be given. Feeding should be done judiciously during the short days of winter, to avoid softening the growth and bloom. Pulverized sheep-manure, dried blood and wood-ashes are used mostly for this purpose. The manure and blood improve the size and quality of the bloom, and the ashes strengthen the stem.

*Ventilation and temperature.*—The carnation being a cool-temperature plant, abundant fresh air and ventilation should be provided for. A steady temperature is essential to success in growing carnations. Splitting of

812. Showing where to top (a) or to head back.

813. Undeveloped five-petaled carnation.

814. Carnation flower showing the calyx which has split on account of poor shape.

the calyx may usually be traced to either irregular temperature or to overdoses of feeding. Any point between 48° and 52° will prove a satisfactory night temperature for most varieties, providing it is evenly maintained. The temperature should be 10° higher during the day. Care should also be exercised, when building, in plac-

ing the ventilators, so that the atmosphere in the house may be changed without causing cold drafts to strike the plants. By placing the ventilators alternately on both sides of the ridge, this may be accomplished. The side ventilators are used only during mild weather.

The modern type of carnation house runs east and west, is of even span and is 30 feet or more in width, having ventilators on both sides of the ridge and in the side walls, if houses are detached. Many ranges are connected by gutters 6 feet or more from the ground. When econ-

815. Carnation flower showing a well-shaped calyx that will seldom burst.

omy in ground is necessary, this is a good plan, but such ranges always contain some benches inferior for growing stock on account of the shade cast by gutters. The single detached house is ideal. See *Greenhouse*.

#### Varieties.

The leading varieties in cultivation in this country at this time are—*White*: White Perfection, White Enchantress, White Wonder, Shasta, Matchless. *Flesh-Pink*: Enchantress, Pink Delight, Mayday, Pres. Valentine. *Rose-Pink*: Rose-Pink Enchantress, Dorothy Gordon, Gloriosa, Mrs. C. W. Ward, Philadelphia Pink. *Dark Pink*: Rosette, Washington, Peerless Pink, Northport. *Scarlet*: Beacon, Victory, St. Nicholas, Herald, Commodore. *Crimson*: Harry Fenn, Octoroon, Pocahontas. *Yellow*: Yellow Prince, Yellowstone. *White Variegated*: Benora, Mrs. B. P. Cheney. *Any other color*: Gorgeous, Rainbow. New varieties are being registered with the American Carnation Society at the rate of about twenty-five each year. Few varieties remain in cultivation longer than ten years, so that the list changes continually.

#### Diseases.

Stemrot (*Rhizoctonia*) is the common wet stemrot which does perhaps more damage than all the other diseases combined, and it is also more difficult to control than any of the others. Its presence does not manifest itself until its damage is wrought, and the plant is seen to wilt and die. The cause of the disease is a fungus which exists in the soil, and which will lie dormant in the soil for several years if there are no plants to attack. Hence no carnations should be planted for several years in soil which is known to have this fungus present.

Species of *Fusarium* cause a slow rot of the heart of the plant; the treatment is same as above.

Carnation-rust (*Uromyces caryophyllinus*) is more common than stemrot, but not nearly so destructive. A slight swelling of the outer tissue of the leaf is the first sign of its presence. Later on this bursts open, releasing a brown-colored powdery substance, comprising the spores by which the fungus is propagated. Keeping the foliage dry and the atmosphere buoyant and bracing will prevent the appearance of this disease. Spraying with bordeaux mixture has been found effective in combating this disease after it has gained a foothold.

Fairy-ring (*Heterosporium echinulatum*) is perhaps the most destructive of

the spot diseases. It is brought on by a humid or foul atmosphere, and must be fought with remedies which will produce the opposite in atmospheric condition. Bordeaux is the standard remedy for all spot diseases.

Bench rot may be caused by any one of a number of organisms attacking the ends of the cuttings in the propagating-bench. It is frequently a very serious disease. The fungi most frequently causing the trouble are in the sand and under the ideal conditions of temperature and moisture of the propagating-bench spread very rapidly. The use of clean sand, free from all organic matter, and the securing of new sand for each lot of cuttings and cleanliness in the propagating-house will help to control this trouble.

#### Insect pests.

A green plant-louse (*Myzus persicae*) is frequently troublesome on carnations. It also attacks a large number of greenhouse and garden plants as well as several fruit trees. Nicotine applied in one of the many forms will destroy it. Spraying and vaporizing are both employed successfully as preventives of the attacks of aphids.

Thrips (*Heliothrips haemorrhoidalis*) are equally destructive and more difficult to control. The same treatment as for aphids is suggested. Sweetened paris green used as a spray is also effective (three gallons of water; two pounds of brown sugar; two table-spoonfuls paris green).

The punctures made by thrips and plant-lice cause yellowish spots on the leaves, a diseased condition known as *stigmose*.

Red-spider (*Tetranychus bimaculatus*) is found mostly where plants grow near steam-pipes, where ventilation is poor, or in houses kept too dry. Persistent syringing with water will usually destroy them if the spray is applied to the under surface. Use much force and little water to avoid drenching the beds. Sulfur as a dust or in water will also destroy them.

The carnation mite (*Pediculus graminum*) injures the buds by transmitting the spores of a fungus (*Sporotrichum poae*) which causes them to decay. The injured buds are easily recognized and should be promptly gathered and burned to prevent further spread of the trouble.

#### Raising new varieties.

It is a long way from the undeveloped five-petaled carnation (Fig. 813) of early days to the perfectly formed full bloom of today. This filling out of the bloom has evolved gradually, and has been assisted by cross-fertilization and selection by the carnation-breeders through the many years in which the flower has been cultivated. This crossing, which has been the means of perfecting the American strain of the perpetual-flowering carnation, has been prosecuted continuously ever since the arrival of the first plants in this country. Many men have found both pleasure and

profit in the work, and those with scientific inclination will find no subject more interesting. Not only have the blooms become larger, but the color has varied widely, the "substance" has been much improved, the calyx has been developed for non-bursting (Figs. 814, 815), the keeping qualities of the flowers have been improved, and the stems have been lengthened.

The operation of pollinating the bloom, or transferring the pollen from one flower to the stigma of another, is a simple matter, and is perhaps of less importance than other parts of the work of producing desirable new varieties.

816. Cross-section of carnation flower showing reproductive organs.

817. Carnation flower Pink Delight, showing nearly entire-edged petals.

The Fig. 816 is a section of a flower showing the reproductive organs; *a* shows the pod which encases the ovules or forming seeds, *b*. From the tip of the pod rises the style which has usually two, but frequently three curved ends, or stigmas, *c*. When the stigma is in the proper stage to be fertilized, which is indicated by the fuzzy appearance of the upper part, the pollen, which is the powdery substance released by the anthers,

*d*, is applied to the fuzzy parts. To prevent self-fertilization, these anthers should be removed from flowers intended to be pollinated, before the pollen is released. Within one to three days, if fertilization has taken place, the bloom will wilt, the ovary will begin to swell and within a week the seed-pod can be seen to increase in size. As soon as the bloom has

818. Carnation flower Radiance, showing deeply serrated petals.

wilted, the petals should be removed and the calyx slit down the sides to prevent water from standing inside the calyx and causing the pod to decay. In six to eight weeks the seeds will be ripe and should be sown at once. Each seed may prove to be the beginning of a variety which will be one of the milestones of progress in the improvement of the carnation. Not one should be discarded until it has bloomed.

The seedlings should be potted as soon as the first pair of character-leaves appears. Later on they may be shifted into larger pots and bloomed, or they may be planted in the field and marked as they bloom and only the promising ones housed in the fall. The selecting of the plants for further trial is of the very greatest importance and requires a thorough knowledge of the subject. There are many points in the make-up of a first-class carnation, and a combination of as many of these as is possible to get in one plant is the object sought. No carnation has ever been found which was perfect in every way. The hybridist must be able to judge correctly as to the relative value or loss represented in certain characteristics shown by a seedling plant. This discrimination between the desirable and undesirable calls for the clearest judgment, and a valuable variety might be discarded through the failure of the grower to see its good points.

Among the seedlings will probably appear variety of colors, shapes and sizes of bloom, different types of growth, perfect in some respects and faulty in others. From these the hybridist is to select those which most nearly represent his ideal of the perfect carnation. This ideal should be of a pleasing shade of color, pure in tone, so as to hold when the bloom ages. The form should be symmetrical, resembling as nearly as possible a half sphere with just enough petals to fill the bloom nicely without crowding. The petals may range from the smooth-edged, as seen in Fig. 817, to the deeply-serrated, as seen in Fig. 818. The texture of the petals should be such as will resist bruising. The odor should be strong clove. The size should be as near 4 inches across as possible under ordinary culture. The calyx should be strong and large enough to hold the petals firmly at all stages of development. The stem should be 30 to 36 inches long, and strong enough to hold the bloom erect. The plant should have a free-growing habit, throwing blooming shoots freely after a shoot is topped or a bloom is cut. It should also be healthy and disease-

resistant. The American Carnation Society uses the following scale of points for new varieties:

Color.....	25
Size.....	20
Calyx.....	5
Stem.....	20
Substance.....	15
Form.....	10
Fragrance.....	5
	100

The most uniform results have been secured by confining the breeding to separate colors; as, for example, crossing white with white, red with red or crimson, pink with pink, and so on. This method has been proved to produce the largest percentage of self-colors, which are considered the most valuable commercially in this country.

New varieties are frequently secured by sporting or mutation. A variety of a certain color may produce a bloom of another color, and by propagating the cuttings from the stem which carried the odd bloom a new variety is established. The securing of a new variety in this way is purely a matter of good fortune, as no method for causing the sporting is yet known.

Leading books on the carnation are: "The American Carnation," by C. W. Ward; "Carnations, Picotees and Pinks," by T. W. Sanders; "Carnations and Pinks," by T. H. Cook, Jas. Douglas and J. F. McLeod; "Carnation Culture," by B. C. Ravenscroft. The last three are English.

A. F. J. BAUR.

**CARNÉGIEA** (named for Andrew Carnegie, philanthropist). *Cactaceæ*. The giant tree cactus of Arizona, California and Mexico.

Large columnar plants, usually single, strongly ribbed, with numerous spines, those from flowering and sterile areoles quite different: fls. borne from the upper areoles, diurnal, funnelform; petals white: fr. an oblong edible berry; seeds black and shining.

*gigantæa*, Brit. & Rose (*Cereus gigantæus*, Engelm.). SUWARRO. (Plate III, Fig. 819.) A tree 20-60 ft. high, usually single, but sometimes with one or more branches: ribs in mature plants 18-21: fr. 2-3 in. long. B.M. 7222. A.G. 11:451, 528.—In rocky valleys and on mountainsides, S. Ariz. and Sonora, with 2 stations in Calif. [reported, but probably not to be found, in Lower Calif.]. This great cactus does not do well in cult., although large plants are often brought into greenhouses and grounds about railroad stations in the S. W. It is not suited for small collections. The fr. is gathered in great quantities by the Indians of Ariz. J. N. ROSE.

**CAROB:** *Ceratonia*.

**CAROLINEA:** *Pachira*.

**CARPENTÈRIA** (after Professor Carpenter, of Louisiana). *Saxifragaceæ*. Ornamental shrub cultivated for its large fragrant white flowers.

Evergreen: lvs. opposite, petioled, usually entire: calyx 5-parted; petals 5; stamens numerous; ovary almost superior, 5-7-celled; styles 5-7, connate at the base, with linear-oblong stigmas: fr. a many-seeded dehiscent caps. with numerous oblong seeds.—One species in Calif.

This is a highly ornamental evergreen plant, with rather large opposite leaves and showy white and fragrant flowers in loose and terminal corymbs. Hardy only in warmer temperate regions. It requires a well-drained, light and sandy soil, and sunny, somewhat sheltered position; it especially dislikes moisture during the winter, and its perishing is more often due to an excess of moisture than to the cold. Propagated by greenwood cuttings under glass in

819. Flower of Carnegiea gigantea. ( $\times \frac{1}{4}$ )

summer, and by suckers, which it produces freely; also, by seeds sown in spring.

**californica**, Torr. Shrub, 6–10 ft.: lvs. elliptic-lanceolate, entire or remotely denticulate, bright green above, whitish-tomentose beneath, 2–4 in. long: fls. pure white,  $2\frac{1}{2}$ –3 in. diam., fragrant; petals orbicular, concave. June, July. B.M. 6911. Gn. 31:100; 34, p. 75; 36, p. 26; 54, p. 248; 76, p. 376. G.C. II. 26:113; III. 40:6, 7; 44:112. R.H. 1884, p. 365. J.H. III. 29:251; 45:107; 59:61. M.D.G. 1913:121. ALFRED REHDER.

#### CARPET-BEDDING: *Bedding*.

**CARPINUS** (ancient Latin name). *Betulaceæ*. HORNBEAM. Trees cultivated for their handsome foliage, assuming bright autumnal tints; also for the light green attractive fruit-clusters.

Deciduous trees or rarely shrubs: winter-buds conspicuous, acute with many imbricate scales: lvs. alternate, petioled, serrate, with deciduous stipules: fls. monœcious; staminate catkins pendulous, each scale bearing 3–13 stamens, 2-forked at the apex; pistillate catkins terminal, slender, each scale bearing 2 ovaries, the bracts and bractlets of which develop into a large, leafy, more or less 3-lobed bract, embracing the small, nut-like fruit at their base.—About 20 species, most of them in Cent. and E. Asia, 5 in Eu. and W. Asia and 1 in N. and Cent. Amer. Monogr. by Winkler in Engler, Pflanzenreich, *Betulaceæ*, hft. 19, pp. 24–43, quoted below as W. B.

The hornbeams are trees usually with dense round head, rarely shrubby, with medium-sized, bright green ovate to lanceolate leaves and rather insignificant flowers appearing with the leaves and followed by pendulous catkins consisting of large bracts bearing a small nutlet in their axils. The wood is very hard and close-grained, and much used in making tools and other small articles. The handsome foliage is rarely attacked by insects, and assumes a yellow or scarlet color in fall. The most beautiful are *C. cordata*, with large leaves, and *C. japonica*, of graceful habit and with elegant foliage. The European hornbeam bears severe pruning well, and is very valuable for high hedges; it was formerly much used in the old formal gardens for this purpose; it makes, also, an excellent game cover, as it retains its withered foliage almost throughout the winter.

The species are of comparatively slow growth and thrive in almost any soil, and even in dry, rocky situations; most of them are quite hardy North. Propagated by seeds, sown usually in fall, germinating very irregularly; if they do not appear the first spring, the seed-bed should be covered until the following spring with moss or leaf-mold, to keep the soil moist. If intended for hedges, the seedlings should be transplanted after the first year, and allowed sufficient space to prevent them from growing into slender tall plants, unfit for hedges. The varieties of rarer species are grafted in spring under glass, or in the open air on seedlings of one of the common species.

A. Lvs. with 7–15 secondary veins: mature catkins with spreading narrow bracts.

**caroliniana**, Walt. (*C. americana*, Michx. *C. virginiana*, Michx. f.). AMERICAN HORNBEAM. BLUE BEECH. Fig. 820. Bushy tree, rarely 40 ft.: lvs. ovate-oblong, usually rounded at the base, acuminate, sharply and doubly serrate, glabrous at length, except in the axils of the veins beneath, 2–4 in. long: fr.-clusters peduncled, 2–4 in. long: bracts ovate or ovate-lanceolate,  $\frac{3}{4}$ –1 in. long, with 2 broad and short unequal lateral lobes, and a much longer middle lobe, usually serrate only on one margin. E. N. Amer., west to Minn. and Texas; also, in Mex. and Cent. Amer. S.S. 9:447. Em. 1:199. Gn. 24, p. 418.—Bushy tree, with dense, but slender and

often somewhat pendulous branches, and dark bluish green foliage, changing to scarlet or orange-yellow in fall.

**Bétulus**, Linn. EUROPEAN HORNBEAM. Tree, to 60 or 70 ft.: lvs. similar to those of the former, cordate or rounded at the base, ovate or oblong-ovate, of somewhat thicker texture, and the veins more impressed above: fr.-clusters 3–5 in. long: bracts over  $1\frac{1}{2}$  in. long, with ovate, lateral lobes, and much longer oblong-lanceolate middle lobe, the margins almost entire or remotely denticulate. Eu. to Persia. H.W. 2:17, pp. 31–33. W.B. 29. F.S.R. 3, p. 153. Gn. 24, pp. 418, 419, 420.—The most remarkable of the garden forms are the following: Var. *incisa*, Ait. (var. *asplenifolia*, Hort.). Lvs. incised or lobed, smaller. Gn. 24, p. 419. Var. *pyramidalis*, Dipp. (var. *fastigiata*, Hort.). Of upright growth. Var. *purpurea*, Dipp. Lvs. purplish when young, green at length.—It grows into a taller tree than the American species, although the former is of more vigorous growth when young; the foliage turns yellow in fall, and remains on the tree throughout the winter.

AA. Lvs. with 15–25 pairs of veins: mature catkins with loosely appressed ovate and dentate bracts, of cone-like appearance.

**japonica**, Blume (*C. Carpinus*, Sarg. *Distocarpus Carpinus*, Sieb. & Zucc.). Tree, to 50 ft.: young branchlets pubescent: lvs. reddish brown when unfolding, oblong-ovate or oblong-lanceolate, 2–4 in. long, acuminate, rounded or subcordate at the base, unequally serrate, with 20–24 pairs of veins deeply impressed above, bright green and glabrous above, beneath brownish pubescent on the veins at first, finally glabrous or nearly so: mature catkins ovoid-oblong, 2 in. long, slender-peduncled; bracts inflexed at the base inclosing the nutlet. Japan. G.F. 6:365. R.H. 1895, p. 427. S.I.F. 1:24.—A very graceful species and quite hardy; sometimes cult. under the name *C. laxiflora*, which is an entirely different species with the lvs. having only 10–14 pairs of veins.

**cordata**, Blume. Tree, to 40 ft.: young branchlets hairy at first, soon glabrous: lvs. ovate or oblong-ovate, acuminate, distinctly cordate at the base, 3–6 in. long, unequally serrate, with 15–20 pairs of veins deeply impressed above, pubescent on the veins beneath or glabrous: mature catkins 2–3 in. long, slender-peduncled; bracts not inflexed at the base, but with an opposite bractlet about as long as the nutlet. Japan, Manchuria, Korea. G.F. 8:295. S.I.F. 1:24.—A very handsome species and quite hardy.

*C. americana*, Michx.=*C. caroliniana*.—*C. duinensis*, Scop.=*C. orientalis*.—*C. laxiflora*, Blume. To 50 ft.: lvs. ovate or elliptic-ovate, long-acuminate, 2–3 in. long, with 10–14 pairs of veins. Japan. S.I.F. 1:25.—Very attractive in fall, with its long and slender catkins. Var. *macrostachya*, Winkl. Lvs. ovate-oblong: fruiting catkins  $2\frac{1}{2}$ –3  $\frac{1}{2}$  in. long. W. China. H.I. 20:1989.—Recently intro.—*C. orientalis*, Mill. Bushy tree, to 15 ft.: lvs. ovate or oblong-ovate,  $1\frac{1}{2}$ –2 in. long, with about 10 pairs of veins. S.E. Eu. to Persia. Gn. 24, p. 418.—*C. Páxii*, Winkl.=*C. Turczaninowii*.—*C. polyneura*, Franch. (*C. Turczaninowii* var. *polyneura*, Winkl.). Small tree: young branchlets pubescent, soon glabrous: lvs. ovate-lanceolate, long-acuminate, usually rounded at the base,  $1\frac{1}{2}$ –2  $\frac{1}{2}$  in. long, with 15–20 pairs of veins; fruiting bractlets ovate to lanceolate, serrate. W. China. W.B. 39.—*C. Turczaninowii*, Hance (*C. Páxii*,

820. *Carpinus caroliniana*. ( $\times\frac{1}{2}$ )

Winkl.) Shrubby tree: lvs. ovate, acute, 1-2 in. long, with 10-12 pairs of veins. N. China.—*C. virginiana*, Michx. f.—*C. caroliniana*.—*C. yedoensis*, Maxim. Small tree: branchlets and lvs. beneath pubescent: lvs. ovate-elliptic or ovate-lanceolate, with about 12 pairs of veins, 2-3 in. long. Japan. S.I.F. 2:11. ALFRED REHDER.

**CARRIÈREA** (after E. A. Carrière, prominent French horticulturist and botanist, died 1896). *Flacourtiaceæ*. Ornamental tree chiefly cultivated for its handsome bright green foliage.

Deciduous: lvs. alternate, long-petioled, serrate: fls. dioecious; sepals 5, broadly ovate, pubescent outside; petals wanting; stamens numerous, shorter than the sepals; ovary 1-celled with numerous ovules, rudimentary in the staminate fls.; styles 3-4, 3-lobed, short and spreading: fr. a dehiscent caps.; seeds winged.—One species, or possibly two, in Cent. China.

This is a medium-sized tree very much resembling *Ilex* in appearance, the apetalous flowers with large white sepals in terminal corymbs or short racemes, the staminate usually many-flowered, the pistillate few-flowered, rarely solitary, and with large capsular long-pointed fruits. It has proved fairly hardy at the Arnold Arboretum. Propagated by seeds; can probably also be propagated like *Ilex* by greenwood and root-cuttings.

**calycina**, Franch. Tree, to 30 ft., with a wide-spreading flat fr. lvs. elliptic or ovate to oblong-obovate, 3-6 in. long, short-acuminate, rounded at the base,

821. Last year's umbel of wild carrot.

lustrous on both surfaces, glabrous, crenately-serrate: sepals broadly cordate-ovate about  $\frac{3}{4}$  in. long and nearly as broad, white: caps. 2-2 $\frac{1}{2}$  in. long, pubescent. Cent. China. R.H. 1896, p. 498. ALFRED REHDER.

**CARROT** (*Daucus Carota*, Linn.). *Umbelliferae*. Garden vegetable, grown for its elongated subterranean crown-tuber.

The carrot is native of Europe and Asia, and one of the bad introduced weeds of eastern North America (Fig. 821). The improved succulent-rooted garden varieties are thought to be descended from the same stock, though this has been denied. It seems probable that the horticultural improvement of the species was begun in Holland, and it is said that the cultivated forms were introduced thence into the gardens of England during the reign of Queen Elizabeth. The carrot is now very generally, though not extensively, cultivated everywhere, both for culinary purposes and for stock-feeding. It is sometimes forced under glass, but to no great extent. Carrots are most useful in culinary practice for soups, stews, and salads, and as this class of cookery has never been reasonably popular in America, this vegetable has not received the attention it deserves.

The carrot is hardy and may be planted as soon as the ground is in fit condition to be properly prepared for seeding. When grown as a market-garden or truck

crop, this early seeding is essential to maximum returns. The best soil for carrots is a medium to light loam, rich, friable and comparatively free from weeds. As the seed is slow to germinate, it is a good plan to sow some quick-germinating seed with the carrot seed so that the rows may be noticed in time to keep them ahead of weed growth. Lettuce serves well for this purpose. When the carrots are thinned, this lettuce is pulled out. The carrot seed is best sown in rows 12 to 15 inches apart, using enough seed to produce a plant every inch or two along the row. When the carrots are 3 to 5 inches high, they should be thinned to stand 3 inches apart in the row. The only further culture necessary is frequent tillage to conserve soil-moisture and to prevent weed growth. The early crop should be ready to pull and bunch for sale seventy-five days after sowing. Early carrots are an important crop on the market-garden and truck-farm. They are pulled as soon as they have attained sufficient size and tied into bunches of three, six or seven roots, according to the size of the roots and the market demands. The earlier the crop and the more active the demand, the smaller the roots which may be salable. A later sowing is made for the main or winter crop or for live-stock. This may be from four to six weeks after the first sowing. The crop is handled in the same manner as the early crop except that it is allowed to continue growth as long as the weather is suitable. It is then pulled, the tops cut from the roots and the roots placed in frost-proof storage for winter sale.

The expense of production of carrots is considerable, but the returns are usually satisfactory. The fall crop should yield 500 to 1,000 bushels to the acre. Truck-growers of the South ship many bunched carrots to the large northern markets in March, April and May, where they meet a ready demand at prices ranging from 35 cents to \$1 per dozen bunches.

There are several distinct market types of carrots, the variation being chiefly with respect to size and shape. The smaller varieties, as they mature more quickly, are used to some extent for the early bunching, while the larger kinds are always more popular in the general market.

The varieties of carrots differ chiefly in respect to size and grain, with differences in earliness closely correlated. The following are now favorite varieties:

**French Forcing** (Earliest Short Horn).—One of the smallest and earliest; root small, almost globular, orange-red.

**Oxheart** or **Guerande**.—Small to medium in size; root 2 to 4 inches long, growing to a blunt point, of good quality and popular in some sections for an early bunch carrot.

**Chantenay**.—Large to medium in size; root 3 to 5 inches long, more tapering than Oxheart; of good quality and a better carrot for the bunched crop than the above.

**Danvers Half-Long**.—Six to 8 inches long, 2 to 3 inches in diameter, at top tapering to a blunt point; the most popular garden carrot grown.

**True Danvers**.—A long carrot, 8 to 12 inches; tapering to a slender point like a parsnip; grown more for live-stock or exhibition purposes. The Half-Long has largely displaced it as a market sort chiefly because of the greater ease with which the latter strain is harvested.

**Half-Long Scarlet**.—Top small, roots medium size, cylindrical, pointed; much used for bunching.

**Early Scarlet Horn**.—Top small, roots half-long, somewhat oval, smooth, fine grain and flavor; a favorite garden sort.

**Large White Belgian**.—Of much larger size than the above-named varieties, of less delicate flavor and coarser texture; a popular variety for live-stock.

The variation in the different strains of carrot seed is marked and it is important to secure seed from carefully selected roots true to shape and color. Carrot seed may be produced in any location in which the crop of roots is grown successfully.

The carrot may be successfully forced under glass and is grown in this way to a limited extent. The small early varieties are used, such as French Forcing, Early Parisian, Early Scarlet Horn and Golden Ball. These will usually be grown as a catch-crop between tomatoes or cucumbers. When grown in this way, the carrot is one of the most delicious of all vegetables, and deserves much wider popularity. See *Forcing*.

The field cultivation of carrots for live-stock differs little from the garden or horticultural treatment except that earliness is not desired, and the longer-rooted later-maturing kinds are mostly used; and less intensive cultivation is employed. See Vol. II, *Cyclo. Amer. Agric.*, p. 540.

F. A. WAUGH and H. F. TOMPSON.

**CARTHAMUS** (Arabic name, alluding to a color yielded by the flowers). *Compósitæ*. Hardy annuals.

Plant 2-3 ft. high, with spiny lvs.: involucre with spreading and leafy outer scales and the inner ones more or less spiny; receptacle chaffy; corolla 5-fid, nearly

822. Garden carrots of the shorthorn type.

regular, smooth, expanded above the tube: achenes glabrous, mostly 4-ribbed, the pappus none or scale-like. —A genus of 20 species, from the Canary Is. to Cent. Asia. Of easiest cult., from seed.

**tinctórius**, Linn. (*Cárduus tinctórius*, Falk.). SAFFLOWER. FALSE SAFFRON. One to 3 ft. high, glabrous, branched: lvs. ovate, spiny-toothed, almost as broad as long: fl.-heads with upward-tapering involucre, and a globular crown of orange florets. Asia.—Florets used like saffron; they have diaphoretic properties and have also been used for dyeing, especially silks; and in making rouge.

N. TAYLOR.†

**CARUELIA:** *Ornithogalum*.

**CARUM** (probably from Caria, in Asia Minor). *Umbelliferae*. Glabrous annual or perennial herbs, some of which yield aromatic and edible garden products.

Leaves pinnate: fls. white or pinkish, small, in compound umbels with involucre and involucels, the calyx-teeth small: fr. ovate or oblong, more or less ribbed, glabrous, or sometimes hispid: root usually tuberous or filiform.—Twenty or more species, widely distributed in temperate regions. The genus is variously defined and understood. *C. Petroselinum*, the parsley, is here kept under the genus *Petroselinum*.

**Cárvi**, Linn. CARAWAY (which see). St. slender but erect, furrowed, 1-2 ft.: lvs. pinnately decompound, with thread-like divisions. Old World.—Sometimes runs wild.

**Gáirdneri**, Gray. St. solitary, 1-4 ft.: lvs. pinnate or the upper ones simple, with 3-7 linear lfts., the upper lfts. usually entire, but the lower ones often divided: fr. with long style. Dry hills, in Calif. and Nev. and to Brit. Col.—Intro. in 1881, by Gillett, as an ornamental plant. Roots tuberous and fusiform.

L. H. B.

**CARÚMBIUM:** *Homalanthus*.

**CÀRYA** (*Karya*, Greek name for the walnut tree). Syn., *Hicòria*. *Juglandaceæ*. HICKORY. Trees grown for their handsome foliage and strong habit, and some species for their edible nuts.

Deciduous: branches with solid pith: lvs. alternate, without stipules, with 3-17 serrate lfts.: fls. monœcious, apetalous, appearing with the lvs.; staminate fls. in axillary, slender, pendulous catkins, each fl. with 3-10 stamens, borne in the axil of a 3-lobed bract; pistillate fls. in a terminal, 2-10-fld. cluster or spike, consisting of a 1-celled ovary inclosed by a 4-lobed involucre: fr. globular to oblong, with a husk separating into 4 valves and a bony nut, incompletely 2-4-celled.—About 18 species of hickory, all in E. N. Amer. from Canada to Mex.; the Chinese species recently described by Dode from nuts only is probably not a *Carya*. See Rep. Mo. Bot. Gard. 7, pp. 28-42, pls. 1-23, and Rep. of U. S. Dept. Agric., Div. Pomol., Nut-Culture (1896), cited below as U. S. N. C. (the first number referring to the plate, the second and third to the figure). By some, *Hicoria* is considered to have priority, but *Carya* is retained as one of the "nomina

conservanda" of the Vienna code of nomenclature, because of its long-established usage.

The hickories are hardy ornamental, usually tall trees with rather large, deciduous odd-pinnate leaves, small greenish flowers, the staminate ones in conspicuous pendulous racemes, and with rather large green dehiscent fruits inclosing a mostly edible nut. The hickories are among the most beautiful and most useful trees of the American forest, and are all very ornamental park trees, with a straight, sometimes high and slender trunk and a large, graceful, pyramidal or oblong head of usually light green foliage, turning from yellow to orange or orange-brown in fall. They are hardy North except *C. Pecan*, *C. aquatica* and *C. myristicæformis*, but *C. Pecan* thrives rarely in Massachusetts in sheltered positions. Most of the species have heavy hard strong and tough wood, much valued for many purposes, especially for handles of tools, manufacture of carriages and wagons, also for making baskets and for fuel. The nuts of some species, as *C. Pecan* and *C. ovata*, also *C. laciniata* and some varieties of *C. glabra* and *C. alba*, are edible, and are sold in large quantities, mostly gathered from the woods, though in later years orchards of improved varieties have been planted. A large number of insects prey upon the hickory, attacking the wood, foliage and fruit, for which see the Fifth Ann. Rep. of the U. S. Entom. Com., pp. 285-329. There are also some fungi sometimes causing an early defoliation of the trees.

The hickories generally thrive best in rich moist soil, but some, especially *C. glabra*, *C. alba* and *C. ovata*, grow equally well in drier localities. They are of rather slow growth, and difficult to transplant if taken from the woods; therefore the seeds are often planted where

the trees are to stand, but if grown in the nursery and transplanted several times when young, trees 6–10 ft. high may be transplanted successfully.

Propagation is usually by seeds stratified and sown in spring in rows about 3 inches deep; named varieties may be grafted in spring in the greenhouse, on potted stock of *C. cordiformis*, which seems to be the best species for this purpose, veneer- or splice-grafting being usually employed; sometimes also increased by root-sprouts. For further horticultural advice, see *Hickory-nut* and *Pecan*.

A. Scales of buds valvate, 4–6: fr. with winged sutures; nut usually thin-shelled: lfts. 7–15, usually falcate.

B. Nut mostly elongated, almost terete; husk thin, splitting to the base; kernel sweet; cotyledons entire or only notched at the apex.

1. *Pecán*, Engler & Graebn. (*Juglans Pecán*, Marsh. *Hicòria Pecán*, Brit. *C. illinoensis*, Koch. *C. olivæformis*,

823. Foliage and pistillate flowers of *Carya Pecan*.

Nutt.). **PECAN**. Fig. 823. To 170 ft., with branches pubescent when young; bark deeply furrowed, grayish brown: winter-buds yellow: lfts. 11–17, short-stalked, oblong-lanceolate, acuminate, serrate or doubly serrate, tomentose and glandular when young, usually glabrous at length, 4–7 in. long: staminate catkins almost sessile: fr. 3–10 in clusters or spikes, oblong,  $1\frac{1}{2}$ – $3\frac{1}{2}$  in. long; nut ovoid or oblong, smooth, brown, irregularly marked with dark brown, 2-celled at the base; kernel sweet. From Iowa and Ind. south to Ala. 2nd Texas; also in Mex. S.S. 7:338–9. A.G. 12:273–275. U.S.N.C.1, 8, 9.—This species is the most important as a fr. tree, and many named varieties are cult. in the southern states, but it is tender N. The wood is less valuable than that of the other species. Hybrids are known of this species with *C. cordiformis*, *C. alba* and *C. laciniosa*, for which see Rep. Mo. Bot. Gard. 7, pls. 20–23 and Gng. 2:226. See *Pecan*.

2. *myristicæformis*, Nutt. (*Hicòria myristicæformis*, Brit.). **NUTMEG HICKORY**. Tree, to 100 ft., with dark brown bark, broken into appressed scales: winter-buds brown: lfts. 5–11, short-stalked or almost sessile, ovate-lanceolate, the uppermost much larger and obovate, serrate, scurfy-pubescent beneath when young and with brown scales above, at length dark green above, silvery and lustrous beneath, 3–5 in. long: staminate catkins peduncled: fr. generally solitary, short-ovoid or obovate, about  $1\frac{1}{2}$  in. long; nut ovoid, reddish brown marked with irregular spots and stripes, thick-shelled, 4-celled below; kernel sweet. From S. C. to Ark. and Mex. S.S. 7:342–3.—A very decorative species on account of its handsome foliage, but not hardy N.

BB. Nut usually so broad as long, compressed, with irregularly angled or reticulate surface, thin-shelled, 4-celled below; kernel bitter; cotyledons deeply 2-lobed.

3. *aquatica*, Nutt. (*Hicòria aquatica*, Brit.). **WATER HICKORY**. **BITTER PECAN**. Usually small tree, rarely to 100 ft., with light brown bark separating into long, thin plates: winter-buds dark reddish brown: lfts. 7–13, sessile or short-stalked, lanceolate, long-acuminate, finely serrate, yellowish tomentose when young, glabrous at length: fr. 3–4, ovoid to broadly obovate,  $1\frac{1}{2}$  in. long; husk thin, splitting to the base; nut obovate, much compressed, irregularly angled and ridged, dull reddish brown; kernel very bitter. From Va. to Ill., south to Fla. and Texas. S.S. 7:344–5. U.S.N.C. 12, 7–8.

4. *cordiformis*, Koch (*Hicòria minima*, Brit. *C. amara*, Nutt.). **BITTERNUT**. **SWAMP HICKORY**. Tree, to 100 ft.: bark grayish brown, broken into thin scales: young branches and petioles glabrous: winter-buds bright yellow: lfts. 5–9, ovate-lanceolate to lanceolate, acuminate, densely serrate, pubescent when young and glandular, almost glabrous at length, 3–6 in. long: fr. 2–3, broadly obovate or subglobose, winged from the apex to the middle,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long; husk thin, splitting somewhat below the middle; nut slightly compressed, roundish, abruptly contracted into a short point, smooth, gray; kernel bitter. Que. to Minn., south to Fla. and Texas. S.S. 7:340–1. Em. 226.—A valuable park tree, with handsome rather broad head, growing in cult. more rapidly than other hickories.

AA. Scales of buds imbricate, more than 6: fr. not or slightly winged at the sutures; nut usually thick-shelled, 4-celled below: lfts. 3–9, not falcate, the uppermost larger and generally obovate.

B. Buds small,  $\frac{1}{4}$ – $\frac{1}{2}$  in. long; husk thin; nut slightly or not angled.

C. Lvs. glabrous or only slightly pubescent while young; nut not or only slightly angled, thin-shelled.

5. *glabra*, Sweet (*Hicòria glabra*, Brit. *C. porcina*, Nutt.). **PIGNUT**. Figs. 824, 825. Tree, occasionally to

120 ft., with usually dark gray fissured bark and slender, glabrous branchlets: lfts. 3-7, almost sessile, oblong to oblong-lanceolate, long-acuminate, sharply serrate, almost glabrous, 3-6 in. long: fr. usually ovoid or obovate, the sutures usually slightly winged toward the apex and the husk splitting mostly only half way

824. Characteristic growth of the pignut hickory, *Carya glabra*.

to the base; nut usually brownish, not angled; kernel mostly astringent. Maine to Ont. and south to Fla., Ala. and Miss. S.T.S. 2:179. A.G. 11:386-7. U.S.N.C. 12, 5.—A very handsome park tree, with rather narrow-oblong head, and slender often pendulous branchlets. A very variable tree.

6. *ovális*, Sarg. (*Juglans ovalis*, Wang. *Hicoria microcarpa*, Brit. *H. glabra* var. *microcarpa*, Trel.). SMALL PIGNUT. FALSE SHAGBARK. Figs. 826-829. Tree, similar to the preceding: bark close and furrowed on young trees, shaggy on old trunks: branches first hairy, soon glabrous: lfts. 5-7, sessile, oval, oblong or ovate, 3-6 in. long, acute or acuminate, rounded or narrowed and unequal at the base, coarsely and shallowly toothed, glabrous; terminal lfts. cuneate at the base, short-stalked: fr. subglobose to short-oblong,  $\frac{3}{4}$ -1 in. across, densely scaly and slightly winged, tardily splitting nearly to the base; nut slightly flattened, often broader than high and usually rounded at the apex, sometimes slightly angular, brownish, shell rather thin; kernel small and sweet. Mass. to Wis., south to Ga., Ala., and Miss. A.G. 11:381-383, 1, 2, 5, 8, 10. U.S.N.C. 12, 4, 6. Var. *obcordata*, Sarg. (*J. obcordata*, Muhl. *J. porcina* var. *obcordata*, Pursh. *C. microcarpa*, Darl.). Fr.

825. Ore form of pignut—*C. glabra*. (Natural size.)

nearly globose or ovoid; nut angled, broader than high, sometimes obcordate. S.S. 7:354, figs. 5, 6, 7, 9. Var. *odorata*, Sarg. (*Hicoria glabra* var. *odorata*, Sarg.). Lfts. generally broader, ovate or oblong-ovate, glandular: fr. subglobose or higher than broad, with distinctly winged sutures, splitting freely to the base; nut gray, very slightly ridged, slightly higher than broad. Conn. to Pa. and Mo. S.S.

7:354, fig. 8. Var. *obovalis*, Sarg. Fr. obovoid; nut much compressed, pointed or rounded at the apex, and rounded at the base. Mass. to Va. and Mo. Var. *borealis*, Sarg. (*Hicoria borealis*, Ashe. *C. borealis*, Schneid.). Bark scaly: lfts. usually 5, lanceolate: fr. ovoid, flattened, about  $\frac{3}{4}$  in. long, very narrowly winged and often incompletely splitting; nut ovoid, ridged, whitish; kernel sweet. Mich., Ont. B.T. 236.

cc. Lvs. hairy beneath: nut angled, thick-shelled.

7. *villösa*, Schneid. (*Hicoria villosa*, Ashe. *H. glabra* var. *villösa*, Sarg. *H. pallida*, Ashe). Tree, to 20 or sometimes to 50 ft.: branchlets slender, pubescent mixed with silvery scales, later glabrous: lfts. 5-9, usually 7, sessile or short-stalked, oblong to oblanceolate, 3-5 in. long, acuminate, narrowed at the base, coarsely serrate, when unfolding glandular above, hairy below and with silvery scales; petioles pubescent and with tufts of brownish hairs, finally often glabrous: fr. subglobose to pear-shaped,  $\frac{3}{4}$ -1  $\frac{3}{4}$  in. long, winged; husk thin, splitting to below the middle or nearly to the base; nut slightly angled, somewhat compressed, thick-shelled, pale or light brown; kernel small and sweet. N. J. to Fla., Miss. and E. Texas. S.S. 7:355. G.F. 10:305.

826. Fruit of *C. ovalis*, the false shagbark. (Natural size.)

BB. Buds large,  $\frac{1}{2}$ -1 in. long: nut angled; kernel sweet.

C. Bark not shaggy: branches and petioles tomentose: outer bud-scales falling in autumn: husk not separating quite to the base.

8. *alba*, Koch (*Hicoria alba*, Brit. *C. tomentosa*, Nutt. Not to be confounded with *C. alba*, Nutt., which is *C. ovalis*). MOCKERNUT. BIG-BUD HICKORY. Tree, rarely attaining to 100 ft.: lfts. 7-9, almost sessile, oblong-lanceolate, long-acuminate, usually finely serrate, glandular and tomentose beneath, very fragrant when crushed, 4-8 in. long: fr. globose to pear-shaped,

827. *Carya ovalis*, the false shagbark.

1½-2 in. long; nut light brown, globular to oblong, slightly compressed, angled, narrowed toward the apex, thick-shelled; kernel small, sweet. Mass. to Ont. and Neb., south to Fla. and Texas. S.S. 7:350-1. U.S.N. C. 12, 1-3. Em. 222.

828. Twig of *C. ovalis*.

cc. Bark shaggy, light gray; branches and petioles glabrous or pubescent; husk very thick, separating to the base; outer bud-scales persisting through the winter.

9. *laciniōsa*, Engler & Graebn. (*Hicoria laciniōsa*, Sarg. *H. acumināta*, Dipp. *C. sulcata*, Nutt.). BIG or BOTTOM SHELL-BARK HICKORY. KING-NUT. Tall tree, occasionally to 120 ft.: branchlets orange-red; lfts. 7-9, oblong-lanceolate, acuminate, serrate, pubescent when young, usually glabrous at length, 4-8 in. long; fr. generally oblong, 1¾-2½ in. long; nut yellowish white, oblong, but sometimes as broad as long, slightly compressed and obscurely 4-angled, pointed at both ends; kernel sweet. N. Y. to Iowa, south to Tenn. and Okla. S.S. 7:348-9. U.S. N.C. 11.

10. *ovata*, Koch (*Hicoria ovata*, Brit. *C. alba*, Nutt.). SHAGBARK HICKORY. Also LITTLE SHELLBARK HICKORY, although

the latter name by some is applied to the preceding. Figs. 830, 831. Tree, occasionally to 120 ft.: lfts. generally 5, sessile, oblong or oblong-lanceolate, acuminate, serrate, densely fimbriate, pubescent and glandular when young, glabrous at length, 4-6 in. long; fr. subglobose, about 1½-2½ in. long; nut white, oblong to broadly obovate, 4-angled; kernel sweet. From Que. to Minn., south to Fla. and Texas. S.S. 7:346-7. Em. 217. U.S.N.C. 10. A.G. 11:386, 6, 9; 387, 3; 388, 11. Gng. 7:51. A.F. 14:339.—Next to Pecan the best as a fruit tree, especially for northern states, where the pecan is not quite hardy. Several named varieties are in trade, of which probably var. *Halesii*, Hort., with large, thin-shelled nut, is the best known. An ornamental, often very picturesque tree; the stout branches forming a rather broad, usually somewhat open, head. Var. *Nuttallii*, Sarg. (*C. microcarpa*, Nutt. in part). Fr. smaller; nut rounded, usually obovate, much compressed and prominently angled, about ½ in. across. Mass. to Pa. and Mo. Nuttall, Silv. N. Am. 1:13. Var. *fraxinifolia*, Sarg. Lfts. lanceolate or

829. Habit of the small-fruited pignut, *Carya ovalis*.

nearly oblanceolate, the terminal one 5-6 in. long and 1¾-2 in. wide; fr. generally smaller, ovoid, pointed, 1¼ in. long; nut long-pointed. W. N. Y.

*C. arkansana*, Sarg. Allied to *C. glabra*. Tree, to 70 ft.: bark dark gray, scaly; branchlets pubescent. Lfts. 5-7, lanceolate, densely pubescent when unfolding, glabrous at maturity, 4-7 in. long; fr. ovoid or obovoid; husk usually splitting to the middle; nut slightly obovoid; shell very thick and hard; kernel sweet, small. Ark. and Okla. S.T.S. 2:181.—*C. Buckleyi*, Durand (*C. texana*, Buckl., not DC.). Allied to *C. alba*. Tree, to 50 ft., with dark, furrowed bark; lfts. 7, lanceolate or oblanceolate, pubescent on the veins below, 3-6 in. long; fr. subglobose or ovoid, 1½ in. across; husk thin, splitting to the base; nut reddish brown, veined; shell hard; kernel sweet. Texas to Okla. and Ark. S.T.S. 2:182.—*C. carolinæ-septentrionalis*, Engler & Graebn. (*Hicoria carolinæ-septentrionalis*, Ashe). Allied to *C. ovata*. Branchlets slender; lfts. 3-5, lanceolate, glabrous; fr. smaller; nut thin-shelled. N. C. to Ga. S.S. 14:720.—*C. floridana*, Sarg. Allied to *C. cordiformis*. Buds valvate, brownish yellow; lfts. usually 5, elliptic-oblong to lanceolate, densely scaly beneath, 2-3½ in. long; fr. obovoid, about 1 in. long, husk tardily splitting to the base; nut obovoid or subglobose. Fla. S.T.S. 2:177.—*C. megacarpa*, Sarg. Closely related to *C. glabra*. Bark close; buds larger:

830. Twig of *Carya ovata*.

831. Fruit of *Carya ovata*, the shagbark hickory. The cross-section is to show structure, not to show a good horticultural fruit. (Natural size.)

lfts. to 8 in. long; fr. broadly obovoid, to 1½ in. long; husk thick, tardily dehiscent to the middle; nut obovoid; kernel small, sweet. N.Y. to Mo. and Fla. S.T.S. 2:180.—*C. mexicana*, Engelm. Tree, with shaggy bark and tomentose-pubescent lvs.; fr. depressed, with rather thick husk and broad, sharply 4-angled, white nut. Mex. The only species not native to the U.S.—*C. texana*, DC. (*Hicoria texana*, Le Conte). Similar to *C. Pecan*, but lfts. broader, less falcate, almost sessile; nut smaller, much darker, with somewhat rough surface; kernel bitter. Texas. S. S. 14:719.—*C. texana*, Buckl. = *C. Buckleyi*.

ALFRED REHDER.

**CARYOCAR** (from the Greek word for nut). *Caryocaraceæ*; formerly included in *Ternstroemiaceæ*, and by some referred to *Rhizophoraceæ*. Trees, or rarely shrubs, of about 10 species in Trop. Amer., one of which is well known for its large edible nuts. Lvs. opposite, digitately 3-5-foliate, leathery, often serrate; fls. bractless, in terminal racemes; calyx deeply 5-6-parted, the lobes orbiculate and strongly imbricate; petals 5-6, imbricate; stamens many, somewhat joined at the base; ovary 4-6-celled; fr. drupaceous, with a hard stone or stones and very large seeds. *C. nuciferum*, Linn., produces the souari-nut or butternut of the American tropics. Although native of Guiana, it is cult. in some of the W. Indies isls.: tree, attaining 100 ft. or more, producing durable timber used chiefly in ship-building; lvs. trifoliate, the lfts. elliptic-lanceolate, glabrous; fls. large, purple, the stamens white and very numerous; fr. several inches in diam., nearly globular or becoming misshapen by abortion of the contents, containing 2-4 hard-shelled nuts the size of a hen's egg, and which are flat-kidney-shaped, warty and reddish brown; kernel or meat white, with a nutty or almond-like flavor, and yielding oil when subjected to pressure. B.M. 2727, 2728. The nuts now and then appear in northern markets. The closely allied *C. villosum*, Pers., of Guiana and Brazil, is reported as a notable timber tree; and the oily pulp surrounding the seed is eaten boiled and the kernel of the seed is eaten raw.

L. H. B.

**CARYOPHYLLUS**, the clove tree, is now referred to *Eugenia*.

**CARYOPTERIS** (Greek for *nut* and *wing*). *Verbenaceæ*. Ornamental woody plants grown for their lavender-blue flowers profusely produced in autumn.

Deciduous small shrubs: lvs. opposite, short-petioled, serrate: fls. in axillary cymes; calyx campanulate, deeply 5-lobed with lanceolate teeth, spreading and somewhat enlarged in fr.; corolla 5-lobed, with short cylindric tube and spreading limb, 1 segm. larger and fringed; stamens 4, exserted, 2 of them longer; style slender, 2-parted at the apex: fr. separating into 4 somewhat winged nutlets.—About 6 species in E. Asia.

These are glabrous, pubescent or tomentose shrubs with small blue or violet late flowers. Free-flowering and very valuable for their late blooming season; not hardy North; even if well protected they will be killed almost to the ground, but the young shoots, springing up freely, will flower profusely the same season. They require well-drained and sandy soil and sunny position; if grown in pots, a sandy compost of peat and leaf soil or loam will suit them, and they will flower in the greenhouse until midwinter. Propagated readily by cuttings of half-ripened wood in summer or fall under glass, and by seeds sown in spring.

*incana*, Miq. (*C. Mastacanthus*, Schauer. *C. sinensis*, Dipp.). Fig. 832. Suffrutescent, 1–5 ft.: lvs. petioled, ovate or oblong, coarsely serrate, pubescent above, grayish tomentose beneath, 2–3 in. long: cymes peduncled, dense-flld.; fls. small, violet-blue or lavender-blue. Aug.–Nov. China, Japan. B.R. 32:2. B.M. 6799. R.H. 1892:324. R.B. 19:273. G.C. II. 21:149; III. 42:409. Mn. 5:5. S.H. 2, p. 89. G.W. 6, p. 197. Gn. 24, p. 523; 76, p. 24. G.M. 43:7.—Known in the nursery trade as “blue spirea.” Var. *candida*, Schneid. has white fls.

*C. mongolica*, Bunge. Lvs. lanceolate, almost entire: cymes with fewer but larger fls. R.H. 1872:450. ALFRED REHDER.

**CARYOTA** (old Greek name). *Palmaceæ*, tribe *Arècææ*. FISH-TAIL PALM. Spineless monocarpic palms, with tall stout ringed trunks, at length bearing suckers.

Leaves disposed in an elongated terminal fringe, ample, twice pinnately divided; segms. dimidiate-flabelliform, or cuneate, entire, or split, irregularly dentate, plicate, folded back in the bud; midnerves and primary nerves flabellate; petiole terete below; sheath keeled on the back, fibrous along the margins; ligule short: spadices usually alternately male and female: peduncle short, thick: branches long, pendent: spathes 3–5, not entire, tubular; bractlets broad: fls. rather large, green or purple: fr. the size of a cherry, globular, purple.—Species, 9. Malaya, New Guinea, Austral. G.C. II. 22:748.

These palms are remarkable for the delta-shaped or fish-tail-shaped leaflets, which make the graceful, spreading fronds very attractive. They are excellent warmhouse palms, very useful for decoration, particularly when young. They are frequently planted out in protected places for the summer. *C. urens*, the wine-palm of India, yields, when full grown, about twenty-four pints of wine in twenty-four hours. The beverage is very wholesome and a valuable article of commerce. There being so many different genera to choose from in selecting plants for moderate-sized conservatories, the members of this genus are not very popular for providing small specimens. In a high, roomy structure, however, they are among the most ornamental of the tribe. They are quick-growing, with large broad leaves, finely cut up, the small divisions resembling the tail of a fish; hence the name “fish-tail palm.” After reaching maturity the plant begins flowering at the top, and continues downward until the vitality of the stem is exhausted. Suckers are freely produced by some species, but these, as a rule, do not become so robust as the parent stem, owing probably to the soil becoming

exhausted. Seeds are offered by most dealers. The young plants should be grown in a warm, moist atmosphere, the soil consisting of loam with about one-third of its bulk leaf-mold and sand in equal parts. They sometimes lose their roots if kept too cool and wet in winter. Prop. is by seeds and suckers. (G. W. Oliver.)

*mitis*, Lour. (*C. sobolifera*, Wall. *C. furfuracea*, Blume). Caudex 15–25 ft. high, 4–5 in. diam., soboliferous: petioles, lf.-sheaths and spathes scurfy-villous: lvs. 4–9 ft.; pinnae very obliquely cuneiform, irregularly dentate, upper margins acute; pinnules 4–7 in. long. Burma to Malaya.

*urens*, Linn. WINE-PALM. TODDY PALM. Caudex stout, even in cult. specimens 60–80 ft. high and 18 in. thick, much higher in the wild, not soboliferous: lvs. 18–20 by 10–12 ft.; pinnae 5–6 ft., curved and drooping, very obliquely truncate, acutely serrate, the upper

832. *Caryopteris incana*. (X $\frac{2}{3}$ )

margin produced and caudate; pinnules 4–8 in.; petiole very stout. India, Malaya. A.F. 12:295. Gn. 5:131. A.G. 21:533.

*Rumphiana*, Mart. Lvs. 2-pinnate, several feet long, the pinnules thick, sessile, 6 in. long or nearly so, oblong. Malaya. Var. *Albertii*, Hort. (*C. Albertii*, Muell.), is in the trade. It is large and free-growing, the lvs. being 16–18 ft. long and two-thirds as broad; lf.-segms. fan-shaped and oblique, toothed.

*C. Blanci*, Hort., from the Philippines, has been listed in the American trade. It is probably a form of *C. urens*.

JARED G. SMITH.

CASAREEP: *Blighia*.

CASCARILLA: *Croton*.

CASHEW: *Anacardium occidentale*.

**CASIMIROA** (named in honor of Cardinal Casimiro Gomez de Ortega, Spanish botanist of the eighteenth century). *Rutaceæ*. Evergreen trees, one of which is grown for the edible fruits.

Leaves alternate, long-petioled, digitate, 3–7-foliate; lfts. petiolulate, lanceolate, entire or slightly serrate, smooth or pubescent beneath: fls. regular, poly-

gamo-dioecious; calyx 5-parted, small; petals 5, oblong, valvate, apex incurved; disk inconspicuous, circular; stamens 5, free; filaments subulate; anthers cordate; ovary sessile, on disk, globose, 5- or occasionally 6-8-lobed, 5-celled; stigma sessile, 5-lobed; ovules solitary in the cells, axillary; fr. a drupe, large, depressed-globose; pulp agreeable to taste, edible; seeds oblong, compressed, exalbuminose.—Four species in Mex. and S.

**edulis**, Llav. & Lex. **WHITE SAPOTE.** **COCHIL SAPOTA.** Large tree: trunk ashen gray, with warty excrescences; lvs. dark green, glossy; fls. greenish yellow, small: fr. greenish yellow when ripe, with strong, thick epicarp,  $\frac{1}{2}$  in. thick, about the size of an orange; seeds nearly 1 in. long and half as wide. Mex.—The fr. of this species has a delicious flavor, similar to that of a peach. It is used in Mex. as an aid in inducing sleep, and the lvs. as a remedy for diarrhea. It grows on the coast of Mex. to an altitude of about 7,000 ft. See *Sapote*, *White*.

H. J. WEBBER.

**CASSABANANA:** *Sicana*.

**CASSANDRA:** *Chamædaphne*.

**CASSAVA:** *Manihot*.

**CASSEBEËRA** (from a German botanist). *Polypodiaceæ*. Small Brazilian ferns allied to the maiden-hair, but rarely seen in cult. There are 3 species: sori terminal on the veins, oblong or nearly globular; indusium within the margin and distinct from it. They require hothouse conditions. *C. pinnata*, Kaulf., has fronds 6 in. long, pinnate, the pinnæ linear-oblong and crenate. *C. triphylla*, Kaulf., has 3-5-parted fronds, the parts linear-oblong and crenate. *C. gleichenioides*, Gardn., has twice-pinnate fronds, the pinnules 4-cornered.

**CÁSSIA** (ancient Greek name). *Leguminosæ*. **SENNA.** Herbs, shrubs or trees, a few of which are in cultivation in America, as border plants and under glass.

Leaves even-pinnate: fls. nearly regular (not papilionaceous), with the nearly equal calyx-teeth mostly longer than the tube; corolla of 5 spreading, nearly equal clawed spreading petals; stamens 5-10, frequently unequal and some of the anthers abortive, the good anthers opening at the top; fr. a stalked pod which is either flat or terete, containing numerous seeds and often partitioned crosswise.—Species nearly or quite 400 in the warmer parts of the globe, some of them in cool temperate regions. See page 3566.

The cassias delight in a sunny exposure. Most of those cultivated in the United States are herbs or herb-like shrubs, attractive for the finely cut foliage and the showy flowers. Some of them are cultivated only in the extreme South. *C. corymbosa* is probably the best garden subject. Cassias are summer bloomers, for the most part. Propagation is mostly by divisions and seeds, the annual species always by seeds.

Senna leaves, used in medicine as a cathartic, are derived from various species, chiefly from *C. acutifolia* of Egypt, and *C. angustifolia* of India and other Old World tropics. The "Cassia lignea" of pharmacopœas is the product of a *Cinnamomum*. Cassia pods of commerce, used in medicine, are the fruits of *C. Fistula*. Many of the species contribute to therapeutics. Some of them provide tanning materials.

**A. Hardy border plants: lfts. 5 or more pairs.**

**marylândica**, Linn. **WILD SENNA.** Perennial, glabrous or nearly so, sts. nearly simple: lfts. 5-10 pairs, oblong or lance-oblong and entire, short-acuminate or nearly obtuse: fls. in axillary racemes near the tops of the sts. and often appearing as if panicked, bright yellow, wide open: pods linear, flat. New England, west and south, mostly in wet soil.—Grows 3-4 ft. high, and has attractive light green foliage.

**Chamæcrista**, Linn. (*Chamæcrista nictitans*, Moench). **PARTRIDGE PEA.** Annual, erect or spreading, 2 ft. or

less high: lfts. 10-15 pairs, small, narrow-oblong, mucronate, sensitive to the touch: fls. large, 2-5 together in the axils, canary-yellow and 2 of the petals purple-spotted.—Dry soil, Maine, south and west. Sometimes known as Magothy Bay bean and sensitive pea, and formerly recommended as a green-manuring plant. See *Cyclo. Amer. Agric.*, Vol. II, p. 309, for account and picture.

**AA. Tender plants, grown far south, or under glass: lfts. few or many.**

**B. Tree, with woody indehiscent pods.**

**Fistula**, Linn. **PUDDING-PIPE TREE. GOLDEN SHOWER.** Lvs. large, the lfts. 4-8 pairs, and ovate-acuminate: fls. in long lax racemes, yellow, the pedicels without bracts: pods cylindrical, black, 3-furrowed, 1-2 ft. long, containing 1-seeded compartments. India, but intro. in W. Indies and other tropical countries. Sparingly cult. S.—Furnishes the cassia pods of commerce.

**grândis**, Linn. **PINK SHOWER.** Lfts. 10-20, oblong, abrupt at either end, more or less pubescent beneath and above: fls. in long drooping axillary racemes, rose-colored, without bracts subtending the pedicels: pod 3 in. or less long, compressed-cylindrical, glabrous, transversely rugose. Trop. Amer.; offered in S. Calif., and grown in many tropical countries.

**BB. Shrubs or herbs, with more or less dehiscent pods.**

**Sophëra**, Linn. (*C. schinifolia*, DC. *C. Sophëra*, Auth.). Shrub, 6-10 ft.: lfts. 6-10 pairs, lanceolate-acute: fls. yellow on many-fld. axillary and terminal peduncles, which are shorter than the lvs.: pod thin, tardily dehiscent. Oriental tropics. Intro. in S. Calif.

**corymbösa**, Lam. (*C. floribunda*, Hort.). Shrub, half-hardy in middle states, 4-10 ft.: lfts. 3 pairs, oblong-lanceolate and somewhat falcate, obtuse or nearly so: fls. yellow, in long-stalked, small axillary and terminal corymbs. Argentina. B.M. 633. G.C. III. 31:252. Gn. 50, p. 139. J.H. III. 61:139. G. 25:553. H.F. II. 3:252. G.W. 3, p. 421; 6, p. 391.—The best-known garden species, being an excellent conservatory plant for spring, summer and autumn bloom. It is an old favorite, now coming again into prominence (as *C. floribunda* and var. *A. Boehm*, corrupted apparently into *C. Boema*) as a pot-plant, as a tub specimen for lawns, or for plunging in the border; winters readily in a dormant state in a cellar; very free-flowering.

**tomentösa**, Linn. Shrub, 10-12 ft.: lfts. 6-8 pairs, oval-oblong and obtuse, white-tomentose beneath: fls. deep yellow. Mex.—Said to be a good winter bloomer in S. Calif., and naturalized in some parts.

**artemisoides**, Gaud. Bushy shrub, soft-canescens and gray all over: lfts. 3-4 pairs, very narrow-linear: racemes axillary, 5-8-fld., the fls. sulfur-yellow: pods flat, shining brown. Austral.—Intro. in S. Calif. Withstands drought.

**biflora**, Linn. Shrub, 4-8 ft.: lfts. 6-10 pairs, broad-oblong or obovate-oblong, very obtuse but mucronulate: fls. large, yellow, on 2-4-fld. peduncles, which are shorter than the lvs.: pod 3 in. or less long, oblong-linear or narrower, membranaceous. S. Amer. and W. Indies. B.M. 810.—Sparingly cult. in greenhouses.

*C. lævigata*, Willd. Shrub, glabrous: lfts. 3-4 pairs, ovate-oblong or ovate-lanceolate, acuminate: fls. yellow in terminal and axillary racemes: pod leathery, 2-3 in. long, nearly cylindrical. Tropics.—*C. occidentalis*, Linn. **HEDIONDA.** Annual or subshrubby, widely distributed in the tropics as a weed, the seeds used as a substitute for coffee; it is the "fedegosa" and "negro coffee" of Afr.: lfts. 4-12 pairs, ovate-lanceolate or lanceolate, acuminate, and a gland near the base of the petiole: racemes short and few-fld.: pod glabrous, oblong-linear compressed or nearly cylindrical; the small seeds produced abundantly—*C. splendida*, Vogel. Shrub, 6-10 ft., much branched: fls. bright yellow, very large. S. Amer. Recently catalogued in S. Calif.—Others of the numerous species of Cassia are likely to appear in cult., particularly some of the native kinds; but as a whole, the genus is not rich in horticultural subjects.

L. H. B.

**CASSINE** (a name said to have been used by the Indians in Fla.; see *Ilex Cassine*). *Celastraceæ*. Some 20 or less erect or climbing glabrous shrubs of the Cape region in Afr., apparently not known in cult. in this country. Lvs. opposite, thick, entire or serrate; fls. small, white, in axillary clusters; calyx 4-5-parted, minute; petals 4-5; stamens 4-5, on the disk, which encircles the ovary; fr. a 1-2-seeded drupe, with a hard pit or stone. *C. Colpoon*, Thunb. (or *C. capensis* var. *Colpoon*) is the ladlewood of the Cape, the wood being used in the making of small articles. *C. Maurocenia*, Linn. (now placed in a separate genus, *Maurocenia capensis*, Sond.) is the Hottentot cherry. H.I. 6:55 2.

**CASSIOPE** (Greek mythological name). *Ericaceæ*. Ornamental small shrubs sometimes cultivated for their handsome delicate flowers.

Evergreen: lvs. very small, usually scale-like and opposite, rarely alternate and linear: fls. solitary, axillary, or terminal; calyx small, 5-parted; corolla campanulate, 5-lobed or 5-cleft; stamens 10, the anthers with recurved appendages; style included; fr. a 5-valved caps. with numerous minute seeds.—Ten species in arctic regions and high mountains of N. Amer., N. Eu., N. Asia and Himalayas. Formerly included under *Andromeda*.

Cassiopeas are graceful, delicate plants, adapted for rockeries, flowering in summer. They are of somewhat difficult culture, and require peaty and sandy moist but well-drained soil and partly shaded situation, though *C. hypnoides* grows best in full sun, creeping amongst growing moss. Drought, as well as dry and hot air, is fatal to them. Propagated readily by cuttings from mature wood in August under glass; also by layers and by seeds treated like those of *Erica*.

*C. fastigiata*, Don (*Andromeda fastigiata*, Wall.). Ascending: lvs. imbricate, in 4 rows, with white-fringed margin; fls. axillary, white. Himalayas. B.M. 4796 G.C. III. 47:379 (habit). Gn. 43, p. 189. G. 15:709.—*C. hypnoides*, Don. (*Harrimania hypnoides*, Coville). Creeping: lvs. linear, alternate, crowded; fls. terminal, deeply 5-cleft. Arctic regions. B.M. 2936. L.B.C. 20:1946. G.C. III. 39:226 (habit).—*C. Mertensiana*, Don. Erect or ascending to 1 ft. high: lvs. imbricate in 4 rows, carinate on the back; fls. axillary, white or slightly tinged rosy. Sitka to Calif.—*C. tetragona*, Don (*Andromeda tetragona*, Linn.). Similar to the former, but lower, and the lvs. with a deep furrow on the back. Arctic regions. B.M. 3181. M.D.G. 1910:125, 137 (habit).

ALFRED REHDER.

**CASSIPOURÈA** (a native name in Guiana). *Rhizophoraceæ*. Perhaps a dozen or less species (if the African *Dactylopetalum* is included in the American *Cassipourea*) in Trop. Amer. and in Afr., one of which is now offered. Glabrous trees or shrubs: lvs. opposite or whorled, stalked, somewhat leathery, oblong or lanceolate, entire or somewhat crenate; fls. small or medium in size, white, solitary or fascicled in the axils; calyx 4-5-lobed; petals 4-7, fimbriate, linear or spatulate, inserted in the cup-like disk; stamens 10-30; ovary 2-4-celled: caps. ovoid, somewhat fleshy, tardily dehiscent, the cells 1-seeded. *C. verticillata*, N. E. Br., Natal, a handsome tree, with very shiny foliage: lvs. about 4 in. long and half as broad, in 3's or 4's, lightly crenate-serrate or almost entire; petals 5-7, exserted, very narrow; stamens 10-14.—A rare mangrove-like tree, found at considerable elevations away from the coast. Offered in S. Calif. L. H. B.

**CASTALIA**: *Nymphaea*.

**CASTANEA** (ancient Latin name). *Fagaceæ*. CHESTNUT. Fruit and ornamental trees, grown for their edible nuts and also for their handsome foliage and attractive flowers.

Deciduous trees, rarely shrubs: lvs. alternate, serrate, elliptic-oblong to lanceolate: fls. monœcious, the staminate ones with 6-parted calyx and 10-20 stamens, in long, erect, cylindrical catkins; the pistillate ones on the lower part of the upper catkins, usually 3 together in a prickly involucre; ovary 6-celled: fr. a large

brown nut, 1-7 together in a prickly involucre or bur: winter-buds with 3-4 scales: branchlets without terminal bud.—About ten species in the temperate regions of N. E. Amer., Eu., N. Afr. and Asia.

The chestnuts are very attractive when in bloom. The handsome foliage is generally not injured by insects or fungi, but the whole tree is attacked by a serious disease known as the chestnut bark disease which has spread rapidly during the last years, chiefly in New York, Pennsylvania and the adjacent states. It was first discovered in 1904. It is caused by a fungus,

*Endothia parasitica*, which penetrates the bark, develops its mycelium in bark and sapwood, finally girdles the branch or trunk and causes the death of the portion above the infected place. The presence of reddish pustules on the infected area is a sure sign of the presence of this fungus. The cutting and destroying of the infected parts seems so far the only way of checking the spreading of the disease. This disease was without doubt imported with plants from eastern Asia, as the disease has been discovered recently in China on *C. mollissima*. The latter species and *C. crenata* seem much more resistant than the American and European varieties and there is much hope for a successful selection and breeding of resistant varieties and for keeping this disease under control, as it is done successfully in China.

*C. dentata* and *C. sativa* are large-sized trees, while *C. pumila* and *C. crenata* usually remain shrubby. The coarse-grained wood is much used for furniture, railway ties and fence-posts, as it is very durable in the soil. The chestnut is extensively cultivated in Europe and eastern Asia and also in this country for its edible fruit. It grows best in well-drained soil on sunny slopes, and even in rather dry and rocky situations, but dislikes limestone soil. The American species is perfectly hardy North, while the European species is somewhat tenderer.

Propagated by seeds, sown in fall where there is no danger of them being eaten by mice or squirrels; otherwise they should be stratified in boxes and

833. *Castanea dentata*.  
( $\times \frac{1}{2}$ )

buried 1 or 2 feet deep in a warm soil until early spring, when they are sown in rows about 3 inches deep. If growing well, they can be transplanted the following fall or spring 2 or 3 feet apart from each other, and planted after three or four years where they are to stand. They are also increased by layers in moist soil. Varieties are usually worked on seedling stock or on sprouts by whipgrafting above the ground when the stock is just beginning to push into leaf. Crown-grafting, root-grafting and budding are also sometimes practised, but no method gives wholly satisfactory results, and usually only one-half take well. See *Chestnut*.

A. Nuts 2 or more in one involucre and more or less compressed, usually broader than high.

B. Branchlets glabrous or at first with close white tomentum: lvs. usually glabrous at maturity, often with close white tomentum while young.

C. Lvs. glabrous or nearly glabrous even while young.

**dentata**, Borkh. (*C. americana*, Raf.). Fig. 833. Tree, occasionally 100 ft.: lvs. cuneate at the base, oblong-lanceolate, acuminate, coarsely serrate, nearly glabrous when young, 6-10 in. long and somewhat pendulous: fls. of heavy fragrance, in June or July: nuts about  $\frac{1}{2}$  in. wide. S. Maine to Mich., south to Ala. and Miss. S.S. 9:440-1. Em. 187. G.F. 10:373. F.E. 14, p. 30; 29, p. 895.—The tallest, most vigorous-growing and hardest species. The nuts, though smaller, have a better flavor than the European varieties. Lvs. said to have sedative properties; used in whooping-cough; bark astringent, tonic, febrifuge.

cc. Lvs. stellate-tomentose beneath while young.

**sativa**, Mill. (*C. vesca*, Gaertn. *C. Castanea*, Karst. *C. vulgaris*, Lam.). Fig. 834. Tree, 50-80 ft.: lvs. oblong-lanceolate, often truncate or rounded at the base, coarsely serrate, slightly pubescent or tomentose beneath when young, nearly glabrous at length, 5-9 in. long, erect: nut over 1 in. wide. June. From S. Eu. and N. Afr. to China. Gn. 27, p. 292; 50, p. 389. Gng. 3:209. G.W. 8, p. 350, 385.—There are some garden forms with variegated lvs., and others, of which var. **asplenifolia**, Lodd., with laciniately cut and divided lvs. is the most remarkable. Of several varieties cult. for their fr., Paragon, a precocious kind, and Numbo, a variety with very large fr., are the most extensively planted in this country. See *Chestnut*.

**crenata**, Sieb. & Zucc. (*C. japonica*, Blume. *C. sativa* var. *pubinervis*, Makino). Fig. 835. Shrub or tree, to 30 ft.: lvs. elliptic or oblong-lanceolate, usually rounded at the base, acuminate, crenately serrate, or the teeth reduced to a long, bristle-like point, slightly pubescent when young, glabrous at length or only pubescent on the veins beneath, 3-7 in. long, erect: nut over 1 in. wide. Japan, China. S. I. F. 1:34.—Shrubby and very precocious; it usually begins to fruit when about six years old. Hardy as far north as Mass.

834. *Castanea sativa*.  
( $\times \frac{1}{2}$ )

BB. Branchlets pubescent, with spreading hairs: lvs. soft-pubescent beneath, at least those toward the end of the shoots.

**mollissima**, Blume. Tree, to 40 ft.: lvs. oval-oblong to oblong-lanceolate, acuminate or short-acuminate, rounded or truncate at the base,  $3\frac{1}{2}$ -6 in. long, coarsely serrate, glabrous above, white-tomentose or nearly green, but soft-pubescent beneath, at least on the veins: petioles pubescent, with spreading hairs: nut about 1 in. wide; spines of the husk pubescent. N. and W. China.—Has proved perfectly hardy at the Arnold Arboretum and is to be recommended for its hardiness and large nuts.

AA. Nuts solitary, round, higher than thick.

**pumila**, Mill. CHINQUAPIN. Shrub or small tree, rarely 50 ft.: lvs. cuneate, elliptic-oblong or oblong-obovate, acute, serrate, teeth often reduced to bristle-like points, white-tomentose beneath, 3-5 in. long: fr. ovate, small, about  $\frac{1}{2}$  in. wide and  $\frac{3}{4}$ -1 in. long. May, June. From Pa. to N. Fla. and Texas. S.S. 9:442-3.—Useful for planting on dry and rocky slopes; attractive when in fl., and again in fall with its abundant light green burs among the dark foliage. The closely allied *C. alnifolia*, Nutt., in the southern states, grows only a few feet high, and has larger lvs. and fr.

**Vilmoriniana**, Dode. Tree, to 80 ft.: branchlets glabrous: lvs. oblong-lanceolate to lanceolate, long-acuminate, usually rounded at the base, the teeth mostly reduced to slender bristles, quite glabrous even while young, 4-7 in. long: fr. globose-ovate, about  $\frac{1}{2}$  in. thick and slightly longer. Cent. China.—A valuable timber tree. Recently intro. by the Arnold Arboretum.

ALFRED REHDER.

CASTANEA of commerce: The nuts of *Bertholletia*.

**CASTANOPSIS** (*Castanea* and *opsis*, chestnut-like) *Fagaceæ*. Ornamental trees or shrubs sometimes cultivated for their handsome evergreen foliage.

Closely allied to *Castanea*, but pistillate fls. usually on separate catkins, sometimes solitary; ovary 3-celled. fr. ripening the second year: involucre sometimes tuberculate; winter-buds with many scales; terminal bud present: lvs. evergreen, entire or dentate.—About 25 species, chiefly in the tropical and subtropical mountains of Asia, and 1 in W. N. Amer., which is the hardest, and is sometimes cult.; also several Chinese species have been recently intro. into cult., but their names have not yet been determined. For prop. see *Castanea*.

**chrysophylla**, DC. (*Castanea chrysophylla*, Hook.). Fig. 836 (adapted from Pacific R. R. Rep.). Tree, to 150 ft., shrubby at high elevations: lvs. ovate-oblong or oblong-lanceolate, narrowed at both ends, entire, dark green above, coated with minute golden yellow scales beneath, 2-6 in. long: nut about  $\frac{1}{2}$  in. wide, usually solitary in the spiny involucre. Summer. Ore. to Calif. S.S. 9:439. B.M. 4953. G.C. III. 22:411; 36:145. Gn. 76, p. 634. F.S. 12:1184. R.B. 7:240.—A highly

835.  
Japanese Chestnut—  
*Castanea crenata*.  
( $\times \frac{1}{2}$ )

ornamental tree with beautiful foliage, hardy only in the warmer temperate regions, but the shrubby form is much hardier.

ALFRED REHDER.

**CATANOSPÉRMUM** (*chestnut seed*, because of the taste of the seeds). *Leguminosæ*. A genus of 2 species, one of which is a tall Australian tree, with odd-pinnate lvs., the lfts. broad, thick, entire: fls. large, yellow-orange, in lateral or axillary loose racemes which are usually about 5 in. long; petals 4; stamens free; ovary long-stipitate, many-ovuled: pod 8-9 in. long with 4-5 seeds larger than Italian chestnuts, globular. *C. australe*, Cunn., is the species known locally

836. *Castanopsis chrysophylla*. ( $\times \frac{1}{4}$ )

as "Moreton Bay chestnut." The seeds are roasted and eaten. Intro. in S. Calif., but not common. The other species is New Caledonian, and apparently not in cult.

**CASTILLÈJA** (a Spanish botanist, D. Castillejo). *Scrophulariææ*. PAINTED-CUP. Herbs with showy bracts in a terminal head or spike, sometimes cultivated.

Flowers small, solitary, in terminal gaudy-bracted spikes; corolla tubular, sometimes flattened laterally, 2-lipped; lower lip smaller, more or less 3-toothed; stamens 4: lvs. alternate, entire or cut—Upwards of 30 species in U. S. and Mex., and 1 in N. Asia. Castillejas are little known in gardens. They are more or less root-parasitic.

*coccinea*, Spreng. Biennial or annual, 1-2 ft., hairy: radical lvs. clustered, ovate or oblong, mostly entire; st.-lvs. lacinate or cleft, and the middle lobe of the bright scarlet bracts dilated: corolla pale yellow, about the length of the calyx. Low grounds and grassy places, Canada, south.

*indivisa*, Engelm. Annual, 1-2 ft.: lvs. lance-linear and entire (or sometimes 2-3-lobed): bracts not lacinate, bright red and showy. Texas.—Blossoms early in spring.

*affinis*, Hook & Arn. Perennial, 1-2 ft.: lvs. narrow-lanceolate, entire or the upper ones toothed at apex: fl.-bracts becoming short and broad, red: spike lax below. Calif., in moist soils.—Intro. 1891 by Orcutt.

*foliolosa*, Hook. & Arn. White-woolly perennial, 1-2 ft., the base woody: lvs. small (1 in. or less long), narrow-linear, crowded or fascicled: bracts 3-parted; spike dense. Calif., in dry soils.—Intro. 1891 by Orcutt.

*integra*, Gray. Perennial, 1 ft. or less, tomentose: lvs. grayish, linear, 3 in. or less long, entire: bracts of the short spike linear-oblong or obovate-oblong, entire or sometimes incised, red or rose. Texas to Ariz. and Colo.—Has been offered in Germany.

L. H. B.

**CASTILLÒA** (for Castillejo, the Spanish botanist). *Morææ*. Laticiferous trees, of which *C. elastica* Cerv., is one of the important rubber-producing plants. There are 2 or 3 species, in Cuba and Cent. Amer. Lvs. alternate, short-petioled, often large, entire or toothed: plant monœcious, the sexes borne in the same cluster; sterile fl. with no perianth, stamens numerous and crowded, with scales intermixed; fertile fls. with 4-lobed perianth, including the short-styled ovary: fr. a crustaceous pericarp containing a pendulous seed. The cult. of *C. elastica* for rubber is described in *Cyclo. Amer. Agric.*, Vol. II, p. 557.

**CASTOR BEAN, CASTOR-OIL PLANT:** *Ricinus*.

**CASUARINA** (said to be derived from *Casuarus*, the Cassowary, from resemblance of the branches to the feathers). *Casuarinææ*. BEEFWOOD. SHE-OAK. Odd slender-branched leafless trees and shrubs grown in warm regions and rarely seen under glass. They are thintopped trees of striking appearance.

Casuarinas are usually classified near the walnut and hickory tribes, although very unlike them—other known plants—in botanical characters. They are jointed and leafless plants, somewhat suggesting equisetums in gross appearance. Flowers are unisexual; staminate in cylindrical terminal spikes, each fl. consisting of a stamen inclosed in 4 scales, 2 of the scales being attached to the filament; pistillate fls. in dense heads borne in the axils, and ripening into globular or oblong cones, composed of 1-ovuled ovaries subtended by bracts: fr. a winged nutlet.—About 25 species in Austral., New Caledonia and E. Indies. The species fall into 2 groups, those having cylindrical and verticillate branches, and those having 4-angled and only imperfectly verticillate branches. The species bear small toothed sheaths at the joints.

Beefwood is planted in the extreme South for its very odd habit, and also to hold sands of the seacoast. The wood burns quickly, and is very hard and durable. The redness of the wood has given the popular name, beefwood.—The species are remarkable for rapid growth. They grow well in brackish and alkaline soils. Propagated by seeds and by cuttings of partly ripened wood.

*equisetifolia*, Linn. Fig. 837. Tree, becoming 150 ft. high in favorable climates, and a most rapid grower: branches drooping, pale green, simple, terete or nearly so, the internodes very short (less than  $\frac{1}{4}$  in.); sheath-teeth 7 (6-8) lanceolate and appressed: staminate cone nearly terete; pistillate cone short-peduncled, ellipsoid, about  $\frac{1}{2}$  in. diam. Widely distributed in the farther Old World tropics, and the best-known species in this country (in S. Fla. and Calif. and south). Gn. M. 7:21. L.B.C. 7:607.—The wood is valuable for many purposes. The casuarinas are known as "oak" in Austral.

837. *Casuarina equisetifolia*. ( $\times \frac{1}{2}$ )

**Cunninghamiana**, Miq. Tree with slender branches, much like *C. equisetifolia*, but cones smaller, about  $\frac{1}{3}$  in. diam., globular and very irregular, with prominent valves. Austral.—Described as a rapid-growing tree in Calif., with strong and dense growth and numerous fine branches with very short internodes.

**stricta**, Dry. (*C. quadrivalvis*, Labill.). Becoming 20–30 ft. high: branches erect, simple, 6–7-angled, scarcely green, internodes short, as in the latter: sheath-teeth usually 7, ovate-lanceolate and appressed: staminate cone slender; pistillate cone nearly sessile, oblong (sometimes staminate above), about 14-sided, 1 in. diam. Austral. Gn.M. 7:21.

**torulosa**, Dry. (*C. tenuissima*, Sieber). Reaches 70 or 80 ft.: branches erect, capillary, mostly terete, internodes short: sheath-teeth 4, very short, triangular appressed: staminate cones filiform; pistillate cones ellipsoidal, 8–10-sided. Austral.

**sumatrana**, Jungh. Shrub with dense very slender branches which are sharply angled, the internodes often very short, the sheath-teeth short: cone large, elliptical or globose, the valves thick and concave-truncate at apex. Sumatra.—Offered in England, and the branches said to be useful for bouquets; very much branched.

L. H. B.

**CATÁLPA** (the Indian name of *C. bignonioides*). *Bignoniaceæ*. Ornamental trees, often cultivated for their handsome flowers appearing in large and showy panicles in summer, and for their heavy foliage.

Leaves usually deciduous, opposite, long-petioled, entire or coarsely lobed: fls. in terminal panicles; calyx splitting irregularly or 2-lipped; corolla campanulate, 2-lipped, with 2 smaller upper and 3 larger lower lobes; fertile stamens 2, curved, with diverging anther-sacs, not exceeding the tube of the corolla; style 2-lobed at the apex, slightly longer than the stamens: fr. a very long cylindrical caps., separating into 2 valves, with numerous small oblong compressed seeds bearing a tuft of white hairs on each end.—About 10 species in N. Amer., W. India and E. Asia, of which 6 are hardy in the northern temperate regions.

Catalpas are deciduous or rarely evergreen trees with opposite or sometimes whorled, long-petioled, large

838. *Catalpa ovata* in fruit.  
( $\times \frac{1}{6}$ )

and simple leaves emitting in most species a disagreeable odor when bruised, and with white, pinkish or yellowish flowers in large and showy panicles followed by very long and narrow cylindrical pods.

The coarse-grained and soft wood is very durable in the ground, and, therefore, much valued for fence-posts and railway ties. *Catalpa bignonioides* and particularly *C. speciosa* are sometimes planted as avenue trees. For formal gardens, if low round-headed trees are desired, *C. bignonioides* var. *nana* is to be recommended. They

grow in almost any somewhat moist soil, and are hardy as far north as New England. Propagated by seeds sown in spring, in the North, best with slight bottom heat, or by cuttings from ripe wood, the varieties often by softwood cuttings in early summer or by grafting on seedlings or on roots under glass in spring; also increased sometimes by layers and root cuttings.

A. Infl. paniculate: lvs. usually pubescent, with simple-hairs.

B. Fls. yellow, striped inside orange and spotted dark violet, less than 1 in. long.

ovata, Don

(*C. Kaempferi*, Sieb. & Zucc. *C. Henryi*, Dode).

Fig. 838. Tree, to 20 ft.: lvs. broadly cordate-ovate, abruptly acuminate, often 3–5-lobed, nearly

glabrous at length, with reddish spots in the axils of the veins beneath, 5–8 in. long; panicles many-fl'd., 4–7 in. long, fragrant. June. China, much cult. in Japan. B.M. 6611. I.H. 9:319. L.I. 10. S.I.F. 2:71.—Hardier than the American species.

BB. Fls. white, with 2 yellow stripes inside, and spotted purplish brown,  $1\frac{1}{2}$ –2 in. long.

**bignonioides**, Walt. (*C. Catalpa*, Karst. *C. syringifolia*, Sims). **CATALPA. INDIAN BEAN.** Tree, 20–50 ft.: lvs. often whorled, cordate-ovate, abruptly acuminate, sometimes with 2 lateral lobes, pubescent beneath, 5–8 in. long, of unpleasant odor: panicles many-fl'd.; fls. about 2 in. diam., thickly spotted inside: pod 6–20 in. long,  $\frac{1}{4}$ – $\frac{1}{3}$  in. thick. June, July. Southern states, north to Tenn., often naturalized elsewhere. B.M. 1094. L.B.C. 13:1285. S.S. 6:288–9. Gng. 6:118–9. G.F. 3:537, 539. J. H. III. 32:121. G.C. III. 21:298; 29:167; 44:10, 312. F.E. 23:479. G.W. 7, p. 88. G. 23:481. G.M. 37:627. Gn. 22, p. 74; 26, p. 164–5; 33, p. 393; 36, p. 239; 66, p. 205.—Usually low tree, with very wide-spreading branches. Not much used medicinally, but pods and seeds said to possess antispasmodic, cardiac, and sedative properties: bark anthelmintic, alterative. There are some garden forms. Var. **alba**, Lav. Lvs. yellow. G.M. 53:709. Var. **nana**, Bur. (*C. Bungei*, Hort., not C. A. Mey.). Forms a dense, round bush, often grafted high. Gng. 3:195. M.D.G. 1903:616. F.E. 14, p. 31.

**speciosa**, Warder. Figs. 839, 840. (*C. cordifolia*, Jaume, partly). **WESTERN CATALPA.** Tree, to 100 ft.: lvs. cordate-ovate, long-acuminate, pubescent beneath, 8–12 in. long; panicles comparatively few-fl'd.; fls. about  $2\frac{1}{2}$  in. diam., inconspicuously spotted inside: pod  $\frac{1}{2}$ – $\frac{3}{4}$  in. thick. June. From S. Ill. and Ind. to La. and Miss. S.S. 6:290–1. R.H. 1895:136. M.D.G. 1903:229–30 (habit).—A very desirable ornamental tree, closely allied to the former, but taller and hardier. Properties similar to *C. bignonioides*. Var. **pulverulenta**, Paul & Son. Lvs. freely dotted with white or cream color. G.M. 53:30. G. 30:289. F.E. 31:319.

**hybrida**, Spaeth (*C. Teasii*, Penhall. *C. Teasiana*, Dode). **HYBRID CATALPA.** Hybrid between *C. bignonioides* and *C. ovata*. Large tree, intermediate between the parents: the lvs. resemble more those of *C. ovata*, and are purplish when unfolding, but much larger and slightly pubescent beneath, while the fls. are more like *C. bignonioides*, but smaller and with the infl. often twice as long. Originated at J. C. Teas' nursery at Baysville, Ind. G.F. 2:305. Gt. 47:1454. G.W. 3, p. 569.—A very valuable tree, flow-

839. *Catalpa speciosa*. ( $\times \frac{2}{3}$ )

ering profusely; of rapid growth and hardy. Seedlings usually resemble *C. ovata*. Var. *japónica*, Rehd. (*C. japónica*, Dode). Lvs. broader and more abruptly acuminate, nearly glabrous beneath. Var. *purpurea*, Rehd. (*C. hybrida* var. *atropurpurea*, Spaeth. *C. bigonioides* var. *purpurea*, Hort.). Lvs. dark purple when young, green at length.

AA. Infl. racemose; pedicels very slender, 1-1½ in. long, occasionally the lower ones with 2 or 3 fls.

B. Lvs. pubescent or tomentose beneath, with branched hairs.

**Fárgesii**, Bur. Tree, to 60 ft.: lvs. ovate, acuminate, rounded at the base, entire, slightly pubescent above, densely beneath, 3-6 in. long: racemes pubescent, 7-10 fld.; fls. about 1½ in. long, rosy pink with purplish brown dots in throat: pod to 2 ft. long, ¼-½ in. thick. W. China. Nouv. Arch. Mus. Paris III. 6:3.

BB. Lvs. quite glabrous.

**Ducloëxii**, Dode (*C. sulchuentensis*, Dode). Tree, to 80 ft.: lvs. ovate, acuminate, usually rounded or subcordate at the base, with purple spots in the axils of the veins beneath, 5-8 in. long and often 4 or 5 in. broad: racemes 5-15 fld., the lower branches sometimes with 2 or 3 fls.; fls. rosy pink with orange markings in throat, 1½-1¾ in. long: pod about 2 ft. long and ¼-½ in. thick. Cent. China.

**Búngei**, C. A. Mey. Small tree: lvs. narrowly triangular-ovate, entire or with 1 or few pointed teeth near the base, long-acuminate, truncate or sometimes broadly cuneate at the base, with purple spots in the axils beneath, 3-6 in. long and not over 3 in. wide: racemes 3-12 fld.; fls. white with purple spot, 1-1½ in. long: pod 12-15 in. long. N. China. Nouv. Arch. Mus. Paris III. 6:4.—Has proved perfectly hardy at the Arnold Arboretum. Var. *heterophylla*, C. A. Mey. (*C. heterophylla*, Dode). Lvs. with several pointed teeth near the base: racemes 3-5 fld.

*C. longissima*, Sims. Tree to 50 ft.: lvs. oblong-ovate, coriaceous: fls. small, white. W. Indies; often planted as shade tree in Cuba.

ALFRED REHDER.

**CATANÁNCHÉ** (Greek name, referring to ancient custom of using the plant in making love-philters). *Compositæ*. Annual or perennial garden herbs, grown for the bloom.

Leaves crowded at the base of the st., and linear or lanceolate: head long-peduncled, blue or yellow: achene oblong, ribbed and usually villous or setose: pappus of 5-7 lanceolate long-acuminate scales.—A half dozen species in the Medit. region. Of easiest cult. in any garden soil, particularly if light. Prop. by seeds and division. Useful for cutting.

**cærulea**, Linn. Perennial, 2 ft.: lvs. tomentose, lanceolate and few-toothed, 3-nerved: fl.-heads 2 in. across, with wide flat-toothed blue rays, on long slender sts. Blooms in June, July and Aug. S. Eu. B.M. 293. R.H. 1890, p. 523. G. 28:541. Gn. 42, p. 25; 55:368. Var. *álba*, Hort., has white fls. Gn. 55:368. Var. *bicolor*, Hort., has white margin and blue center. Often used as everlastings. L. H. B.

**CATASÈTUM** (Greek for *downward* or *backward*, and *bristle*). *Orchidaceæ*. Epiphytic or terrestrial orchids, requiring hothouse conditions.

Stems short fusiform: lvs. plaited, membranaceous: scapes basal; fls. in racemes, globose or expanded; labellum fleshy; column erect, provided with sensitive appendages which, when touched, cause the pollen-masses to fly out; pollinia 2. The genus includes *Monachanthus* and *Myanthus*.—There are about 50 or 60 species in the American tropics.

The flowers are in racemes or spikes, firm in texture, and white or in shades of green, yellow, brown or purple. Catasetums are not much cultivated, since most of the species are not showy, but they are interesting to

the botanist and amateur because of the striking ejection of the pollen-masses. Gardeners often have trouble with catasetums, but they are not difficult to grow if given good care. They need a high temperature, long period of rest, and free supply of water during the growing season. They are grown in both pots and baskets. Readily propagated by dividing the plants at the base; also from very ripe pseudobulbs cut in pieces and put in sand. For culture, see *Orchids*.

A. Fls. white.

**Bungerðthii**, N. E. Br. Sts. 8-9 in. tall: sepals larger than the petals, nearly 2 in. long; labellum tending toward concave, roundish; appendages thickish. Ecuador. B.M. 6998. G.C. III. 1:142. I.H. 37:117; 34:10. Gn. 33:388. A.F. 6:633.—A striking plant.

840. *Catalpa speciosa* in fruit. (×¼)

AA. Fls. yellowish, more or less marked with brown or red.

**macrocarpum**, Rich. (*C. Claveringi*, Lindl. *C. tridentatum*, Hook.). Fls. large, nearly 3½ in. across; petals and sepals yellow, verging on green, spotted with reddish brown; labellum yellow. Guiana. B.M. 2559, 3329. I.H. 33:619. Var. *rùbrum*, Hort. A red-fld. form.

**fimbriatum**, Lindl. & Paxt. Pseudobulbs 2-3 in. long: raceme pendulous, 8- or more-fld.; fls. 2½ in. across; sepals whitish or pale yellow, closely barred with red. Brazil. B.M. 7158. A.F. 6:609. Var. *aùreum*, Hort. Fls. pale green, slightly marked with rose, center of lip deep golden yellow.

**longifolium**, Lindl. Pseudobulbs deflexed: lvs. narrow and glaucous, reaching 3 ft.: fls. on drooping, compact spikes; sepals and petals greenish yellow tipped with dull red; lip helmet-like, orange-yellow. Guiana.—Epiphyte.

AAA. Fls. essentially red or brownish.

**decipiens**, Reichb. f. Fls. 1½ in. across; sepals and petals lanceolate, red-brown and spotted; lip saccate, yellowish outside and red-brown inside. Venezuela. A.F. 6:609.

AAAA. Fls. many-colored, grotesque.

**Gnòmus**, André. Pseudobulb oblong-ovate and alternate, articulated: fls. in a long loose raceme on slender pedicels; sepals greenish and purple-barred; 2 lateral petals spreading, concave, purple; lip bluntly conical, olive-green spotted outside, ivory-white within, fringed above. S. Amer. I.H. 24:270. A.F. 12:293.

*C. barbàtum*, Lindl. Fls. green, blotched with purple. Guiana.—*C. callòsum*, Lindl. Odd: fls. with chocolate-brown, narrow-lanceolate sepals and petals; lip greenish, speckled with red. Venezuela. B.M. 4219, 6648.—*C. Christyànum*, Reichb. f. Sepals and petals usually chocolate; lip greenish yellow, purple fringed. S. Amer. (?) G.C. III. 18:617. B.M. 8007.—*C. Claessianum*, Lindl. & Cogn. Fls. greenish yellow; lip fringed along sides. Brazil. G.C. III. 44:211.—*C. Cliftonii*, Hort. Probably a form of *C. Bungerothii*. G.M. 54:593 (desc.).—*C. Còlmanizæ*, Hort. Fine yellow fl. with 3-lobed lip stained with deep crimson.—*C. discolor*, Lindl. Fls. purple. An old sort, now rarely seen. Brazil.—*C. eburneum*, Rolfe.

**Fls.** ivory-white; sac of lip deep yellow. Colombia.—*C. Garnettianum*, Rolfe. Allied to *C. barbatum*. Fls. small; sepals and petals very narrow, green, with large bars of red-brown; lip white, fringed. Amazon. B.M. 7069.—*C. imperiale*, Lind. & Cogn. Sepals and petals ovate-acute, white, purple-spotted; lip orbicular-cordate, purple in center and white-margined. G.C. III. 17:329. S.H. 1, p. 369. J.H. III. 30:25.—*C. labiatum*, Rodr. Scapes  $1\frac{1}{2}$  ft. long, the male 10-fld., female 2-fld. Organ Mts. *C. Lindeni*, Cogn. Fls. large (as of *C. Bungeirothii*); sepals and petals yellow, with purplish spots and bars; lip yellow, spotted at base. G.C. III. 17:329. S.H. 1, p. 369.—*C. maculatum*, Kunth. Sepals acuminate, spotted with claret; petals broader, red-blotched; lip yellowish green outside, dark brown within. Colombia and Nicaragua.—*C. mirabile*, Cogn. Fls. very large, the sepals and petals oblong-lanceolate, and yellowish, with purple spots and bars; lip kidney-shaped, bright yellow with 2 purple spots, toothed. G.C. III. 17:329. S.H. 1, p. 369.—*C. monodon*, Kränzl. Spike long with 6-8 greenish fls.; lip flat, with fringes along border. Brazil. G.C. III. 35:354 (desc.).—*C. pileatum*, Reichb., var. *aureum*, Hort. Fls. creamy white, shaded with greenish yellow. G.M. 47:829, 831.—*C. quadridentis*, Rolfe. Fls. with pair of short, acute teeth situated at lower angles of abortive stigma.—*C. Rhamphastos*, Hort. Raceme few-fld., up to 10 in. long; fls. pale green. Andes of Colombia.—*C. Scirra*, Reichb. f. Compact: fls. fragrant, yellowish white, green-veined; lip 3-lobed. Guiana. G.C. II. 7:304-5.—*C. spinosum*, Lindl. (*Myanthus spinosus*, Hook.). Lip spreading, with succulent hairs, bearing on upper side at base an erect 3-partite spine and a much larger one below the acumen. Brazil. B.M. 3802.—*C. splendens*, Cogn. Intermediate between *C. Bungeirothii* and *C. macrocarpum*. Sepals greenish white with purplish center; petals white with many purple spots; lip cream-color, purple-marked. Runs into many forms: var. *album*, Lind. & Cogn., white or nearly so. Var. *Aliciae*, Lind. & Cogn. Fls. large; sepals and petals purplish; lip white, toothed. Var. *aureo-maculatum*, Bossch. Yellow. I.H. 43:54. Var. *atropurpureum*, Hort. Blackish purple.—*C. tenebrosum*, Kränzl. Fls. almost black, very spreading. Peru. G.C. III. 48:229 (desc.).—*A. Tracayanum*, Hort. A provisional name for a distinct species with whitish green fls.—*C. viridi-flavum*, Hook. Fls. green, the lip conic, yellow inside. Cent. Amer. B.M. 4017.—*C. Warscewiczii*, Lindl. & Paxt. From Panama. Now rarely seen.

OAKES AMES.

L. H. B.†

CATCHFLY: *Silene*.CATECHU: *Acacia Catechu*; *Areca Catechu*.

**CATERPILLARS.** The worm-like pods of *Scorpiurus vermiculata*, Linn., *S. subvillosa*, Linn., and others (*Leguminosæ*), are sometimes used as surprises in salads and soups; and for that purpose they are cultivated in parts of Europe, and seeds are sold in this country. They are sometimes catalogued as Worms. They are annuals of the easiest culture. The pods of *Medicago scutellata*, Mill., and others are known as Snails. The pods are not edible. European plants. A.G. 13:681.

L. H. B.

**CATESBÆA** (Mark Catesby, 1679-1749, author of natural histories of parts of N. Amer.). *Rubiaceæ*. Spiny shrubs of the W. Indies and one (*B. parviflora*) reaching the coast of Fla., of 6 species, one of which is offered in the trade: lvs. small, opposite or fasciculate, mostly ovate or oblong: fls. axillary and solitary, white, sometimes showy, 4-merous; corolla funnel-shaped, with short lobes; stamens 4, inserted deep in the tube: fr. a globular berry. *C. spinosa*, Linn., offered in Fla., is a slow-growing evergreen shrub from the W. Indies: lvs. ovate to obovate, nearly as long as the straight spines: fls. yellow, large and conspicuous, the corolla-tube tapering down to the middle and then very narrow or filiform, the segms. much shorter than the tube: berry ovoid, yellow, edible.—Recommended for hedges.

L. H. B.

**CĀTHA** (Arabian name). *Celastraceæ*. One evergreen spineless shrub of Arabia and Afr., and cult. in warm countries for the lvs., which are said to possess sustaining and recuperative properties and which are eaten by the Arabs or used in the preparation of a beverage. *C. edulis*, Forsk. (*Celastrus edulis*, Vahl). KHAT. CAFTA. Glabrous, to 10 ft.: lvs. opposite, or on the leafy shoots alternate, thick, narrowly elliptic or oval-oblancoate, serrate, narrowed to the short petiole, 4 in. or less long: fls. small, white, in short axillary clusters; calyx 5-lobed; petals 5; stamens 5, borne on a disk: fr. an oblong or clavate caps., 3-valved, 1-3-

seeded,  $\frac{1}{3}$  in. long.—Recently offered in this country. The twigs and lvs. are an object of commerce in Arabia.

L. H. B.

CATMINT or CATNIP: *Nepeta*.

**CATÓPSIS** (Greek compound, of obscure application). *Bromeliaceæ*. Fifteen or more species in Trop. Amer., with strap-shaped or lanceolate mostly rosulate lvs. and spikes or racemes of white or yellow fls. terminating a scape, very little known in cult.: sepals and petals separate to base; stamens shorter than the calyx; stigma subsessile. They require the cultural conditions of the erect tillandsias. *C. nitida*, Griseb. (*Tillandsia nitida*, Hook.), from W. Indies and S., is 6-18 in. tall, with oblong-mucronate shining green lvs. in rosettes, and white fls. in slender spikes. *C. penduliflora*, Wright, from Peru, is recently intro., with oblong-elliptic lvs. (6 in. long) in a rosette and with thin denticulate margins, and white pendulous short-stalked fls. on a racemously branched scape  $1\frac{1}{2}$  ft. high.

CAT-TAIL: *Typha*.

**CATTLEYA** (William Cattley, an early English horticulturist and naturalist). *Orchidaceæ*. Epiphytic orchids, requiring intermediate temperatures.

Pseudobulbs ovoid, clavate, fusiform or cylindric, short or elongated, smooth or furrowed, bearing 1-3 lvs.: lvs. coriaceous: fls. single or in clusters, borne usually at the apex of the pseudobulb, rarely on a leafy st. arising from the base of the pseudobulb, showy; sepals and petals similar or the petals much broader, membranous or fleshy; lip usually 3-lobed; lateral lobes commonly forming a tube inclosing the column, rarely the lateral lobes small; column clavate, fleshy; pollinia 4.—A genus of about 40 species, natives of continental Trop. Amer., especially numerous in Brazil and in the Andean region. Innumerable hybrids and horticultural forms have been named, those of the labiata group alone running into hundreds. Showiest of all orchids, and of great commercial value.

The growing of cattleyas.

The cattleyas are indigenous to the western hemisphere only, Central and South America being the regions in which they abound, particularly in the latter, from the different countries of which large quantities are imported yearly. During the last few years the collecting and importing of cattleyas into the United States has assumed large proportions, owing to a continually and steadily increased demand, not only by amateurs but also by the trade in general. There are two particular reasons for this increased demand: first, the exquisitely beautiful flowers, combined with size and marvelous colors adapted for decorations at all sorts of functions, are never out of place; second, their easy culture. Florists and amateurs alike are beginning to realize that, after all, orchids are plants, and if only treated in a commonsense way they are by far easier to grow than a good many other plants, and especially so the cattleyas, provided some attention is paid to their requirements.

Cattleyas, as a whole, delight in a genial atmosphere, with all the air possible when the outside temperature will permit. In summer, from May on to the end of October, air should be admitted day and night; thus there are no temperatures to be prescribed for these months. Later, when artificial heat has to be depended on, 50° to 55° at night is the best, bearing in mind that the earliest species to flower may be kept at the warmer end, and the later summer-blooming species, such as *C. Mossiæ* and *C. gigas*, may be wintered at the cooler end of the structure; thus beginning in autumn with *C. labiata*, *C. Percivaliana*, *C. Trianae*, *C. Schraederæ*, *C. Mossiæ*, *C. Mendelii*; and, last of all, *C. gigas*, in their regular order of bloom, these may be treated according to their season of flowering. One cannot change the

XXIII. *Cattleya Lawrenceana*.

time of blooming of a cattleya, that is to say force it as other plants may be forced, without injury to the plants and a poor quality of bloom, but they are often retarded by systematic cooler treatment.

The best potting material is the soft brown osmundine, used alone with no sphagnum moss unless it is possible to make this moss live, and even then it is of no value to the plants except as an index to the presence of moisture. Moss that is dead and inert is a detriment in the potting material of all orchids. The one imperative thing in the potting of cattleyas is that they be made perfectly firm in their receptacles; if loose potting is practised, the young roots are injured each time the plant is handled, and the material is like a sponge, holding too much moisture in suspension for the plants to do well, and, given a time when the roots do not dry out quickly, all will soon die.

Newly imported cattleyas, as they arrive from South America, are usually much dried up, due to the treatment given before shipment to avoid loss by decay or fermentation on the way. If the plants are washed well with soap and water, placed in an airy shaded house for a few weeks and allowed to plump up again, roots will soon be seen starting. At this time, pot each piece in a receptacle suitable to the size of the plant (never let it be too large, but always err on the minimum when in doubt), fill the pots half full of drainage if common flower-pots are used, and fill up with osmundine to the top, pressing this material in with a blunt-pointed stick so that the plant will be firm. Moisture from this time on for weeks may be applied by spraying overhead during bright days. If the pieces are large, baskets are preferable to pots, as there is more aëration through the material and the plants may be suspended and space economized. Newly established plants often bloom the first year, and one may get an idea of the infinite variety found among the plants, as no two are alike. Some districts known to collectors produce better forms than others, in fact, in certain localities, the plants found produce flowers of very inferior quality. It is becoming more difficult to collect orchids, especially cattleyas from their native habitats, transportation not having improved and the distance to travel being greater each time. In consequence of this, hybridizers are now turning their attention to the reproduction of fine forms true to themselves, with considerable success, and should the supply of wild plants fail, there cannot now, in view of the well-understood and successful methods of raising cattleyas, be a time when the plants will be unobtainable. Considering the variation found among the wild plants, it is to be expected that home-raised seedlings will vary; but if the best-known forms are used, and these only are worth the trial, one may expect a large measure of success.

In our climate there is no period when the cattleyas should be kept dry at the roots. The plants are either getting ready to bloom, in crop, or recuperating therefrom, and these three periods cover the year. One does not have to resort to drying to attain ripening as do the European cultivators, and failure here is often traceable to foreign training or text-books.

Established plants should be repotted at least every second year. This is as long as the osmundine will remain suitable for the roots to ramify in, and if the plants are grown in pots, immerse the same a day before if the roots are dry, or most of them will remain attached to the pots. Remove all decayed portions of material and roots, wash with clean water, and repot as with newly imported plants, remembering always that a size too large often proves fatal to success. Plants that have been newly potted must not be placed among others that have not received attention, but all should be put in a situation in which they can be treated to little water at the roots for several weeks until the weather is such that there is no danger of their becoming overwatered. Cattleyas should be attended to in

this respect in the winter months, taking first *C. labiata*, as it is the first to start growing, then *C. Trianae*; the later kinds may be potted before flowering with less injury than afterwards, if done with care.

In hot weather, cattleyas should always be watered in the evening or latter part of the day. A generous spraying overhead will supply the moisture at a time when the roots get most of it, as may be seen by an examination in early morning. There is no danger of injury if an abundance of air is supplied. One has only to be careful during such times as the atmosphere outside is surcharged with moisture, then it is wise not to use any moisture inside even for a week at a time. This is when the dreaded "black spot" disease is often seen. It usually begins at the union of leaf and bulb, and when first seen, amputation must be practised to a point below infection, and dry sulfur and powdered charcoal applied at once as an absorbent. A small can of this ought always to be ready to hand, for if the disease gets down to the rhizome, several bulbs will be affected at once, and it is often difficult to save the plant. The disease is also highly infectious and may easily be transmitted to a healthy plant by means of a knife used to cut off diseased parts of another.

841. *Cattleya Mendelii*.

Apart from seeds, the propagation of cattleyas is a slow process to be accomplished only by the cutting of the rhizome between the bulbs, leaving at least three of the leading ones and separating the older ones according to their strength or the dormant buds at the base that are visible. A clean cut or notch that almost severs the rhizome is the best, leaving the parts where they are until new growth and roots are made, then potting in small receptacles, wiring or staking the little pieces firmly. Apart from the three last-made bulbs on the rhizome, the older ones are a source of weakness to the plants and are better removed, and in the case of valuable forms utilized as above. This is the way all duplicates of the many albino varieties have been obtained. There are many white cattleyas bearing the same name, as *C. Trianae alba* or *C. Mossiae Wagneri*, for many have appeared among importations, but these differ in each individual and unless a plant is increased by division one cannot be sure of the same thing.

Opinions are divided as to the "feeding" of orchids. It is certain that when rain-water is saved in cisterns for the plants, and these happen to be in the vicinity of cities where soot collects on the roofs of the houses, the

plants show unusual vigor and in consequence of this, many have practised the use of fertilizers in exceedingly dilute proportions in all the water used on the plants, and some have had surprising results. The temptation, however, is always present to feel that if a little is good, more would be better, and herein lies the danger. When plant-foods are used in solution, they should be considered only as sufficient to make the difference between rain-water and that which comes out of a pipe.

The best twelve varieties of cattleyas for commercial purposes, and, indeed, for amateurs also, are the following: *C. Trianae*, fls. Jan.-March; *C. Schroederæ*, fls. March, Apr.; *C. Mossiæ*, fls. April, May; *C. Mendelii*, fls. Apr., May; *C. Warneri*, fls. May, June; *C. gigas*, fls. June, July; *C. aurea*, fls. June, July; *C. Gaskelliana*, fls. Aug., Sept.; *C. Harrisoniana*, fls. Sept., Oct.; *C. labiata*, fls. Oct., Nov.; *C. Bowringiana*, fls. Oct., Nov.; *C. Percivaliana*, fls. Dec.

With a number of plants of each of the above kinds, it will be seen that it is possible to have a succession of flowers from one end of the year to the other.

E. O. ORPET and JOHN E. LAGER.

The following American trade names belong to Lælia: *C. crispa*, *C. lobata*, *C. marginata*, *C. pumila*. See, also, the list of hybrids at the close of *Cattleya*. For *C. aurantiaca*, see *Epidendrum*.

The cattleyas enter into various generic hybrids: consult, for example, *Brassocattlælia*, *Brassocattleya*, *Brasso-Lælia-Cattleya*, *Epicattleya*, *Læliocattleya*.

Of several of the following species, there are named varieties in the American trade, varying in stature, habit and particularly in the color of the flowers.

#### KEY TO THE SPECIES.

- A. Infl. terminal.  
B. Lateral lobes of lip small or wanting, the column exposed.  
C. Peduncles 1-2-fl., from a very short spathe or naked: pseudobulb fusiform, short..... 1. Aclandiae  
CC. Peduncles many-fl., from a large spathe: pseudobulbs long..... 2. bicolor  
BB. Lateral lobes of lip large.  
C. Corners recurved, exposing column. 3. dolosa  
CC. Corners not recurved, concealing column.  
D. Pseudobulbs 1-lvd.  
E. Plants large: pseudobulbs fusiform or clavate: fls. large.  
F. Sepals and petals yellow; lip ample, rich purple, beautifully veined and reticulated with gold..... 4. Dowiana  
FF. Sepals and petals not yellow.  
G. Petals about twice as broad as the sepals which are markedly undulate.  
H. Tube narrowly cylindric, the limb not striped.... 5. Lawrenceana  
HH. Tube cylindric-funnelform, the limb bordered with white and streaked with darker color, with a median yellow line.... 6. maxima  
GG. Petals 3 times or more as broad as the sepals which are not undulate or but slightly so.  
H. Lip with a large orange blotch in the center, surrounded by circles of white and purple in order..... 7. Eldorado  
HH. Lip with other color arrangement.  
I. The lip about as wide as or wider than the petals.  
J. Tube of lip yellow; sepals and petals white..... 8. Rex  
JJ. Tube white or colored other than yellow.  
K. Border of limb white, the center bright purple variegated with violet..... 9. Mossiæ  
KK. Limb without white border.  
L. Throat with a yellow or white eye on each side..... 10. Luddemanniana  
LL. Throat without eye.  
M. Color of tube white, or the same as petals; limb purple-crimson.... 11. Mendelii  
MM. Color of tube and limb bright purple; throat with 2 yellow spots... 12. Warszewiczii  
N. The lip narrower than petals.  
J. Limb much shorter than the tube, the margin relatively but little crisped..... 13. Trianae  
JJ. Limb about as long as the tube, the margin much crisped.  
K. Throat with a golden eye on each side.... 14. labiata  
KK. Throat without eye.  
L. Margin of limb different in color from the center.  
M. Petals longer than the sepals and lip; fls. 4½-5 in. across..... 15. Percivaliana

## KEY TO THE SPECIES, continued

- H. Middle lobe much broader than the tube; sepals and petals spotted.....31. *Schilleriana*
- HH. Middle lobe not broader than the tube; sepals and petals not spotted.....32. *Forbesii*
- AA. Infl. from the base of the pseudobulb.
- B. Pseudobulbs 1-lvd.: lateral lobes of lip separated, exposing column....33. *Walkeriana*
- BB. Pseudobulbs 2-lvd.: lateral lobes of lip forming a tube, concealing column.....34. *nobilior*

1. *Aclándiæ*, Lindl. Sts. 4-5 in. tall, bearing 2 or 3 lvs. 2-3 in. long; peduncle with 1 or 2 fls. 3-4 in. across; sepals and petals similar, obtuse, greenish yellow, marked with spots of black-brown; lip fleshy in the middle, somewhat fiddle-shaped, the lateral lobes small, curved over the column, the middle lobe large, broadly reniform, undulate, rose-purple with darker veins. Brazil. B.M. 5039. C.O. 23. There is a var. *nigréscens*.

2. *bicolor*, Lindl. Pseudobulbs cylindric, deeply striate, 1-3 ft. tall, 2-lvd.: lvs. 4-6 in. long, oblong-lanceolate; peduncle with 2-6 fragrant fls. 3-4 in. across; sepals oblong, acute, usually olive or bronze-green, the lateral falcate; petals like the sepals but undulate;

lip crimson-purple, sometimes white-margined, the lateral lobes wanting, the middle lobe recurved, oblong-cuneate, bilobed, channeled in the center. Brazil. B.M. 4909. C.O. 10. O.R. 10:305.

3. *dolôsa*, Reichb. (*C. Walkeriana* var. *dolôsa*, Veitch). Pseudobulbs 4-6 in. long, usually 2-lvd., the lvs. oblong; peduncle 1- or 2-fld.; sepals and petals acute, rose-purple to lilac, the sepals oblong-lanceolate, the petals cuneate-ovate; lip 3-lobed, the lateral lobes erect, the middle lobe reniform, emarginate, amethyst-purple. Brazil. G.C. II. 5:430-1. V.O. 2:49. A.G. 11:159.

4. *Dowiâna*, Batem. (*C. labiata* var. *Dowiâna*, Veitch). Pseudobulbs up to 1 ft. tall, furrowed, 1-lvd.: lvs. up to 1 ft. long; peduncle 2-6-fld.; fls. 6-7 in. across; sepals and petals nankeen-yellow, the sepals lanceolate, acute, less than half as wide as the undulate petals; lip ample, about as long as the petals, the tube yellow, striped with purple, the limb crisped, velvety, dark purple, finely and beautifully veined with golden lines which radiate from the median lines. R.H. 1869:30. A.F. 25:593; 21:838; 30:1078. C.L.A. 11:45; 19:343. Costa Rica, where it was discovered by Warszewicz.—It was rediscovered in 1864 by Mr. Arce, who sent plants to Eu., where they were purchased by Messrs. Veitch & Son, in whose establishment they flowered for the first time. Var. *aûrea*, Williams & Moore (var. *chrysotôxa*, Hort.), has the sepals and petals of a deeper yellow and the golden veins on the lip more copious and anastomosing. Colombia. A.F. 6:563; 12:10. F.R. 1:76. C.O. 2a. O.R. 19:17. Var. *jenseniana*, Hort. A large and handsome form. Var. *rosita*, Hort. Sepals creamy white, tinged with purple; petals rose-purple, tinged with yellow.

5. *Lawrenceana*, Reichb. Pseudobulbs 12-15 in. tall, fusiform-clavate, compressed, furrowed, 1-lvd.: lvs. oblong, 6-9 in. long; peduncle 5-8-fld.; fls. 4-5 in. across; sepals and petals pale rosy purple to almost white, the sepals linear-oblong, the petals elliptic-oblong, undulate, about twice as wide as the sepals; lip with a narrowly cylindric tube, colored externally like the sepals and petals, the limb purple with a maroon blotch. Brit. Guiana. B.M. 7133. R. 1:12.

6. *máxima*, Lindl. Pseudobulbs about 1 ft. tall, claviform, furrowed, compressed, 1-lvd.: lvs. oblong, 5-10 in. long; peduncle 3-6-fld.; fls. 4-5 in. across; sepals and petals lilac or pale rose, acute, the sepals lanceolate-ligulate, the petals about twice as broad as the sepals, undulate or crisped; lip as long as petals, the limb crisped, pale rose or crimson-purple with a median yellow stripe, from which radiate darker lines, the border white. Ecuador and Peru. B.M. 4902. F.S. 20:2136. F.R. 1:298. C.O. 13.

7. *Eldorâdo*, Lind. (*C. labiata* var. *Eldorâdo*, Veitch). Pseudobulbs 6-8 in. tall, stout, 1-lvd.: lvs. oblong, 8-12 in. long; peduncle with 1-3 fragrant fls. 5-6 in. across; sepals and petals pale rosy lilac passing to white, the sepals lanceolate, acute, the petals oval-rhomboid, obtuse, undulate; lip longer than lateral sepals, externally the same color as petals, the limb crisped, emarginate, a large central orange blotch surrounded by zones of white and purple. Brazil. F.S. 18:1826. C.O. 26. Var. *crocata*, Hort. Sepals and petals white or pale rose, the orange spot of lip extended in a broad line to the base. Var. *Wallisii*, Rand. (*C. Wallisii*, Lind.). Fls. pure white except golden spot on lip. C.O. 26a.

8. *Rêx*, O'Brien. Pseudobulbs 8-14 in. tall, claviform or fusiform, furrowed, 1-lvd.: lvs. up to 1 ft. long, oblong; peduncle with 3-6 fls. 6-7 in. across; sepals and petals cream-white, the sepals acutish, linear-oblong, the petals obtuse, as long as sepals but 3 times their width, oval-rhomboid, undulate; lip about as long as lateral sepals, the tube yellow, veined with purple, the limb crisped, the front part margined white surround-

ing a crimson center veined with a lighter shade. Peruvian Andes. B.M. 8377. R.H. 1894:228. C.O. 22.

9. *Móssiæ*, Hook. (*C. Carrièrei*, Houll. *C. labiata* var. *Móssiæ*, Lindl. *C. Peetersii*, André). Pseudobulbs fusiform, compressed, furrowed, 12–15 in. tall, 1-lvd.: lvs. 6–8 in. long, oblong; peduncle with 3–5 fls. 6–7 in. across; sepals and petals rose, of equal length, the sepals lanceolate, the petals oval-elliptic, crisped, especially on upper margin; lip with the tube colored like petals, the limb ample, emarginate, strongly undulate-crisped, the center purple, variegated with violet, the margin white, the throat yellow lined with purple-crimson. La Guayra. B.M. 3669. R.H. 1857, p. 322. S.H. 1:149. O.R. 18:241. C.O. 9. A.G. 14:70. A.F. 6:563. Var. *cærùlea*, Cogn., has the sepals and petals and spot on the limb a pale blue-violet. C.O. 9e. Var. *Reineckiana*, O'Brien (*C. Reineckiana*, Reichb.), has the sepals, petals and external of tube white, the limb a mauve-lilac, bordered white, the throat yellow, veined purple-violet. C.O. 9b. Var. *Wágeneri*, Veitch (*C. Wágeneri*, Reichb.), has fls. white except the small yellow spot on lip. O.R. p. 24. Var. *rouseleana*, Hort., has rosy fls. Var. *oundoniénsis*, Hort. Fls. large and richly colored. Var. *dúlcis*, Hort. Fls. rose-tinted; lip orange in center, rich rose-crimson in front, finely crimped. Var. *boelénsis*, Hort. Dark-colored form. Var. *coeléstis*, Hort. Fls. lavender-tinted. Var. *fúlgens*, Hort. Fine fls. in shape and color. Var. *Alexándræ*, Hort. Fls. pure white with tinge of rose-pink on lip. Var. *álba*, Hort. Fls. white. Var. *Goosensiana*, Hort. Lip deep reddish violet, with white crimped margin; sepals and petals white. Var. *aureòla*, Hort. Fls. large, white. Var. *Flóryæ*, Hort. Fls. pure white.—A variable group.

10. *Luddemanniæ*, Reichb. f. (*C. labiata* var. *Luddemanniæ*, Reichb. f. *C. Dawsonii*, Warner. *C. speciosissima*, Hort. *C. Roëzlii*, Reichb. f. *C. Malouana*, Lind. *C. Bassetii*, Hort.). Pseudobulbs clavate, 8–12 in. tall, 1-lvd.: lvs. oblong, 6–10 in. long; peduncle 2–5 fld.; fls. 5–6 in. across; sepals and petals rose-purple, suffused with white, the sepals oblong, acute, the petals elliptic, undulate; lip with the tube of same color as petals, the front lobe crisped, emarginate, amethyst-purple, the throat with 2 yellow or white blotches, separated by lines of amethyst-purple. Venezuela. C.O. 21. Var.

*álba*, Hort. Fls. white. O.R. 16:201. Var. *Stánleyi*, Hort. Fls. white, disk of lip yellow, front lobe lined with purple.

11. *Méndelii*, Backh. (*C. labiata* var. *Méndelii*, Reichb. f. *C. Mórghanæ*, Williams). Fig. 841. Pseudobulbs 12–16 in. tall, compressed, furrowed, 1-lvd.: lvs. oblong, 6–10 in. long; peduncle with 2 or 3 fls. 7–8 in. across; sepals and petals white, or often tinted pale rosy mauve, the sepals oblong-lanceolate, the petals obliquely oval, obtuse, crisped; lip with the tube white or colored like petals, the front lobe much crisped, rich crimson-purple abruptly passing into the yellow throat which is reddish streaked. Colombia. O.R. 1:273; 10:233. S.H. 2:413. C.O. 19. Var. *Blúntii*, Hort., has the fls. white, except a small yellow spot on lip. Var. *Maùdeæ*, Hort. White with rose markings on the lip. Var. *gigantæa*, Hort., has a very large lip. Var. *hackbridgensis*, Hort. Petals blotched with crimson. Var. *Bértii*, Hort. Fls. white tinted with rose. Var. *leucoglóssa*, Hort. Sepals bluish tinted. Var. *Lôwíæ*, Hort. Lip white, pale purple at apex. Var. *wisetónensis*, Hort. Lip rich rose-purple, delicately veined; throat yellow veined with reddish purple. Var. *macroziána*, Hort. Fls. very large. R.H. 1903, p. 253 (desc.). Var. *Láchneri*, Hort. Lip curiously colored, front lobe having a broad marginal band of dark purple sparingly blotched with white and an inner band of lighter purple. Var. *Piëtíæ*, Hort. Fls. nearly white; lip marked with pink. Var. *majéstica*, Hort. Fls. large, white. Var. *Díxonæ*, Hort. Attractive bluish-pink form. Var. *Lambeanæ*, Hort. Fls. white.

12. *Warscewiczii*, Reichb. f. (*C. labiata* var. *Warscewiczii*, Reichb. f. *C. gloriòsa*, Carr. *C. imperialis*, Wallis). Pseudobulbs 1 ft. or more tall, stout, compressed, furrowed, 1-lvd.: lvs. oblong, 8–10 in. long; peduncle with 2 or 3 fls. 7–9 in. across; sepals and petals rosy mauve, the sepals lanceolate, acute, the petals oval, obtuse, undulate; lip entirely bright purple except 2 yellow spots and lines of the same color in the throat, crisped, the front lobe ample. Colombia. O.R. 12:241. G.C. III. 22:163; 42:312. Gn. 33, p. 18. C.O. 1. Var. *gigas*, Hort. (var. *Sanderiana*, Hort. *C. gigas*, Lind. & André. *C. Sanderiana*, Hort. *C. labiata* var. *Sanderiana*, Hort.). Fig. 842. A noble form, the sepals and petals dark rose, with a deep purple-magenta lip, the fls. larger than those of any other form of the *labiata* group. Colombia. I.H. 21:178. Gn. 45, p. 445. G.F. 1:437. A.G. 19: July 23, suppl. F.R. 1:77, 674. F.E. 10:892. C.L.A. 11:42, 44. The following forms of this variety occur: *álba*, fls. pure white, the rarest of all cattleyas (O.R. 18:232); var. *albescens*, sepals and petals white, with faint blush, the lip rose-purple, fringed; var. *atropurpurea*, of deeper color; var. *rochellensis*, sepals and petals white, the lip with the faintest trace of color. Var. *saturata*, Hort. Fls. bright rose, with ruby-crimson lip.

13. *Triànæ*, Lind. & Reichb. f. (*C. labiata* var. *Triànæ*, Duch. *C. Leànæ*, Sander. *C. Rollissoniana*, Moore. *C. quadricolor*, Batem. *C. Massangeana*, Reichb. f. *C. bogoténsis*, Lind.). Fig. 843. Pseudobulbs about 1 ft. tall, clavate, 1-lvd.: lvs. oblong, 6–8 in. long; peduncle bearing 2 or 3 fls. about 6 in. across; sepals and petals a delicate rose to white, the sepals oblong-lanceolate, the petals much broader than sepals, obtuse, oval-rhomboid, crisped; lip narrower than in the other related forms, the tube rose, the front lobe purple, less crisped than in most of the related species, emarginate, the throat yellow, often streaked with deeper color. Colombia. O.R. 6:145. B.M. 5504. R.H. 1860, pp. 406–7. A.G. 17:177. Gng. 3:151. A.F. 6:607; 13:715. F.E. 9:325. F.R. 1:672–3. C.O. 5.

842. *Cattleya Warscewiczii*  
var. *gigas* ( $\times \frac{1}{2}$ ).

S.H. 1:11, 27; 2:403, 405. Var. *álba*, Hort. Fls. white, except yellow blotch in throat. C.O. 5a. Var. *atropurpurea*, Hort. Fls. crimson-purple. Var. *Backhousiána*, Hort. Sepals and petals rose-purple, the petals strongly marked with amethyst-purple at the apex, the tube of lip rose-purple, the front lobe purple-magenta. C.O. 5e. Var. *chocoénsis*, Hort. Fls. very fragrant,

not fully expanding, the sepals and petals white, sometimes flushed pale lilac. I.H. 20:120. A.F. 6:563. Var. *delicata*, Hort. Sepals and petals white, faintly flushed pale amethyst-purple, the deeper lip with a pale yellow spot. F.M. 1:8. Var. *Schröderæ*, Hort. (*C. Schröderæ*, Reichb. f.). Fls. fragrant, the sepals and petals a delicate blush, faintly suffused with white, the petals and broader lip much more crisped than in other forms of this species. G.C. III. 20:73. A.G. 15:211. O.R. 11:177. C.L.A. 11:45. F.E. 9:331. The following forms of this variety occur: *álba*, the fls. pure white; *albescens*, the fls. nearly white; *cærulea*, the lip a bluish color; *Méta*, sepals and petals pink, the throat bright yellow; *lilacina*, lilac; *refulgens*. Var. *grataxiána*, Hort. A large and richly colored form. Var. *cándida*, Hort. Fls. snow-white; lip with faint violet spot. Var. *coundoniénsis*, Hort. Purple-rose sepals and petals. Var. *Márieæ*, Hort. Silvery white sepals and petals veined with pink; front of lip deep magenta-crimson, with 2 yellow blotches on throat. Var. *triúmphans*, Hort. Sepals and petals rose-colored; lip rich purple with an orange-yellow tube. Var. *enfieldiénsis*, Hort. Fls. white; tip of lip blush-pink. Var. *boetzelaériénsis*, Hort. Rose-colored form. Var. *tessellata*, Hort. Large rose-colored form curiously marked.

Var. *Brandneriána*, Hort. Anterior part of lip dark purple-violet. Var. *Höltzei*, Hort. Lip dark. Var. *Wélesleyæ*, Hort. A pretty white form. Var. *Mooreána*, Hort. Sepals and petals light rosy lilac; lip ruby-claret color, orange at base. Var. *Hölmessii*, Hort. Broad petals and rich rose-purple lip. Var. *brunoyénsis*, Hort. Sepals and petals mauve. Var. *Goodsónii*, Hort. Richly colored; petals flushed with deep rose.

14. *labiata*, Lindl. (*C. Lemoinei*, Lindl. *C. Naldereána*, Reichb. f. *C. Perrinii*, Endl. *C. labiata vera*, Veitch. *C. labiata autumnális*, L. Lind. *C. labiata* var. *Warocqueána*, Rolfe. *C. Warocqueána*, L. Lind.). Pseudobulbs claviform, compressed, furrowed, 4-8 in. tall, 1-lvd.: lvs. 5-7 in. long, ovate or oblong; peduncle, from a double spathe, bearing 3-5 fls. about 6 in. across; sepals and petals usually rose-lilac, the sepals lanceolate, the petals undulate; lip with the tube colored usually like the petals, the front lobe deeply emarginate, undulate-crisped, commonly a violet-purple with deeper veins, the color running in streaks to the yellow throat which has an orange spot each side. The color-variations of this species are numerous. Brazil. B.R. 32:35; 1859. O.R. 16:281. B.M. 3998. Gt. 5:146. F.S. 1893-4. P.M. 4:121. A.G. 17:65; 19:811. G.C. III. 19:13. A.F. 6:607. F.R. 1:8; 2:531.—Intro. from the Organ Mts. in S. Brazil in 1818. Var. *álba*, Hort. Fls. white, except yellow throat. C.O. 3. Var. *Amesiána*, Hort. Sepals and petals white, the lip lilac. Gn. 62, p. 401. Var. *Cooksóniæ*, Hort. Fls. white, except the

crimson-purple lip with a narrow white margin. Var. *superba*, Hort. Sepals and petals deep rose, with a deep crimson-purple lip.

15. *Percivaliána*, O'Brien (*C. labiata* var. *Percivaliána*, Reichb. f.). Pseudobulbs up to 1 ft. tall, clavate, strongly furrowed when old, 1-lvd.: lvs. oblong; peduncle bearing 2 or 3 fls. 4-5 in. across; sepals and petals commonly rose-lilac, tinted purple-amethyst, the sepals linear-lanceolate, the petals longer than the sepals, crisped; lip rather small, shorter than the petals, the tube of the same color as petals, tinged with yellow, the front lobe purple-crimson, shaded with maroon, the undulate border lilac, the throat yellow to orange, streaked with purple. Venezuela. C.O. 7. F.R. 1:297. J.H. III. 32:179. Var. *grandiflora*, Hort. Fls. larger, the sepals and petals bright rose, the petals strongly crisped above, the lip with the tube yellow-orange variegated with rose, the front lobe maroon-purple with a bright rose border, the throat orange-yellow. C.O. 7a. Var. *summiténsis*, Hort. Sepals and petals a pale delicate pink.

16. *Gaskelliana*, Reichb. f. (*C. labiata* var. *pallida*, Williams. *C. labiata* var. *Gaskelliana*, Sander.). Pseudobulbs 8-12 in. tall, oblong-fusiform, compressed, furrowed, 1-lvd.: lvs. 8-12 in. long, oblong; peduncle bearing 2 or 3 lfts. 6-7 in. across; sepals and petals of equal length, commonly purple-violet, suffused with white, the color sometimes deeper and more uniform, rarely marked with a median band of white, the sepals lanceolate, the petals oval, undulate; lip as long as the petals, the tube of same color as petals,

the front lobe emarginate, undulate, purple-violet, with a pale border, the throat yellow streaked with darker yellow, bordered on each side with a zone of yellowish white. Brazil and Venezuela. I.H. 33:613. A.F. 6:185; 30:662. Var. *álba*, Williams. Sepals and petals pure white, the lip cream-white, the throat a pale yellow streaked with darker yellow. C.O. 20a. Var. *cærulea*, Hort. Fls. pure white with bluish spot on base of lip. Var. *Hédgkinsonii*, Hort. Sepals and petals white; front of lip crimson.

17. *Wärneri*, Moore (*C. trilabiata*, Rodr. *C. labiata* var. *Wärneri*, Veitch). Pseudobulbs 4-8 in. tall, cylindrical or fusiform, furrowed, 1-lvd.: lvs. oblong, 6-7 in. long; peduncle with 3-5 fls. 6-8 in. across; sepals and petals rosy mauve, the sepals lanceolate, the petals oval; lip shorter than lateral sepals, the tube the color of the petals, the front lobe strongly crisped, emarginate, bright purple-violet, the throat yellow-orange, streaked with white or pale lilac. Brazil. C.O. 12. A.F. 6:563.—Very like *C. labiata*, but flowering in late spring and early summer. Var. *álba*, Hort. Fls. white, except the pale yellow throat, streaked with orange-yellow. C.O. 12a.

18. *lutæola*, Lindl. (*C. Hölfordii*, Hort. *C. flavida*, Klotzsch. *C. Meyeri*, Regel. *C. modesta*, Mey.). Dwarf: pseudobulbs 2-3 in. long, ovoid, 1-lvd.: lvs. 3-4 in. long, elliptic-oblong; peduncles bearing 2-5 fls. about 2 in. across; sepals and petals similar, yellow, oblong-lanceolate; lip nearly orbicular when spread

843. *Cattleya Trianae* (× 1/2)

out, yellow, the middle lobe crisped, whitish on margin, the side lobes sometimes streaked purple inside. Brazil. B.M. 5032. F.S. 23:2479.

19. *citrina*, Lindl. (*C. Karwinskii*, Mart.). Fig. 844. Pseudobulbs 2-3 in. long, ovoid, 2-3-lvd.: lvs. 4-7 in. long, ligulate, acute, glaucous; peduncle pendent, bearing usually a single fragrant fl., rarely 2 or 3 fls., yellow except the white border of front lobe of lip; sepals oblong, acute, the petals cuneiform-oblong; lip longer than the petals. Mex. B.M. 3742. J.H. III. 30:399. Gn. 33, p. 535. C.O. 6. F.S. 16:1689. Gt. 27:931. R.1:20. Var. *gigantæa*, Hort. Fls. large and intensely colored.

844. *Cattleya citrina*. (× 1/4)

20. *amethystoglôssa*, Lind. & Reichb. f. (*C. guttata* var. *Prinzii*, Reichb. *C. Prinzii*, Hort. *C. guttata* var. *Keteleerii*, Houl.). Pseudobulbs 1½-3 ft., cylindric, 2-lvd.: lvs. 6-12 in. long, elliptic-oblong; peduncles 5-8-fl.; fls. 3½-4½ in. across; sepals and petals white, suffused with rose-purple, spotted amethyst-purple, especially on the upper half, the dorsal sepal linear-oblong, the lateral falcate, the petals obovate, rounded at apex; lip much shorter than petals, the lateral lobes erect, purple at apex, the middle lobe broader than long, emarginate or 2-lobed, violet-purple, the radiating ridges papillose. Brazil. B.M. 5683. R.H. 1869:210. G.C. III. 38:105. Var. *Sänderæ*, Hort. A creamy white form.

21. *Bowringiana* Veitch (*C. autumnalis*, Hort. *C. Skinneri* var. *Bowringiana*, Kränzl). Pseudobulbs 10-20 in. tall, stout, fusiform above, 2-lvd.: lvs. 6-8 in. long, oblong; peduncle bearing 5-12 fls. 2½-3 in. across; sepals, petals, and tube of the lip rose-purple, the sepals acute, oblong, somewhat undulate, the petals oval-oblong, obtuse, undulate; lip shorter than the lateral sepals, the front lobe emarginate, the throat with a large white spot, surrounded by a zone of bright maroon and bordered with deep purple. Honduras. R.B. 21:37. R.H. 1890:300. G.C. III. 39:114. A.F. 19:651; 34:804. C.O. 24. O.R. 12:361; 16:337. Var. *triumphans*, Hort. Fls. rich purple.

22. *Skinneri*, Lindl. (*Epidendrum Hügelianum*, Reichb.). FLOWER OF ST. SEBASTIAN. Pseudobulbs 5-10 in. tall, 2-lvd.: lvs. 6-8 in. long, oblong-oval; peduncle bearing 5-10 fls. 3½-5 in. across, rose-purple except the white throat of the lip, the sepals elliptic-lanceolate, acutish, the petals oval-oblong, broader than the sepals; lip with the front lobe acute. Guatemala to Costa Rica. B.M. 4270. P.M. 11:193. R.B. 22:201. G.C. III. 20:6. G.F. 3:201. C.O. 30. Var. *alba*, Hort. Fls. white.

23. *Victória-regina*, O'Brien. Pseudobulbs 1-1½ ft. tall, somewhat compressed and clavate, 1-2-lvd.: lvs. 3-6 in. long, oblong or elliptic-oblong; peduncle bearing 2-5 fls., rarely more, 5-6 in. across; sepals purple a little tinged with yellow, striated with darker purple, oblong-lanceolate, obtuse, the petals purple tinged with violet, obliquely striated with darker purple, elliptic-oblong, obtuse, undulate; lip distinctly 3-lobed, the lateral lobes exteriorly white or flushed with rose, violet-purple at the obtuse apex and inside, the front lobe reniform, bright rose-violet, crisped, the disk yellow streaked purple. Pernambuco. G.C. III. 11:808. O.R. 3:17; 8:361. R. 2:85. C.O. 3.—Said to grow wild in company with *C. labiata* and *C. Leopoldii*

var. *pernambucensis*, and considered by some a natural hybrid between the two. The variability of 1 or 2 lvs. on a pseudobulb points in this direction.

24. *intermedia*, Graham (*C. amethystina*, Morr. *C. ovata*, Lindl. *C. maritima*, Lindl. *C. Loddigesii* var. *amethystina*, Lem. *C. Aquinii*, Rodr.). Pseudobulbs up to 1½ ft. tall, cylindric, somewhat furrowed, 2-lvd.: lvs. 5-6 in. long, oblong; peduncle bearing 3-5 fls. 4-5 in. across; sepals and petals equal, pale rose or white, acute, oblong, the lateral deflected, the petals somewhat falcate; lip a little shorter than the lateral sepals, distinctly 3-lobed, the tube the same color as the petals, the lateral lobes rounded, the front lobe bright rose-purple, orbicular, strongly crisped. S. Brazil. B.M. 2851. O.R. 8:73; 15:156. P.M. 1:151. J.F. 4:379. C.O. 8. B.R. 1919. V.O. 2:39. Var. *Parthénia*, Reichb. f. Fls. pure white. C.O. 8a. Var. *punctatissima*, Sander. Sepals and petals spotted and dotted with deep rose. C.O. 8b.

25. *violacea*, Rolfe (*C. superba*, Schomb. *C. Schomburgkii*, Lindl. *C. odoratissima*, P. N. Don). Pseudobulbs 8-12 in. tall, clavate, somewhat compressed, 2-lvd.: lvs. 3-5 in. long, oval or oval-oblong; peduncle bearing 3-5 fragrant fls. 4-5 in. across; sepals and petals bright rose-purple, the sepals oblong-lanceolate, acute, the petals oblong-rhomboid, acutish, undulate, broader than sepals; lip fleshy, distinctly 3-lobed, deep purple-violet except the yellow disk streaked with purple, the lateral lobes triangular, acutish, the front lobe nearly orbicular, crisped. N. S. Amer. B.M. 4083. P.M. 9:265. J.H. III. 31:321. A.F. 11:1351. C.O. 28. Var. *spléndens*, Hort., has paler fls.

26. *Loddigesii*, Lindl. (*C. Arembérgii*, Scheidw. *C. intermedia* var. *variegata*, Hook.). Pseudobulbs 8-12 in. tall, cylindric, 2-lvd.: lvs. 4-5 in. long, oblong-elliptic; peduncle bearing 2-5 fls. 3-4½ in. across; sepals and petals rose-lilac, oblong-elliptic, the lateral sepals somewhat falcate, the petals a little broader than the sepals, undulate; lip shorter than the lateral sepals, distinctly 3-lobed, the tube externally colored like petals, internally whitish, the lateral lobes rounded, undulate, the front lobe nearly orbicular, pale amethyst, strongly crisped, the disk whitish passing into yellow at the base. Brazil. C.O. 18. O.R. 15:145.—There is a white form. Var. *alba*, Hort. Var. *delicatâ*, Hort. Fls. bluish white. Var. *innocens*, Hort. Fls. milky white. Var. *spléndens*, Hort. Fls. with bright purplish rose sepals; lip white inside, pale lilac outside; disk and side lobes pale yellow.

27. *Harrisoniana*, Batem. (*C. Harrisonæ*, Paxt. *C. Papeiansiana*, Morr. *C. Harrisonii*, Beer. *C. Loddigesii* var. *Harrisonæ*, Veitch. *C. Loddigesii* var. *Harrisoniana*, Rolfe). Pseudobulbs 8-16 in. tall, cylindric, 2-lvd.: lvs. 4-6 in. long, oblong-lanceolate; peduncle bearing 2-5 fls. 4-4½ in. across; sepals and petals similar, oblong, bright rose-lilac, the lateral sepals falcate, the petals undulate, a little broader than sepals; lip shorter than lateral sepals, 3-lobed, the tube the same color as the petals, the front lobe crisped, rose-purple, the disk yellow-orange. Brazil. P.M. 4:247. C.O. 17. Gn. 48:380. Var. *alba*, Beer. Fls. white, or sometimes faintly tinged with rose or yellow. C.O. 17a. Var. *cândida*, Hort. Fls. white except yellow disk of lip. Var. *gigantæa*, Hort. A large form. Var. *maculata*, Hort. Fls. purple-dotted. Var. *superbissima*, Hort. Fls. large, the sepals and petals dark rose, the lip creamy white. Var. *violacea*, Hort. Fls. deeper colored.

28. *Leopoldii*, Versch. (*C. guttata* var. *Leopoldii*, Lind. & Reichb. f.). Pseudobulbs 15-30 in. tall, fusiform, 2-3-lvd.: lvs. 6-8 in. long, oblong-elliptic; peduncle bearing 10-25 fls. 3-4 in. across; sepals and petals brown, oblong-cuneate, purple-spotted, the lateral sepals somewhat falcate, the petals undulate and a little broader than the sepals; lip strongly 3-lobed, the

lateral lobes acute, the front lobe broadly cuneate-obcordate, undulate, bright amethyst-purple, the tube paler, the disk covered with small tubercles and elevated papillate lines. S. Brazil. C.O. 15. F.S. 14:1471-2.

29. *granulosa*, Lindl. Pseudobulbs 1-2 ft. tall, rather stout, cylindric, 2-lvd.: lvs. 5-6 in. long, lanceolate-oblong; peduncle bearing 5-9 fls. 3-4 in. across; sepals and petals obtuse, olive-green, red-spotted, the lateral sepals strongly falcate and deflected, the petals obovate-oblong, a little wider than sepals, undulate; lip deeply 3-lobed, the tube white externally, internally yellowish or rose, the lateral lobes acute, the terminal lobe white, crimson-papillate, undulate, round-reniform, emarginate, the long claw yellow, marked with crimson. Guatemala. B.R. 28:1. Gn.M. 9:30. C.O. 14. Var. *Du Buysoniana*, Hort. (*C. Dubuysoniana*, Hort.). Sepals and petals yellow, often spotted with rose. Var. *Russelliana*, Lindl. Lvs. broader: fls. larger with broader sepals and petals, the lateral lobes of lip orange-yellow internally, the front lobe spotted with small crimson-purple papillae. Brazil. B.R. 31:59. B.M. 5048. Var. *Schofieldiana*, Veitch. (*C. Schofieldiana*, Reichb. f.). Sepals and petals yellow-brown, densely spotted with crimson-purple, the lateral lobes of lip cream-white externally, yellow, purple-marked internally, the front lobe with numerous purple-magenta papillae, and a broad white border. Brazil. C.O. 14a.

30. *guttata*, Lindl. (*C. elatior*, Lindl.). Pseudobulbs 18-30 in. tall, cylindric, 2-lvd.: lvs. 5-9 in. long, oblong-elliptic; peduncle bearing 5-10 fls. 3-4 in. across; sepals and petals yellowish green, spotted deep purple, the sepals obtuse, the lateral somewhat falcate, the petals undulate, broader than sepals; lip 3-lobed, the lateral lobes white externally, acute, the front lobe amethyst-purple, obcordate, papillate. S. Brazil. B.R. 1406.

31. *Schilleriana*, Reichb. f. (*C. Regnellii*, Warner. *C. Aclandiae* var. *Schilleriana*, Jenn.). Pseudobulbs 5-6 in. tall, clavate, furrowed, 2-lvd.: lvs. 2½-6 in. long, oblong-elliptic; peduncle bearing 1-3 fls. 4-5 in. across; sepals and petals olive-green tinted with brown and spotted with black-purple, oblong-ligulate, undulate, especially in the petals; lip a little shorter than the lateral sepals, deeply 3-lobed, the lateral lobes whitish outside, pale yellow marked with purple inside, the front lobe reniform, sessile, crimson, lined and margined with white, undulate, the disk yellow with 5 sunken lines. Brazil. B.M. 5150. F.S. 22:2286. A.F. 6:563. C.O. 16.

32. *Förbesii*, Lindl. (*C. vestalis*, Hoffm.). Pseudobulbs 8-12 in. tall, cylindric, 2-lvd.: lvs. 4-5 in. long, oblong; peduncle bearing 2-5 fls. 3-4 in. across; sepals and petals a pale yellowish green, obtuse, undulate, sepals oblong-ligulate, the petals oblong-lanceolate; lip distinctly 3-lobed, the tube pale yellow outside, inside a bright yellow streaked with red, the terminal lobe small, sessile, orbicular, undulate, pale yellow, with a bright yellow center marked with purple. S. Brazil. B.M. 3265. C.O. 11. B.R. 953.

33. *Walkeriana*, Gardner (*C. bulbosa*, Lindl. *C. Gardneriana*, Reichb. f. *C. princeps*, Rodr.). Pseudobulbs 2-5 in. tall, oval-fusiform, furrowed, 1-lvd.: lvs. 2-5 in. long, oblong-elliptic; fls. 1-3, very fragrant, 3-5 in. across, on a scaly st. arising from the base of the pseudobulb; sepals and petals pale rose-lilac or a deep purple-rose, the sepals oblong-lanceolate, acute, the petals about twice as wide, oval-rhomboid, undulate; lip a little shorter than sepals, fleshy, 3-lobed, the lateral lobes rose, separated, exposing the column, the front lobe nearly orbicular, emarginate, crisped, violet-purple, the disk yellow, streaked with bright purple. Brazil. B.R. 33:42.

34. *nobilior*, Reichb. f. (*C. Walkeriana* var. *nobilior*, Veitch). Pseudobulbs 3-5 in. tall, ovate-fusiform or nearly clavate, furrowed, 2-lvd.: lvs. 2-4 in. long,

elliptic-ovate: fls. 1 or 2, on a scaly st. arising from the base of the pseudobulb, very fragrant, 3-4½ in. across; sepals and petals purple-lilac, acute, the sepals oblong, the petals ovate-rhomboid, about twice the width of the sepals; lip fleshy, about as long as lateral sepals, deeply 3-lobed, the tube the same color as the petals, the front lobe broadly reniform, emarginate, scarcely undulate, the disk yellow, many-costate. Brazil. G.C. II. 19:729. I.H. 30:485.

The following are some of the many hybrid forms: *C. Adula* = *C. bicolor* × *C. Hardyana*; *C. Albertii* = *C. intermedia* × *C. violacea*; *C. atalanta* = *C. Leopoldii* × *C. Brazil.—*C. Grossii*, Hort., var. *pallida*. A nearly white form; sepals slightly tinged with green; lip pale rose.—*C. Hardyana*, Hort., var. *alvea*. Lip deep yellow.—*C. Jenmanii*, Rolfe. Allied to *C. Gaskelliana*, but lvs. broader and fls. smaller. British Guiana.—*C. marginata*, Paxt. = *Laelia pumila*.—*C. velutina*, Reichb. Ss. slender, the fragrant fls. with the sepals and petals orange, spotted purple, the lip orange and white, veined yellow. Brazil. G.C. III. 24:333. C.O. 29a.

GEORGE V. NASH.

**CAULIFLOWER** (*Brassica oleracea*, Linn., var. *botrytis*, DC.). A form of the common cabbage species, producing an edible head of malformed and condensed flowers and flower-stems (the word cauliflower means stem-flower); it will hybridize with the cabbage and form some very interesting freaks. See *Forcing*.

A perfect "curd" or head of cauliflower is one in which the parts are so adjusted to one another that it looks almost homogeneous. This condition is most often found in the young or partly developed heads. As soon as segmentation begins to take place, the curd has reached full development and maturity from the market-gardeners' standpoint. The breaking-up of the curd is an indication of the formation of floral parts. The value of the curd depends upon its symmetry and form; and the length of time that it will hold without beginning to break up into distinct parts.

Not all plants produce perfect curds. Growers recognize a peculiar form which is known as the "ricy" curd illustrated at *a* in Fig. 845. Another form, which is equally undesirable is a segmented curd between the segments of which leaves appear, known as a "leafy" curd shown at *b*. A head in perfect condition is shown at *c*. Segments are apparent in *c*, but the development of the curd is almost ideal and the head as a whole is very nearly perfect. It is the aim of the seed-grower as well as of the gardener to produce plants which will return curds of the type shown at *c*.

Cauliflower is the most fastidious and exacting member of the cabbage family. It is less tolerant of adverse soil and climatic conditions than any of its near relatives. This accounts, in a great measure, for its limited cultivation and the fact that it is grown only in certain localities. When well grown, however, it is one of the most profitable market-garden crops. Because of its

intolerance to heat, it is grown in the open so as to take advantage of the cool seasons of early spring and autumn. It is one of those crops, therefore, which is less adaptable than those having a greater range of heat-endurance. If the season happens to be favorable the amateur may have good luck, but if the season proves severe the most expert grower may fail.

A rich loamy soil, thoroughly charged with available plant-food is suited to this plant. Light thin sandy soils or those extremely heavy and retentive are, as a rule, not well suited for this crop. The soil should be one which does not dry out quickly but which will furnish the plants a constant supply of moisture. High-grade cauliflower is quite as dependent upon careful handling of the plants and a constantly available supply of moisture as high-grade celery. Among the fertilizers, none is better than well-decomposed manure from the horse-stable, thoroughly incorporated with the soil at the time of preparing it for the crop.

If commercial fertilizers are necessary, quick-acting ones are most desirable, except it is thought that sulfate of potash is preferable to muriate. The nitrogen-content of the fertilizer, however, should be in the form of nitrate of soda or sulfate of ammonia rather than in a slow-acting form. If a fertilizer is to be used, a portion of it should be scattered over the field before the plants are set. An application of 500 pounds to the acre at this time, applied broadcast, and a side dressing about the time "buttons" begin to form, will prove an advantage. The side dressing may be at the rate of 500 pounds, making a total application of 1,000 pounds to the acre. A good fertilizer is one carrying 3 to 4 per cent of nitrogen, 6 to 8 per cent of phosphoric acid and about 10 per cent of potash.

Cauliflower plants in northern latitudes are handled so as to prepare them either for an early or a late crop. The early crop should be started at the same time as early cabbage, or a few days later. Cauliflower plants cannot, however, be started in the autumn and successfully wintered in coldframes, as can early cabbage plants. Plants so handled are less likely to give a desirable product. The best early-crop plants are produced from hotbed or greenhouse propagated stock started in a mild temperature and grown so as to produce a sturdy broad-leaved plant to be set in the field a few

The early crop is usually grown on a smaller scale than the autumn crop. Plants grown in the hotbed are usually transplanted and the transplanted plants carried and set in the field by hand. The distance between the rows should be sufficient to permit of cultivation with horse-power implements, but the plants need not be set more than 18 inches apart in the row.

The late crop, however, is frequently transplanted during the drier parts of the season and, largely on this account, growers prefer to use a transplanting machine so as to water the plants at the same time they are set. A convenient distance between the rows is 3 feet, with the plants 20 to 24 inches apart in the row, depending upon the variety grown.

The old adage that "cabbage should be hoed every day" applies with equal force to cauliflower. Cultivation should be of such character as to prevent the formation of a crust and to discourage the development of weeds. The maintenance of a soil-mulch by shallow cultivation which shall not disturb or severely prune the roots of the plants is desirable.

Cauliflower is subject to the same enemies and diseases as cabbage. Clubroot and mildew are two of the most annoying diseases. The aphid, root-maggot and both the green cabbage-worm and the cabbage-looper are annoying pests. The delicacy of the curd requires that the plants be kept perfectly free from insects which devour any portion of the plant.

Cauliflower requires more careful field attention than that required by any other garden crop except those that are blanched either by tying or banking. The young curd of the cauliflower, as soon as it has reached the size of a hen's egg, should be carefully protected from the elements by adjusting the leaves in such a manner as to prevent discoloration by the action of sun or rain. The expert growers accomplish this and at the same time indicate the stage of maturity of the plants by different methods of folding the leaves together over the curd or by tying them with different tying materials, a different method being used each time the field is gone over. To illustrate: the earliest developed curds may be protected by tying the leaves together with rye straw, the next later size may be indicated by folding the leaves together over the plant, while the third may be indicated by tying the leaves with raffia. Usually three operations will be sufficient to care for the entire season's crop. As soon as the curds have reached the desired market size, which varies greatly with different producers and somewhat also with different varieties and is to a degree dependent upon the season and fertility of the land, the plants are harvested by cutting the heads with at least two or three whorls of leaves attached.

After the heads have been cut and a sufficient number assembled in one place to justify packing, they are trimmed by using a large knife to sever the leaves just above the edge of the curd so as to form a border or "ruche" of leafstalks with a part of the blade attached about the curd. This border of stiff green leafstalks about the white curd gives it a very attractive appearance.

After the curds have been properly trimmed, which varies somewhat with different operators, they are protected by the use of tea paper, either white or brown, placed over the head in such a manner as to protect it from dirt and contact with its neighbors. The curds are then packed in crates or barrels, the California and Florida product being largely packed in crates holding one dozen heads in a single layer. If the heads are to be packed in barrels, a layer of excelsior is first placed in the barrel and the wrapped heads, curd down, are carefully placed so as to form a layer resting upon the excelsior over the bottom of the barrel. The next row of curds is placed stem end down and curds up; on top is placed another cushion of excelsior and the operation repeated until the barrel is filled in such a manner as to

845. Types of cauliflower heads: *a*, ricy; *b*, leafy; *c*, perfect.

days later than the early crop of cabbage. Young cauliflower plants are less hardy than young cabbage plants and, for this reason, planting in the open must be somewhat delayed.

For the late cauliflower crop in the North, seed-beds are prepared on the shady side of a building or in a partially shaded situation and handled in same manner as seed-beds for late cabbage, the late crop in the Long Island region being placed in the open the last days of June or early in July.

leave the last row with the stem end upward, over which a cushion of excelsior and a burlap cover are placed. Ventilated barrels are ordinarily used for this purpose, but for long-distance shipment the smaller crates holding a single layer of heads have proved most advantageous.

During late years, the marketing of this crop has been very greatly facilitated and the returns to the growers considerably enhanced by a coöperative method of sale which has taken into consideration a more extended distribution of the crop than formerly. In this the Long Island Cauliflower-Growers' Association and the California Vegetable-Growers' Union have both been very helpful.

One of the handicaps in the cultivation of cauliflower has been the entire dependence of the American growers on foreign seed, little or no cauliflower seed having been produced in this country and that in the open only in the Puget Sound region. The seed has been expensive and not always to be depended upon. The greatest care should be given to securing a perfectly reliable stock of seed.

#### Broccoli.

Broccoli, which is a long-season cauliflower, is in all respects like cauliflower except that its vegetative parts are somewhat coarser, the heads somewhat smaller, and it does not form an edible curd early in its life as does cauliflower.

Broccoli is cultivated only in climates having a mild winter, when it can be planted the summer before and carried through the winter to form heads early the following spring. It is a popular plant in all parts of France and particularly in England. It is undoubtedly the parent type of the cauliflower, the cultivated varieties of cauliflower being short-season forms.

For best results, the seed should be sown at the same time as that of autumn cabbage and the plants transplanted to the field about the same time, so that they will make their vegetative growth during the late summer and autumn. Where winters are mild, the plants can be left in the open, but in more rigorous climates at the approach of cold weather, a small number of plants can be lifted with earth adhering to the roots, stored in a suitable root-cellar, and the following spring transferred to the open to form heads.

L. C. CORBETT.

**CAULOPHYLLUM** (Greek, *stem-leaf*). *Berberidaceæ*. **BLUE COHOSH.** Two species of perennial herbs (sometimes combined with *Leontice*), one in E. Amer. and the other in Asia, the former sometimes removed from the woods to cult. grounds. Rhizomatous: sts. erect, very smooth: lf. 1, large, tritermately compound and sessile: fls. small, yellow-green, panicle; sepals 6, subtended by 3 or 4 bracts; petals 6, much smaller than the sepals and appearing like glands or scales; stamens 6; ovary soon bursting, freeing the 2 ovules which develop into depressed-globular berry-like seeds (without pericarp). *C. thalictroides*, Michx., Fig. 846, is the American species, a smooth or glaucous plant of rich woods from Canada south, 2-2½ ft. high. The plant is always attractive because of its trim growth and interesting habit; in Sept. and later, when the foliage is dead, the drupe-like seeds stand erect on the dry stalks and afford one of the richest and best of deep blues.

L. H. B.

**CAUTLÈA** (Sir P. Cautley, 1802-1871, British naturalist). *Zingiberaceæ*. About a half-dozen Himalayan species closely allied to *Roscoea*, differing in the spherical rather than narrow fr., and the spicate infl. Probably not in cult. in this country. *C. lutea*, Royle (*Roscoea lutea*, Royle. *R. gracilis*, Smith). Erect or leafy perennial herb, 1½ ft. or less: lvs. narrow-lanceolate, slender-tipped, reddish underneath: fls. 2 in. or less long; corolla yellow; calyx reddish purple, the linear

segms. prominent, the lateral ones spreading or reflexed and the dorsal one erect and with an incurved erect staminode under it.—Treatment of *Alpinia* and *Roscoea*.

**CAVAN:** *Acacia Caventa*.

**CAYENNE PEPPER:** *Capsicum*.

**CAYRÁTIA JAPÓNICA:** *Cissus japonica*.

**CEANOTHUS** (ancient Greek name). *Rhamnaceæ*. Ornamental woody plants grown for their profusely produced white, blue or pink flower-clusters.

Deciduous or evergreen shrubs or trees: lvs. alternate or sometimes opposite, short-petioled, serrate or entire, usually 3-nerved, with small stipules: fls. perfect, small, 5-merous, in small umbels forming panicles or racemes; sepals often incurved, colored; petals clawed, spreading or recurved; filaments slender; disk annular; ovary partly adnate to the calyx-tube, 3-celled; style 3-cleft: fr. a 3-celled drupe, dry at length and separating into 3 one-seeded dehiscent nutlets.—Nearly 50 species in N. Amer., chiefly in the Pacific coast region.

These are free-flowering shrubs, some especially valuable for their late flowering period. Many of them are hardy only in the warmer temperate regions, but *C. americanus*, *C. ovatus*, and *C. Fendleri* are hardy North, while the numerous hybrids of *C. americanus* are only half hardy, and even if protected they are killed to the ground in the North, but the young shoots will usually flower the same season. The safest way, however, to have good free-flowering plants of these beautiful hybrids will be, in the North, to dig them up in fall, store them away in a frost-proof pit or cellar, and plant them out again in spring. Pruning of the late-flowering species will be of advantage; about one-half of last year's growth may be taken away. They grow in almost any soil, but best in a light and well-drained one, and most of the Californian species prefer a sunny position. Propagated by seeds sown in spring and by cuttings of mature wood in autumn, inserted in a cold-frame or greenhouse; softwood cuttings also grow readily if taken in early spring from forced plants. Sometimes increased by layers, and the varieties and hybrids by grafting on roots of *C. americanus* under glass in early spring; the cions must be fresh and with leaves, taken from plants kept in the greenhouse during the winter.

846. Seed-berries of blue cohosh, *Caulophyllum thalictroides*. (×½)

A. *Lvs. alternate.* (Nos. 1–13.)

B. *Margin of lvs. serrate or crenate.*

C. *Foliage glabrous beneath or slightly pubescent.*

D. *Fls. white; lvs. thin, deciduous.*

E. *Peduncles slender, at the end of the new growth.*

1. *americanus*, Linn. Fig. 847. Low, erect shrub, to 3 ft.: lvs. ovate, usually acute, finely and irregularly serrate, bright green and dull above, paler and pubescent or nearly glabrous beneath,  $1\frac{1}{2}$ –3 in. long: fls. in terminal and axillary panicles on slender peduncles, forming large, corymbose panicles. July–Sept. From Canada to S. C. and Texas. B.M. 1479. Gt. 61, p. 92. Gn. 56, p. 137.—Common in dry woods and making a profusion of bloom, which, however, is short-lived. Many hybrids have been raised from this species in Eu. (see *C. hybridus*). Var. *intermedius*, Trel. (*C. intermedius*, Pursh), has smaller, ovate or ovate-lanceolate lvs. and the fls. in small, very slender-peduncled, short racemes or panicles. Tenn. to S. C.

847. *Ceanothus americanus*. ( $\times \frac{1}{4}$ )

tuse or acute, crenulate-serrate, nearly glabrous, glossy above, 1–2 in. long: infl. like the former, but usually smaller. New England to Colo. and Ala.

EE. *Peduncles usually stout, from lateral buds of the old wood.*

3. *sanguineus*, Pursh (*C. oreganus*, Nutt.). Tall shrub, with purple or reddish glabrous branches: lvs. orbicular to ovate or obovate, obtuse, serrate, nearly glabrous, 1–3 in. long: fls. in rather long, narrow panicles, on stout, leafless peduncles, axillary, from branches of the previous year. May, June. Brit. Col. to Calif. B.M. 5177.

DD. *Fls. blue or pink, rarely white; lvs. usually half-evergreen.*

4. *híbridus*, Hort. Hybrids of garden origin, chiefly between *C. americanus* and *C. thyrsiflorus*, between *C. ovatus* and *C. thyrsiflorus* and between *C. americanus* and *C. azureus*; the hybrids of the first group may be classed under *C. roseus*, Koehne, of the second under *C. pallidus*, Lindl., and those of the third group under *C. Arnouldii*, Hort. Some of the most distinct are: *albo-plenus*, with double white fls.; *atrocaeruleus purpureus*, fl. blue, foliage purple when young; *Arnouldii*, fls. sky-blue, in large panicles; *Gloire de Versailles*, with bright blue, large panicles (M.D.G. 1903:485); *Gloire de Plantières*, fls. dark blue, in large panicles; *Victor Jouin*, fls. deep blue, darker than in the preceding, one of the hardest hybrids; *Ciel de Provence*, fls. deep blue, profusely produced (R.H. 1903:332); *Marie Simon*, fls. flesh-colored; *roseus*, fls. pink (R.H. 1875:30); *pallidus*, fls. pale blue, lvs. green and pubescent below (B.R. 26:20).

5. *thyrsiflorus*, Esch. Shrub or small tree: lvs. oblong, obtuse, crenate-serrate, nearly glabrous, 1–1½

in. long: fls. blue, rarely white, in narrow panicles, about 3 in. long. May–July. Ore. to Calif. B.R. 30:38. S.S. 2:64. G.C. III. 20:363; 37:179; 41:221. Gn. 74, p. 303. G.M. 50:430.—A very fine, free-flowering species of beautiful blue color. Probably natural hybrids of this species are: *C. Veitchianus*, Hook. (*C. thyrsiflorus*  $\times$  *C. rigidus*), with deep blue fls. in dense panicked clusters (B.M. 5127; F.S. 13:1383), and *C. Lobbianus*, Hook. (*C. thyrsiflorus*  $\times$  *C. dentatus*), with deep blue fls., in oval, peduncled, solitary clusters. B. M. 4810 (4811 by error). F.S. 10:1016.

cc. *Foliage tomentose or densely pubescent beneath: half-evergreen or evergreen (see also C. hybridus).*

D. *Branchlets and the veins beneath nearly glabrous: lvs. very obtuse; fls. white.*

6. *velútinus*, Douglas. Tall shrub: lvs. persistent, broadly elliptic, mostly subcordate, obtuse, serrate, dark green and glabrous above, canescent beneath, but the veins glabrescent, 2–3 in. long: fls. in large, compound panicles at the ends of the branches. June, July. Brit. Col. to Colo. and Calif. B.M. 5165.

DD. *Branchlets and the veins tomentose or pubescent: lvs. mostly acute; fls. usually blue.*

E. *The lvs. glabrous or puberulous above, whitish or tawny tomentose beneath.*

7. *arboreus*, Greene (*C. velútinus* var. *arboreus*, Sarg.). Small tree, with whitish bark: branchlets at first angled and pubescent, later glabrescent and glossy: lvs. elliptic-ovate, obtusish or acutish, rounded or subcordate at the base, closely serrate, with close white tomentum beneath,  $1\frac{1}{2}$ –3 in. long: fls. pale blue to white in panicles 2–3 in. long. Spring. Isls. off the Calif. coast. S.S. 2:65.

8. *azúreus*, Desf. (*C. bicolor*, HBK. *C. caeruleus*, Lag.). Tall shrub: branchlets terete, densely tomentose: lvs. oblong-ovate or oblong, acute or obtuse, rounded at base, serrate, with villous tawny tomentum beneath, 1–3 in. long: fls. deep blue, in slender panicles 2–4 in. long. Spring. Mex. L.B.C. 2:110. B.R. 4:291. P.M. 2:74. Gn. 61, p. 223.—Under this name, a hybrid species with *C. americanus* is often cult.

EE. *The lvs. villous or hirsute on both sides, usually green beneath.*

9. *hirsútus*, Nutt. Shrub or small tree, with villous branches: lvs. broadly elliptic or ovate, rounded or cordate at the base, obtuse or acute, with glandular teeth,  $\frac{1}{2}$ –2 in. long: fls. deep blue to purplish, in narrow panicles 1–2 in. long. April, May. Calif.—Called “wild lilac” in Calif. Var. *Órcuttii*, Trel. (*C. Órcuttii*, Torr.). Fls. blue, paler: fr. loosely villous.

BB. *Margin of lvs. entire or nearly so (sometimes serrate on vigorous shoots).*

C. *Shrub prostrate; fls. white.*

10. *Féndleri*, Gray. Low, prostrate and spiny shrub: lvs. oval, rounded or nearly acute at both ends, entire, rarely finely serrulate, grayish green, minutely tomentose beneath,  $\frac{1}{2}$ –1 in. long: fls. white, in short racemes, terminal, on short, lateral branchlets. June, July. From S. D. to New Mex. and Ariz. R.H. 1901, p. 423. M.D.G. 1908:208; 1912:499.—A very graceful and free-flowering shrub of almost creeping habit, well adapted for covering dry, sandy banks; half evergreen and hardy N.

cc. *Shrubs tall, upright.*

D. *Branchlets terete or slightly angled, rarely spiny.*

11. *integérrimus*, Hook. & Arn. Tall, erect shrub, with glabrescent branches: lvs. broadly elliptic or ovate, obtuse, sparingly hairy or glabrous, bright green beneath, 1–3 in. long: fls. blue, sometimes white, fragrant, in 3–6 in. long, narrow panicles. April–June. Wash. to Calif. and S. E. Ariz. B.M. 7640.

12. *divaricatus*, Nutt. Tall, erect shrub, with usually glaucous branches and often spiny: lvs. ovate, obtuse or nearly acute, glaucous and glabrous or grayish tomentose below,  $\frac{1}{2}$ –1 in. long: fls. pale blue, sometimes whitish, in 2–3 in. long, narrow panicles. April–June. Calif. Gn. 74, p. 425 (habit).

DD. Branchlets angled, spiny.

13. *spinosus*, Nutt. Tall shrub, sometimes arborescent: branchlets glabrous: lvs. elliptic to oblong, thinly coriaceous, rounded or broadly cuneate at the base, very obtuse or emarginate, scarcely 3-nerved, glabrous,  $\frac{1}{2}$ –1½ in. long: fls. light blue to almost white in large terminal panicles 4–6 in. long. Spring. Cent. and S. Calif., Coast Range and down to sea-level. S.S. 13:621.

AA. Lvs. opposite, persistent.

14. *cuneatus*, Nutt. Tall, much-branched shrub: lvs. spatulate or cuneate-obovate, mostly obtuse, entire, minutely tomentose beneath,  $\frac{1}{4}$ –1 in. long: fls. white, in small clusters along the branches. March–May. Ore. to Calif. B.H. 8:170.

15. *prostratus*, Benth. Procumbent shrub: lvs. cuneate, obovate or spatulate, coarsely and pungently toothed, sometimes only 3-pointed at the apex, often minutely silky when young,  $\frac{1}{2}$ –1 in. long: fls. blue, in clusters, terminal on short branchlets. Spring. Wash. to Calif.

*C. africanus*, Linn. = *Noltea africana*. — *C. dentatus*, Torr. & Gray. Low shrub: lvs. oblong, penninerved, dentate, glandular-papillate above, loosely hairy: fls. blue, in peduncled clusters. Calif. F.S. 6:567, 2. B.H. 3:101. — *C. dentatus* var. *floribundus*, Trel. (*C. floribundus*, Hook.). Fl.-clusters numerous, nearly sessile: lvs. smaller. B.M. 4806. F.S. 10:977. I.H. 7:238. B.H. 5:129. — *C. foliosus*, Parry. Low shrub: lvs. small, broadly elliptic, glandular-toothed, slightly hairy, pale or glaucous beneath: fls. deep blue, in numerous small clusters. Calif. — *C. laevigatus*, Douglas. Tall shrub: lvs. broadly elliptic, serrate, glabrous, glaucous beneath: fls. yellowish white, in large panicles. Calif. — *C. microphyllus*, Michx. Low shrub: lvs. very small, obovate or elliptic, nearly glabrous: fls. white, in small, short-peduncled clusters. — *C. papillosus*, Torr. & Gray. Low shrub: lvs. narrow-oblong, dentate, glandular-papillate above, villous beneath: fls. deep blue, in peduncled, axillary oblong clusters. Calif. B.M. 4815. F.S. 6:567, 1. P.F.G. 1, p. 74. R.H. 1850:321. — *C. Parryi*, Trel. Large shrub: lvs. elliptic or ovate, denticulate, cobwebby beneath: fls. deep blue, in peduncled, narrow panicles. Calif. — *C. rigidus*, Nutt. Rigid, much-branched shrub: lvs. opposite, cuneate-obovate, denticulate, usually glabrous, small: fls. blue, in small, nearly sessile, axillary clusters. Calif. B.M. 4660 (as *C. verrucosus*) and 4664. J.F. 3:316; 4:348. — *C. verrucosus*, Nutt. Low shrub: lvs. mostly alternate, roundish obovate, emarginate, denticulate, nearly glabrous: small: fls. white, in small, axillary clusters along the branches. Calif. — *C. verrucosus*, Hook. = *C. rigidus*.

ALFRED REHDER.

CEARA RUBBER: *Manihot*.

CÉBATHA: *Cocculus*.

CECRÒPIA (from Greek word referring to use of the wood of some species in making wind instruments). *Moraceæ*. Milky-juiced trees, with peltate leaves, sometimes planted in grounds in tropics and warm countries.

Leaves large, alternate, long-petioled, the blade circular in outline; segms. or lfts. 7–11: dioecious; fls. very small, sessile in cylindrical heads or receptacles, which are arranged in umbels; calyx tubular and petals 0; sterile fls. with 2 stamens; fertile fls. with free ovary and divided stigma: frs. small 1-seeded nuts combined into short spikes. — Species about 40, from Mex. to Brazil. *C. peltata*, Linn., is the trumpet-tree of the W. Indies and S. It is a middle-sized tree with lvs. 1 ft. across; hollow branches used for the making of wind instruments. The juice of some species yields rubber. The hollow stems are often perforated by ants, which nest and rear their young in them.

*palmata*, Willd. Fig. 848. A characteristic tree of the farther W. Indies (and planted somewhat in S. Fla.), with a single long weak thin trunk and at the top a few horizontal or deflexed awkward branches bearing at their ends large palmate lvs. with divisions like thumbs, the trunk and branches partitioned at the

nodes: lvs. 7–11-lobed to the middle, white-tomentose beneath, the lobes oblong-obovate and blunt. — The tree attains a height of 50 ft.; wood soft; branches more or less hollow; grows rapidly, like an herb; often covering areas that have recently been burned over.

L. H. B.

CEDAR: *Cedrus*, *Juniperus*.

CEDAR, WHITE: *Thuja*, *Chamaecyparis*.

CEDAR, WEST INDIAN: *Cedrela*.

CÉDRELA (from *Cedrus*, the wood resembling that of *Cedrus*). *Meliaceæ*, including *Toona*. Ornamental trees, grown for their handsome foliage; some are valuable timber trees.

Trees with alternate, usually abruptly pinnate lvs., without stipules: lfts. petioled, entire or slightly serrate: fls. inconspicuous, whitish, usually perfect, 4–5-merous, in large, pendulous, terminal panicles; calyx short, 4–5-parted, the petals forming a tube with spreading limb, below partly adnate to the disk; stamens shorter than petals; ovary 5-celled; style simple, with capitate stigma, somewhat longer than the stamens: fr. a caps., dehiscent, with 5 valves not splitting to the base, with many flat, winged seeds. — Nine species in Trop. Amer. and 8, forming the subgenus *Toona*, in E. India and Austral. *Toona* is often considered a distinct genus, distinguished from *Cedrela* by the disk being much longer than the ovary and by the seeds being winged above or at both ends, while in *Cedrela* the disk is as long or shorter than the ovary and the seeds are winged below. The first 3 species below belong to the subgenus *Toona*, the others are true *cedrelas*.

*Cedrelas* are tall ornamental trees with large pinnate foliage, well adapted for avenues: *C. sinensis* is hardy as far north as Massachusetts; the others are hardy only in southern California and in the Gulf states except *C. odorata*, which is tender even there. The wood of some species, particularly of *C. odorata*, is known as cedar wood, and much valued for making furniture and boxes. They thrive best in rich loam, and are propagated by seeds or by cuttings of mature wood, and, also, by root-cuttings, all with bottom heat.

848. *Cecropia palmata*.

A. *Lfts.* 10-25.B. *Lvs.* quite glabrous.C. Margin of *lvs.* more or less serrate; panicles very long, pendulous: seeds winged above.

*sinënsis*, Juss. (*Toöna sinënsis*, Roem. *Ailanthus flavëscens*, Carr.). Tree to 50 ft.: *lvs.* long-petioled, 10-20 in. long; *lfts.* 10-22, oblong or oblong-lanceolate, acuminate, slightly and remotely serrate, light green beneath, 4-8 in. long; *fls.* white, in very long, pendulous panicles; ovary glabrous; 5 subulate staminodes alternating with the stamens: fr. oblong or obovate, about 1 in. long. June. China. R.H. 1891, p. 574-5; 1875, p. 87. Gng. 4:1. M.D.G. 1902:495. F. 1876, p. 175. F.E. 13, p. 1.—Ornamental tree, with large feathery foliage; very valuable for avenues; similar to *ailanthus*, and nearly of the same hardiness, but of more regular and dense growth, and without the disagreeable odor when flowering. *Ailanthus* can be easily distinguished by the few coarse teeth near the base of the *lfts.*, each bearing a large gland beneath (Fig. 849).

849. Leaflets of *Cedrela* and *Ailanthus*. *Cedrela* on the right. ( $\times \frac{1}{5}$ )

*serrata*, Royle (*Toöna serrata*, Roem.). Tree, to 70 ft.: *lvs.* usually odd-pinnate, 15-20 in. long; *lfts.* 15-25, ovate-lanceolate or ovate-acuminate, irregularly serrate, glaucous beneath: panicles longer than the *lvs.*, pendulous; *fls.* fragrant, often 6-merous; ovary glabrous. Himalayas, to 8,000 ft. altitude. Royle, Ill. 25. Collett, Flor. Siml. 82.—This is probably the hardiest of the tropical species. Sometimes united with *C. Toona*.

cc. Margin of *lvs.* entire: panicles shorter than the *lvs.*

*Toöna*, Roxbg. (*Toöna ciliata*, Roem.). Tree, to 70 ft., nearly evergreen: *lvs.* abruptly pinnate; *lfts.* 10-20, usually opposite, lanceolate or ovate-lanceolate, sometimes undulate, 3-6 in. long; *fls.* white, honey-scented, 5-merous; ovary hairy; seeds winged at both ends. Himalayas. Wight., Icon. 161. Brandis, Forest Fl. 14.

*odorata*, Linn. WEST INDIAN CEDAR. Tree, to 100 ft.: *lvs.* 10-20 in. long; *lfts.* 12-20, ovate-lanceolate, acuminate, entire, bright green on both sides, 4-6 in. long; panicles shorter than the *lvs.*: fr. oblong,  $1\frac{1}{2}$  in. long; seeds winged below. W. Indies.—The cedar wood comes mostly from this species. Wood brown, fragrant, the source of the cigar-box wood of commerce. It is a very durable wood,

and is much prized in the W. Indies in the manufacture of cabinets, furniture, canoes, and other articles. In the W. Indies known as "cedar."

BB. *Lvs.* densely pubescent beneath.

*fissilis*, Vell. Tree: *lvs.* 10-15 in. long, abruptly pinnate; *lfts.* 18-24, opposite, nearly sessile, oblong-lanceolate, acuminate: panicles pubescent, longer than the *lvs.*; calyx pubescent outside; petals fulvous tomentose; ovary glabrous. Brazil, Paraguay. St. Hilaire, Fl. Brazil. 2:101.—According to Franceschi it does better at Santa Barbara than any other species of this genus.

AA. *Lfts.* 6-10, finely ciliate.

*Dugësii*, Wats. Tree: *lvs.* 10-15 in. long; *lfts.* cuneate, ovate-lanceolate, long and slender acuminate, nearly entire, shining above, pale green and glabrous or nearly so beneath, 4-6 in. long; panicles rather compact, much shorter than the *lvs.* Mex.

ALFRED REHDER.

**CEDRONÉLLA** (a little cedar, from the odor of *C. triphylla*, a species from the Canary Islands sometimes called "Balm of Gilead"). *Labiataë*. Herbs or shrubs, sometimes planted in borders in the middle and southern parts of the United States.

Four species allied to *Dracocephalum*, to which the first 2 belong according to Benth. Engler and Prantl consider the genus monotypic, containing only the third species below. The 2 native kinds described below are compact, free-flowering border perennials, with aromatic *lvs.* and numerous showy purplish pink *fls.* with blue stamens, and borne in dense whorls on long racemes or spikes: calyx a trifle oblique, 5-toothed; corolla-tube exerted, the limb 2-lipped; stamens 4, the anthers 2-celled.—They are not quite hardy N., and should have a sheltered sunny position, or some winter protection. The first 2 prop. by division of the root, the last by cuttings.

*cana*, Hook. Height  $2\frac{1}{2}$ -3 ft.: sts. hard, square, subshrubby; branches numerous, especially at the base, opposite, hoary with a minute pubescence: upper *lvs.*

small,  $\frac{1}{2}$ - $1\frac{1}{2}$  in. long, entire, hoary, numerous near the *fls.*, ovate; lower *lvs.* larger, cordate-ovate, dentate-serrate: spikes numerous; whorls dense, 15- or more-flid.; corolla 1 in. long, limb 5-cleft, the lowest lobe largest, crenate, revolute. June-Oct. Mex. and New Mex. B.M. 4618.

*mexicana*, Benth. (*Gardôquia betonicoides*, Lindl.). Height 1-3 ft.: root creeping: *lvs.*  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. long, ovate-lanceolate (the lower ones cordate), crenate-dentate, becoming purplish below, petioled: *fls.* very like the above, bright pink. Mex., Mts. S. Ariz. B.M. 3860.—Rarer in cult. than above; *lvs.* larger, longer and fewer. Intro. into cult. in 1839.

*triphylla*, Moench (*Dracocephalum canariense*, Linn.). BALM OF GILEAD. Shrubby, 3 to 4 ft.: *lfts.* 3, oblong or lanceolate: *fls.* purple or

850. *Cedrus atlantica*.

white, in loose spicate whorls. Aromatic plant from Canary Isls.

*C. pallida*, Lindl. Similar to *C. mexicana*, but differing in having shorter, pale red fls. B.R. 1846:29. It is sometimes confused with *C. mexicana*.

N. TAYLOR.†

**CÉDRUS** (*Kedros*, ancient Greek name). *Pináceæ*. CEDAR. Trees grown for their persisting foliage and striking habit; they are also valuable timber trees.

Large evergreen trees, with quadrangular, stiff,

fasciculate lvs.: fls. monœcious, the staminate forming cylindrical catkins: cones ovate or ovate-oblong, thick, 3-5 in. long, with broad, closely imbricate, bracts, attaining maturity in 2 or 3 years; seeds winged.—Three closely allied species in N. Afr., Asia Minor and Himalayas.

The cedars are large ornamental conifers, with wide-spreading branches, very distinct in habit from most other conifers. They are usually considered tender, but a hardy race of *Cedrus Libani* has been recently introduced by the Arnold Arboretum from the highest elevation where the species occurs in Asia Minor; the plants have stood all the winters since 1902 unprotected at the Arnold Arboretum and have proved perfectly hardy. It is very gratifying that one is now able to grow so far north the famous cedar of Lebanon which, aside from its beauty, is of peculiar interest for its historic and religious associations. The race of *Cedrus Libani* commonly cultivated is rather tender, more tender than *C. atlantica* which may be grown as far north as New York in sheltered positions, while *C. Deodara* can be grown safely only in California and southern states. The very durable and fragrant wood of all species is highly valued.

The cedars prefer well-drained, loamy soil, and will also grow in sandy clay, if there is no stagnant moisture. Propagated by seeds sown in spring; the varieties by veneer grafting, in late summer or in fall, on seedlings of *C. atlantica*; or, in warmer regions, on *C.*

*Deodara*; they grow also from cuttings, if the small shoots are selected which spring occasionally from the old wood. Plants of this genus are the true cedars; but trees of other genera are often called cedar. See *Chamæcyparis*, *Juniperus*, and *Thuja*; also *Cedrela*.

A. Branches stiff, not drooping: cones truncate, and often concave at the apex.

*atlantica*, Manetti. Fig. 850. Large, pyramidal

851. Cedars on Mt. Lebanon, *Cedrus Libani*.

tree, to 120 ft., with upright leading shoots: lvs. mostly less than 1 in. long, usually thicker than broad, rigid, glaucous green: cones 2-3 in. long, light brown. N. Afr. Gng. 2:163. G. F. 9:417. R.H. 1890, p. 32. G. W. 6, p. 498. Gn. 37, p. 195. Gt. 61, p. 449. Var. *glauca*, Carr. Foliage glaucous, with silvery hue; a very desirable and vigorous form. Gng. 8:275. Var. *fastigiata*, Carr. Of upright columnar habit. R.H. 1890, p. 32.

*Libani*, Loud. Fig. 851. Large tree, with wide-spreading, horizontal branches, forming a broad head when older, leading shoot nodding: lvs. 1 in. or longer, broader than thick, dark or bright green, sometimes bluish or silvery: cones 3-4 in. long, brown. Lebanon, Taurus, S. Anatolia and N. Afr. Gng. 5:65.

Mn. 1:39. G.F. 8:335; 2:149 (adapted in Fig. 851). Gn. 48, p. 237; 66, pp. 124-5, 178. G.C. III. 34:265. F.S.R. 2, pp. 291-4. Var. *brevifolia*, Hook. With shorter lvs. and smaller cones. Cyprus. Var. *glauca*, Carr. (var. *argentea*, Veitch). Foliage of blue or silvery hue. Var. *nana*, Loud. Dwarf form.

AA. Branches and leading shoot pendulous: cones obtuse.

*Deodara*, Loud. Tall tree, of pyramidal habit, to 150 ft.: lvs. 1-2 in. long, dark bluish green, rigid, as thick as broad: cones  $3\frac{1}{2}$ -5 in. long, reddish brown. Himalayas. Gng. 2:8. G.C. III. 25:139; 34:400. F. 1876, p. 103. Gn. 28, p. 223. V. 20:185. Var. *robusta*, Carr. Lvs. about 2 in. long, rigid. Var. *pendula*, Beissn. (var. *recurvata pendula*, Hort.). With long pendulous branches

or prostrate if not supported. G.W. 14, p. 413. Var. *fastigiata*, Carr. Of columnar habit. Var. *verticillata*, Rehd. (var. *verticillata glauca*, Tutenberg). A compact form with the lvs. whorled at the base of the shoots: foliage bluish white: the hardiest form of the species. G.W. 11, p. 89. Var. *viridis*, Knight. Lvs.

oblong-obtuse, hairy outside: caps. 4-8 in. long, 5-valved, bearing many woolly seeds. Tropics of Asia, Afr., and Amer. B.M. 3360.—One of the characteristic and well-known trees of tropical countries. The wings of some of the old trees run far in all directions, sometimes being prominent 30 ft. or more; note the

picture (fig. 852) of the well-known tree at Nassau on the island of New Providence. The wood is used to some extent in interior construction, but is soft, white and brittle. The cotton-like material in the pods is used in beds and pillows and for stuffing life-buoys, but it cannot be spun into threads; it is the "kapok" of commerce. Offered in S. Calif. and Fla., as a tree of rapid growth.

*grandiflora*, Rose. Tree, 15-20 ft., 8-12 in. diam., the branches with short prickles: petioles 2-4 in. long; lfts. 3-5, glabrous, oblong, cuneate at base, entire or slightly serrulate, 2-3½ in. long; petals white, silky, 4-5 in. long, strap-shaped; stamens 5, the filaments 3½ in. long and each with 2 anthers: caps. oblong, 4½ in. long. Trop. W. Mex.—The fls. are fleshy; they change to brown. Listed in S. Calif.

L. H. B.

852. *Ceiba Casearia*, the great silk-cotton tree at Nassau.

bright green. Var. *argentea*, Carr. Foliage of silvery hue. Var. *nivea*, Annesley. Young growth white. G.C. III. 25:399. Var. *albo-spica*, Annesley (var. *albo-spicata*, Beissn.). Young growth green, becoming later white at the tips. G.W. 11, p. 89. Var. *aurea*, Beissn. Foliage golden yellow. G.W. 11, p. 87.

ALFRED REHDER.

**CÈIBA** (aboriginal name). *Bombacaceæ*. **SILK-COTTON. KAPOK. CEIBA.** Trees, one of which is widely known in the tropics for its great size as a shade tree, and for the "cotton" of its seed-pods. *Eriodendron* is a more recent name.

Leaves digitate, with 5-7 entire lfts.: fls. medium to large, rose or white, on 1-fl. peduncles, solitary or fasciated; calyx cup-shaped, truncate or irregularly 3-5-lobed; petals oblong, pubescent or woolly; staminal tube divided at the apex into 5 or 10 parts, each part bearing a stamen; ovary 5-celled: fr. a coriaceous caps., pubescent within and bearing obovoid seeds embedded in a wool-like or cotton-like fiber.—Allied to *Bombax* and *Adansonia*, from which it differs in having 5 parts in the staminal body or column, rather than a much more divided column bearing many stamens on each division. Ten or more species, mostly in Trop. Amer., extending to Asia and Afr.

*Casearia*, Medic. (*C. pentandra*, Gaertn. *Bombax pentandrum*, Linn. *B. guineense*, Schum. & Thoun. *Eriodendron anfractuosum*, DC. *E. occidentale*, Don. *E. orientale*, Kostel. *Xylon pentandrum*, O. Kunze.). **SILK-COTTON TREE. CEIBA. POCHOTE.** Figs. 852, 853. Great tree, reaching 100 ft. and more, and having immense horizontal far-spreading branches and wide-lying thin buttresses or flanges: trunk spiny when young; branches verticillate: lfts. 7, arising from a nearly circular plate or disk at the top of the petiole, lanceolate-acuminate, undulate, smooth, each 4-6 in. long: fls. white or rose, the corolla 2-3 in. long; petals

**CELÁSTRUS** (*Kelastros*, ancient Greek name). *Celastraceæ*. Woody plants grown chiefly for their brightly colored fruit; some also for their handsome foliage.

Shrubs, usually climbing, with alternate, petioled, usually deciduous and serrate glabrous lvs.: fls. polygamous, 5-merous, inconspicuous, greenish white, in axillary or terminal panicles or racemes; calyx 5-parted; petals small, oblong-ovate; disk entire or crenate; stamens short; ovary superior; style short with 3-lobed

853. Leaves and fruits of *Ceiba Casearia*, the silk-cotton tree. ( $\times \frac{1}{4}$ )

stigma: fr. a caps. dehiscent into 3 valves, each containing 1 or 2 seeds, inclosed in a fleshy crimson aril. —More than 30 species in S. and E. Asia, Austral. and Amer. The species with perfect fls. in axillary cymes and with evergreen lvs., being rigid and often spiny shrubs, are now included under *Gymnosporia*, which see.

These shrubs are hardy and ornamental, very effective with their bright-colored fruit remaining usually throughout the winter; *C. angulatus* is also worth growing for its large handsome foliage. They are very valuable for covering trelliswork, trees or rocks and walls: they grow in almost any soil and situation, and as well in shaded as in sunny positions. Propagated by seeds, sown in fall or stratified, and by root-cuttings or layers; suckers are freely produced, and become sometimes a nuisance in nurseries; they also can be increased by cuttings of mature and of soft wood.

A. Under side of lvs. green.

c. Fls. and fr. in axillary few-fl. cymes along the branches.

**orbiculatus**, Thunb. (*C. articulatus*, Thunb.). Fig. 854. High-climbing shrub: lvs. cuneate, suborbicular to oblong or obovate, acute or acuminate, crenate-serrate, 2-3 in. long: fr. globular, orange-yellow, with crimson seeds. Japan, China. B.M. 7599. G.F. 3:550 (adapted in Fig. 854). A.F. 9:534. G.C. III. 23:29; 43:242. Gng. 5:119. M.D.G. 1902:306. Var. **punctatus**, Rehd. (*C. punctatus*, Thunb.). A less vigorous grower, with smaller, elliptic lvs.—*C. orbiculatus* is of more vigorous growth than the following species, and fruits very profusely, but the frs. are hidden by the foliage, and are not very conspicuous until the lvs. have fallen, while *C. scandens* bears its frs. above the lvs.

cc. Fls. and fr. in terminal panicles.

**scandens**, Linn. FALSE BITTER-SWEET. WAX-WORK. Fig. 855. High, climbing to 20 ft.: lvs. cuneate, ovate to ovate-lanceolate, acuminate, crenate-serrate, glabrous, 2-4 in. long: fls. in terminal, many-fl. panicles or racemes 2-4 in. long: fr. about  $\frac{1}{2}$  in. diam., orange-yellow, with crimson seeds. Canada to S. D. and New Mex. Em. 545. A.G. 11:29, 31. G.F. 5:569 (adapted in Fig. 855). Gng. 5:119. A.F. 9:534. V. 3:315. Gn. 33, p. 393 (habit).

854. *Celastrus orbiculatus*. ( $\times \frac{1}{2}$ )

**paniculatus**, Willd. (*C. dependens*, Wall.). Branches brown with numerous small white lenticels, pendulous: lvs. ovate-oblong or obovate, sometimes to 5 in. long: fls. in terminal pendulous panicles 4-8 in. long. Himalayas.—Not hardy N.

855. *Celastrus scandens*. ( $\times \frac{1}{2}$ )

BB. Lvs. 4-6 in. long and 3-5 in. broad: branchlets angular.

**angulatus**, Maxim. (*C. latifolius*, Hemsl.). Glabrous shrub, climbing to 20 ft.: branchlets angular, finely lenticellate: lvs. broadly ovate or roundish, abruptly short-acuminate, crenately serrate: terminal panicles 4-6 in. long: fr. subglobose, nearly  $\frac{1}{2}$  in. thick, on thick short stalks, yellow with orange seeds. N.W. and Cent. China. H.I. 23:2206.—Even without fr. effective on account of its large foliage; has proved hardy at the Arnold Arboretum.

AA. Under side of the lvs. bluish white.

**hypoleucus**, Warb. (*C. hypoglauca*, Hemsl. *Erythrospermum hypoleucum*, Oliver). Glabrous shrub with terete brown branches scarcely lenticellate: lvs. elliptic or oblong-elliptic, 2-4 in. long, short-acuminate, remotely serrulate: terminal panicles 2-5 in. long, loose: fr. about  $\frac{1}{2}$  in. thick on slender stalks,  $\frac{1}{4}$ - $\frac{1}{2}$  in. long. Cent. China. H.I. 19:1899.

*C. flagellaris*, Rupr. Allied to *C. orbiculatus*. Branches with persistent spiny stipules, sometimes rooting: lvs. ovate or oval, small, finely serrulate, slender-petioled: fr. axillary, small. N. China, Korea, Japan. Quite hardy, but not so handsome as *C. orbiculatus*.—*C. nitans*, Hort. Reasoner, not Roxbg.=*Quisqualis indica*.—*C. Orixia*, Sieb. & Zucc.=*Orixia japonica*.

ALFRED REHDER.

**CELERIAC** (*Apium graveolens*, Linn., var. *rapaceum*, DC.). *Umbelliferae*. Fig. 856. An offshoot of the celery species, producing an edible root-part instead of edible leaves.

Celeriac is very little grown in this country, and to Americans is almost unknown, but it is much prized in Europe. Here it is cultivated chiefly where there is a foreign population. Fifteen or twenty varieties are mentioned in the seed catalogues, but there is very little difference in the various sorts, some seedsmen even making no distinction between varieties, but cataloguing the plant simply as celeriac.

In general, the culture is the same as for celery, except that no blanching is required, since it is the enlarged root that constitutes the edible part. Sow the seed during the spring in a well-prepared seed-bed, preferably in a more or less shaded location. A coldframe or a spent hotbed is a good place. The seed is slow

856. Celeriac trimmed for market ( $\times \frac{1}{2}$ ); also an untrimmed root, on a smaller scale.

to germinate, and must be kept well watered. When the plants are 2 or 3 inches tall, they ought to be transplanted; about 3 inches apart each way is a good distance to place them at this handling. Later, again transplant them to the open ground, in rows about 2 feet apart and 6 or 8 inches distant in the row. The soil should be a rich light loam well supplied with moisture. (The seed may be sown where the plants are to remain, and thinned to the required distance, but stronger, more stocky plants are secured by transplanting as directed.) Plants thus treated will be ready for fall and winter use.

If they are desired for earlier use, the seeds may be sown in a mild hotbed and transplanted to the open.

Aside from frequent tillage, celeriac requires but little attention during growth. It is a frequent practice with growers to remove a little of the earth from about the plants after the root has become well enlarged, and to cut off the lateral roots. This tends to make the main root grow larger, smoother and more symmetrical in shape. For winter use, the plants may be protected with earth and straw to keep out frost, or packed in moist sand and placed in a cool cellar.

The principal use of celeriac is for the flavoring of soups and stews, but it is also served in several other ways. It may be boiled and eaten with a white sauce, like cauliflower; as a salad, either first being cooked as beets or turnips, or else cut up into small pieces and used raw; when boiled, sliced and served with oil and vinegar, it forms the dish known as "celery salad." An extract may be obtained from it which is said to have medicinal properties.

Just how long celeriac, or turnip-rooted celery, has been in cultivation is unknown. Its history as a garden vegetable can be traced definitely as far back as the middle of the seventeenth century, although writers for a century or more previous to this time made references which would seem to relate to this vegetable, but the identity is obscure. Its origin was probably the same as that of the common garden celery, of which it is doubtless a state wherein the root has become enlarged and edible. This form is supposed to be the one most remotely removed from the wild state.

H. P. GOULD.

**CELERY** (*Apium graveolens*, Linn.). *Umbelliferae*. A major garden vegetable, grown for its blanched leaf-stalks which are eaten raw and also used in cookery.

Biennial, sometimes annual, plants: lf-stalks 6-15

in. long, bearing 3 pairs and a terminal lft. coarsely serrated and ternately lobed or divided. The fl-stalks are 2-3 ft. high, branched and leafy; fls. white, inconspicuous and borne in compound umbels; seeds very small, flattened on the sides, broader than long. An acrid, pungent flavor characterizes the wild plants.

The genus *Apium* is variously understood. As mostly accepted, it comprises some 15 or 20 species of annual or perennial glabrous herbs with pinnate or pinnately compound lvs., and small greenish white fls. in compound umbels; calyx-teeth wanting; petals ovate or rounded. The species are distributed widely in temperate regions and in the mountains in the tropics. *A. graveolens* is the one important species to the horticulturist. Var. *rapaceum* is celeriac, a form or race in which the crown of the plant is thickened and turnip-like (see *Celeriac*). The wild celery plant is not stout, nor are the lf-stalks thickened, as they are in the domesticated races. It grows 1-2 ft. high when in bloom, in marshy places near the sea, on the coasts of Eu., Afr., and Asia; and it has run wild from cult. in some parts of N. Amer.

Celery probably was not cultivated until after the Middle Ages, and the varieties now grown so extensively have been developed within the past thirty-five years. It is not many years since this vegetable was regarded as a luxury and sold at prices that could be paid only by the wealthy, but today it is one of the standard vegetables and is produced in enormous quantities for the city markets. The industry is often highly profitable on muck areas, and thousands of acres of this land are used for celery-culture in Michigan, Ohio, New York, Florida and California. Intensive market-gardeners of the North regard it as one of their most profitable crops, and results are especially satisfactory if the land can be irrigated. When good markets are available, celery is an excellent crop to follow early garden crops, such as peas, beans, beets, bunch onions, radishes and other vegetables that mature in ample time to allow the after-planting of celery to mature. Soils that have been previously cropped the same season should be manured liberally before celery is planted.

#### Types and varieties.

The methods of cultivation and handling of celery depend so much on the variety that this part of the subject should be discussed at the outset. Celery may be classified into two general groups—green varieties, and the so-called self-blanching varieties. Formerly, the green kinds were grown almost exclusively, but commercial growers soon discovered that the self-blanching varieties possess certain cultural advantages that make them highly desirable from a business point of view. They are more easily blanched, and this is probably the most important consideration when the crop is to be grown for commercial purposes. This is particularly advantageous in the summer crop, and equally appreciated by those who plant large areas for the late market. When boards are used for blanching, more than twice as many plants may be set on an acre as when green varieties are employed and the crop bleached with earth. It is

857. The Boston ideal.

universally conceded, however, that the light-colored varieties are somewhat inferior in quality to the green sorts. For this reason it is a mistake to rely wholly on self-blanching varieties in the home garden. Many home gardeners plant the light-colored kinds for summer use only, and green varieties for fall and winter use.

In some regions, a plant with a much-branched base is desired as in Fig. 857; but in general a less spreading or a lighter plant is grown, as in Fig. 858. These differences are mostly matters of the way in which the plants are grown, as to room in seed-bed and field.

*White Plume* is one of the best known of the self-blanching varieties. It is vigorous in growth and attains a greater height than Golden Self-blanching and, for this reason, does not meet with as great favor among commercial growers. The quality is also inferior to Golden Self-blanching.

*Golden Self-blanching* is by far the most popular of American varieties. It is a favorite with amateurs and constitutes probably 90 per cent of all the celery grown in the United States. The plants attain a height of 14 to 20 inches, and are compact and stocky. The stems are short, thick, easily blanched to a creamy white, and the foliage is abundant.

*Rose-ribbed Golden Self-blanching* has a tinge of rose-color on the ribbing of the stems, which makes the variety attractive for the home garden. It is not grown largely for commercial purposes.

*Giant Pascal* is an old green-stem variety that is not surpassed in quality. In rich moist soils the plants attain a height of 30 inches or more. It is a favorite of home gardeners who take pride in producing tall, tender stalks of the highest quality.

*Winter Queen* is a more popular green variety among commercial growers than *Giant Pascal*. It does not attain such a great height and grows more compactly, so that less space is required between rows, and the crop is more convenient to store.

*French Success* is a very stocky compact winter variety that possesses excellent keeping qualities.

*Boston Market* is famous for its excellent quality. It is grown extensively about Boston in the home gardens and for commercial purposes. It is low, compact, crisp, tender and of the best flavor.

Many other varieties are planted to some extent, but the most important have been mentioned.

#### Soils.

As previously stated, great commercial plantations are on muck soils, although the business is not confined to such lands. The mucks usually provide ideal conditions for the culture of celery. The plant thrives in soils abounding in vegetable matter, and as mucks contain 60 per cent or more of organic matter this requirement is fully met. A Kalamazoo (Michigan) muck soil, used extensively for celery, analyzed as follows:

	Per cent
Sand and silicates.....	19.16
Alumina.....	1.40
Oxide of iron.....	3.94
Lime.....	6.09
Magnesia.....	0.81
Potash.....	0.34
Soda.....	0.38
Sulphuric acid.....	1.31
Phosphoric acid.....	0.88
Carbonic acid.....	1.95
Organic matter (containing 2.53 per cent of nitrogen).....	63.76
Water.....	6.51

Properly prepared mucks are loose and friable, and this is a great advantage in transplanting and in performing all tillage operations. The land is easily plowed, harrowed, leveled, marked and cultivated, and the work of ridging the plants is accomplished with the greatest ease. The depth of the water-table in muck lands varies greatly, but about 3 feet is considered most favorable; at this depth the plants never suffer from drought.

While it is universally conceded that muck soils provide the best conditions for the extensive cultiva-

tion of celery, the crop is grown with entire success on a great variety of soil types. In fact, the plants thrive in any friable soil which is adequately provided with moisture, plant-food and vegetable matter. Near all the northern cities of the United States may be found plantations of limited area that return excellent profits. This is particularly true in sections devoted to the most intensive types of market-gardening, when stable manure and commercial fertilizers are used almost lavishly. With this system of soil-management, the ground soon changes its physical properties and in some cases approaches the muck soils in mechanical composition. It is not uncommon to find small areas on various types of soil, cultivated intensely, which make a gross return of \$1,000 or more to the acre. These results indicate the great possibilities of the home garden for the production of celery. There is no reason why every gardener, whatever his type of soil, should not be fully successful in growing a bountiful supply of the choicest celery for the home table.

The reclaiming of new muck lands is often an expensive undertaking. The land must be cleared of brush and sometimes timber. Drainage must be provided

858. A good celery plant in the general market.

by means of tile or open ditches. The land is often acid, and lime should be employed to correct the acidity. For a year or two other crops than celery should be planted to get the land in the proper physical condition. The first plowing should be done in the fall so that the land will be exposed to frost during the winter. Corn is an excellent crop to plant the following spring. There should be repeated cultivation throughout the summer to destroy any other vegetation that may start.

Other types of soil should be prepared as in the usual way for the small garden crops. Fall plowing, after large quantities of manure have been added, is often desirable when an early crop is to be started the following spring. Smoothing harrows and plank drags should be used to make the soil fine and smooth preparatory to planting. All preparatory tillage operations should be conducted with a view to conserving soil-moisture, which is exceedingly important to celery throughout the period of growth.

#### Fertilizing.

As previously stated, it is important for land that is to be planted in celery to abound in vegetable matter. There must also be an abundance of available plant-food in order to secure a rapid and vigorous growth. When applying either manure or commercial fertilizer, the grower should bear in mind that this is a shallow-

rooted plant and the materials should not be placed at great depths.

All classes of growers, whether they are producing on a garden or field scale, and whatever their type of soil may be, recognize stable-manures as the best fertilizer that can be applied for this crop. Stable-manures are the most satisfactory because they furnish both organic matter and plant-food. It is often desirable to supplement stable-manures with commercial fertilizers, but the success of this crop will be far more certain if reliance is placed on barn-manures rather than chemical fertilizers.

An effort should be made to have the manures near the surface of the ground, and this can be accomplished by applying rotten or composted manure after plowing and working into the soil with a disc-harrow. If coarse fresh manure must be used and partially decayed manure is not available, it is preferable to apply it before plowing. Market-gardeners often apply thirty to forty tons to the acre, although smaller quantities give excellent results, especially if fertilizers are used in addition to the manure. Ten tons of manure on muck land is a decided advantage over no manure, even when fertilizers are used in large quantities.

Probably no commercial grower of celery should attempt to produce this crop without the use of at least some commercial fertilizer. When stable-manures are used lavishly, a little acid phosphate, nitrate of soda or potash will often give increased profits.

When stable-manure is not used at all, or perhaps in very small amounts, commercial fertilizers should be used with freedom. Two tons of a high-grade fertilizer to the acre is not an unusual application, and some of the most intensive growers use larger amounts. In the smaller areas, from which a gross return of \$800 to \$1,200 to the acre is expected, there should be no hesitancy in spending \$100 to \$125 an acre for manure and fertilizer. Celery requires much nitrogen and the mixed fertilizer applied before planting, or afterwards as a side-dressing, should contain not less than 4 per cent of this element. There should also be an abundance of potash and phosphoric acid. A fertilizer containing 4 per cent of nitrogen, 8 per cent phosphoric acid and 10 per cent potash should meet the requirements of this crop in all soils, when applied in sufficient quantity.

Some growers have found it highly desirable to apply nitrate of soda or complete fertilizer as side-dressings after the crop is well started. These applications may vary from 100 to 200 pounds to the acre and should be made at intervals of about three weeks.

#### *Starting the plants.*

The greatest care should be exercised in procuring seed, for inferior seed may result in pithy or hollow

seed directly from foreign producers, which, however, is unnecessary if the proper precautions are taken in the selection of a responsible seedsman. Practically all of the seed of the self-blanching varieties is grown in France, while most of the seed of green varieties is produced in California. As there is never absolute

certainly of securing entirely satisfactory seed, some growers follow the excellent practice of buying in large amounts, sufficient to last several years. Only a small

quantity of the seed is planted the first year to determine its real merit, and if found satisfactory there is sufficient quantity on hand to last several years. If kept in sealed jars in a room where the temperature does not vary greatly, the germinating power will be retained at least six years.

Celery seed is very small. An ounce contains about 70,000 seeds, and with the very best conditions should produce at least half this number of plants. It is not safe, however, to count on a much greater number than 10,000 plants to the ounce, because many of the seeds usually fail to germinate and the plants at first are very small and easily perishable. The seeds are slow to germinate. They should be planted in fine soil which, if possible, should be kept constantly moist but never wet.

Seed for the early crop is seldom sown before the first of March. If checked in growth at any time, there is great danger of the plants producing seed shoots which renders them unsalable. Plants started the first of March will, with proper care, be ready for market in August. Earlier sowing is possible and sometimes desirable, but adequate facilities must be provided to avoid crowding the plants, which invariably results in checking the growth. Some gardeners have found it to be profitable to start the plants the latter part of February, finally transplanting into frames, where the crop is matured.

Seed for the early crop may be sown in the beds of the artificially heated frame or greenhouse. Many growers use flats or shallow plant-boxes, which are placed in the hotbed or greenhouse. While broadcasting of the seed is often practised, it is better to sow in drills 2 inches apart. The furrows should be very shallow, as the seeds should not be covered with more than  $\frac{1}{8}$  inch of earth. Muck mixed with a small amount of sifted coal-ashes, sand and a little bone-meal, is most excellent for starting plants under glass. After sowing and lightly covering the seed, place a piece of burlap over the bed, and water it. Keep the bed covered with burlap or a piece of cloth until the plants begin to come up. Do not water more than necessary to keep the bed moist. When the plants appear they will need plenty of light, sunshine and fresh air. A temperature of 70° to 75° is most favorable to germination, but 10° lower should be maintained if possible after the plants are up. Higher temperatures, however, will do no harm if the proper attention is given to ventilation.

When the rough leaves appear, the seedlings should be transplanted into beds or preferably flats, spacing the plants 1½ inches apart each way. Stronger plants will be developed if they are set 2 inches apart. The flats may be about 2 inches deep and half filled with

860. Blanching celery by wrapping it with paper.

859. Celery planted thick, and the patch edged with boards. The "new celery-culture."

stalks, a poor stand of plants in the seed-bed, seedlings of low vitality, or a large percentage of seed shoots. Only the most reliable dealers, those who have a reputation for furnishing first-class seed of the varieties desired, should be patronized. To make certain of securing good seed, some careful growers import their

rotten manure, the remainder of the space being filled with good rich soil. The manure will furnish ideal conditions for the roots of the young seedlings and make it possible to transplant them to the open ground with blocks of earth and manure so that there will be practically no check in growth. If earliness is an important consideration, this method of treatment is highly important. Young celery plants require considerable nursing, and it will not do to take them from warm greenhouses or hotbeds to coldframes before the season is well advanced. They will suffer even more than tomato plants from low temperature. One of the most successful of our American growers invariably plants from the greenhouse to the open ground, beginning about May 10.

Spraying the seedlings several times with bordeaux mixture may be the means of avoiding loss from fungous diseases.

Seed for the late crop should be sown in the open ground or in protected beds as soon in the spring as the soil can be prepared. Delay in starting the plants is often responsible for a failure of the late crop. It is not so easy to control moisture in the outdoor seedbeds. If overhead irrigation lines are available, there will be no difficulty in this matter. The beds are often shaded with brush or lath screen. Small beds may be kept covered with moist burlap. When starting on a large scale, the rows may be a foot or more apart. Thinning is often necessary to secure stocky plants. The plants may be set where they are to mature any time after they have attained a height of about 3 inches. Ordinarily seedlings started out-of-doors are transplanted directly to the permanent bed or field without an intermediate shift, although this is an advantage in developing stronger plants with better roots. If the plants attain a height of 5 inches or more before they are set in the field, the tops should be cut back before transplanting.

#### *Planting in the field.*

As previously indicated, plants for the early crop should not be set in the open ground until about May 10 in the latitude of Philadelphia and New York. There is danger of injury from hard frosts if transplanted before this time, and such injury may result in a large percentage of the plants producing seed shoots, thus rendering them unsalable. Seedlings for the late crop may be transplanted in permanent quarters any time after June 20.

The time of planting in the field will depend largely on the varieties to be used. For example, Golden Self-blanching may be set out three or four weeks later than Giant Pascal and have time to mature fully before hard freezing weather is likely to occur. Many commercial growers do not transplant the late crop until nearly the first of August. In most parts of the North, it is better to transplant early in July. The date of transplanting, however, is not so important as to have the plants, as well as the ground, in proper condition before transplanting is started. Plants that are 3 to 5 inches high are much more likely to live and thrive than taller ones. The ground should be smooth, fine and moist. It is exceedingly important to have the rows perfectly straight and this can be accomplished by the use of a marker. A line may be used for this purpose, but transplanting may be accomplished much more rapidly by using a rope-and-peg marker.

There is the greatest variation in the planting distances for celery. Some of the most intensive growers plant 7 or 8 inches apart each way. Others prefer to space the rows about a foot apart and have the plants stand 4 inches apart in the row. When such close planting is followed, it is known as "the new celery-culture" (Fig. 859). The plants stand so close together

when this method is used that they blanch themselves and it is unnecessary to use boards or other devices. "The new celery-culture" is better adapted to greenhouse and coldframe use, where the plants can be watered by sub-irrigation. When plants stand so close together, there is little circulation of air and heart-rot or other diseases are likely to occur in hot moist weather. The possibilities of a small area by use of this method are very large and the system appeals to growers who have only small tracts of land to cultivate.

A more common practice is to space the rows 18 inches to 2 feet apart and to set the plants 4 or 5 inches apart in the row. This method is now almost universally employed for Golden Self-blanching when boards are to be used for blanching the crop. When transplanted 4 by 24 inches apart, about 60,000 plants are required to set an acre. If horse implements are to be used in planting, it is better to allow at least 28 inches between rows.

Some growers prefer to plant Golden Self-blanching in double rows 6 inches apart, placing the plants 4 or 5 inches apart in the row. This plan is not universally popular because it is not favorable to the full development of every plant. Boards are also used for blanching when this system of planting is followed.

When soil is to be used for blanching, more space

861. The last earthing-up or banking of celery.

must be allowed between rows. Formerly the almost universal practice was to allow 5 feet between rows. With tall-growing varieties, such as Giant Pascal, this is not too much space to provide sufficient soil for blanching. When lower-growing varieties, such as Winter Queen, are used, the rows need not be more than 4 or 4½ feet apart to give sufficient space for blanching with earth. The larger varieties of the green type should not be planted quite so close together in the row as Golden Self-blanching; for the best development of the plants, it is better to space them 5 or 6 inches apart in the row.

Growers who plant both early and late varieties often alternate the rows. The early variety is removed first, of course, and then there is 4 feet or more of space between the rows of late varieties which are blanched with earth. Transplanting should proceed as rapidly as possible without undue exposure of the roots to the air. If the plant-beds are watered twenty-four hours in advance of transplanting, the plants may be removed with less injury.

#### *Subsequent tillage practice in the North.*

Celery is often inter-cropped with other vegetables. One of the most common plans is to plant five rows of onions about a foot apart as early in the spring as the ground can be prepared. The fifth rows are pulled for bunching, and celery is planted instead of the onions. This is a most excellent combination for muck soils where good markets can be found for both crops. Radishes are also excellent to precede celery. If desired, the small button-shaped varieties may be

used, every fifth row to be planted in celery and later-maturing varieties of radishes in the four rows between.

Frequent tillage is necessary for the best results with celery. As it is a shallow-rooted plant, tools that run at considerable depth should be avoided. For horse tillage, there is nothing superior to the spike-tooth cultivator in general use. If the plants are small, great care should be exercised to avoid throwing dirt on top of the hearts. If the ground contains many

862. Water-holding celery crate.

weeds, more or less hand work will be required between the plants in the rows.

The mulching of soils with horse-manure has been a very popular and profitable practice in recent years. It has been shown in the laboratory as well as in field practice that a fine mulch of 3 or 4 inches of horse-manure conserves moisture more perfectly than the most thorough tillage. The mulching of celery in the field not only conserves moisture but it reduces the labor of tillage and also furnishes nourishment to the plants. The rains carry liquid food to the roots and a more rapid growth invariably follows. Considerable hand labor is required, of course, to place the manure between the rows, but this is probably no greater than the labor needed to till the crop when a mulch is not used. It is customary to use fresh horse-manure, which has been aerated in thin layers for a few days before making application. The ground is completely covered, although the manure is not allowed to touch the plants. The mulch may be applied immediately after planting or, as some prefer, the plants may be tilled for ten days or two weeks and the mulch then applied. Very few weeds will appear if 3 or 4 inches of horse-manure is used.

Irrigation makes the crop more certain, and it is also a means of securing larger and more vigorous growth and consequently better quality. Most of the intensive growers of the East are prepared to irrigate. Various methods are employed. Some who cultivate very small areas use the hose or other sprinkling device. The method that is now in most common use is the overhead system of irrigation, providing for parallel pipe lines about 50 feet apart (see *Irrigation*). These are turned at will by means of levers at the ends and the water is thrown out at any desired angle through small nipples placed about 4 feet apart on the lines. It is important to do the watering if possible in the evening or at night so that the foliage may be as dry as possible during the day. It is also important to make thorough applications, as it is not advisable to water more frequently than absolutely necessary.

#### *Blanching.*

All American markets demand celery with creamy white stalks. This light color is secured by causing the plants to grow with the stalks in the dark, or nearly so, which prevents the development of chlorophyll. When boards, earth, paper, tile or other means are used, most of the leaves are not covered, and growth is not hindered in the least.

Green varieties are blanched almost exclusively by the use of earth. There should be no ridging until the weather is cool and, therefore, this operation is

not usually undertaken until early in September at the North. At first the ridging should be only a few inches high, but later should extend to the full height of the stems. Finally, the rows are ridged so that only the tops protrude above the ridges, as shown in Fig. 861. Special tools are available for this operation and the work may be done very rapidly.

The early crop is blanched mostly by means of boards, although paper (Fig. 860) and other devices are sometimes used. Hemlock, pine and cypress lumber are used for this purpose in various parts of the country. The boards need not be more than 10 inches wide, although 12-inch boards are commonly used. They may be of any convenient length, say 14 to 16 feet long. To prevent warping and splitting, cleats about 3 inches wide and  $\frac{1}{2}$  inch thick should be nailed at each end and in the middle of the boards. The boards are placed on edge, one on each side of the row and brought as close together as convenient at the upper edge and secured by means of wire hooks. Sometimes stakes are driven at the sides, although wire hooks are more convenient. The hooks should be 6 or 7 inches long and may be made of heavy fence wire. From ten days to two weeks is required for proper blanching with boards. As the crop is sold, the boards are shifted from place to place so that they may be used several times during the season. When not in use, the boards should be stored under cover or stacked in piles with strips between them. With good care, boards that are sound when purchased will last fifteen years.

#### *Harvesting and marketing.*

The harvesting of the celery crop when grown in coldframes usually occurs in the month of July. If the climate is not too severe, it is possible to have celery ready for market the latter part of June. The late crop, which is produced without the use of boards, is not usually ready for market until August. It is lifted with forks or perhaps cut with a sharp knife just beneath the surface and conveyed to the packing-house where it is prepared for market. In some sections the roots are not trimmed at all, the plants being tied in bunches of a dozen and packed in a standard crate such as is shown in Fig. 862. These crates are 24 by 24 inches at the base, and contain six to sixteen dozen plants, depending on the size of the celery. The height of the crate may be varied to suit the height of the celery. Another form of celery crate is shown in Fig. 863. In some regions, the roots are trimmed into tapering cubes as shown in Fig. 864. A very convenient method of bunching is to place three plants side by side, tapering the roots as indicated, tying the tapering roots tightly and then securing the tops. Formerly twine was used almost entirely for bunching, while in recent years many growers have found it desirable to use either blue or red tape, which gives the celery a more attractive appearance on the market. Michigan growers and other producers of celery in the Great

863. Celery crate.

Lake district use small crates of very thin lumber. These vary in size and range about as follows: 6 by 12 by 24 inches; 6 by 16 by 24 inches; 2 by 20 by 24 inches; 6 by 26 by 24 inches and 6 by 30 by 24 inches. The number of bunches in the crates depends on the size of the celery and of the crate, but varies from four to twenty-four dozen. For local markets, the plants may be tied in bunches of the most popular size and packed in any crate of convenient form and size.

*Storage.*

A large percentage of the late celery crop is placed in city cold-storage houses. It is packed with the roots on, and there is very little trimming. Golden Self-blanching keeps fairly well in cold storage, or at least the hearts are presentable when they come out of storage. This is the product that now meets the general demand of the large cities until celery begins to arrive from Florida.

In the North, this crop is very commonly stored in trenches. The trenches are dug in well-drained ground and must be deep enough to accommodate the plants so that the tops will not extend more than about 2 or 3 inches above the trenches. The celery will keep better if the trenches are not too wide. Ordinarily they are dug 10 to 14 inches wide. The plants are lifted and stood as close together in the trench as possible. Some growers prefer to place a little earth over the roots, although this is not necessary. If the tops

of the plants are dry when stored, and if the plants are not permitted to wilt by being in the sunshine, they should keep in perfect condition in the trenches. Boards are nailed together in the form of a trough and placed over the trenches as rapidly as they are filled. Early in the season, and especially if the weather is quite warm, it is an advantage to provide additional ventilation by placing stones or blocks under the edges of the trough. As the season advances and the weather becomes colder, these should be

removed and when necessary, earth, or, better, manure, thrown over the boards to give additional protection. Four or 5 inches of manure will protect the crop thoroughly in most sections until Thanksgiving and perhaps Christmas, depending on the weather. Two kinds of trench storage are shown in Figs. 865, 866.

The late crop is often stored in coldframes of sufficient depth to receive the plants. The frames are usually covered with boards lapped in roof fashion, and straw or marsh hay is placed over the boards when necessary to give additional protection.

Ordinary house cellars, which are well ventilated and not too warm, may be used for storing a limited quantity of celery. Various types of houses have been built for keeping the crop. Cement or brick structures are perhaps the most serviceable. It is important to provide ample ventilation in structures of this kind. In some regions, as around Boston, pits are constructed. The sides of these should be about 2 feet high and the roof may be constructed in an even-span form or simply a shed roof against some other building. Boards are also used for the roofs and covered with straw or hay to give protection during cold weather.

864. Celery plant trimmed for market.

*Enemies.*

Celery does not have any serious insect enemies. Diseases are much more destructive and difficult to control. The most important diseases are the blights (*Cercospora apii* and *Septoria petroselinii* var. *apii*), leaf-spot (*Phyllosticta apii*), and rust (*Puccinia bulbata*). The application of bordeaux mixture in the seed-bed will help to control some of these diseases. Many growers also find it necessary to make frequent applications of bordeaux mixture in the field in order to prevent serious losses. The complete control of diseases in the field may be the means of avoiding loss in storage. The earlier applications of bordeaux mixture are regarded as the most effective. Rotation is also desirable in preventing losses from disease.

R. L. WATTS.

*Celery-growing in the South.*

The method of raising celery seedlings is not the same in the South, and especially in Florida, as it is in the North. Sowing is done in July, August, and September, at a time of the year when there is continued warm weather, and frequent beating rain.

A place is chosen for the seed-bed near the celery field,—usually a plot at the edge. The size of the field to be planted will determine the extent of the seed-bed. The width of the seed-bed varies from 18 to 36 inches. Rows are sown across it, making it possible to weed and keep the earth worked from both sides. Immediately after sowing, pieces of heavy burlap (usually old fertilizer sacks) are placed over the beds to conserve the moisture, cool the soil, and to protect the seeds against the beating of heavy rains. The seed-beds are sprinkled as often as is necessary to keep the surface moist.

After the seeds have germinated and the seed-leaves have pushed their way through the ground, the sacking is removed and a screening of cheese-cloth is placed over the bed. Some beds may be covered with cheese-cloth parallel to the surface of the soil. In other cases, a wire is run lengthways over the middle of the bed, and the cheese-cloth is placed over the wire and secured at the sides like a roof. The covering is about 8 to 12 inches above the bed, which gives room for the circulation of air. The beds are kept moist by repeated watering, applied directly through the cheese-cloth.

As soon as the plants are 2 or 3 inches high and are well greened, they will be strong enough to stand direct sunlight and will shade the ground sufficiently to keep it from drying out rapidly.

*The best variety.*

Formerly nearly all varieties of which seeds were offered by seedsmen were planted. In recent years, however, all have been nearly eliminated except the Golden Self-blanching. The seed of this variety is very high in price and, in years of scarcity, seed supplied under this name is often found to be more or less untrue to type. Seed of low-germinating quality is often found to contain many plants that will make unwelcome vegetables, probably because the undesirable green and red strains that may occur in the Golden Self-blanching variety are more resistant to deterioration than the true type.

*Planting and blanching.*

Blanching is secured entirely by the boarding-up method. For this purpose, second- or third-grade cypress boards are used; these low-grade boards usually have defective parts or are filled with worm-holes so as to be obtainable rather cheaply. The expense of the lumber, notwithstanding, is so great that it becomes necessary to plant the celery in double rows. Two rows are planted 8 or 10 inches apart, and the plants set 6 or 8 inches apart in the row. By alternating the settings in the two rows, additional space is secured for the plants.

A space of 30 to 40 inches is allowed between the sets of double rows. As soon as the celery has reached the proper stage of growth, or the market has arrived at a condition in which it is thought wise to ship the celery, the boards are placed alongside the plants and held in place by stakes driven into the ground. Further to exclude the air and light, a small quantity of soil is plowed against the bases of the boards, although this

865. An old method of growing celery in trenches. It is yet sometimes stored for winter in such trenches.

is unnecessary when the soil is sufficiently mellow. The tops of the boards are placed firmly together so that only a part of the foliage extends above them.

With the Golden Self-blanching variety, it is only a few days until the celery is sufficiently blanched and crisp to make a good vegetable.

#### Fertilizer.

In the preparation of the field, large quantities of fertilizer are used. Stable manure is not a favorite, unless it can be applied to the land early enough to become thoroughly rotted before the plants are set out. The quantity obtainable, however, is usually so small and the price so high in the South that commercial fertilizers have largely replaced it. The quantity of fertilizer applied may range up to \$80 or even \$125 worth per acre (of the formula given on page 704.)

#### Irrigation.

In the most productive celery regions, sub-irrigation systems (as described under *Irrigation*) are established. The laterals are laid 15 to 25 feet apart, according to the contour of the land, and the notion of the grower. The irrigation system at the same time serves as a drainage system. This makes it especially convenient, since abundant artesian water is present in nearly all the celery-growing sections far south. The system has been found so convenient that a large amount of damage has been done by over-irrigation, not only in carrying off much soluble fertilizer, but also by water-logging the soil and thus driving the roots of the celery plants so near the surface as to be constantly liable to injury. In the hands of careful celery-growers, however, the system is the best that has been invented.

P. H. ROLFS.

#### Celery-growing in California.

There are two principal celery-growing districts in California,—Orange County, which is situated in the swamp lands south of Los Angeles; and the northern district, which includes the peat or swamp lands along the Sacramento and San Joaquin Rivers between Sacramento

and Stockton.

Several varieties of celery have been tested in this state, but the Golden Self-blanching is most popular and profitable.

#### Seeding.

In California the seed is sown in the open ground, but, owing to its extremely small size, it is difficult to get a good stand unless the ground is well pulverized. It is commonly estimated that enough plants may be grown on 1 acre of seed-bed to plant 20 acres in the field. To produce healthy, vigorous plants, heavy

watering is the rule at first, but as soon as the plants have begun to grow the quantity of water is reduced, and it should never be allowed to stand on the surface of the bed. In order to accomplish this the land must be well drained. The seed is usually sown in March, April or May.

#### Irrigation and drainage.

Although not nearly so much water is required for the plants in the field as in the seed-bed, celery plants cannot stand drought at any stage of their growth; a well-controlled irrigation system is imperative, except where the water-table is close to the surface.

Good drainage is as important as irrigation, for, if water is allowed to stand in the field even for a short time, the plants will suffer seriously. As most of the California celery land is low and the ordinary drainage is poor, an extended system of tile drainage has been laid in nearly all celery fields, especially in Orange County, to prevent losses from standing water.

#### Subsequent tillage.

When the plants are large enough to be transplanted, they are pulled from the seed-beds, placed in tin pans and hauled to the field, where they are planted 6 inches apart in the furrows  $3\frac{1}{2}$  feet apart. The depth of the furrows in which the plants are set is somewhat varied, depending on the soil-moisture, and the size of the plants. The average depth is from 3 to 5 inches.

After the plants have been set in the field for about three weeks or a month and have recovered from the transplanting, the field is "crowded." This operation consists in moving the earth away from the young plants so that they will have more air around them and to kill what weeds have grown so close to the plants that it is impossible to reach them with the cultivator.

As the earth between the rows of plants is left in a ridge after the plants have been "crowded," a large wooden roller, which extends across several rows, is now used to flatten down these ridges and to pack the soil more firmly. The roller is used only when the plants are small, otherwise they would be injured by being crushed. If the plants have grown so large that there is danger of injury by this rolling of the middles, the ridges are smoothed down by the cultivator.

When the plants are 12 to 15 inches tall, earth from between the rows is drawn up to them. This is termed "splitting." This should be done carefully, for, if the earth is put too close or too high up on the plants, they will become tender and weak, especially if the weather is hot. The object of "splitting" is gradually to encourage the plants to grow tall and straight instead of spreading out. This operation is repeated twice in the season, the first time when the plants are 14 to 16 inches tall and the second time just before banking. This last "splitting" also aids blanching.

#### Blanching.

Practically all the celery grown in California is banked with earth for blanching. Banking is done when the celery is reaching its maturity and is nearly ready for shipment. This is the last field operation before the crop is cut. When the celery is banked for the first time, the earth is not drawn very high on the plants, but each time the field is banked the soil is drawn higher so as firmly to hold the leaves together and in an upright position. If celery that has been banked for the last time is not harvested shortly, it will soon become "punky." The length of time that it can safely be left in the bank depends upon the character of the soil, the weather conditions, and upon the condition of the plants themselves. Celery on sandy soil will keep much longer in the bank than on heavy clay loam or peat soil. If the celery has not matured or if the weather is hot or moist, its keeping quality

866. A good form of trench storage.

will be injured. Holding too long in the bank will result in a wilted and "punky" product.

#### Harvesting and shipping.

When the celery is ready to harvest, a cutting machine is used which cuts off the plants just below the crown, leaving a few roots attached. The plants are then lifted and shaken from soil, trimmed and thrown in piles by laborers, who are usually Japanese. Another gang of men then place the plants in crates, marking on each crate the number of dozens it contains. More men follow, nail the crates securely, load them on wagons which transport them to the railroad siding, where they are ready for shipment and distribution to the various markets in the United States and Canada.

The celery is packed in the fields in crates 22-by-24-inch base and 18 to 24 inches in height, according to the quality. One of these crates holds from five to ten dozen celery plants. An ordinary car holds from 160 to 165 of these crates. The shipping of the crop starts in October and continues through March, but the bulk of the crop is harvested during November, December and January. The earlier shipments come into competition with celery from Michigan and other middle western states, and the later shipments come into competition with celery from Florida. A very efficient system of marketing has been developed by means of various associations of the growers which have representatives in the leading markets in the United States so that the celery is shipped to points of greatest demand.

#### Enemies.

The most important disease in California is the late blight (*Septoria petroselinii* var. *apii*), which has done an immense amount of damage in the past but is now handled successfully by most of the growers. Spray with bordeaux mixture. For early blight (*Cercospora apii*) keep plants growing thriftily and spray with bordeaux. (For a detailed account of the diseases of celery in California see Bulletin No. 208, published by the University of California.) STANLEY S. ROGERS.

**CELMÍSIA** (a name in mythology). *Compósitæ*. More than 40 New Zealand perennial herbs, and 1 in Austral. and Tasmania, some of which may be expected in botanic gardens and collections. Lvs. radical and in rosettes, or densely imbricated if borne on the sts., usually tomentose; heads large and solitary on a long or short scape, with imbricate pubescent or glandular bracts in several or many series; rays in a single row, always white. The celmisias are characteristic plants of New Zeal., covering the mountain slopes and valleys, especially in the South Isl., with the showy daisy-like fls. Probably none is regularly in cult.

L. H. B.

**CELÒSIA** (Greek, *kelos*, burned; referring to the burned look of the flowers in some species). *Amarantaceæ*. **COCKSCOMB**. Popular garden annuals, grown for the showy agglomerated flower-heads and sometimes for colored foliage.

Alternate-leaved annual herbs, the lvs. entire or sometimes lobed, mostly narrow; fls. in dense terminal and axillary spikes, the spikes in cult. forms becoming densely fascicled and often the sts. much fasciated; perianth very small, 5-parted, dry, the segms. oblong or lanceolate, erect in fr.; stamens 5, the filaments united at base: fr. a circumscissile utricle, with 2 to many seeds.—About 35 species, all tropical, in Asia, Afr. and Amer.

There are two main types of celosias, the crested form and the feathered or plummy ones. The crested cockscomb is very stiff, formal and curious, while the feathered sorts are less so, and are used to some extent in dried bouquets. The plummy sorts are grown abroad for winter decoration, especially under the name of *C.*

*pyramidalis*, but to a small extent in America. The crested cockscomb is less used as a summer bedding plant than formerly, but it is still commonly exhibited in pots at small fairs, the object being to produce the largest possible crest on the smallest plant.

For garden use, the seeds are sown indoors in early spring, and the plants set out May 1 to 15. If the roots dry out, the leaves are sure to drop off. The cockscomb is a moisture-loving plant, and may be syringed often, especially for the red-spider, which is its greatest enemy. A light, rich soil is needed.

#### A. Spikes crested, monstrous.

**cristata**, Linn. **COCKSCOMB**. Fig. 867. Height 9 in. or more: st. very glabrous: lvs. petiolate, ovate or somewhat cordate-ovate, acute, glabrous, 2–3 in. long, 1 in. wide: spikes crested, subsessile, often as wide as the plant is high: seeds small, black, shining, lens-shaped. Tropics. Gn. 13, p. 231. R.H. 1894, p. 58.—There are 8 or 9 well-marked colors in either tall or dwarf forms, the chief colors being red, purple, violet, crimson,

867. *Celosia cristata*.

amaranth and yellow. The forms with variegated lvs. often have less dense crests. *A. japonica*, Mart., little known to botanists, is said to be a distinct garden plant with branching, pyramidal habit, each branch bearing a ruffled comb.

#### AA. Spikes plummy, feathery, or cylindrical.

**argentea**, Linn. Taller than the above: lvs. shorter-stalked, narrower, 2–2½ in. long, 4–6 lines wide, linear-lanceolate, acute: spikes 1–4 in. long, erect or drooping, long-peduncled, pyramidal, or cylindrical. India.—This species is considered by Voss (in Vilmorin's *Blumengärtner*) to be the original one from which the crested forms are derived. He makes 9 botanical forms, to one of which he refers *C. cristata*. The range of color is even greater in the feathered type than in the crested type. The spikes are very various in form and habit. Various forms are shown in Gn. 6, p. 513; 9, p. 149; 17, p. 331 (all as *C. pyramidalis*). R.H. 1857, p. 78, and 1890, p. 522 (as *C. pyramidalis*).

**Húttoni**, Mart. Height 1–2 ft.: habit bushy, pyramidal: st. sulcate-striate: lvs. reddish or crimson, lower ones lanceolate, subsessile: spikes red, cylindrical, oblong, obtuse, 1½ in. long; perianth-segms. oblong (not lanceolate, as in *C. argentea*). Java.—A foliage plant, and less common than the 2 species above.

*C. spicata*, Hort.=(?). Not the *C. spicata*, Spreng.; perhaps some form of *C. cristata*.—*C. Thompsonii magnifica*, Hort., is a trade name and apparently without botanical standing.

WILHELM MILLER.

**CÉLSIA** (Olaus Celsius, 1670–1756, a Swedish orientalist). *Scrophulariaceæ*. Herbs, with yellow fls. in terminal racemes or spikes, closely allied to *Verbascum*, but has only 4 stamens, and they are of 2 sorts. About 40 Old World species, mostly from the Medit. region.

Only *C. crética*, Linn. f., is known in Amer., and that very sparingly. It is a hardy or half-hardy biennial, with alternate lvs., of which the lower are slightly pinnate and lanceolate, and the upper ovate-lanceolate, toothed and clasping: fls. large (nearly 2 in. across), and somewhat as in *Antirrhinum*, yellowish, with dark markings in the center and conspicuous deflexed stamens. Stout hairy plant, 3-6 ft. high, from Crete. B.M. 964.—A very showy plant well worth much wider cult. See page 3566.

*C. pónica*, Hort. Has whitish lvs. and pure white fls.

N. TAYLOR.†

**CÉLTIS** (ancient Latin name). *Ulmaceæ*. NETTLE-TREE. Woody subjects grown chiefly as shade or lawn specimens.

Trees or rarely shrubs, sometimes spiny: lvs. alternate, petiolate, stipulate, deciduous or persistent, usually oblique at the base and 3-nerved: fls. polygamous-monoecious, inconspicuous, apetalous, 4-5-merous, axillary, the staminate in small clusters on the lower part of the branchlets, the fertile solitary in the axils of the

868. *Celtis occidentalis* ( $\times \frac{1}{2}$ ). (Detail  $\times \frac{1}{4}$ )

lvs. on the upper part of the branchlets, with a 1-celled superior ovary crowned by a 2-parted style and with 4-5 short stamens: fr. a 1-seeded, small drupe, edible in some species; embryo with broad cotyledons.—Seventy species in the temperate and tropical regions of the northern hemisphere, of which a few hardy ornamental species are cult.

The nettle-trees are valuable as shade trees or as single specimens on the lawn, mostly with wide spreading head and light green foliage, which is rarely seriously injured by insects or fungi; they thrive in almost any soil and even in dry situations; they are of vigorous growth when young, and are easily transplanted. The straight-grained wood is light and elastic, easily divided, and much used for the manufacture of small articles and for furniture; that of *C. australis* is valued for carving. Propagated by seeds, sown after maturity; also by layers and cuttings of mature wood in fall; rarer kinds are sometimes grafted on *C. occidentalis*.

A. Lvs. entire, or rarely with few teeth, thin, at length glabrous.

*mississippiensis*, Bosc (*C. laevigata*, Willd. *C. integrifolia*, Nutt.). Tree, 60-80 ft.: lvs. unequally rounded or

cuneate at the base, oblong-lanceolate or ovate, acuminate, usually falcate, smooth above, 2-4 in. long: fr. orange-red, nearly globular,  $\frac{1}{4}$  in. thick, on slender pedicel, longer than the petiole; stone pitted. From S. Ill. to Texas and Fla., west to Mo. S.S. 7:318. G.F. 3:41, figs. 9-11. Mn. 7:225, 227.

AA. Lvs. serrate, sometimes entire and pubescent.

B. Ovary and fr. glabrous.

C. Branchlets usually and lvs. more or less pubescent, at least when young.

D. Fr.-stalks slender, longer than petioles: lvs. usually rough above: stone pitted.

E. Under surface of lvs. glabrous at maturity.

*occidentalis*, Linn. Fig. 868. Large tree, occasionally 120 ft.: branchlets glabrous or slightly pubescent: lvs. oblique and rounded at the base, ovate-acuminate, pubescent when young, usually rough above, sometimes smooth at maturity, usually entire toward the base, light green, 2-6 in. long: fr. orange-red,  $\frac{1}{2}$ - $\frac{1}{2}$  in. long, on slender pedicel, longer than the petiole. S.S. 7:317. G.F. 3:40 (adapted in Fig. 868) and 43. Em. 304. Mn. 7:231, 233. A.G. 20:240, 531.—Very variable species. Var. *crassifolia*, Koch (*C. crassifolia*, Lam.), has firm, very rough and large lvs., to 5 in. long, usually cordate at base and more strongly serrate. Michx. Hist. Arb. 3:228.

EE. Under surface of lvs. pubescent.

*australis*, Linn. Tree, to 60 ft.: lvs. oblique, broadly cuneate or rounded at the base, ovate-oblong, long-acuminate, pubescent beneath,  $2\frac{1}{2}$ -5 in. long: fr. over  $\frac{1}{2}$  in. long, dark purple, sweet; pedicels 2-3 times longer than the petioles. Medit. region to Persia. H.W. 3:40, p. 11.—Not hardy N.

*Héleri*, Small. Tree, to 30 ft.: branchlets pubescent: lvs. ovate or ovate-oblong, obtuse or acute, truncate to subcordate at the base, rough above, grayish and pubescent or tomentose, and reticulate below, 2-3 in. long: fr.  $\frac{1}{2}$  in. thick, light brown, on pubescent pedicels about  $\frac{1}{2}$  in. long and rather stout. Texas.—Sometimes planted as a street tree in Texas.

DD. Fr.-stalks rather stout, as long or slightly longer than petioles: lvs. grayish green beneath: stone smooth.

*sinensis*, Pers. (*C. japonica*, Planch.). Tree, to 30 ft.: lvs. usually rounded or cordate at the base, broadly ovate to oblong-ovate, acuminate, serrate-dentate, pubescent when young, pale or glaucescent and prominently reticulate beneath, 2-4 in. long: fr. dull orange-red; pedicels rather stout, not much longer than the petioles. China, Japan. S.I.F. 1:36.—Has proved hardy at the Arnold Arboretum.

CC. Branchlets and lvs. quite glabrous: stone smooth.

D. Foliage bluish or grayish green.

*Tournefortii*, Lam. (*C. orientalis*, Mill., not Linn.). Tree, to 20 ft., or shrub: lvs. ovate, acute, usually rounded or subcordate at the base,  $1\frac{1}{2}$ -3 in. long, of firm texture, not reticulate, sometimes pubescent: fr. reddish yellow, about  $\frac{1}{2}$  in. across, its stalk about as long as petiole,  $\frac{1}{2}$  in. long or somewhat less. Greece, Sicily and Asia Minor.—Not quite hardy N.; attractive on account of its bluish green foliage.

DD. Foliage bright green, lustrous.

*Bungeana*, Blume. Tree: lvs. usually rounded at the base, ovate, acuminate, crenate-serrate, nearly glabrous when young, green and shining on both sides,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in.: fr. purplish black, small; pedicels longer than the petioles. N. China.—Hardy, and a very distinct species, with dark green and glossy foliage.

BB. Ovary and fr. pubescent; subtropical, tender tree.

*Kraussiana*, Bernh. Tree: lvs. oblong-ovate, usually rounded at the base, acuminate, crenate-serrate, pubes-

XXIV. *Cœlogyne cristata*, one of the popular and easily grown orchids.

cent on the veins beneath, semi-persistent: ovary tomentose: fr. mostly pubescent, slender pedicelled. S. Afr. to Abyssinia. Sim, Forest Fl. Cape Colony, 134. —Hardy only S.

*C. Biéridii*, Pampanini. Lvs. broader than in *C. Bungeana*, grayish below: frs. dark blue, small. Cent. China.—*C. caucásica*, Willd. Allied to *C. australis*. Lvs. broadly rhombic-ovate, somewhat smaller: fr. smaller, reddish brown. Caucasus, N. Persia.—*C. Davidiana*, Carr. Allied to *C. Bungeana*. Small tree: lvs. ovate-oblong or elliptic-oblong, often sparsely hairy on the veins below, 2-5 in. long. N. China. Incompletely known.—*C. georgiana*, Small. Allied to *C. occidentalis*. Shrub or small tree: branchlets pubescent: lvs. ovate, acute, entire or sharply serrate, 1-2 in. long: fr.  $\frac{1}{4}$  in. across, short-stalked. Md. to Fla., Ala. and Mo.—*C. orientalis*, Linn. = *Trema orientalis*.—*C. orientalis*, Mill. = *C. Tournefortii*.—*C. reticulata*, Torr. (*C. mississippiensis* var. *reticulata*, Sarg.). Small tree, to 50 ft.: branchlets pubescent. lvs. ovate, usually cordate, entire or serrate, rough above, pubescent and reticulate below,  $1\frac{1}{2}$ -3 in. long: fr.  $\frac{1}{4}$  in. thick, orange-red. Colo. to Texas and Ariz.—*C. Smillii*, Beadle. Allied to *C. mississippiensis*. Lvs. lanceolate or oblong-lanceolate, thin, sharply serrate, 2-4 in. long: fr.  $\frac{1}{4}$  in. thick, slender-stalked. N. C. and Tenn. to Ga. and Ala.

ALFRED REHDER.

**CEMETERY GARDENING.** Treated under Landscape Gardening.

**CÉNCHRUS** (an ancient Greek name). *Gramineæ*. Mostly annual grasses with simple racemes of burs that become detached and adhere readily to clothing and animals. Spikelets as in *Panicum*, but 2-6 together in a spiny involucre or bur. *C. carolinianus*, Walt. (*C. tribuloides* of American authors), SAND-BUR, is a common weed in sandy soil. Dept. Agric. Div. Agrost. 20:40.

A. S. HITCHCOCK.

**CÊNIA** (Greek for *empty*, in allusion to the hollow receptacle). *Compósitæ*. Low herbs from S. Afr., with the aspect of mayweed. Head small and rayed, the ray-fls. pistillate, the disk-fls. compressed and 4-toothed, the receptacle gradually enlarged from the top of the peduncle, and hollow. About 8 species, none of which are of much horticultural value. *C. turbinata*, Pers. (*C. pruinosa*, DC.), is a common weed in Cape Colony, and it is occasionally seen in American gardens. It is annual, diffusely branched, and a foot or less high, with finely dissected, soft, almost moss-like foliage, and long-peduncled, small, yellow heads. Of easy cult. United with *Cotula* by Hoffmann in Engler & Prantl.

L. H. B.

**CENTAURËA** (a *Centaur*, famous for healing). *Compósitæ*. CENTAURY. DUSTY MILLER. BACHELOR'S BUTTON. CORNFLOWER. Knapweed. Annuals or hardy and half-hardy perennials with alternate leaves, useful for bedding, vases, baskets and pots, and for borders and edgings; species many and various.

Involucre ovoid or globose, stiff and hard, sometimes prickly: receptacle bristly: marginal florets usually sterile and elongated, making the head look as if rayed. Differs from *Cnicus* in having the achenes obliquely attached by one side of the base or more laterally.—Species about 500, much confused, mostly in Eu., Asia and N. Afr., 1 in. N. Amer., 3 or 4 in Chile. Several Old World species have become weeds in this country. J.H. 43:76. The species are of simple cult., coming readily from seeds. Many of the perennial species make excellent border plants, and their blue and purple heads are welcome additions to the horde of yellow-flowering composites.

A. DUSTY MILLER.—*White-tomentose low plants, used for bedding or for the sake of their foliage.*

1. *Cineraria*, Linn. (*C. candidissima*, Lam.). Fig. 869. Perennial: sts. erect, 3 ft., branched, the entire plant white-tomentose: lvs. almost all bipinnate (except the earliest), the lower petioled, all the lobes linear-lanceolate, obtuse: scales of the ovate involucre appressed, with a membranous black margin, long-ciliate, the apical bristle thicker than the others: fls. purple. S. Italy, Sicily, etc.—Much used as a bedding plant, not being allowed to bloom. The first lvs. of seedlings are nearly entire (as shown in Fig. 869), but the subsequent ones become more and more cut. Grown both from seeds and cuttings. Seedlings are very apt to damp off unless care is taken in watering.

2. *depressa*, Bieb. A flat, almost prostrate perennial: st. floccose-tomentose and much branched: lower lvs. scarcely denticulate, the upper oblong-linear, entire: bracts of the involucre white- or black-margined: fls. showy, the blue rays about  $\frac{1}{2}$  in. long. Persia, Caucasus. July.

3. *gymnocarpa*, Moris & DeNot (*C. argentea*, Hort. *C. plumosa*, Hort.). Fig. 870. Perennial: entire plant covered with velvety white pubescence: sts.  $1\frac{1}{2}$ -2 ft. high, erect: lvs. bipinnatisect; segms. linear, entire, acute: fl.-heads small, in a close panicle, mostly hidden by the lvs.; fls. rose-violet or purple. Caprea. V. 4: 337.—Very ornamental on account of its velvety finely cut lvs. Much used, like No. 1, for low foliage bedding: lvs. more compound, and usually not so white.

869. Lower leaf from a young plant of *Centaurea Cineraria*. ( $\times \frac{1}{2}$ )

870. Radical leaf of *Centaurea gymnocarpa*. ( $\times \frac{1}{2}$ )

4. *Clementei*, Boiss. Perennial, the entire plant densely white-woolly: sts. erect, branching, with few lvs.: root-lvs. petioled, pinnate, the lobes ovate-triangular, sharp-pointed; st.-lvs. sessile: fl.-heads terminal on the branches, globose; involucre scales with scarious, ciliate margins, scarcely spiny; fls. yellow. Spain.

AA. CORNFLOWER, OR BACHELOR'S BUTTON.—*Tall-growing annual, with very narrow lvs., grown for the showy fls.*

5. *Cyanus*, Linn. (*Cyanus arvensis*, Moench.) BLUE-BOTTLE. BLUET. BACHELOR'S BUTTON (see also *Gomphrena*). CORNFLOWER. RAGGED SAILOR. FRENCH PINK. Fig. 871. Annual, slender, branching, 1-2 ft. high, woolly-white when young: lvs. linear, entire or the lower toothed, sometimes pinnatifid: fls. blue, purple, pink or white, the heads on long, naked sts.: involucre bracts rather narrow, fringed with short, scarious teeth. S. E. Eu. Gt. 38, p. 641; 39, p. 537. V. 5, p. 44; 13:361.—One of the most popular of garden fls., variable. It is perfectly hardy, blooming until frost

and coming up in the spring from self-sown seed. The following are varieties of this: *Pure White*; *Victoria*, a dwarf, for pots and edgings (Gn. 40, p. 147); *Emperor William*, fine dark blue; *flore pleno*, with the outer disk-fls. converted into ray-fls.; *nana compacta*, dwarf. (Gt. 44, p. 150.) *Centaurea Cyanus* is one of the "old-fashioned flowers," everywhere well known and popular. It often escapes from gardens.

AAA. SWEET SULTANS.—*Straight-growing smooth annuals or perennials, with dentate lvs., grown for the large fragrant heads.*

6. *moschata*, Linn. (*C. suaveolens*, Linn. *C. odorata*, Hort. *C. Amberbøii*, Mill. *Amberbøa moschata*, Less.).

SWEET SULTAN. Fig. 872.

Annual: sts. 2 ft. high, branching below, erect: whole plant smooth, bright green: lvs. pinnatifid, the lobes dentate: fl.-heads long-peduncled; involucre round or ovate, smooth, only the innermost of the involucreal scales with scarios margins: fls. white, yellow or purple, fragrant. Orient. Mn. 4, p. 149. Gn. 54:372. I.H. 42, p. 106. Gng. 4:147. G. 5:289; 16:267; 25:71.

Var. *alba*, Hort. (*C. Margaritæ*, Hort.). Fls. white. Gn. 19, p. 337; 54:372. A.G. 13:607. This form, known as *C. Margaritæ*, is pure white and very fragrant. It was intro. by an Italian firm in 1891. Var. *rùbra*, Hort. Fls. red. Gn. 54:372.—A popular, old-time garden fl., with long-stalked heads; of easy cult. It does not bear transplanting well.—*C. imperialis*, Hort., is said to be the offspring of *C. moschata* and *C. Margaritæ*, intro. into the American trade in 1899. Gn.M. 13:74. Plants are said to inherit the vigorous free growth of *C. moschata*, being of the same easy cult. and forming clumps 3–4 ft. high. The fls. resemble *C. Margaritæ*, but are twice as large and abundantly borne on long sts. from July until frost. They range through white, rose, lilac and purple, are fragrant, and if cut when first open will keep 10 days. *C. Máriae*, Hort., intro. 1899, resembles *C. imperialis*, but the fls. open sulfur-yellow, become lighter, and are tipped with rose. All sweet sultans do best if the bloom is secured before very hot weather.

7. *glastifolia*, Linn. A strong-growing border perennial with a rough much-branched and winged st.: lvs. oblong, entire, decurrent, the basal lvs. petiolate, sometimes divided: fls. yellow, the heads solitary, without bracts, and quite smooth. Cent. Eu. B.M. 62. June–Sept.

AAAA. OTHER CENTAUREAS of various kinds, occasionally grown in hardy borders, for their fls. or imposing stature. See page 3567.

B. *Foliage green on both sides.*

C. *Lvs. pinnate or bipinnate.*

8. *spléndens*, Linn. (*C. Margaritæcea*, Ten.). Perennial: sts. erect, branched: lvs. smooth, the lowest bi-

pinnate, the upper pinnate, all with very narrow, linear, entire, acute lobes: fl.-heads subglobose; scales of the involucre with a rounded almost entire rather lax tip; fls. purple. Spain, Italy.

9. *ruthénica*, Lam. Hardy perennial about 3 ft.: st. erect, branching, smooth: lvs. pinnatisect, the lobes linear-toothed, sharply narrowed at both ends, the base often somewhat decurrent: fl.-heads usually solitary, the pale-yellow rays about  $\frac{3}{4}$  in. long; pappus double: achenes glabrous. Cent. Eu. July. G. 26:630.

CC. *Lvs. entire or dentate, not pinnatisect.*

10. *americana*, Nutt. (*Plectocéphalus americanus*, Don). BASKET FLOWER. Fig. 873. Hardy annual,

nearly smooth: sts. stout, simple or sometimes a little branched, 2–5 ft., thickened under the naked head: lvs. mostly entire, oblong-lance-shaped, mucronate: involucre  $\frac{1}{2}$ –1 $\frac{1}{2}$  in. diam., its bracts all with fringed scarios appendages: fls. rose or flesh-colored, sometimes purplish; disk 1–3 in. diam.; narrow lobes of the ray-fls. often 1 in. long. Mo. and Ark. to La. and Mex. F.S. 4:327. S.H. 2:223. A.F. 16:1644 (*alba*). Gng. 9:341 (*alba*).—Very attractive.

11. *macrocéphala*, Puschk. Perennial: sts. simple, erect, swollen below the fl.-head, leafy, 2 $\frac{1}{2}$ –3 ft. high: lvs. ovate-lanceolate, slightly decurrent, scabrous, acute, somewhat serrate, gradually diminishing upwards to the base of the single terminal head: head subglobose, larger than a hen's egg, often 3–4 in. diam.; involucre of 8–12 rows of appressed, scarios-margined, rusty, fringed scales; fls. yellow, the marginal and disk alike. Armenia. B.M. 1248. J.H. III. 33:331; 52:547; 63:319.—Often grown from seeds.

12. *nigra*, Linn. KNAPWEED. HARDHEADS. Perennial, 1–2 ft. high: sts. branching, rough pubescent: lvs. lance-shaped and entire or lower sparingly toothed or lobed, but not pinnatifid: involucreal bracts with pectinate-ciliate-fringed black appendages: fls. all alike, the disk and marginal ones of the same size. Eu. Var. *variegata*, Hort. Lvs. edged with creamy white, tufted. A very striking

border plant; useful in dry or open places.

BB. *Foliage white or tomentose, at least beneath (often green above).*

C. *Sts. low, weak, not strict.*

13. *leucophylla*, Bieb. (*C. declinata*, Bieb.). Perennial: sts. short, decumbent, with very few lvs.: root-lvs. petioled, tomentose-woolly on both sides, pinnate, the ovate lobes undulate, sparsely cut-lobed or sinuate-toothed: fl.-head with few bracts, solitary, terminal; scales of the ovate involucre lanceolate, acuminate, brown, long-ciliate; fls. purple. Caucasus.

14. *montana*, Linn. MOUNTAIN BLUET. Perennial: sts. low, stoloniferous, unbranched, 12–16 or rarely 20

871. *Centaurea Cyanus*. ( $\times \frac{1}{2}$ )

in. high: lvs. decurrent, the young ones silvery white, oval-lance-shaped: involucre of 4 or 5 rows of scales, black-ciliate along the margins: fls. blue, the marginal ones 1 in. long; disk-fls. very short, becoming purple. Eu. B.M. 77. G.M. 47:243. Var. *álba*, Hort. Fls. white. G. 25:71; 29:109. G.M. 51:162. Var. *rósea*, Hort. Fls. rose-colored. Var. *citrina*, DC. (var. *sulphúrea*, Hort.). Disk-fls. brown, rays yellow. Armenia. B.M. 1175 (as *C. ochroleuca*).

cc. Sts. erect, simple or branched.

15. *dealbata*, Willd. Perennial: sts. sub-erect, 8-24 in. high: lvs. white-villous beneath, glabrous above, the lower ones 1-1½ ft. long, petioled, pinnate, the obovate lobes coarsely cut-toothed or auricled at the base; st.-lvs. sessile, pinnate, with oblong-lance lobes: fl.-head solitary, just above the uppermost lf.; fls. red, those of the disk rosy or white; outer scales of the involucre with lanceolate tips, the middle rounded, deeply fringed, ciliate. Asia Minor, Persia. J.H. III. 46:515.

16. *nervosa*, Willd. A stout perennial about 2-2½ ft. tall with a simple unbranched rough st.: lower lvs. glandular, usually slightly toothed, the st.-lvs. clasping by the auriculate base; heads solitary, the rays deep purple. A branched and numerous-fl. form is known in the wild but not to the trade. Cent. Eu. July., Aug.

17. *atropurpurea*, Waldst. & Kit. (*C. calocéphala*, Willd.). Perennial: sts. erect, branched, about 2-3 ft. high, the branches white-woolly at the summit: lvs. bipinnate, lobes linear-lanceolate, acuminate; lowest lvs. petioled, uppermost pinnatifid: fl.-heads without bracts; involucral scales with fringed ciliate white lanceolate tips, the innermost ones rounded, scarious-margined; fls. black-purple. Hungary.

18. *babylónica*, Linn. Silvery white perennial: sts. simple, stout, erect, 6-10 or 12 ft. high: lvs. long, coriaceous, strongly decurrent on the st., the radical lyrate, the lower st.-lvs. oval or oblong-acute, entire or undulate, the upper lance-acute: fls. yellow, the globular heads almost sessile in the axils of narrow bract-like lvs.; one-third to half of the st. fl.-bearing; involucre-scales with a short, recurved tip. Asia Minor, Syria. Gn. 2, p. 73; 8, p. 263. R.H. 1859, pp. 540-1.—Tall, stout and striking plant.

*C. alpina*, Linn. Lvs. downy beneath, prickly: fl.-heads yellow; scales of involucre ovate, obtuse: hardy herb, 3 ft., from Eu., sometimes seen in collections.—*C. eriophora*, Linn. A low plant with a spiny calyx and silvery lvs., is cult. in England. Not known in Amer.—*C. pulcherrima*, Willd. (*Etheopappus pulcherrimus*, Hort.). A stout hardy perennial about 2½ ft. with brilliant rose fls. is known in the trade.—*C. rigidifolia*, Hort. Stout perennial, 2½ ft., with crimson heads is apparently *C. orientalis*, Linn.—Not much known in U. S.

N. TAYLOR.†

CENTAURIDIUM: *Xanthisma*.

CENTAURY: *Sabatia*.

CENTRADÈNIA (Greek for spurred gland, alluding to the anther glands). *Melastomaceæ*. Tropical herbs or sub-shrubs grown in greenhouses for their showy-colored leaves and pretty flowers.

Branches angled or winged: lvs. petiolate, opposite,

lanceolate or ovate, entire, ribbed: fls. with 4-lobed calyx, 4 petals, 8 stamens, and a 4-lobed ovary, pink or white, in axillary or terminal clusters.—Species 4-6, in Mex. and Cent. Amer. They fall into 2 groups,—those with very unequal stamens, and *C. floribunda* with nearly equal stamens.

Centradenias are very showy and desirable plants. The stems are often colored. They like rich leaf-mold with sharp sand, and brisk heat. Give a light but shady position. Strong plants are much benefited by liquid manure, and such applications give better colors in both flowers and fruit.

*grandifolia*, Endl. Branches 4-winged: lvs. ovate-lanceolate, strongly 3-nerved, brilliant red beneath, long-pointed and curving at the end: cymes many-fl., shorter than the lvs., the fls. light rose, rotate, the petals very obtuse, the stamens unequal. Mex. B. M. 5228.—The plant grows 2 ft. high, and blooms in winter. Very showy, and the species usually cult. The cut branches hold their color a long time, making the plant useful for decorations.

*inæquilatèralis*, Don (*C. rósea*, Lindl.). Lvs. ovate-lanceolate, unequal-sided, entire, ciliate, reddish beneath: fls. pink, in terminal corymbose racemes: dwarf. Mex. B.R. 29:20.

*ovata*, Klotzsch. Lvs. ovate-acute, smooth and shining, pale beneath, 3-nerved: fls. pink in large terminal clusters. Cent. Amer.

*floribunda*, Planch. Branches obscurely angled, pubescent, red: lvs. narrow-lanceolate, tapering below, 3-nerved, red-nerved below: fls. pink, in terminal panicles. Mex. F.S. 5:453.

L. H. B.†

CENTRÁNTHUS (Greek, spurred flower). *Valerianaceæ*. CENTRANTH. Annual and perennial herbs, one of which is frequent in old gardens.

Leaves opposite, entire, dentate, or pinnatisect: fls. in dense clusters, small, red or white, terminating the branches; calyx cut into 5-15 narrow divisions, enlarging after flowering; corolla slender-tubed, 5-parted, spurred at the base; stamen 1; fls. with a pappus-like crest.—About a dozen species in the Medit. region, some of them sometimes half shrubby. *C. ruber*, the common garden species, sometimes escapes and becomes more or less spontaneous.

*ruber*, DC. RED VALERIAN. JUPITER'S BEARD. Perennial, 1-3 ft., smooth and glaucous, forming a compact and floriferous bushy plant: lvs. ovate to lanceolate, some of them toothed at base but mostly entire: fls. numerous, deep crimson to pale red, fragrant. Eu., E.—A very handsome old garden plant, too much neglected; blooms all summer; excellent for cutting. Increased by division; also by seeds. There is a white-fl. form (var. *albus*).

*angustifolius*, DC. Perennial, glaucous, to 2 ft., simple or somewhat branched: lvs. linear-lanceolate or linear, very entire, nearly perfoliate: fls. clear rose, fragrant. S. Eu.—There is a white-fl. form (var. *albus*).

*macrosiphon*, Boiss. Annual, of easy cult. in any good soil: 1-2 ft.: lvs. ovate, glaucous, toothed: fls. larger than in the last, deep

872. *Centaurea moschata*. (×¼)

873. *Centaurea americana*. (×¼)

rose. Spain.—There are white-fl'd. (var. *albus*) and dwarf (var. *nanus*) forms. Excellent for rockeries and borders; also for lawn vases. L. H. B.

**CENTROPÏGON** (Greek *kentron*, spur, and *pogon*, beard, referring to the fringed stigma). *Campanulacæ*. Sub-shrubs or shrubs, often scandent, grown under glass.

Plants with alternate mostly dentate lvs., and axillary, long, tubular fls. which are violet, purple, red, or orange, and usually borne singly on long peduncles: corolla 2-lipped, the tube incurved: bracteoles very small or wanting.—More than 100 species in Trop. Amer. Warmhouse perennials useful for hanging-baskets, prop. by cuttings which it is better to put under a bell-jar.

**Lucyânus**, Houll. Height 1-2 ft.: st. somewhat woody: lvs. short-petioled, finely toothed: fls. rose, hemispherical, with lanceolate segms. recurved at the tips. R.H. 1868:290. Native country unknown.—Described from a cult. specimen and said to be a hybrid of *C. fastuosus* and *Siphocampylus betulæformis*, but seems to show little influence of the latter, which has longer petioles and peduncles, more coarsely toothed lvs., longer calyx-segms., and a yellow-tipped corolla.

**fastuosus**, Scheidw. Lvs. peach-like, oblong, acute, bordered with glandular teeth, very glabrous, short-petioled: fls. rose-colored, winter; calyx hemispherical, with 5 lanceolate denticulate segms. Mex. R.H. 1853: 181.

WILHELM MILLER.

**CENTROSÈMA** (Greek, *spurred-standard*). *Leguminosæ*. BUTTERFLY-PEA. Twining or trailing herbs, one of which is sometimes cultivated.

Leaves pinnate, 3-7-foliolate: fls. in the axils, showy, white or reddish, papilionaceous, the standard spurred on the back, the keel broad, and the style bearded at the apex: pod long and narrow, many-seeded, with 2 thick-edged valves.—Species about 30 in Trop. Amer. and 2 in U. S. *Centrosema* is a more recent name than *Bradya* of Rafinesque, but it is thoroughly established in usage and is retained in the "nomina conservanda" of the Vienna Congress.

**virginiânum**, Benth. (*Bradya virginiana*, Kuntze). Roughish, climbing, 2-6 ft.: lfts. ovate to linear, shining, stipitate: fls. 1-4 in the axil, 1 in. long, violet and splashed, showy: pod straight and long-pointed, 4-5 in. long. N. J. and S., in sandy lands. A.G. 13:649.—Intro. to cult. many years ago, but again intro. in 1892 (as *C. grandiflorum*), and much advertised. It is a hardy and desirable perennial vine, blooming the first season from seed; easily grown. There is a white-fl'd. form.

L. H. B.

**CENTURY PLANT:** *Agave*.

**CEPHAËLIS** (Greek-made compound, referring to the fls. being borne in heads). *Rubiaceæ*. Tropical shrubs, sub-shrubs or herbs, one of which yields ipecac; some of them sometimes rarely seen in growing collections. As the genus is commonly delimited, it comprises perhaps 75 species of both the eastern and western hemispheres. Engler & Prantl and others, however, unite it with the Linnæan *Uragoga*. Lvs. opposite, usually ovate, oblong or obovate: fls. mostly small, white, collected in an involucrate head; calyx 4-7-toothed and persistent; corolla trumpet-shaped or salver-shaped, the short limb 4-5-lobed; stamens 4 or 5, inserted in the throat of the corolla: fr. a dry or fleshy 2-seeded drupe. *C. Ipecacuânha*, Willd. (*Psychotria Ipecacuânha*, Muell.-Arg. *Uragoga Ipecacuânha*, Baill.), from the root of which the commercial ipecac is produced, is a low creeping herb (4-8 in. high) with oblong-ovate entire lvs. which are pubescent beneath: heads becoming pendulous: root slender, knotty; it is exported in large quantities from Brazil.

L. H. B.

**CEPHALANDRA:** *Coccinia*.

**CEPHALANTHÈRA** (Greek for *head* and *anther*). *Orchidacæ*. About 10 species of small temperate-region terrestrial orchids, allied to *Epipactis* and *Pogonia*. Some of them are western N. American, and others are European. Sepals 3; petals small, ovate; lip saccate: lvs. (sometimes wanting) lanceolate or oblong: fls. mostly small (sometimes showy), in an open spike. The species are scarcely known in cult., but 2 Japanese species have been offered by importers. These are *E. falcata* Blume, yellow, and *E. erecta*, Blume, white.

**CEPHALANTHUS** (Greek, *head* and *flower*; flowers in heads). *Rubiaceæ*. BUTTON-BUSH. Bush grown for its attractive white flower-heads appearing in summer.

Shrubs with opposite or whorled entire stipulate lvs.: fls. small, tubular, white or yellowish, 4-merous, with included stamens and long exserted style, in globular heads; ovary 2-celled: fr. dry, separating into 2 nutlets.—Five species in Amer. and Asia, of which only the one N. American species is cult: hardy ornamental shrub, with handsome glossy foliage and very attractive with its fl-

balls appearing late in summer. It thrives in any good garden soil, best in a sandy, somewhat moist one; naturally it grows in swamps and on the borders of streams and ponds, often with the sts. partly submerged. Prop. by seeds or by cuttings of ripened wood in fall, and also by greenwood cuttings taken from forced plants early in spring.

874. *Cephalanthus occidentalis*. ( $\times \frac{1}{2}$ )

**occidentâlis**, Linn. Fig. 874. Shrub, 3-12 ft., sometimes tree-like: lvs. long-petioled, ovate or oval, acuminate, glossy above, glabrous or slightly pubescent below, 3-6 in. long: heads about 1 in. diam., long-peduncled, 3 or more at the end of the branches. July-Sept. From New Brunswick south, west to Ont. and Calif. Em. 394. R.H. 1889, p. 280. S.S. 14:711. Var. *angustifolia*, André. Lvs. oblong-lanceolate, usually in 3's. R.H. 1889, p. 281.

*C. natalensis*, Oliv. Branchlets hairy: lvs. ovate, acuminate, 1 in. long: fls. green, in solitary heads: fr. edible. S. Afr. B.M. 7400.

ALFRED REHDER.

**CEPHALÀRIA** (Greek for *head*, alluding to the capitate flower-clusters). *Dipsacæ*. Coarse annual or perennial herbs planted to some extent in herbaries. Much like *Dipsacus*, but the heads less spiny and mostly smaller: heads terminal, ovoid or globular, bearing many 4-parted yellowish, whitish or bluish florets; stamens 4, perfect; style filiform: fr. a 4-ribbed achene, the calyx-border often remaining on its summit.—About 30 species in the Medit. region, N. and S. Afr. and W. Asia; also in Abyssinia. Lvs. entire, dentate, or lobed. They are not much planted in Amer., but they make striking subjects for summer bloom, and the long sts. make them useful for cut-fls. The bloom is something like that of *scabiosa*. Of simple cult.; grown readily from seeds.

**alpina**, Schrad. Perennial: tall and widely branched, 5 or 6 ft.: lvs. pubescent and pinnatifid, the segms. cut

and decurrent: fl.-heads sulfur-yellow; involucre with 8 aristate teeth. S. Eu.—A good coarse plant for summer bloom. Hardy N.

*leucantha*, Schrad. Perennial: lvs. pinnate-parted, the lobes linear or oblong: fls. in subglobose heads, creamy white, in autumn. S. Eu. Variable.

*transylvanica*, Schrad. Annual, slender, 2–3 ft.: lower lvs. lyrate; the segms. serrate and the terminal one large; upper lvs. pinnate-parted into linear-lanceolate divisions: fls. in globular heads on long peduncles, the ray-corollas bluish and disk-corollas whitish (fls. said to be yellow, in trade lists, to bloom June–Aug. and plant perennial). Greece and eastward.

*tatarica*, Schrad. Perennial, 6 ft., rank, with striate sts., suited to the rear border, where strong effects are desired, with showy cream-white, flat heads in July and Aug.: lvs. pinnate, the lfts. broad-lanceolate and serrate. Russia, Asia Minor and E.—Grows readily, and is increased by seed or dividing the clumps.

L. H. B.

**CEPHALOCÈREUS** (referring to the crown of long hair). Syn. *Pilocèreus*. *Cactaceæ*. Mostly large columnar plants, single or branched, usually characterized by an abundance of wool or long white hair developing at the top or on one side near the top: fls. nocturnal, small, thick, fleshy, naked: fr. small, globular berry, naked: seeds black.—Some 16 or more species are known.

The culture of the species is similar to that of the arborescent species of *Cereus*. The species of *Cephalocereus* are well suited only for large collections and are rarely seen elsewhere, except in the case of *C. senilis*, of which enormous quantities are shipped to Europe by commercial dealers. See *Succulents*.

*senilis*, Pfeiff. (*Pilocèreus senilis*, Lem.). OLD MAN CACTUS. Columnar, reaching a height of 35 ft. and a diam. of 1 ft., branching at the very base, the branches becoming parallel with the parent: ribs 20–30, very little elevated; areoles bearing 20–30 white, wavy bristles 2–5 in. long; later appear also, at first 1, then 3–5 strong, yellowish spines: fls. very numerous in the cephalium, nearly 4 in. long, red outside, reddish white within: fr. violet, 2 in. long. Cent. Mex. R.H. 1889, p. 568; 1890, p. 128.

*Sartoriânus*, Brit. & Rose (*Pilocèreus Houlettii*, of authors, not of Lem.). Tree-like, attaining 40 ft. in height: branches divaricate: cult. plants usually 3–4 in. diam.: ribs 6–8, rounded, glaucous: radial spines 7–9, spreading,  $\frac{1}{2}$  in. long, honey yellow; central twice as long and stronger: areoles of the sterile st. with more or less hairs, which in the fruiting area are very numerous, making a shaggy tract sometimes 1 ft. long: fls. 3 in. long, imbedded in the wool, turbinate, greenish-red outside, rose-red within: fr. dark red, depressed-globose. Mex. R.H. 1862, pp. 427–30.

*Röyenii*, Brit. & Rose (*Pilocèreus Röyenii*, Rümpl. *P. floccosus*, Lem.). Columnar, branching, reaching 15 ft. height, 2–3 in. diam.: ribs 9–10, obtuse, bluish, pruinose: spines 12–16, rigid, divaricate, bright amber-yellow, the inner ones larger, nearly an inch long: on the sterile branches long hairs are found on areoles, on the fertile bract these are more numerous and aggregated: fls. and fr. as in the last species, but lighter in color. Isl. of St. Croix.

*Hoppenstédii*, Schum. (*Pilocèreus Hoppenstédii*, Web.). Columnar, simple, slender, reaching a height of 30 ft.: ribs numerous, more than 16: radial spines 14–18, very short; centrals 5–8, the lower longest one reaching 3 in.; all the spines at first yellowish, then white: cephalium of 1–2 in. long tufts of yellowish hairs, forming a narrow bract on the north side of the plant: fls. 3 in. long, bell-shaped, whitish, with rosy tips. Mex.

*polylophus*, Brit. & Rose (*Pilocèreus polylophus*, Salm-Dyck. *Cereus Nickelsii*, Hort.). Columnar,

attaining a height of 50 ft. and a diam. of  $1\frac{1}{2}$  ft., rarely branching: ribs 10–22, sharp-angled, shallow, the old sts. perfectly cylindrical: spines small and bristle-like, less than  $\frac{1}{2}$  in. long; radials 5–6; central usually 1; spines of the flowering area 2–3 in. long, crowded: fls. large, trumpet-shaped, dark red: fr. red, scaly. Mex.

*scoparius*, Brit. & Rose (*Pilocèreus scoparius*, Poselg.). Tree-like, richly branched, 25 ft. high, 1 ft. diam.: radial spines 12–15, very short; centrals 7–8, not much longer; in the flowering branches the spines change to longer stout bristles and the areoles are closer together, forming a bristly cephalium: fls. small, bell-shaped, reddish: fr. size of a hazelnut. Near Vera Cruz, Mex.

*exërens*, Rose (*Pilocèreus exërens*, Schum. *P. virens*, Lem.). Branching at base, 3–4 ft. high, 2–3 in. diam., tapering above: ribs 4–6, obtuse, the sterile shoots with short, sparse, woolly hairs at the top: spines commonly 7: radials, very short, 1–3: centrals 4 times as long; woolly hairs much more abundant on the blooming plant: fls. about 3 in. long, trumpet-bell-shaped, without wool or spines. Brazil.—Not common, if occurring at all, in cult. in U. S.

The following species have been reported or may be expected in cult., but none is as yet at all common. *C. chrysocanthus*, Brit. & Rose; *C. comètes*, Brit. & Rose; *C. lanuginosus*, Brit. & Rose; *C. Russellianus*, Rose (*Cereus Russellianus*, Rümpl.). *C. nobilis*, Brit. & Rose.

J. N. ROSE.

**CEPHALOSTACHYUM** (Greek, *head* and *spike*). *Gramineæ*. A few species of grasses of the bamboo tribe in E. Indies and Madagascar, one of which (*C. pergracile*) has been offered in this country. Tall shrubs: spikelets in dense solitary heads at the ends of the branches or in scattered glomerules, the heads bristly with the subtending lvs.; stamens 6; empty glumes 1–2; style long, 2–3-cleft: fr. elongated and beaked. *C. pergracile*, Munro. Forty ft., sts. 2–3 in. thick: lvs. 14 in. or less long; an elegant species, growing in clumps. Burma. It is offered in S. Calif. In Fla., it loses most of its lvs. in winter, but the new growth in spring and summer is very attractive; it is said not to do well there on high dry pine land, preferring moderately moist soil; it needs much water in summer, and responds readily to fertilizer.

L. H. B.

**CEPHALOTÁXUS** (Greek, *head*; *Taxus*-like plant, with fls. in heads or clusters). *Taxaceæ*. Yew-like plants, grown for their handsome evergreen foliage.

Trees or shrubs, with evergreen linear pointed lvs. with 2 broad, glaucous lines beneath, arranged in 2 rows: fls. dioecious, staminate in 1–8-fl., short-stalked clusters, pistillate consisting of a small cone with several bracts, each bearing 2 naked ovules: seed inclosed in a fleshy envelope, drupe-like, about 1 in. long, reddish or greenish brown. From allied genera it may be easily distinguished by the resin-canal in the center of the pith; and by the glaucous lines beneath from *Taxus*, which has the lvs. yellowish green beneath; and from *Torreya* by the glaucous lines being broader than the 3 green lines, while in *Torreya* the glaucous lines are narrower than the green ones.—Six closely allied species from Himalayas to Japan.

These are ornamental evergreen shrubs, in appearance very like a yew, but of more graceful habit. Not hardy North, or only in very sheltered positions. They thrive best in a somewhat moist but well-drained sandy loam, and in partly shaded situations. Propagated by seeds, stratified and sown in spring; imported seeds usually do not germinate until the second year; increased also by cuttings in August, under glass, and by veneer-grafting in summer, on one of the species or on *Taxus baccata*. For cions and cuttings, terminal shoots should be chosen, which form regular plants with whorled branches like seedlings, while cuttings from lateral branches grow into irregular, low, spreading shrubs.

A. *Lvs.* 2-3 in.: branchlets yellowish green, pendulous.

**Fórtunei**, Hook. *Lvs.* tapering gradually into a sharp point, usually falcate, dark green and shining above; fr. greenish brown, obovate. N. China, Japan. B.M. 4499. F.S. 6:555. R.H. 1878, p. 117.—This is the most graceful species, with long and slender branches, attaining in its native country 50 ft. in height, in cult. usually remaining a shrub.

AA. *Lvs.* 1-2 in. long.

B. *Base of lvs. cuneate; lvs. loosely 2-ranked.*

**Harringtonia**, Koch (*C. pedunculata*, Sieb. & Zucc. *C. drupacea* var. *Harringtonia*, Pilger). With spreading, often somewhat pendulous branches, dark green when young: *lvs.* to 2 in. long, narrowed into a sharp point, shining and dark green above: staminate fls. distinctly peduncled: fr. ovoid, rounded at both ends, rarely globular. Japan, China. G.C. II. 21:113; III. 18:716; 33:228.—In Japan, tree to 25 ft., usually shrub in cult. A remarkable form is var. *fastigiata*, Silva Tarouca (*C. pedunculata* var. *fastigiata*, Carr. *Podocarpus koraiana*, Sieb. & Zucc.), of columnar habit, with upright branches and spirally arranged *lvs.* G.C. II. 21:112; III. 33:229. S.H. 2:450. Gng. 2:341. Var. *sphaeralis*, Rehd. (*C. pedunculata* var. *sphaeralis*, Mast.), has globose fr.: *lvs.* falcate, subacuminate,  $1\frac{1}{2}$ -2 in. long. G.C. II. 21:117.

*drupacea*, Sieb. & Zucc. Branches spreading, stiff, usually light green when young: *lvs.* about 1 in. long, abruptly pointed, narrow and straight, often upturned: staminate fls. very short-stalked: fr. usually obovate, narrowed at the base. Japan. G.C. III. 18:717; 33:227. B.M. 8285.—The dwarfest species. Var. *sinensis*, Rehd. & Wilson. Shrub, to 12 ft.: *lvs.* linear-lanceolate, tapering to sharp point. Cent. and W. China.

BB. *Base of lvs. truncate; lvs. very closely set.*

**Óliveri**, Mast. Shrub or small tree: *lvs.* strictly 2-ranked, rigid, broadly linear, spiny-pointed, about 1 in. long, bright green with 2 broad white bands beneath, the midrib scarcely elevated: fr. ovoid or obovoid, shortly apiculate, about  $\frac{1}{2}$  in. long. Cent. China. H.I. 1933 (as *C. Griffithii*). G.C. III. 33:226.—Differs from the other species in the very closely set rigid *lvs.*

ALFRED REHDER.

875. *Cephalotus follicularis*.

**CEPHALÔTUS** (Greek, *head-shaped*, in reference to the knob-like swelling behind each anther). *Cephalotaceæ*, a monotypic family near *Saxifragaceæ*. The one species *C. follicularis*, Labill. (Fig. 875), is abundant at King George's Sound and Swan River in S. W. Austral. From there it has frequently been intro. into cult., and is now met with in American collections. The short creeping rhizomes form 2 sets

of *lvs.* each season: a set of 4-6 flat spatulate *lvs.*, and later as many dainty pitched *lvs.* that are richly colored green, crimson or purple, and white. The pitchers are  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. long, are covered externally with minute alluring glands, and these with the coloring attract insects. They slip from the smooth-ribbed rim into the cavity, and there are digested by ferment liquids poured out by special glands. The erect scape bears an interrupted spike of small white apetalous fls., each with a 6-parted calyx, 12 stamens, and 6 separate 1-seeded carpels. The plant grows best under a bell-jar, and in a pot amongst fine sandy loam that is covered by sphagnum moss. The lower part of the pot should stand in a vessel with about  $\frac{1}{2}$  in. of water, and the whole should be placed in a cool greenhouse near the light, when the pitchers assume richest colorings. Prop. is easily effected by separation of small pieces of rhizome that bear 1 or 2 *lvs.*, also by seeds that mature not unfrequently under cult. R. B. 23, p. 233. I.H. 27:391. F.S. 3:290. G. 23:340. G. W. 8:390. J.H. III. 35:260.

J. M. MACFARLANE.

**CERÁSTIUM** (Greek for horn, alluding to the shape of the pod). *Caryophyllaceæ*. MOUSE-EAR CHICKWEED.

Decumbent annuals or perennials, used in rockeries or for bedding and borders.

Pubescent or hirsute herbs, rarely glaucous: *lvs.* small, opposite, entire: fls. white, borne in terminal, dichotomous cymes; sepals 5, rarely 4; petals as many, emarginate or 2-cleft; stamens 10, rarely fewer; styles 5, rarely 4 or 3, opposite the sepals: caps. cylindric, often curved, dehiscing at the top by 10, rarely 8, teeth.—About 100 species of world-wide distribution according to the largest delimitation of the genus; by some authorities reduced to 40 or 50 species.

Cerastiums are of easy culture in ordinary garden soil. They are propagated by divisions or by cuttings taken after flowering and planted in a shady place. They are more or less used for edgings and in rockeries.

A. *Lvs. green, merely pubescent.*

**arvense**, Linn. (var. *oblongifolium*, Holl. & Brit.). STARRY GRASSWORT. Fig. 876. Perennial, low, much branched and matted: sts. 8-12 in. long: *lvs.* oblong or lanceolate, pale green, pubescent, obtuse,  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. long,  $\frac{1}{4}$  in. wide: fls. very numerous, appearing in Apr. and May; petals 5, deeply bifid: caps. twice as long as the calyx.—A species of very wide range, growing mostly in dry rocky places from Labrador to Alaska and south to Ga. and Calif.; also in Asia and Eu. Gn. 71, p. 504.—Recommended as a bedding plant, for its mat-like habit, covered with white bloom. Var. **compáctum**, Hort., is hardy in S. E. Canada.

**purpuráscens**, Adams. Perennial, hairy, pubescent, caespitose, about 4 in. high: lower *lvs.* oblong, narrowed into the petiole; upper *lvs.* linear-lanceolate: cymes dichotomous or often simply umbelliform; fls. white; petals twice as long as calyx, ovate-oblong: caps. cylindric, twice as long as calyx. Asia Minor.—Hardy.

876. *Cerastium arvense*.

AA. *Lvs. silvery or grayish.*

B. *Caps. equaling the calyx.*

**grandiflorum**, Waldst. & Kit. (*C. argenteum*, Bieb.). Creeping perennial: lvs. linear, acute, the margins reflexed: infl. dichotomous; fl.-sts. 6-8 in. high; petals oval, 2-parted, transparent white, twice as long as calyx. E. Eu.

BB. *Caps. much longer than the calyx.*

**Bièbersteinii**, DC. Perennial: sts. 6 in., creeping, diffuse, branched: lvs. ovate-lanceolate, tomentose-woolly: peduncles erect, dichotomous; fls. white: caps. ovate-cylindrical. Tauria. B.M. 2782. Gn. 59, p. 470. —Like *C. tomentosum*, but with larger lvs. Fine for edgings.

**Boissieri**, Gren. Perennial, low: lvs. silvery, ovate-lanceolate, acute, entire, sessile: peduncles 4-12 in. high; infl. a dichotomous cyme; fls. large, white. Spain.

**tomentosum**, Linn. SNOW-IN-SUMMER. Perennial, low, creeping, branched: lvs. oblong, spatulate, grayish woolly, upper lvs. lanceolate: peduncles 6 in. high, erect, dichotomous; fls. white: caps. cylindrical. Eu. G. 29:555. Gn. 69, p. 143. —Much used for edgings.

E. Z. B.†

**CÉRASUS** (from *Cerasunt* or *Cerasonte*, a place in Asia Minor on the Black Sea, whence cherries are said to have been brought to Italy before Christ). CHERRY. *Rosaceæ*. Tournefort in 1700 founded the genus *Cerasus*, but by general usage it is now combined with *Prunus* inasmuch as no single important character holds clearly between the two groups. The name is sometimes kept distinct in trade lists, representing the cherries as distinct from the plums. Botanically, the group is distinguished from *Prunus* proper (the plum group) in having conduplicate vernation (young lvs. with the halves folded together) rather than involute vernation, fls. more characteristically in umbels or racemes, fr. mostly lacking bloom and pubescence, and the stone not corrugated or pitted. See *Prunus*.

L. H. B.

**CERATÏOLA** (Greek, *a little horn*, referring to the four-branched, serrate stigma). *Empetraceæ*. A heath-like evergreen, from the sand barrens of South Carolina to Florida and Alabama; rarely cultivated North, but not hardy.

Branches often whorled as are the lvs., which are narrow, strongly revolute and thus almost tubular: fls. dioecious, 2-3-whorled in the axils, sessile; sepals, petals and stamens, each 2.—Only 1 species.

**ericoides**, Michx. Height 2-8 ft.: branches subverticillate, marked with scars of numerous fallen lvs., the younger and upper ones only retaining foliage: lvs. crowded,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long, linear, rigid, shining, pale: fls. inconspicuous reddish, whorled in the axils: drupe round, orange-yellow, berry-like. B.M. 2758.

N. TAYLOR.†

**CERATÓLOBUS** (Greek for *horned pod*). *Palmaceæ*, tribe *Calámææ*. Low or creeping pinnate palms allied to *Calamus*, and not as yet common in the American trade.

Stems and lf.-stalks spiny but not the lf.-blades: sts. frequently 30 ft. or more long and armed with stout spines an inch long: lvs. pinnate, often as much as 7 ft. long, with numerous alternate or opposite lfts., which are crenate-dentate towards the apex: fls. polygamous-monœcious, in a paniculately branched spadix: fr. drupe-like, 1-seeded.—There are only 3 wild species and 2 species known in horticultural literature, the botanical status of which is doubtful. All the wild species come from Java or Sumatra. For cult., see *Calamus* to which *Ceratolobus* is closely related, differing in having rhomboid, not linear lfts. G.C. II. 23:338.

**glaucescens**, Blume. St. up to 30 ft. and about as thick as one's wrist: lvs. 6-7 ft. long, of 14-18 sessile, erect or spreading lfts. which are 8-10 in. long,  $2\frac{1}{2}$ - $3\frac{1}{2}$  in. wide, opposite above, alternate below: spadix from the axils of the upper lvs.: spathes 2-horned, 4-6 in. long. Java.

*C. cœncolor*, Blume. Similar, with 10-14 lfts., relatively broader than in *C. glaucescens*. Sumatra.—*C. Findleyanus*, Hort. Lvs. 2-4 ft. long, clear pale shining green. Hab. (?). A.G. 15:169.—*C. Micholitziana*, Hort. Very elegant palm, the st. and lf.-rachis with scattered spines: lvs. oblong, the lfts. remote, linear-oblong, acute, pale on the under surface.—Horticulturally the most attractive of the group.

N. TAYLOR.

**CERATÏONIA** (Greek for *horn*, in reference to the large pod). *Leguminosæ*. CAROB. A handsome evergreen tree, bearing large pods that are used somewhat for human food but chiefly for forage.

One of the Cassia tribe: calyx-tube disk-bearing, somewhat top-shaped, the segms. 5 and short; petals 0; stamens 5: pod long (4-12 in.), compressed, thick and coriaceous, indehiscent, filled with a pulpy substance, bearing obovate transverse seeds. *C. Siliqua*, Linn. (Figs. 877, 878), the only species, is now widely distributed in warm countries, being grown both for shade and for the edible pods. It reaches a height of 40-50 ft.: lvs. pinnate, shining, the 2-3 pairs of lfts. oval and obtuse: fls. in small lateral red racemes, polygamodioecious, the trees said to be variable in sexuality at different ages. It thrives well in S. Calif. and S. Fla. The dry pods are occasionally seen in the fruit stands in northern markets. There are many varieties, differing in the size and shape of pod.

The *Ceratonia* is known also as *Algaroba*, *Karoub*, *Caroubier*, and *St. John's Bread*. The last name records the notion that the seeds and sweet pulp are respectively the locusts and wild honey which St. John found in the wilderness. The dry valves or pods have been supposed to be the husks that provided the subsistence of the prodigal son. See G.F. 3:318, 323. The seeds are said to have been the original carat weight of goldsmiths.

L. H. B.

The carob is of much importance as a farm crop throughout the Mediterranean basin and other hot and semi-arid regions. According to Alphonse de Candolle, its original home was about the eastern end of the Mediterranean, including the southern coast of Asia Minor and Syria and perhaps Tripoli. Its cultivation began in historic times, and was diffused by the Greeks in Italy and Greece and was carried by the Arabs west as far as Spain and Morocco. In all these countries the large pods, rich in protein and sugar, are a very important forage crop, being eaten with avidity by all kinds of stock, besides furnishing considerable sustenance to the poor in times of scarcity, and are also used for the manufacture of syrups and different fermented drinks. Carob pods were the main sustenance of Wellington's cavalry in the Peninsular campaign and at the present time are the chief food of the British army horses on the island of Malta and the horses of the tramways in the cities of southern Italy. They form one of the principal exports of Palestine, Syria and especially of the island of Cyprus. Thousands of tons are annually imported into England where they are ground for stock-feed. A. Aaronsohn, Chief of the

877. *Ceratonia Siliqua*.

Jewish Experiment Station in Palestine, says that an acre of carob trees on arid soil yields a much greater quantity of food matter than an equal area planted with the best alfalfa. He gives the sugar content at 40 per cent and in some varieties even higher, and the protein content as 7 to 8 per cent. The French and Portuguese writers give somewhat lower percentages, but this seems to be much a matter of climate and varieties. The analysis published by Rivi re and Lecoq points to a high digestive coefficient, and nutritive value a little higher than oats; it is estimated that 147.5 kilos of carobs equals 100 kilos of wheat (a kilo is nearly 2¼ pounds).

The first introduction of the tree into this country on a considerable scale was by the U. S. Patent Office from Alicante, Spain, in 1854 and from Palestine in 1859. About 8,000 plants, grown from seed in Washington, were distributed during the spring of 1860, mostly in the southern states. Some of these plants probably found their way to California, as a number of old trees are growing in various parts of that state from San Diego on the south to Napa and Butte counties on the north. The latest importation was in June, 1911, from Valencia, Spain, by the Office of Foreign Seed and Plant Introduction of the Department of Agriculture. This shipment consisted of cuttings of six of the leading varieties grown in that district which are now being propagated by budding at the Chico (California) Introduction Field Station and will soon be available for distribution.

Centuries of cultivation have given rise to a large number of varieties, differing in quality of pods, vigor and productiveness and adaptability to various soils. The species is either dioecious or monoecious. All trees in California are of course seedlings and, as far as examined by the writer, monoecious, although Aaronsohn states that the best kinds in Palestine are dioecious, and a sufficient number of staminate trees, therefore, must be planted with those varieties to pollinate the female trees. In the province of Algarvia, Portugal, seventeen named varieties are cultivated and about as many in France and Spain. The best of these should be introduced into this country.

878. Pods of *Ceratonia Siliqua*.

The carob tree thrives only in a warm climate, the range being about the same as that of the orange, but with a little protection for two or three winters, the range can be considerably extended. At the Government Field Station at Chico, several varieties have survived temperatures of 18° to 22°, while others when young have been killed to the ground by the same degrees of frost. The old trees scattered about the Pacific Coast States show that a large area is adapted to it.

In France, Spain and Portugal, the carob grows in most kinds of soil, except in stiff clay or wet ground, and even in gravel if fertile and permeable to the roots. The crop is sufficiently valuable to make it worthy of the best soil and treatment.

The carob is usually grown from seed and afterwards budded to the best varieties. It can be raised from cut-

tings, but requires bottom heat and careful treatment. At the Chico Field Station, where thousands of seedlings are grown, the best success is had by planting under glass. Quicker germination is secured by soaking the seed in water for three or four days or until they begin to swell. The tree is difficult to transplant and usually fails unless moved with a ball of earth. The best results are had by growing the plants in pots or in "flats" in tenacious soil, as is the practice with eucalyptus, when the trees are cut apart and lifted with squares of earth attached. At Aleppo, in Syria, the growers make pots of a mixture of clay and cow-dung which, dried in the sun, are strong enough to hold the earth in which the seeds are planted. When ready to put into the orchard the pot is sunk where the tree is to stand. As soon as the pot becomes moist from contact with the earth, it is readily permeable by the roots.

While the carob is a rather slow grower, it lives to a great age and should be planted not less than 35 to 40 feet apart, with interplanting of peaches or other growths for income until the carobs begin to bear. In Algiers and Tunis, it is often planted as a border tree, for which its beauty and utility admirably fit it. When well established, the seedlings are budded with the best varieties. If buds are taken from bearing trees, fruit may be expected in three or four years. In California seedlings bear when six to eight years of age. While it is eminently a dry-climate tree, two or three summer irrigations will greatly aid the development, hasten fruiting and increase the yield. It will respond to the same good treatment that is given to a well-kept fruit orchard.

The crop matures in September and October and, as with most other fruit trees, it is most abundant every second year. When ripe, the pods turn brown and begin to fall. Those that fail to drop are easily knocked down with bamboo or other poles.

Aaronsohn gives the crop in Palestine in good years at an average of 450 pounds to the tree, and states that he has seen wild stocks fifteen to eighteen years after grafting give a yield of 900 to 1,000 pounds of pods. Du Breuil gives the yield in southern France at 220 pounds and mentions single trees at Valencia, Spain, that produce as high as 1,380 kilos, or 3,040 pounds. Rivi re and Lecoq report the yield of trees in Algiers at 100 to 300 kilos, or 220 to 660 pounds. Francis de Mello Lotte gives the crops of mature trees on deep fertile soil in Algarvia, Portugal, at 300 to 750 kilos, or 660 to 1,650 pounds each. As the pods are equal in nutrients to barley and superior to oats for feeding and fattening cattle, sheep, hogs and horses, and the yield is from three to four times the weight per acre of grain, it is evident that few crops will give the farmer an equal value. In the mild climate of the Gulf States, especially the coastal regions of Texas, the southern parts of New Mexico and Arizona and the greater part of California, this beautiful and valuable evergreen tree, when once appreciated, is bound to become a staple addition to farm crops for the nourishment of both man and beast.

G. P. RIXFORD.

**CERATOPÉTALUM** (Greek, *horned petal*). *Cunoniaceæ*; by some, *Cunoniaceæ* is included in *Saxifragaceæ*. Greenhouse trees or shrubs.

Glabrous and resinous trees and shrubs: lvs. opposite, compound, with 1-3 digitate lfts.: fls. small, white, rose or yellow, in terminal branching cymes or panicles; calyx-tube short, 5-lobed; petals 0, or, if present, lacinate; stamens 10, with connectives: fr. a small and hard achene-like body, with persistent calyx-lobes, 1-seeded.—Two or 3 species, in Austral.

**gummiferum**, Smith. Tree, 30-40 ft.: lfts. 3, lanceolate, serrulate, narrowed at base, shining and strongly nerved: petals deeply 3-5-lobed, not exceeding the calyx.—Said to thrive in a peaty soil, and to prop. by cuttings of half-ripened wood under glass. L. H. B.

**CERATÓPTERIS** (Greek, *horned fern*). *Ceratopteridaceæ*. Very succulent tropical ferns, forming also a distinct family. They are the only truly aquatic plants among true ferns and grow floating or rooted under water in the mud or sometimes only occasionally flooded. The lvs. are borne in rosettes, the sterile

879. *Ceratopteris pteridoides*. ( $\times \frac{1}{2}$ )

spreading, often floating, the fertile more erect, 2-4-pinnate, with very slender rolled-up pod-like segms.: sporangia very large, borne separately along the veins and covered by the revolute margins somewhat as in *Pteris*.—Species very few. Best grown by planting in pots, slightly submerged. Reproduced by buds which arise from all parts of the lvs. New plants must be developed each season. Useful in ponds and aquaria.

**pteridoides**, Hook. Fig. 879. Sterile lvs. broadly deltoid, short-stalked, the margins irregularly lobed, floating; the fertile lvs. taller, completely divided into long whip-like segms.: sporangia with a very small annulus, and containing 32 spores. Fla. to S. Amer.

**thalictroides**, Brongn. Sterile lvs. narrowly deltoid, long-stalked, 1-2 pinnatifid into deltoid segms. not floating; fertile lvs. similar but with linear segms.: annulus well developed. Old World tropics.

R. C. BENEDICT.

**CERATOSTÍGMA** (Greek, *horned stigma*). *Plumbaginaceæ*. Diffuse glabrous perennial herbs or subshrubs, one of which is in cultivation as a bedding and border plant.

*Ceratostigma* differs from *Plumbago* in having no glands on the calyx, stamens adnate to the corolla-tube, fls. in dense clusters rather than spicate, and other technical characters: lvs. alternate, lanceolate or obovate, more or less ciliate: fls. mostly in terminal heads, blue or rose; calyx tubular, deeply 5-parted, the lobes narrow; corolla salver-shaped, the tube long and slender, the limb spreading and with 5 obovate obtuse or retuse lobes; stamens 5, attached on the corolla-tube: fr. a 5-valved caps. inclosed in the calyx.—Species 4 or 5, in N. China, Himalayas, Abyssinia.

**plumbaginoides**, Bunge (*Plumbago Lárpentæ*, Lindl. *Valoradia plumbaginoides*, Boiss.). Herb, 6-12 in., the st. red and branchy: lvs. entire, strongly ciliate on the edges: fls. with a deep blue limb, the 5 lobes minutely toothed, collected in dense heads or umbels. China. B.M. 4487. F.S. 4:307.—A hardy bedding plant, producing profusely of its deep blue fls. late in fall; very valuable. Needs covering in winter in the N.

Under the name *C. Póhillii*, a dwarf and creeping shrub, with delicate lavender fls., is mentioned in British journals as coming from high elevations in W. China and giving promise as an outdoor subject.

L. H. B.

**CERATOTHÈCA** (Greek for *horned capsule*). *Pedaliaceæ*. Tropical African glasshouse herbs.

Leaves opposite, ovate: calyx 5-parted; corolla 2-lipped, the lower lip very long in proportion to the upper: fls. in pairs in the axils: caps. 2-horned.—Five species. *C. trifolia*, Mey., is occasionally grown in S.

Fla., and it may be adapted to glasshouses. It is a tall herb (5 ft.), with the habit of foxglove, probably biennial, hairy and rather fleshy: lower lvs. stalked, broadly ovate or almost round, the upper sometimes broadly angular and even 3-lobed, both kinds crenate-dentate: corolla 3 in. long, blue or violet-blue, pubescent, deflexed, the lower lobe prolonged. Handsome. B.M. 6974.—Could be grown in temperate house N. in sandy loam.

N. TAYLOR.†

**CERATOZÀMIA** (Greek, *horned Zamia*; referring to the horned scales of the cones, which distinguish this genus from *Zamia*). *Cycadaceæ*. Handsome Mexican foliage plants, with cycas-like leaves, but less cultivated in American palm-houses than *Cycas*.

Trunk erect in age, crowned by a whorl of pinnate cycas-like lvs. which are petiolate and unarmed: fls. in cones borne from among the lvs., the cones often stalked: seeds rare and little known.—Six species. Best raised from young imported plants, but rarely prop. by seeds, or by offsets from the slow-growing trunk. Burn out the center of the plant with a hot iron, and a number of offsets will spring from the trunk and the crown; these may be used for prop.

**mexicana**, Brongn. Fig. 880. Trunk thick, short, covered with the remains of fallen lf.-stalks: lvs. rich, dark green, pinnate, on prickly petioles 5-6 in. long, which are shaggy when young; lfts. very numerous, 6-12 in. long or more, lanceolate: cones produced annually on separate plants; female cones 9-12 in. long, 4-6 in. thick, the scales 2-horned; male cones narrower, longer, on a hairy stalk, the scales with 2 small teeth. Mex. Gn. 9, pp. 308-9.—An excellent decorative plant, best grown in sandy loam. Give freely of water and heat in spring and summer, but keep cooler and drier in winter. Somewhat tender although grown in Cent. Fla.

*C. Miqueliána*, Wendl. A plant with 20-30 pairs of lfts. and a lf.-stalk 18 in. long; fr. not known certainly. Cult. in botanic gardens and worthy of wider use. Mex. and W. Indies.

N. TAYLOR.†

**CERCIDIPHYLLUM** (*Cercis* and *phyllon*, leaf; the lvs. resemble those of *Cercis*). *Trochodendraceæ*. Tree grown for its handsome foliage and habit.

Leaves deciduous, usually opposite, petioled and palmately nerved: fls. dioecious, inconspicuous, apetalous, solitary; staminate nearly sessile, bearing numerous stamens with slender filaments; pistillate pedicelled,

880. *Ceratozamia mexicana*.—Young plant (fertile).

consisting of 3-5-carpels, ending in long, purplish styles and developing into about  $\frac{3}{4}$  in. long, dehiscent pods, with many seeds.—One species in Japan and W. China. Hardy, ornamental, shrubby tree of pyramidal and, when young, almost fastigiate habit, with handsome,

881. *Cercidiphyllum japonicum*. ( $\times \frac{1}{2}$ )

light green foliage, purplish when unfolding, turning bright yellow or partially scarlet in fall. It prefers rich and moist soil, and grows rapidly when young. Prop. by seeds, sown in spring, and by greenwood-cuttings, taken from forced plants in early spring, or by layers; cuttings from half-ripened wood in summer, under glass, grow also, but not very well.

*japonicum*, Sieb. & Zucc. Fig. 881.

Bushy tree, commonly with several trunks, usually 20-30 ft., but sometimes rising to 100 ft., with slender, glabrous branches: lvs. opposite, occasionally alternate, slender-petioled, cordate, orbicular or broadly ovate, obtuse, crenate-serrate, glabrous, glaucous beneath, 2-3 in. long. Japan. G.F. 7:106, 107, and 6:53. Mn. 3:74. Gag. 5:135. F.E. 32:211 (habit). P.G. 2:105. S.I.F. 1:41. —A very desirable tree, one of the best introductions from Japan. Var. *sinense*, Rehd. & Wilson. Tree, to 120 ft., usually with a single trunk: petioles shorter, about  $\frac{3}{4}$  in. long, somewhat hairy on the veins beneath: caps. gradually narrowed at the apex,  $\frac{1}{2}$  in. long. W. China.—This recently intro. variety is perhaps still more desirable than the type. It is the largest of all broad-ld. trees known from China; the trunk is sometimes free of branches for nearly 50 ft. above the ground and attains to 25 ft. or exceptionally to 55 ft. in girth.

ALFRED REHDER.

**CÉRCIS** (*Kerkis*, ancient Greek name). *Leguminosæ*. **JUDAS TREE. RED-BUD.** Trees or shrubs grown for their pink flowers profusely produced early in spring before the leaves; very interesting, also, in mode of branching, as seen in mature trees.

Leaves deciduous, alternate, petioled, palmately nerved, entire: fls. papilionaceous, pedicelled, pink or red, appearing before or with the lvs., in clusters or racemes from the old wood; calyx 5-toothed, red; petals nearly equal, the uppermost somewhat smaller: pod compressed, narrow-oblong, narrow-winged on the ventral suture, many-seeded.—Seven species in N. Amer., and from S. Eu. to Japan.

These trees and shrubs are very ornamental, with handsome distinct foliage and abundant showy flowers in spring, very effective by their deep pink color. They are well adapted for shrubberies or as single specimens on the lawn, and attain rarely more than 20 or 30 feet in height, forming a broad, irregular head when older. Only *C. canadensis* is hardy North, while *C. chinensis* can still be grown in sheltered positions near Boston, but is occasionally injured in severe winters; the others can not be grown successfully farther north than New York. They grow best in rich sandy and somewhat moist loam, and should be transplanted when young, as older plants can hardly be moved with success. Young plants, four or five years old, produce flowers

freely and may be recommended for forcing, especially *C. chinensis* and *C. racemosa*, which are the most beautiful of all. Propagated by seeds, sown in spring, best with gentle bottom heat; sometimes increased by layers, or by greenwood cuttings from forced plants in early spring; *C. chinensis* grows also from greenwood cuttings in summer under glass.

A. Lvs. abruptly and short-acuminate.

B. Fls. in clusters: lvs. usually pubescent only beneath near the base.

*canadensis*, Linn. Fig. 882. Tree, to 40 ft.: lvs. roundish or broadly ovate, usually cordate, 3-5 in. long: fls. rosy pink,  $\frac{1}{2}$  in. long, 4-8 in clusters: pod  $2\frac{1}{2}$ -3 $\frac{1}{2}$  in. long. From N. J. south, west to Mo. and Texas. S.S. 3:133-4. A.F. 13:1370. Gng. 6:290. F.E. 9:593. Mn. 2, p. 139. M.D.G. 1899:434-5 (habit). Gn. 25, p. 347.—A very desirable ornamental tree for the northern states. Var. *alba*, Rehd. Fls. white. Var. *plena*, Schneid. Fls. double.—Recently *C. canadensis* has been split by Greene into several new species (see Fedde, Rep. Spec. Nov. Veget. 11:110).

*chinensis*, Bunge (*C. japonica*, Sieb.). Fig. 883. Tree, to 50 ft., shrub in cult.: lvs. deeply cordate, roundish, with a white, transparent line at the margin, subcoriaceous, glabrous, shining above, 3-5 in. long: fls. 5-8, purplish pink,  $\frac{3}{4}$  in. long: pod 3-5 in. long, narrow. China, Japan. F.S. 8:849. Mn. 2:139. G.F. 6:476.—A very beautiful species, with the fls. nearly as large as those of *C. Siliquastrum* and more abundant.

BB. Fls. in pendulous racemes.

*racemosa*, Oliv. Tree, to 30 ft.: lvs. broadly ovate, truncate or subcordate at the base, pubescent beneath,

882. *Cercis canadensis*. ( $\times \frac{1}{2}$ )

$2\frac{1}{2}$ -4 in. long: fls. rosy pink, about  $\frac{1}{2}$  in. long on slender pedicels of about equal length, in many-fl. racemes  $1\frac{1}{2}$ -3 in. long: pod  $2\frac{1}{2}$ -4 in. long. Cent. China. H.I. 1894.—The handsomest of all. Young plants have not proved hardy at the Arnold Arboretum, but it is perfectly hardy in S. England.

AA. *Lvs. rounded or emarginate at the apex, usually broader than long.*

*occidentalis*, Torr. (*C. californica*, Torr.). Shrub, to 15 ft.: *lvs.* cordate, roundish, glabrous, about 2 in. wide: *fls.* rose-colored,  $\frac{1}{2}$  in. long: pod 2-2 $\frac{1}{2}$  in. long. Calif. Torrey in U. S. Explor. Exped., 1838-1842, 17, pl. 3.—A closely allied species is *C. reniformis*, Engelm. (*C. texensis*, Sarg.). Small tree: *lvs.* subcoriaceous, 3-5 in. wide, sometimes pubescent beneath: pod 2-4 in. long. Texas, New Mex. S.S. 3:135.

*Siliquastrum*, Linn. Tree, to 40 ft.: *lvs.* roundish, deeply cordate, glabrous, 3-5 in. wide: *fls.* 3-6, purplish rose,  $\frac{3}{4}$  in. long: pod 3-4 in. long. S. Eu., W. Asia. B.M. 1138. Gn. 25, pp. 346, 347, 350; 33, p. 416; 42:342, p. 343; 44, p. 379; 52, p. 5. G.C. III. 52:6 (habit). G. 25:209. R.H. 1899:469 (abnormal form). Var. *alba*, Carr. (var. *albida*, Schneid.) with white *fls.*

**CERCOCÁRPUS** (Greek, *tail* and *fruit*; the fruit with a long, hairy tail). *Rosaceæ*. MOUNTAIN MAHOGANY. Small trees or shrubs but rarely grown for their attractive evergreen or half-evergreen foliage and the peculiar feathery tailed achenes.

Leaves alternate, persistent, rather small: *fls.* inconspicuous, apetalous, whitish or reddish, in the axils of fascicled *lvs.*; calyx-tube cylindric, elongated, abruptly expanded at the apex into a cup-shaped deciduous, 5-lobed limb bearing 15-30 stamens with short filaments; ovary 1-celled, inclosed in the calyx-tube, with a long exerted style: fr. a 1-seeded achene, surmounted by the persistent, long and hairy style.—Small genus of about 10, mostly rather local species, in the Rocky Mts. from Mont. south to Mex. and in Calif.

The cercocarpuses are not particularly ornamental, yet they are attractive with their small evergreen dark foliage and their feathery tailed fruits; they are adapted for planting on dry rocky or gravelly slopes in arid temperate regions, as they thrive under very unfavorable conditions. The very heavy and close-grained wood is manufactured into small articles, and valued as fuel and for making charcoal. *C. ledifolius* and *C. parvifolius* are the hardiest and stand frost to zero, while *C. Traskiae* can be grown only in southern California. They may be cultivated in any well-drained soil in sunny positions, and propagated by seeds or by cuttings of half-ripened wood under glass.

A. *Margin of lvs. toothed: fls. 2-5 in a cluster.*

B. *Lvs. oval to suborbicular, usually rounded at the base.*

*Traskiae*, Eastw. Tree, to 25 ft.: *lvs.* coarsely sinuate-dentate above the middle, lustrous above, tomentose below, 1-2 $\frac{1}{2}$  in. long: achene with the style 2-2 $\frac{1}{2}$  in. long. Santa Catalina Isl., Calif. S.S. 13:635.

383. *Cercis chinensis*.  
(Natural size)

BB. *Lvs. usually cuneate-obovate, smaller.*

*parvifolius*, Nutt. Bushy tree, to 25 ft.: *lvs.* dull green and pubescent above, pubescent or tomentose beneath,  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. long, with 4-5 pairs of veins: style 2-4 in. long. From Neb. and Ore. to Low. Calif. and W. Texas. S.S. 4:166. H.I. 4:323.—D. M. Andrews, of Colo., who handles this shrub, writes of it as follows: "Mountain mahogany, 6 feet. A nearly evergreen rosaceous shrub of peculiar and attractive habit of growth. *Fls.* white, early, followed by the long, plumose achenes, which are 3-5 in. long, strangely curled and twisted, arranged above and on each side of the slender branches, so that at a little distance they have an appearance suggestive of ostrich plumes. Easily transplanted, and thrives anywhere."

*betulæfolius*, Nutt. (*C. parvifolius* var. *glaber*, Wats. *C. parvifolius* var. *betuloides*, Sarg.). Small tree, to 30 ft.: *lvs.* thinner, bright green and glabrous above at maturity, pubescent or glabrescent beneath,  $\frac{1}{2}$ -2 in. long, with 5-6 pairs of veins: style 2-4 in. long. Calif. W.G.Z. 4, pp. 554-5. H.I. 4:322.

AA. *Margin of lvs. entire, revolute: fls. solitary or in pairs.*

*ledifolius*, Nutt. Tree, to 40 ft.: *lvs.* lanceolate, coriaceous, lustrous and glabrous above at maturity, pubescent below, resinous,  $\frac{1}{2}$ -1 in. long, veins obscure: style 2-3 in. long. From Wyo. and Wash. to S. Calif. and New Mex. S.S. 4:165. H.I. 4:324.

ALFRED REHDER.

**CEREALS** (*Ceres*, goddess of agriculture). The agricultural grains, properly those of the grass family: maize or Indian corn, kafir, wheat, emmer, spelt, rice, oats, barley, rye, sorghum (for grain); popularly held to include buckwheat, but not accurately so. Consult Vol. II, Cyclo. Amer. Agric.

**CÈREUS** (from the Latin, but of uncertain application). *Cactaceæ*. Usually arborescent, columnar cacti with the surface covered with spiny ribs.

Flowers large, borne singly along the sides of the st.; fl.-tube slender and, as it decays, cutting off from the ovary; petals numerous; stamens numerous; style single, thick: fr. a large, naked, fleshy berry; seeds small, black. The genus *Cereus*, as it has generally been treated, contained more than 100 species which differed greatly in habit, armament, *fls.* and fr., and was one of the most complex and difficult of the family. As now understood, it contains species of uniform habit, with similar *fls.* and frs., while a number of species of very different habit have been referred elsewhere. Even as here treated, more than half of the species are anomalous. Until the *fls.* and frs. have been studied, it seems best to leave them in *Cereus*. The species are all from S. Amer.

Only a few species of true *Cereus* are grown in this country, and most of these are grown under glass. The flowers do not compare in size and attractiveness with those of the so-called night-blooming *Cereus*, which is described elsewhere under the genus *Selenicereus*. Several of the species have cristate and other abnormal forms which make them desirable to certain growers. *C. lepidotus* is a rather common cultivated species in certain of the West India Islands, where it grows to considerable height, and several of the species are grown in Europe along the Riviera, where they reach great size. With us, however, they do not grow very rapidly. They are easily propagated from seed or by cuttings. See *Succulents*.

The species treated in the first edition of this work that are not here given may be looked for under the following genera: *Acanthocereus*, *Aporocactus*, *Bergocactus*, *Carnegiea*, *Cleistocactus*, *Escontria*, *Harrisia*, *Heliocereus*, *Hylocereus*, *Lemaireocereus*, *Lophocereus*, *Myrtillocactus*, *Oreocereus*, *Pachycereus*, *Rathbunia*, and *Selenicereus*.

A. *Sts. erect, 2 in. or more diam.*

B. *New growth green, not pruinose or covered with a bloom.*

C. *Ribs of st. 10 or more.*

1. *Pasacana*, Web. A gigantic species, reaching a height of 20–30 ft., and sometimes even 50 ft., and a diam. of 12–16 in.; sparingly branching above; in new growth dark green, becoming gray or bluish: ribs 15–20, or in young plants only 9–10: areoles  $\frac{3}{8}$ – $\frac{3}{4}$  in. apart, large, brown, becoming yellowish and finally gray: radial spines 10–13, about 1 in. long, the under one or lowest pair straight, subulate, the others curved; centrals mostly 4, the under and upper ones the longest, reaching 2 in. length, straight or curved; the young spines are clear brown, often with alternating rings of light and dark tissue, later gray, bulbous at the base: fls. from the lateral areoles about 6 in. long, white. Argentina.—This is the giant cereus of the Argentine desert, as *Carnegiea gigantea* is of the certain N. American deserts. It is not a true *Cereus*.

2. *candicans*, Gillies. *Sts.* upright, low, cylindrical, bright green,  $2\frac{1}{2}$ –3 ft. high by 6–8 in. diam.; freely branching from the base: ribs 10, obtuse-angled: areoles  $\frac{5}{8}$ – $\frac{3}{4}$  in. apart, large, depressed, white, becoming gray: radial spines 11–14, spreading, at first thin, needle-form, later stronger, stiff, straight, about  $\frac{3}{4}$  in. long; central solitary or later 3–4 additional ones appearing above, stronger, reaching a length of  $1\frac{1}{4}$  in., sometimes somewhat curved; all the spines horn-colored, with tips and bases brown, later becoming gray: fls. long, funnell-form, resembling those of *Echinopsis*, 10 in. long by 6 in. diam.: fr. spherical to ellipsoidal, about 3 in. diam., red, somewhat spiny, flesh white. Argentina.—Not a true *Cereus*.

3. *lamprochlorus*, Lem. Related to *C. candicans*, of a taller growth, cylindrical, 3–6½ ft. high by about 3 in. diam., at first simple, but later branching at the base; in new growth bright green, later dirty green: ribs 10–11 or occasionally 15; conspicuously crenate, later blunt and but little crenate: areoles medium size, about  $\frac{1}{2}$  in. apart, yellowish white, becoming gray; above each areole 2 radiating grooves form a letter V: radial spines 11–14, spreading, straight, sharp-pointed, about  $\frac{3}{8}$  in. long, clear to dark amber-color; some are strong and rigid, while others are bristle-form; centrals mostly 4, somewhat longer, stronger and deeper colored, with brown bases, becoming dark gray, about  $\frac{3}{4}$  in. long: fls. from the previous year's growth, about 8–10 in. long by 6 in. diam., white. Argentina.—Not a true *Cereus*.

4. *Spachianus*, Lem. *Sts.* upright, at first simple, later profusely branching at the base, branches ascending parallel with the main st., 2–3 ft. high by 2–2½ in. diam., columnar: ribs 10–15, obtuse, rounded: areoles about  $\frac{1}{2}$  in. apart, large, covered with curly yellow wool, becoming white: radial spines 8–10,  $\frac{1}{4}$ – $\frac{3}{8}$  in. long, spreading, stiff, sharp, amber-yellow to brown; central solitary, stronger and longer; all the spines later becoming gray: fls. about 8 in. long by about 6 in. diam., white. Argentina.—Not a true *Cereus*.

5. *chiloensis*, DC. (*Cactus chiloensis*, Colla). *Sts.* strong, upright, simple (so far as known), about  $2\frac{1}{2}$  ft. high by  $3\frac{1}{2}$ –5 in. diam., cylindrical to somewhat clavate, bright, clear green: ribs 10–12, obtuse: areoles about an inch apart, large: radial spines straight, sharp, rigid, at first 9, but later 4 others appear above these; centrals mostly 4, seldom but a single one, bulbous at the base; the young spines are brown honey-yellow, becoming white, with dark tips, and finally gray: fls. from the upper lateral areoles about 6 in. long, white, resembling those of *Echinopsis*. Chile.—This is not a true *Cereus*.

cc. *Ribs of st. 7–9.*

6. *euphorbioides*, Haw. (*C. Olfersii*, Otto). Columnar, simple, 10–16 ft. high by about  $4\frac{1}{2}$  in. diam., in young growth pale green, changing with age to gray-green: ribs 8–10, separated by sharp grooves, sharp-angled, becoming flattened in older growth: areoles about  $\frac{3}{8}$  in. apart, small, white to gray: radial spines mostly 6, the under one the longest, reaching a length of over an inch, strong, yellowish brown to black, the upper ones shorter and bristle-form; central solitary, in young plants twice as long as the radials; all the spines finally become gray: fls. from near the crown,  $3\frac{1}{2}$ –4 in. long, beautiful flesh-red, remaining open for 24 hours. Brazil. R.H. 1885, p. 279.—This plant is insufficiently understood; it may be a form of some species of *Cephalocereus*.

884. *Cereus peruvianus*. A flower that is just closing; from a plant flowered in Washington, D. C., in 1904. (×  $\frac{3}{8}$ )

7. *Sepium*, DC. (*C. Roezlii*, Haage.) Upright, columnar, about 3 in. diam.: ribs 9, separated by sharp, somewhat serpentine grooves, obtuse, above the areoles, 2 radiating, slightly curved grooves form a letter V: areoles  $\frac{1}{2}$ – $\frac{3}{4}$  in. apart, comparatively large, slightly sunken, yellowish, later gray: radial spines 9–12, radiate, nearly  $\frac{1}{2}$  in. long, straight, subulate, tolerably sharp, slightly thickened at the base, clear brown, with darker stripes; central solitary, reaching  $1\frac{1}{2}$  in. long, straight, porrect, later somewhat deflexed, clear brown; later all the spines become gray. Andes of Ecuador.—Near *Borzacactus*; needs further critical study.

8. *tetracanthus*, Labour. Upright, arborescent or bushy, freely branching, young branches leaf-green, later gray-green: ribs 8–9, low, arched: areoles medium-sized, slightly sunken, about  $\frac{1}{2}$  in. apart, white to gray: radials 5, later 7, radiate, about  $\frac{3}{8}$  in. long, straight, subulate, stout, white, with brown tips and bases, later ashy gray; centrals 1–3, under one largest and porrect, when young yellow and translucent, later gray: fls. resemble those of *C. tortuosus*. Bolivia.—This species should doubtless be referred to *Eriocereus*.

ccc. *Ribs of st. 3-6.*

9. *Hankeanus*, Web. Upright, robust, not branching (so far as known), young growth bright green, later dark green, about 2 in. diam.: ribs 4-5, compressed, about  $1\frac{1}{4}$  in. high, conspicuously crenate, with an S-form line passing from each areole toward the center of the st.: areoles,  $\frac{3}{8}$ -1 in. apart, horizontally elliptical to heart-shaped, brown, becoming gray below and yellow above: radial spines 3, needle-like, stout, sharp-pointed, about  $\frac{3}{8}$  in. long, amber-colored when young, turning to brown; central solitary, straight, porrect,  $\frac{1}{2}$  in. long, stronger than the radials, horn-colored; later all the spines become gray: fls. 4-5 in. long, white. S. Amer.

BB. *New growth blue, white- or gray-pruinose.*

c. *Ribs of st. comparatively broad and low: st. more or less triangular in cross-section.*

10. *macrogonus*, Otto. Arborescent, sparsely branching, reaching a height of 20 ft. (in cult., 6 ft. high by 3-5 in. diam.), branches columnar: ribs mostly 7, seldom 8-9, thick, slightly undulate, obtuse and with convex faces, about 1 in. high. bluish green, frequently having a depressed line near the areole: areoles about  $\frac{1}{2}$  in. apart, large, gray: radial spines 6-9, radiate or spreading, strong, subulate,  $\frac{3}{4}$  in. long, horn-color, later black; central spines 1-3, somewhat stronger and longer than the radials, more or less conspicuously porrect: fls. from the lateral areoles near the end of the branches,  $2\frac{1}{2}$ -3 in. long, tolerably fleshy, white: fr. depressed-globose, 2 in. diam. by little more than 1 in. long. Brazil.

cc. *Ribs of st. strongly compressed laterally.*

11. *peruvianus*, Haw. (*C. monoclonos*, DC.). HEDGE CACTUS. Fig. 884. Tall, 30-50 ft., branching freely toward the base, columnar, 4-8 in. diam., new growth dark green and glaucous, becoming a dull green with age, and, in old sts. becoming corky: ribs 5-8, compressed: areoles  $\frac{1}{2}$ -1 in. apart, in new growth covered with conspicuous, curly brown wool, becoming gray: radial spines about 6-7, about  $\frac{3}{8}$ - $\frac{1}{2}$  in. long; central solitary, reaching a length of  $2\frac{1}{2}$  in.; the number of spines increases with age to as many as 20, all are rigid, brown: fls. abundant, from the lower part of the st., white, nocturnal, 6-7 in. long by 5 in. diam. S. Amer. G.C. III. 24:175 (var. *monstrosus*).

Var. *Alacriportanus*, K. Schum. (*C. Alacriportanus*, Mart.). Of somewhat weaker growth, low, and less conspicuously pruinose in the new growth, which is consequently nearly clear green. S. Brazil.

12. *Jamacaru*, Salm-Dyck (*C. validus*, Haw.). Sts. upright, robust, rigid, 12-16 ft. high by as much as 6 in. diam.; young growth azure-blue, turning dark green with age, glaucous: ribs 4-6, thin, compressed, crenate: radial spines 5-7, stiff, needle-like, clear yellow with brown points, or brown and finally black, about  $\frac{1}{2}$ - $\frac{3}{4}$  in. long; centrals 2-4, somewhat stronger, porrect,  $\frac{3}{4}$ -3 in. long: fls. large, 10 in. long by 8 in. diam., white, nocturnal. Brazil, Venezuela.

13. *chalybæus*, Otto. Sts. upright, branching above, arborescent, azure-blue and pruinose, later dark green,  $1\frac{1}{2}$ -4 in. diam.: ribs 6, in young growth very much compressed, later depressed till the st. is nearly cylindrical: areoles about  $\frac{3}{8}$  in. apart, dark gray-brown: radial spines mostly 7, about  $\frac{1}{2}$  in. long; centrals 3-4, similar but somewhat stronger and a little longer; all the spines are pointed, stiff, when young are black, later brown to gray with black tips, bulbous at the base: fls. very similar to those of *C. cærulescens*. Argentina.

AA. *Sts. erect, less than 2 in. diam.*

B. *Ribs of st. 10 or more.*

14. *isogonus*, K. Schum. St. upright, columnar, about 1- $1\frac{1}{4}$  in. diam., in young growth light green to yellow-green, later darker: ribs 15-16: areoles approximate,

white, turning gray: radial spines as many as 20, spreading, at first clear or dark yellow, becoming white, and finally gray, bristle form, flexible, about  $\frac{3}{8}$  in. long; centrals 6-8; two of these are somewhat stronger and stiffer, about  $\frac{3}{4}$  in. long, one directed upward and one downward, yellowish brown to dark honey-color; later gray, as in the radials. S. Amer.

15. *splendens*, Salm-Dyck. Columnar, slender, short, rigid, more or less branching from the base, reaching a height of about 2 ft. and about 1- $1\frac{1}{2}$  in. diam., light to yellowish green: ribs about 10-12, rounded: areoles prominent, about  $\frac{1}{4}$  in. apart, tawny, becoming white, tomentose: radial spines 8-12, radiating, yellow and light brown, becoming gray; centrals 1-3, scarcely larger than the radial, yellowish to white; all the spines slender, bristle form, about  $\frac{1}{4}$ - $\frac{3}{4}$  in. long. —*C. Cavendishii* has been referred to this species, but with some question.

BB. *Ribs of st. 3-10.*

16. *platygonus*, Otto. At first upright, later somewhat reclining, branching, at the base about 1 in. diam., tapering in the new growth: ribs 8, low, arched: areoles about  $\frac{1}{4}$  in. apart, very small, yellow, becoming gray, subtended by a small 3-angled bract: radial spines 12-15, spreading, bristle form, little more than  $\frac{1}{2}$  in. long; central solitary, slightly longer and stronger; all the spines at first yellow-brown, changing to white or gray with age.

17. *cærulescens*, Salm-Dyck (*C. Lándbeckii*, Phil.). Arborescent or shrubby, 3-5 ft. high: sts. 1- $1\frac{1}{2}$  in. diam.: ribs usually 8, obtuse: areoles approximate, white bud soon becoming black: spines rigid; radials 9-12,  $\frac{1}{4}$ - $\frac{1}{2}$  in. long, black; centrals 4,  $\frac{3}{4}$  in. long, stronger, black or white: fls. from the side of the st., slightly curved, 6-8 in. long by 6 in. diam., tube bronze-green, corolla white or occasionally rose-pink: frs. ellipsoidal, pointed at both ends, about 3 in. long and half that in diam., bright red, with blue glaucous covering. Argentina. B.M. 3922.

18. *Bridgesii*, Salm-Dyck. Upright, tall, columnar, simple or later branching at the base, bright green when young, becoming blue to gray-green,  $1\frac{1}{2}$ -2 in. diam.: ribs 5-7, very broad and low: areoles  $\frac{1}{2}$ - $\frac{3}{4}$  in. apart, yellowish to gray: spines 3-5, radiating, the under one, or seldom the upper one, the longest,  $1\frac{1}{2}$  in. long, stiff, sharp, straight, dark honey-yellow, with brown tips, becoming gray with age. Bolivia.

Var. *lageniformis*, K. Schum. (*C. lageniformis*, Forst.). Spines more numerous, somewhat longer.

19. *azureus*, Parm. (*C. Seidelii*, Lehm.). St. upright, tall, slender, columnar, branching from the base, in the young, fresh bluish green, later dark green with gray, glaucous covering, about 3-4 ft. high and about 1 in. diam.: ribs 5-7, rounded, enlarged at the areole: areoles about  $\frac{3}{4}$ -1 ft. apart, elevated, large, abundantly woolly when young: spines 8-18, nearly alike, about  $\frac{1}{8}$ - $\frac{3}{8}$  in. long, stiff, slender, needle-form to bristle-like, black; the 2-4 central ones somewhat longer: fls. 8-12 in. long, obliquely attached to the st., slightly curved, white. Brazil.

20. *cæsius*, Otto. Upright, columnar, branching at the base, somewhat tapering above; in new growth, beautiful light blue, pruinose; later, light green to slightly bluish, about  $1\frac{1}{2}$  in. diam.: ribs 5-6, separated by sharp grooves, about  $\frac{1}{2}$  in. high, compressed, faintly crenate, becoming depressed in older growth: areoles about  $\frac{3}{8}$  in. apart, small, yellow at first, later becoming white and finally gray: radial spines 8-10, sometimes more appear later; radiate, light amber-color, brown at the base, the lower pair the longest, mostly about  $\frac{1}{2}$  in. long; centrals 4-7, like the radials but usually somewhat stronger, longer and darker; all the spines thin, needle-form, flexible, sharp; later, light, horn-color, finally gray. S. Amer.(?).

AAA. *Sts. weak, clambering over rocks or other plants, and without aerial roots.*

21. *Bónplandii*, Parm. *Sts.* at first upright, later clambering over rocks and bushes, about 1-1½ in. diam., branching and spreading, in new growth commonly of a bluish or purplish green, later gray-green: ribs 4-6, sharp, compressed, crenate, separated by broad, concave faces; later the ribs become much depressed, so that the st. is sometimes nearly cylindrical; the ribs commonly run spirally around the axis of the st.: areoles ½-1½ in. apart, at first considerably depressed, later shallower, white, becoming gray: radial spines 4-6 (later 1-4 more appear), straight, spreading, the largest about ½-1 in., stout, subulate, pointed, the under one needle-form and shorter; central solitary, straight, stronger, 1 in. long, deflexed or porrect; the stronger spines are white, with tips and bases brown, when young beautiful ruby-red, later all are gray, with black tips and bulbous bases: fls. from the lateral areoles about 10 in. long, white, nocturnal: fr. nearly spherical, about 2 in. diam., mammate, dark carmine-red. Paraguay, Brazil, and Argentina.

22. *tortuosus*, Forbes (*C. atropurpureus*, Haage). *Sts.* slender, weak, at first upright, but later reflexed, reaching a length of 3-4 ft., and 1-1½ in. diam.: ribs commonly 7, sometimes but 5, rounded, low, separated by regular serpentine grooves: areoles about 1 in. apart, large: radial spines 5-8, about ⅜-1 in. long; centrals 1-4, about ¾-1½ in. long; all the spines slender, rigid, red-brown when young, becoming ashy with age: fls. from the previous year's growth, about 6 in. long, trumpet-shaped, tube olive-green and spiny, in the axils of the reddish green scales; outer petals pale green, tinted with brown; inner petals clear white: fr. spherical, brilliant red without and white within, mammate, bearing a few spines on the summits of the lower mammas. Argentina.

23. *Mártinii*, Labour (*C. monacanthus*, Hort.). At first upright, later requiring a support; freely branching from the base, branches long, reaching nearly 5 ft., ¾-1 in. diam., slightly tapering, dark green: ribs 5-6, separated by serpentine grooves, contracted between the areoles; sometimes the ribs are not evident, when the st. is cylindrical: areoles about 1-1½ in. apart, white: radial spines 5-7, reddish, short, bristle-form, with bulbous bases or short conical, usually about ⅓ in. long; central solitary, mostly deflexed, ½-1 in. long (in young growth, frequently not longer than the radial), subulate, robust, light brown or white, with bases and tips black: fls. from the older growth sts., 8-9 in. long, clear white, nocturnal: fr. spherical (very

similar to *C. tortuosus*), pointed, dark carmine-red, about 2 in. diam., mammate, a few spines on the mammas, toward the base of the fr. Argentina. R.H. 1860, pp. 658-9.—This species is commonly sold under the name of *C. platygonus*.

24. *Pitajaya*, DC. (*C. pernambucensis* [fernambucensis], Lem. *C. formosus*, Salm-Dyck. *C. variabilis*, Pfeiff.). By recent authorities referred to the genus *Acanthocereus*. *St.* at first simple, later branching, in young growth light green, turning grayish green with age, pointed, ¾-1¼ in. diam.: ribs 3-5, commonly 4: areoles about 1 in. apart, large, bearing a conspicuous amount of curly hair, about ½ in. long, in new growth: radial spines 5-7 and a solitary central one, uniform, about ⅜-⅝ in. long, amber color to brown and finally gray: fls. from the older growth, large, about 8 in. long, slightly curved, white, nocturnal. Uruguay, Brazil, Colombia. B.M. 4084.—*C. grandis*, Haw., according to Weber, is but a larger form of this species.

AAAA. *Sts. more or less climbing by means of aerial roots.*

25. *Martiàus*, Zucc. Of bushy growth, branching, reaching a height of 3 ft. and more: branches slender, provided here and there with aerial roots, cylindrical, about ¾ in. diam.: ribs commonly 8, straight, separated by sharp grooves, very low: areoles ¼-¾ in. apart, small, white: radial spines 6-10, bristle-form, spreading, clear honey-yellow, at base brownish, later whitish and becoming gray, about ¼ in. long; centrals 3-4, similar, only somewhat stouter and darker: fls. usually abundant, straight or slightly S-shaped, 4-5 in. long, scarlet-red: fr. spherical, reddish green, covered with bristles. S. Mex. B.M. 3768.

*C. ventimiglia*, Vaupel (*Borziacactus ventimiglia*, Riccob.). *St.* slender, 8- or 9-ribbed: spines in clusters of 8-10, spreading; perianth-tube elongated, opening into a large throat; petals red-violet: fr. small, globular, bearing few bracts. This species apparently does not belong to the true *Cereus*, and is probably much nearer *Cleistocactus*, as suggested in the Kew Bulletin. It was described from plants flowering in the Botanical Garden at Palermo, Italy, and which are said to have come from Ecuador. *Borziacactus* is a recently described genus, not yet intro. into American collections.

*C. alamosensis*=*Rathbunia alamosensis*.—*C. Baummannii*=*Cleistocactus Baummannii*.—*C. Berlandieri*=*Echinocereus*.—*C. caryophyllus*=*Echinocereus*.—*C. candelabrum*=*Lemaireocereus Weberi*.—*C. J. N. ROSE.†

885 *Cerinthe retorte*. (×¼)

**CERINTHE** (Greek, *keros*, wax; *anthos*, flower: the ancients thought that the bees visited the flowers for wax). *Boraginaceæ*. Annual or perennial herbs from Europe and Asia Minor, with alternate glaucous leaves and showy purple bracts.

Calyx deeply divided, the tubular corolla with 5 very small reflexed lobes, usually differently colored from

XXV. Celery.—The cultivation under field conditions, at the hilling-up or banking stage.

the tube.—About 6 species. The best species is *C. retorta*, which has a unique appearance in the garden, and is strongly recommended for more general cult. It is a hardy annual of easy cult.

**retorta**, Sibth. & Smith. HONEYWORT. Fig. 885. Height 1½–2 ft.: lvs. glaucous, often spotted white or red; lower lvs. obovate-spatulate; upper lvs. amplexicaul, with 2 round ears, on the flowering branches gradually becoming smaller and closer together until they pass into purple bracts, which form the chief attractive feature of the plant: fls. when full-blown protruded beyond the bracts; corolla tubular-club-shaped, yellow, tipped purple, with 5 small, spreading teeth: frs. smooth but not shining. Greece. B.M. 5264. Gn. 41:212. For a garden review of the other honeyworts, see Gn. 41, p. 212.

*C. major*, Linn. A showy annual 6–15 in. high: lvs. clasping the st., very rough and ciliate: fls. with showy bracts; the corolla yellow below, purplish at the top: fr. smooth, shining and brown-spotted. Medit. region. B.M. 333.

WILHELM MILLER.  
N. TAYLOR.†

**CEROPEGIA** (Greek, *wax* and *fountain*, the flowers having a waxy look). *Asclepiadaceæ*. Greenhouse vines of Africa and Asia.

Stems fleshy, erect and twining among the other plants in nature, or pendulous: lvs. opposite, sometimes in the S. African species wanting: fls. medium-sized, the corolla more or less inflated at the base, straight or curved; corona something as in our common milkweeds, double.—A genus of 100 species, a dozen of which are known in Old World collections but only the following in Amer. Many of them have tuberous roots, and need a season of rest and dryness. May be grown in a compost of loam, leaf-mold or peat, and sand. Temperate house is the best for the two following. Prop. by cuttings in spring over bottom heat. Odd and handsome.

**Woodii**, Schlecht. With many slender prostrate or trailing sts.: lvs. fleshy, about 1½ in. long, almost rotund: fls. in pairs, axillary on stalks, 3–7 in. long; corolla slightly curved, about ¾ in. long, pink or with dark lines below, the upper part sometimes purplish. Natal. G.C. III. 22:357; 37:244 (desc.). B.M. 7704.

**Sándersonii**, Decne. St. twining, fleshy and thick: lvs. about 1¾ in. long, ovate-lanceolate: fls. cymose, 3–4 at a node, the greenish white corolla about 1½–2 in. long, curved and with an obvious inflation at the base. Natal. B.M. 5792. G.C. III. 40:383. R.H. 1901, p. 111.

*C. barbertonensis*, N. E. Br. Lvs. somewhat variegated with pale green along the veins: fls. similar to *C. Woodii*. Transvaal.—*C. Brönnii*, Ledger. Corolla-tube pale green with dark blotches; lobes greenish with a zone of white and dark purple in the middle. Uganda.—*C. discreta*, N. E. Br. Tuberous: tube whitish, dark-veined; lobes pale yellow at base, purple-green at apex. Madras.—*C. fusca*, C. Bolle. Many succulent sts.: corolla dull reddish brown; corona light yellow. Canary Is. B.M. 8066.—*C. gemmifera*, K. Schum. A tall climbing species: fls. solitary. W. Trop. Afr.—*C. Lugardæ*, N. E. Br. Lvs. thin, 1–2 in. long; tube 1 in. long, abruptly curved immediately above inflated base, dilated at apex into funnel-shaped mouth. Bechuanaland. G.C. III. 30:302 (desc.).—*C. Rëndallii*, N. E. Br. A small species with fl. having an umbrella-like canopy surmounting the corolla: twining. Transvaal.—*C. similis*, N. E. Br. In cult. as *C. Thwaitesii*. Corolla-lobes white or pale green at base, ciliate. G.C. III. 40:384. *C. Thornecroftii*, N. Br. Sts. twining: cymes axillary, many-fld.; corolla white, with purple blotches. Transvaal. B.M. 8458.

N. TAYLOR.

**CEROPTERIS** (Greek, *wax fern*). *Polypodiaceæ*. Hot-house ferns of rather small size, interesting for the powdery covering on the leaves.

A rather small group somewhat related to *Pteris*, characterized most conspicuously by having the under surface of the lvs. covered with a colored powder, often silver, white or bright yellow (so-called silver and gold ferns). The sporangia are borne in indefinite lines and are unprotected by any indusium. The species of *Ceropteris* have in the past been classified under the generic name *Gymnogramma*, but fern students

are now generally agreed in separating it as a distinct genus.

#### INDEX.

argentea, 4.  
argyrophylla, 7.  
calomelanos, 6.  
chrysophylla, 2, 6.  
decomposita, 5.

gigantea, 2.  
Laucheana, 2.  
magnifica, 6.  
peruviana, 7.  
pulchella, 9.

sulphurea, 3.  
tartarea, 8.  
triangularis, 1.  
viscosa, 1.  
Wettenhalliana, 9.

A. Powder commonly yellow: lvs. about as broad as long.

1. **triangularis**, Underw. (*Gymnogramma triangularis*, Kaulf.). Fig. 886. Lf.-blades 2–5 in. wide and long, on stalks 6–12 in. long, dark green above, below deep golden yellow, or occasionally white; lower pinnae much larger than the others, deltoid; the upper lanceolate. Calif. to Brit. Col. Gn. 48, p. 444.—A white-powdered variety with a viscous upper surface and coarser cuttings (var. **viscosa**, D. C. Eaton) is found in S. Calif.

886. *Ceropteris triangularis*.  
(×½)

AA. Powder yellow: lvs. lanceolate, several times as long as broad.

B. Lvs. scarcely more than bipinnate.

2. **chrysophylla**, Link (*Gymnogramma chrysophylla*, Kaulf.). Lvs. 12–18 in. long, with blackish stalks and rachises, the segms. slightly pinnatifid at the base: powder golden yellow. W. Indies to Brazil. R.H. 1856:201. G.C. III. 23:373.—Often considered a var. of *C. calomelanos*. Var. **Laucheana** (*Gymnogramma Laucheana*, Hort.), has triangular lvs. except in its sub-variety *gigantea*. Gn. 48, p. 437.

BB. Lvs. tripinnatifid to quadripinnate.

3. **sulphurea**, Fée (*Gymnogramma sulphurea*, Desv.). Lf.-blades 6–12 in. long on chestnut-brown stalks, the pinnae long, tapering, less than 1½ in. wide at base, the pinnules compact, with 3–7 divisions: powder sulfur-yellow. W. Indies.

4. **argentea**, Kuhn (*Gymnogramma aurea*, Desv.). Lvs. 6–12 in. long, 7–10 in. wide, deltoid; pinnae deltoid, 2–3 in. wide at base, the ultimate divisions cuneate. Madagascar.—By some this is referred to *Gymnogramma argentea*, Mett., a similar fern with white powder.

5. **decomposita**, Baker (known only under the name *Gymnogramma decomposita*, belongs in *Ceropteris*). Lvs. 1½ ft. long, 1 ft. broad, deltoid, quadripinnate or even 5-pinnate; pinnae close, lanceolate, with the ultimate divisions linear and 1-nerved: powder rather scanty. Andes. F.R. 2:25. G.C. III. 11:365. F. 1874, p. 148.

AAA. Powder white: lvs. lanceolate.

B. Segms. acute.

6. **calomelanos**, Underw. (*Gymnogramma calomelanos*, Kaulf.). Fig. 887. Stalks and rachises nearly black: lvs. 1–3 ft. long, with lanceolate pinnae; segms. often with a large lobe-like auricle at the upper side of the base. W. Indies to Brazil. A.G. 14:303.—The most variable species of the genus. *C. magnifica*, Hort., is probably one of the many garden varieties. Var. **chrysophylla**, is here considered a distinct species. (See No. 2.)

BB. Segms. obtuse, rounded.

7. **peruviana**, Link (*Gymnogramma peruviana*, Desv.). Lvs. 6–12 in. long, 3–5 in. wide, with dark

chestnut-brown stalks; pinnæ somewhat regularly pinnatifid on both sides below. Mex. to Peru. By some considered a var. of *G. calomelanos*. Var. *argyrophylla* (*G. argyrophylla*, Hort.) is silvery on both sides.

887. *Ceropteris calomelanos*. ( $\times \frac{3}{10}$ )

in. long, 4 in. wide, the lower pinnæ much the largest; pinnules imbricated; texture rather thin. Venezuela. Var. *Wettenhalliana*, Moore (*G. Wettenhalliana*, Hort.), is a garden variety, with pale sulfur-yellow powder.

L. M. UNDERWOOD.

R. C. BENEDICT.†

**CERÓXYLON** (Greek, *wax and wood*, i.e., wax-tree). *Palmaceæ*. WAX-PALM. Tall palms with ringed stems and pinnate leaves.

Spineless, the trunk covered with wax: lvs. clustered at the top, 15-20 ft. long when full grown, equally pinnate; pinnæ long, rigid, sword-shaped, bases recurved and tips pointed, dark green above and glaucous beneath, the petiole very short and sheathed; fls. mostly unisexual, on spikes nearly or quite covered by the simple spathe; fl.-parts 3; stamens 9-15: seed as large as a hazel-nut, round, bony, inclosed in a soft or crumbling integument.—Perhaps 4 or 5 species in the Andes of Colombia and Ecuador.

*andicolum*, HBK. (*Iriartea andicola*, Spreng. *I. Klopstockia*, Hort. *Klopstockia cerifera*, Karst. *Beethovénia cerifera*, Engl.). The celebrated wax-palm of the Andes, and a good greenhouse subject: said to reach nearly 200 ft.: trunk slender, swollen at the middle: lvs. 6-8 in., the crown, the under sides silvery-scurfy.—The waxy covering of the trunk gives it a marble-like and columnar appearance. The wax, used as an ingredient in the making of candles, is an article of commerce. It is said that *Diplothemium caudescens* (*Ceroxylon niveum*, Hort.) is sometimes sold for the wax-palm by plant dealers. *C. ferrugineum*, Regel, is probably referable to *Iriartea*. It appears not to be in the trade. *C. andicolum* is a free grower under cult., and is a very ornamental subject. It thrives in a warm moist house, and the seeds also germinate well under similar conditions.

L. H. B.

**CESPEDESIA** (named in honor of Juan Maria Cespedes, priest of Bogota). *Ochnaceæ*. Tall handsome glabrous trees, sometimes grown in the juvenile state in hothouses.

Leaves alternate, large, coriaceous, mostly obovate to lanceolate and narrowed at base, entire, or crenate: fls. yellow, showy, in large terminal bractless panicles; sepals 5, small and deciduous; petals 5; stamens 10 to

many: fr. a 5-valved caps.; seeds very small.—Species probably 6-10, in S. Amer. and Panama.

*discolor*, Buil. Lvs. large, lanceolate, drooping, handsomely colored on young growths in bright brown or tan tinted with rose and veined with yellow. Gn. W. 20:618.—A comparatively recent intro. to cult. in England.

L. H. B.

**CÉSTRUM** (old Greek name). Incl. *Habrothamnus*. *Solanaceæ*. Greenhouse shrubs (or low trees) some of them with a climbing habit, and grown in the open in southern California and elsewhere South.

Leaves alternate and entire, usually rather narrow: fls. tubular, in axillary or terminal cymes, red, yellow, greenish or white, often very fragrant; corolla salver-shaped or somewhat trumpet-shaped, the long tube often enlarged at the throat, 5-lobed, exceeding the bell-shaped or tubular 5-toothed calyx; stamens mostly 5, all perfect, attached in the tube: fr. a scarcely succulent mostly reddish or blackish berry, derived from a 2-celled stipitate ovary and seeds few or reduced to 1.—Probably 150 species, in Trop. and Subtrop. Amer. They are much grown in warm countries, where they bloom continuously. For a monograph of the West Indian species (about 20) see O. E. Schulz, in *Urban, Symbolæ, Antillanæ*, vi, p. 249-279 (1909-1910).

Cestrum are among the most useful of bright-flowering shrubby greenhouse plants, and they may be grown either as pot-plants, or planted against the back wall or supports of a greenhouse, where, if given a light position, they will produce an abundance of flowers from January to April. The Mexican species will do well in a winter temperature of 45° to 50°, but the species from Central America require stove temperature. They are propagated by cuttings taken in February or early in March and inserted in sand in a warm temperature, keeping them somewhat close until rooted, when they should be potted in a light soil, after which they may be grown in pots, shifting on as often as required, or planted out in the open ground toward the end of May in a sunny position, where, if kept pinched back to induce a bushy growth and attention is paid to watering, they will make fine plants by the first of September. They should then be lifted and potted in a light rich soil and kept close and shaded for a few days, and then transferred to their winter quarters. After flowering, the plants should be given a rest for a month or six weeks, gradually reducing the supply of water to induce the leaves and wood to ripen, after which they should be cut well back, the old soil shaken

888. *Cestrum elegans*. ( $\times \frac{1}{2}$ )

off, and the roots trimmed back, and then either potted again or planted out for the summer. While in the greenhouse, cestrum are very subject to the attacks of insects, especially the mealy-bug. (E. J. Canning.)

A. Fls. red.

*élegans*, Schlecht. (*Habrothamnus elegans*, Brongn.). Fig. 888. Tall and slender, half-climbing, the branches pubescent; lvs. ovate, lanceolate, long-acuminate, of medium size, pubescent beneath; fls. red-purple, swollen

near the top of the tube, in loose clusters which nod at the ends of the branches, the lobes ciliate. Mex. F.S. 2:82.—One of the old-fashioned greenhouse shrubs, blooming almost continuously. There is a form with variegated lvs. Var. *Smithii* (*C. Smithii*, Hort. Bull.) has beautiful blush-rose fls., profusely produced through summer and autumn. Gn. 62, p. 242, desc.

*fasciculatum*, Miers. Spring bloomer, with larger fls. than those of *C. elegans*, and more compact, nearly globular fl.-clusters, the cluster subtended by small lvs. as if an involucre: lvs. ovate. Mex. B.M. 4183 (and probably the *C. elegans*, B.M. 5659.).

*Néwelli*, Nichols. (*H. Néwelli*, Veitch). Fls. bright crimson, larger and more brilliant than those of *C. elegans* and *C. fasciculatum*. Gn. 34:106.—A free-growing plant, originating from seed by Mr. Newell, Downham Market, England. Evidently an offshoot of one of the preceding species.

AA. Fls. orange or yellow.

*aurantiacum*, Lindl. Of half-climbing habit: lvs. oval to ovate, more or less undulate: fls. sessile in a panicle, orange-yellow. Guatemala. R.H. 1858, p. 238.

*Pseudo-Quina*, Mart. Glabrous: lvs. membranaceous, ovate, obtusish or acute, narrowed at base: peduncles articulated at apex, axillary or in congested 4-8-fld. terminal racemes; corolla slender with acute lobes, much longer than the toothed calyx. Brazil.—Said to have marked medicinal qualities. Differs from *C. Parqui* in having glabrous filaments and pedicellate fls.

AAA. Fls. white, greenish, or cream-yellow.

*Parqui*, L'Her. Shrub, half-hardy, nearly glabrous: lvs. lanceolate to oblong, petioled, short, acuminate: fls. sessile, long, tubular, with a wide-spreading limb, in an open panicle, greenish yellow, very fragrant at night. Chile. B.M. 1770. Adventive in Fla.

*diurnum*, Linn. Quick-growing evergreen shrub, minutely pubescent or glabrous: lvs. oblong and short-acute, thickish and glabrous, shining above: fls. white, very sweet-scented by day, in axillary long-peduncled spikes; corolla-lobes roundish and reflexed: berry nearly globular; filaments erect and not denticulate. W. Indies.

*nocturnum*, Linn. NIGHT-BLOOMING JESSAMINE. Shrub, 4-12 ft.: branches brownish, very slender or flexuose, glabrous or nearly so: lvs. thinner, ovate or elliptic, prominently acuminate: fls. creamy-yellow, very fragrant by night; corolla-lobes ovate and blunt: berry ovoid-oblong; filaments denticulate. W. Indies.

*pūbens*, Griseb. Sts. and lvs. woolly-pubescent: fls. greenish, much like those of *C. nocturnum* and also fragrant at night. Argentina.

*laurifolium*, L'Her. Glabrous shrub: lvs. ovate to oblong, glossy, thick: fls. greenish yellow and changing color (sometimes described under cult as pure white), in erect heads, slightly fragrant; corolla-tube club-shaped, tapering gradually; corolla-lobes ovate-roundish and blunt; filaments toothed: berry ovoid. W. Indies, S. Amer.—Much planted in S. Calif. L. H. B.

**CHÆNÁCTIS** (Greek, *gaping ray*: the marginal corollas often ray-like). *Compositæ*. West American low herbs or undershrubs sometimes planted in the open for ornament.

Leaves alternate and mostly dissected: fls. yellow, white or flesh-colored on solitary peduncles or in loose cymes; florets of one kind, but the marginal ones with a more or less enlarged limb; involucre campanulate; receptacle flat and generally naked: pappus of toothed or entire scales (wanting in one species).—About 20 species, of which 3 have been intro. as border plants; but they are little known to gardeners. Of easy cult. Prop. by seeds or division.

A. *Pappus of entire or nearly entire persistent scales.*

*tenuifolia*, Nutt. Small, tufted annual, white-pubescent when young but becoming nearly or quite glabrous: 1 ft.: lvs. once or twice pinnately parted, the lobes linear or filiform: heads  $\frac{1}{2}$  in. high, lemon-yellow. S. Calif.

*Doùglasii*, Hook. & Arn. Perennial, 3-15 in. high, usually white-woolly when young: lvs. broad, bipinnately parted into short and crowded, obtuse lobes: heads  $\frac{1}{2}$ - $\frac{3}{4}$  in. high, white or whitish, usually in crowded, cymose clusters. Mont. south and west.—Variable. Var. *achilleæfolia*, A. Nelson, is often sold for the type. It has more finely divided lvs.

AA. *Pappus of fimbriate and deciduous scales, or even wanting.*

*artemisifolia*, Gray. Tufted annual, 1-2 ft., rusty pubescent and somewhat sticky on the under side of the lvs., glandular hairy above: lvs. twice or thrice pinnately parted into short-linear or oblong lobes: heads  $\frac{1}{2}$  in. high, the involucre viscid, the florets white or cream-color. S. Calif. N. TAYLOR.†

**CHÆNOMÈLES** (Greek *chainein*, to gape, to split, and *melea*, apple: the fruit was supposed by Thunberg to split into five valves). *Rosaceæ*, subfamily *Pomeæ*. Woody plants, grown chiefly for their handsome brightly colored flowers appearing early in spring; formerly commonly included in *Cydonia*.

Shrubs or small trees, sometimes spiny: lvs. subpersistent or deciduous, alternate, short-petioled, serrate: fls. solitary or fascicled, before or after the lvs., sometimes partly staminate; calyx-lobes entire or serrate; petals 5; stamens numerous; styles 5, connate at the base: fr. 5-celled, each cell with many seeds.—Four species in China and Japan. See page 3567.

These are ornamental plants, nearly hardy North except *C. sinensis*, which can be grown only South. *C. japonica* and *C. Maulei*, with handsome glossy foliage and abundant flowers in early spring, varying in all shades from pure white to deep scarlet, are highly decorative, and especially adapted for borders of shrubberies and for low ornamental hedges. The fruit of all species can be made into conserves. They thrive in almost any soil, but require sunny position to bloom abundantly. Propagated by seeds, usually stratified and sown in spring; also readily increased by root-cuttings made in fall or early spring, and rarer kinds or less vigorous-growing varieties are grafted in the greenhouse in early spring, on stock of the Japanese or common quince; they grow also from cuttings of half-ripened or nearly mature wood, under glass, and from layers.

A. *Fls. solitary, with reflexed serrate calyx-lobes, with or after the lvs.: stipules small. (Pseudocydonia.)*

*sinensis*, Koehne (*Pyrus sinensis*, Poir. *Cydonia sinensis*, Thoun. *Pseudocydonia sinensis*, Schneid.). Shrub or small tree: lvs. elliptic-ovate or elliptic-oblong, acute at both ends, sharply and finely serrate, villous beneath when young, 2-3 in. long: fls. light pink, about  $1\frac{1}{2}$  in. across: fr. dark yellow, oblong, 4-6 in. long. May. China. B.R. 11:905. R.H. 1889:228. A.G. 12:16. B.M. 7988.—The lvs. assume a scarlet fall coloring. Not hardy North of Philadelphia, except in favored localities. See also *Quince*.

AA. *Fls. in leafless clusters, nearly sessile, before or with the lvs.; calyx-lobes erect, entire: stipules large. (Chænomeles proper.)*

B. *Lvs. lanceolate or narrow-lanceolate, pubescent beneath while young.*

*cathayensis*, Schneid. (*Pyrus cathayensis*, Hemsl. *Cydonia cathayensis*, Hemsl.). Shrub, to 10 ft.: lvs. lanceolate or oblong-lanceolate, acute, finely and sharply serrate,  $2\frac{1}{2}$ - $4\frac{1}{2}$  in. long and  $\frac{1}{2}$ - $1\frac{1}{2}$  in. broad;

petioles about  $\frac{1}{2}$  in. long: fls. in clusters, red,  $1\frac{1}{2}$  in. across; styles pubescent at the base; petals distinctly clawed: fr. oblong-ovoid, 6–7 in. long, with a cavity at each end. Cent. China. H.I. 27:2657, 2658.—Closely related to the following species, but lvs. much narrower; less hardy.

BB. Lvs. elliptic-oblong to obovate, glabrous.

**japonica**, Lindl. (*Pyrus japonica*, Thunb. *Cydonia japonica*, Pers. *Chænomeles lagenaria*, Koidzumi). JAPAN QUINCE. JAPONICA. Fig. 889. Shrub, 3–6 ft., with spreading, spiny branches: lvs. ovate or oblong, acute, sharply serrate, glabrous, glossy above,  $1\frac{1}{2}$ –3 in. long: fls. in 2–6 fld. clusters, scarlet-red in the type,  $1\frac{1}{2}$ –2 in. across: fr. globular or ovoid,  $1\frac{1}{2}$ –2 in. high, yellowish green. March, April. China, Japan. R.B. 1:260. L.B.C. 16:1594. Gn. 33, p. 491; 40:126; 50, p. 106 (frs.); 71, p. 262 (habit). G.C. III. 34:434. B.H. 1:260 (frs.). R.H. 1876:330 (fr.). G.M. 35, suppl. Nov. 12. V. 4:38.—Many garden forms in all shades from white to deep scarlet, and also with double fls. Some of the best are the following: Var. **alba**, Lodd. Fls. white, blushed. L.B.C. 6:541. Var. **álbo-cincta**,

889. *Chænomeles japonica*, the Japan or flowering quince. ( $\times\frac{1}{2}$ )

Van Houtte. Fls. white with pink margin. F.S. 14:1403. Var. **álbo-rôsea**, Spaeth. Fls. white, partly pink. G.W. 7:113. Var. **atrosanguinea plèna**, Hort. Fls. deep scarlet, semi-double. Var. **Báltzii**, Spaeth. Fls. beautiful rosy pink, very floriferous. G.W. 7:113. Var. **cándida**, Hort. Fls. pure white. Var. **cardinalis**, Carr. Fls. large, deep scarlet. R.H. 1872:330, f. 1. Var. **ebúrnea**, Carr. Fls. pure white, rather small. R.H. 1872:330, f. 4. Var. **Gaujárdii**, Lem. Fls. salmon-orange. I.H. 7:260. Var. **grandiflora**, Rehd. (*C. álba grandiflora*, Carr.). Fls. nearly white, large. R. H. 1876:410. Gn. 13:144. Var. **Mállardii**, Carr. Fls. rose, bordered white. R.H. 1872:330, p. 2. I.H. 4:135. G.Z. 1:208. Var. **Moerlòdsei**, Versch. Fls. white, striped pink. I.H. 3:107. F.S. 5:510. Var. **Papeleùii**, Lem. Fls. yellow, bordered pink. I.H. 7:260. Var. **péndula**, Temple & Beard, with slender, pendulous branches. Var. **rôsea plèna**, Hort. Fls. rose, semi-double. Var. **rùbra grandiflora**, Hort. Fls. large, deep crimson. Var. **sanguinea plèna**, Hort. Fls. scarlet, double. Var. **seròtina**, André. Fls. in stalked leafy clusters in autumn. R.H. 1894, pp. 424, 425; 1903, p. 20. Var. **Simoniù**, André. Fls. dark crimson, semi-double: low and upright. G.W. 7:113. Var. **sulphùrea**, Hort. (var. *sulphùrea perfècta*, Van Houtte). Fls. yellowish. Var. **umbilicàta**, Sieb. & De Vries. With rose-red fls., and large frs. umbilicate at the apex. F.S. 5:510.

**Maùlei**, Schneid. (*Pyrus Maùlei*, Mast. *Cydonia Maùlei*, Moore. *C. alpina*, Koehne). Low shrub, 1–3 ft.: branches spiny, with short, rough tomentum when young: lvs. roundish oval to obovate, obtuse or acute, coarsely crenate-serrate, glabrous, 1–2 in. long: fls. bright orange-scarlet,  $1\frac{1}{2}$  in. across: fr. yellow, nearly globular, about  $1\frac{1}{2}$  in. across. March, April. Japan. B.M. 6780. G.C. II. 1:757 and 2:741; III. 34:435. Gn. 13:390; 33, p. 490; 50, p. 106; 55, p. 354. F. 1875:49. R.H. 1875:195. F.M. 1875:161. H.B. 26:241.—A very desirable hardy shrub, with abundant fls. of a peculiar shade of red. Var. **alpina**, Schneid. (*C. japonica* var. *alpina*, Maxim. *Cydonia Sárgentii*, Lemoine). Dwarf spiny shrub, with procumbent sts. and ascending branches: lvs. roundish oval,  $\frac{1}{2}$ –1 in. long: flowering and fruiting profusely. R.H. 1911:204. Var. **superba**, Hort. Fls. deeper red. Var. **tricolor** Hort. Dwarf shrub, with pink and white variegated lvs.—By some botanists this species is considered to be the typical *C. japonica*, and the preceding species is called *C. lagenaria*. ALFRED REHDER.

**CHÆNÓSTOMA** (*gaping mouth*, in allusion to the shape of the corolla). *Scrophulariaceæ*. African herbs or sub-shrubs sometimes planted in greenhouses, or in the open in mild climates.

Leaves simple, mostly opposite: fls. axillary or terminal-racemose, showy; stamens attached to the throat of the corolla, more or less exserted; style filiform and club-shaped, and obtuse at the apex; corolla tubular, swollen in the throat, with a 5-lobed spreading limb: fr. a caps. with numerous seeds.—Recent authorities combine this genus with *Sutera*, which, in the enlarged sense, comprises more than 190 species in Afr. and the Canary Isls. *Chænostoma*, as separately limited, has 25–30 S. African plants with white, yellow or reddish fls. axillary or in terminal racemes, lvs. usually opposite, mostly dentate, 4 didynamous stamens which are exserted rather than included as in typical *Sutera* and the top of the style club-shaped and stigma obtuse rather than 2-lobed.

**hispidum**, Benth. (*Sutera brachiàta*, Roth). Small perennial, sometimes an under-shrub, with opposite, oval or oblong, toothed lvs., and bluish-white or rosy white star-like fls.  $\frac{1}{2}$  in. across, in dense clusters. S. Afr. J. H. III. 33:636.—An old and deserving greenhouse or pot-plant, but rarely seen at present. It blooms almost continuously, the fls. sometimes hiding the foliage. Prop. by seeds or cuttings, either in fall or spring. Begins to bloom when 4–6 in. high. To be recommended for windows, and for summer vases. It has been listed as *Schænostoma hispidum*. In S. Calif., it is a half-hardy dwarf shrub (12 to 20 in. high and withstanding 4–6 degrees of frost), recommended for edgings. N. TAYLOR.†

**CHÆROPHÝLLUM** (Greek-made name, referring to the agreeably scented foliage). *Umbellifereæ*. Scented herbs, annual, biennial or perennial, glabrous or hirsute, often tuberous-rooted, of 30–40 species in the northern hemisphere, one of which is cult. Lvs. pinnately or ternately decompound, the segms. also toothed or cut: fls. small, white, in a compound many-rayed umbel; calyx-teeth 0: carpels with 5 more or less apparent ribs, the beak 0 or much shorter than the body. *C. bulbòsum*, Linn., of Cent. Eu. and the Caucasus, biennial, is the turnip-rooted chervil. (See *Chervil*.) St. hairy, at least below, 3–5 ft. tall, branching, swollen below the joints, the root tuberous (and edible): lvs. much compound, the ultimate divisions very narrow. L. H. B.

**CHÆTOSPÉRMUM** (from Greek, *hair* and *seed*). *Limonia* § *Chætospermum*, Roemer. *Rutaceæ*, tribe *Citreeæ*. A small spiny tree, proposed as a stock for citrus fruits.

*Chætospermum* bears hard-shelled frs.: lvs. persistent, trifoliate: fls. pentamerous with 10 free stamens; ovary 8–10-celled, with numerous ovules in each cell; cells filled with spongy vesicular tissue; seeds hairy, the cotyledons aerial in germination: first foliage lvs. opposite.—Only one species is known.

*glutinosa*, Swingle (*Limnoria glutinosa*, Blanco. *Egle decandra*, Naves. *Egle glutinosa*, Merrill). TABOG. Fig. 890. Petioles margined; lateral lfts. small, sessile, scarcely one-third as long as the terminal one; spines slender, straight, sharp, axillary usually in pairs in the axils of the lvs.: fls. rather large, occurring singly, or in few-fl'd. clusters on long slender pedicels in the axils of the lvs.: fr. oblong, 2–3 x 1½ in. with a thick leathery rind longitudinally ribbed, 8–10-celled; it contains numerous flattened hairy seeds, ⅜ to ⅔ in. immersed in a watery tissue. Native to the Isl. of Luzon, Philippine Archipelago. Ill. Blanco., Fl. Filip. ed. III, pl. 124. Vidal y Soler, Sinop. de fam. Fil. pl. 25. Bull. Soc. Bot. Fr. 58, Mem. 8d. pl. 5.—The tabog is a rapid-growing tree when young, and in a warm greenhouse shows a vigorous root-growth. This species is being tested as a stock for use in commercial citriculture. Experiments have shown that oranges, lemons, grapefruits and kumquats grow well when budded or grafted on young tabog plants.

WALTER T. SWINGLE.

**CHÁLCAS** (from Greek for *copper*, as the wood has a copper-colored grain). *Murræa* of Koenig. *Rutaceæ*. Small spineless trees or shrubs, suggested as a stock for citrus fruits.

Leaves pinnate, alternate: fls. large, 4–5-merous, solitary or in terminal or axillary cymes; ovary 1–5-celled, with 1 to several ovules: seeds white, woolly or glabrous, cotyledons aerial in germination: first foliage lvs. opposite.

*exótica*, Millsp. (*Murræa exótica*, Linn.). ORANGE JESSAMINE. A small tree with pale bark, twigs and petioles usually puberulous: lvs. pinnate; lfts. usually 5–9, ovate, obtuse or obtusely acuminate, often emarginate, dark green above, paler below: fls. fragrant, campanulate, 5-parted; petals white; stamens 10, free; ovary 2-celled, style deciduous: fr. subglobose, ⅔–½ in. long, pointed, red. Ill. Beddome, Outlines Bot., pl. vii., Wight, Ic., pl. Ind. I, pl. 96.—The orange jessamine is commonly grown in greenhouses on account of its abundant and very fragrant fls. These are often to be seen along with the mature red fr., which makes a striking contrast with the panicles of white fls. and delicate foliage. The root-growth of this species is remarkably vigorous under greenhouse conditions. Lemons can be budded on it and make a rapid growth. It is being tested as a stock for the common citrus fruits in situations in which a vigorous root-system is desired.

WALTER T. SWINGLE.

**CHAMÆBÀTIA** (Greek, *dwarf*, and *bramble*, alluding to its bramble-like flowers). *Rosaceæ*. A woody plant, grown for its handsome white flowers and for the finely divided aromatic foliage.

Low shrub, clothed with glandular pubescence: lvs. alternate, stipulate, tripinnatifid, persistent: fls. in terminal corymbs, white; calyx-tube broadly campanulate; petals 5; stamens numerous; pistil solitary, with short style and decurrent stigma: fr. a small achene inclosed by the persistent calyx.—One species in Calif. Ornamental shrub of agreeable aromatic odor, with graceful foliage and showy white fls. in June and July. It can be grown only in warmer temperate regions, and thrives best in sandy well-drained soil and sunny position. Prop. by seeds sown in spring and by greenwood cuttings under glass.

*foliolosa*, Benth. Two to 3 ft.: lvs. nearly sessile, oval or ovate-oblong, closely tripinnately dissected, 1½–2½ in. long: fls. white, ¾ in. wide, in 4–8-fl'd.

corymbs. B.M. 5171. G. 29:29. B.H. 10, p. 295. H.F. 1861:9. Gn. 3, p. 27.

ALFRED REHDER.

**CHAMÆBATIÀRIA** (in allusion to the similarity of this plant to *Chamæbatia*). *Rosaceæ*. Shrub grown for its handsome white flowers and the finely divided foliage; allied to the spireas.

Deciduous, with glandular aromatic pubescence: lvs. alternate, bipinnate, with numerous minute segms.; stipules lanceolate, entire: fls. in terminal panicles; calyx turbinate, with 5 erect lobes; petals 5, suborbicular; stamens about 60: carpels 5, connate along the ventral suture, at maturity dehiscent into 2 valves: seeds few, terete, with a simple testa.—One species in W. N. Amer. Very similar in general appearance to *Chamæbatia*, but easily distinguished by the bipinnate lvs. and the large dense panicles, and very different in its floral structure. An upright aromatic shrub with finely cut foliage and white fls. in large terminal

panicles; one of the first shrubs to burst into leaf. It is hardy as far north as Mass., but, like other plants from the same region, it dislikes an excess of moisture, particularly during the winter, and is likely to be killed by it. It prefers a sunny position and a well-drained soil, and likes limestone, but grows nearly as well without; it is not a plant for dense shrubberies. Propagated by cuttings of half-ripened wood taken with a heel in August with slight bottom heat; usually by seeds sown in spring, and treated like those of spirea.

*Millefólium*, Maxim. (*Spiræa Millefólium*, Torr. *Sorbària Millefólium*, Focke). Shrub, to 3 ft., glandular-pubescent: lvs. bipinnate, short-stalked, ovate-oblong to linear-oblong in outline, 2–3 in. long, primary segms. linear, deeply pinnatifid, with closely set obtuse lobes about a line long: fls. white, ½–⅔ in. across, short-pedicelled, in terminal panicles 3–6 in. long: carpels hairy. Calif. to Wyo. and Ariz. B.M. 7810. G.C. III. 22:237; 40:183. Gn. 75, p. 459. G.F. 2:509. R.H. 1900, p. 515. M.D. 1905:198. M.D.G. 1908:208.

ALFRED REHDER.

**CHAMÆCÉRASUS:** *Lonicera*.

**CHAMÆCYPARIS** (*chamai*, dwarf, and *kuparissos*, cypress; referring to its affinity). *Pinaceæ*. Trees or shrubs grown for their handsome evergreen foliage; also valuable timber trees; *RETINOSPORAS*, in part.

Evergreen, with opposite scale-like lvs. in 4 rows, densely clothing the compressed branchlets: fls. monœcious, small; pistillate inconspicuous, globose; staminate yellow or red, oblong, often conspicuous by their abundance: cones small, globular, with 6-11 bracts, each bearing 2, or rarely 5, winged seeds, ripening the first season. Closely allied to *Cupressus*, which differs in its larger cones maturing the second year, the bracts containing 4 or more seeds, and in its quadrangular branches and minutely denticulate lvs.—Six species in N. Amer. and E. Asia, all very valuable timber trees in their native countries. Highly ornamental evergreen trees of pyramidal habit, of which only *C. thyoides* is fully hardy N., while the Japanese species

891. *Chamæcyparis pisifera*.

are hardy in sheltered positions north to New England, and *C. Lawsoniana* only from Mass. south; the horticultural varieties are often shrubby.

They grow best in somewhat moist but well-drained, sandy loam and in a partly shaded position, sheltered against dry winds. *C. Lawsoniana* and *C. obtusa* like more dry, the others more moist situations, and *C. thyoides* grows well even in swamps. Propagated by seeds sown in spring; increased also by cuttings from mature wood in fall, inserted in a sandy soil and kept in a coolframe or greenhouse during the winter; if in early spring gentle bottom heat can be given, it will hasten the development of roots considerably. All the so-called *retinosporas* and the dwarf forms, and most of the varieties of *C. Lawsoniana*, are readily increased in this way, while the other forms of *C. nootkatensis*, *C. obtusa* and *C. thyoides* do not grow well from cuttings; therefore for most varieties veneer-grafting on seedling stock during the winter in green-

house is preferred, but dwarf forms always should be grown from cuttings, as they often lose their dwarf habit if grafted. The so-called *retinosporas* of the gardens, with linear, spreading leaves, are juvenile forms, which have retained the foliage of the seedling state. There are similar forms in *Thuja*. For their distinguishing characters, see *Retinospora*. For the numerous gardens forms, see Beissner, *Handb. der Nadelholzk.*, 2d ed., pp. 528-574, quoted below as Beissner.

A. Lvs. green on both sides or paler beneath.

**thyoides**, Brit. (*C. sphæroidea*, Spach. *Cuprèssus thyoides*, Linn.). WHITE CEDAR. Tree, to 70 or 80 ft., with erect-spreading branches: branchlets irregularly arranged, spreading, not pendulous, very thin and slender, flattened: lvs. closely imbricate, glaucous or light green, with a conspicuous gland on the back, fragrant: cones small,  $\frac{1}{4}$  in. diam., bluish purple, with glaucous bloom. From Maine to Fla., west to Miss. S.S. 10:529. M.D.G. 1896:301 (habit). Beissner 529 (habit). Var. **ericoides**, Sudworth (*C. ericoides*, Carr. *Retinospora ericoides*, Hort.). Compact shrub, of erect, dense habit: lvs. linear-lanceolate, spreading, with 2 glaucous lines beneath, coloring in winter usually reddish brown. Beissner 532; see also *Retinospora*. Var. **andelyensis**, Silva-Tarouca (*C. sphæroidea andelyensis*, Carr. *C. leptoclada*, Hochst. *Retinospora leptoclada*, Hort., not Zucc.). Intermediate form between the former and the type; bluish green, and of erect growth, with loosely appressed, lanceolate lvs.; often some branchlets with lvs. of the type and some with lvs. of the var. *ericoides*. R.H. 1869, p. 32, and 1880, p. 36. M.D.G. 1890:329. R.B. 2:155. Beissner 532; see also *Retinospora*. Var. **glaûca**, Sudworth (*C. sphæroidea glaûca*, Endl. Var. *kewensis*, Hort.). Of compact habit, very glaucous, with silvery hue. Var. **variegata**, Sudworth (*Cuprèssus thyoides variegata*, Loud.). Branchlets partially colored golden yellow.

**nootkatensis**, Sudworth (*Cuprèssus nootkatensis*, Lambert. *C. nutkaensis*, Spach. *Thuyopsis borealis*, Hort.). YELLOW CEDAR. Tree, to 120 ft., with ascending branches, pendulous at the extremities: branchlets distichously arranged, slightly flattened or nearly quadrangular, pendulous: lvs. densely imbricate, usually dark green, acute, mostly without glands: cones subglobose, nearly  $\frac{1}{2}$  in. diam., dark red-brown, with glaucous bloom. From Sitka to Ore. S.S. 10:530. R.H. 1869, p. 48. G. 19:345. F.E. 25:543. Gt. 53, p. 542. G.W. 8, p. 484; 10, pp. 41, 227. Beissner 555. Gn. 5:395. G.C. III. 40:167. Var. **glaûca**, Regel (*Thuyopsis borealis* var. *glaûca*, Jaeger). With very glaucous foliage. Var. **péndula**, Beissn. Distinctly pendulous. Gt. 53, p. 542. G.W. 1, p. 300. G.C. III. 40:166. Beissner 539. Var. **lutea**, Beissn. The young growth colored light yellow. J.H.S. 1902:427, fig. 113. Gn. 50, p. 68. Gn.W. 11:313.—There are other forms with variegated lvs. *C. nootkatensis* is about as hardy as the Japanese species.

AA. Lvs. with glaucous or whitish marks beneath: branches with horizontally spreading ramifications.

**Lawsoniana**, Parlatores (*Cuprèssus Lawsoniana*, Murr. *C. Boursieri*, Decne.). LAWSON'S CYPRESS. Tree, to 200 ft., with horizontally spreading and usually pendulous branches: branchlets frond-like arranged, flattened: lvs. closely appressed, obtuse or somewhat acute, usually bright green, with a gland on the back: staminate catkins bright red (yellow in all other species): cone globose, about  $\frac{1}{2}$  in. across, red-brown and often glaucous. From Ore. to Calif. S.S. 10:531. Gng. 2:327. S.M. 2, p. 49. F.E. 23:309; 33:559. G.W. 10, p. 42. Beissner 541. G. 1:121; 7:129.—This is one of the most beautiful conifers and very variable, about 80 garden forms being cult. in European nurseries and collections. The following are some of the best: Var. **álbo-spica**, Beissn. Tips of branchlets creamy white, of

slender habit. Var. *Álumii*, Beissn. Of columnar habit, foliage very glaucous, with a bluish metallic hue. The best blue columnar form. Var. *argentea*, Beissn. (*Cupressus Lawsoniana argentea*, Gord.). Of slender habit, with very glaucous, almost silvery foliage. Var. *erecta viridis*, Beissn. Dense, columnar habit and

bright green foliage. One of the most beautiful varieties, but somewhat tender. G.W. 14, p. 601. M.D.G. 1909:45. G.M. 51: 511. F. 1871, p. 92. Var. *erecta glauca*, Beissn. Similar in habit, but with glaucous foliage. Var. *filiformis*, Beissn. Branches elongated, somewhat pendulous, with few lateral branchlets, of low, globular habit. Var. *glauca*, Beissn. Foliage of metallic glaucous tint. One of the hardier forms. G.M. 53:832. Var. *gracilis*, Beissn. (var. *gracilis pendula*, Hort.). Elegant light green form, with graceful, pendulous branchlets. Var. *inter-*

*texta*, Beissn. Glaucous form, of vigorous growth, with remote, pendulous branches and distant, thickish branchlets. Beissner 550. Var. *lutea*, Beissn. Of compact habit, young growth clear yellow. G.C. III. 20:721. J.H.S. 1902, p. 426, fig. 110. Var. *nana*, Beissn. (*C. Boursieri nana*, Carr.). Dwarf, globose habit (Beissner 553), with some variegated and glaucous forms. Var. *pendula*, Beissn. With pendulous branches. Mn. 1:43. F.E. 27:187. Gt. 1890, p. 449. Var. *pyramidalis*, P. Smith. Of columnar habit. Var. *pyramidalis alba*, Beissn. Of columnar habit with the young growth colored white. R.B. 4:281. Var. *Weisseana*, Hansen. Low dense form of umbrella-like habit with almost horizontally spreading branches and nodding tips. M.D.G. 1890:245. S.M. 1, p. 214. Var. *Youngii*, Beissn. Upright form of vigorous growth with thickish dark green branchlets. G.C. III. 1:176, 177.

*obtusa*, Sieb. & Zucc. (*Cupressus obtusa*, Koch. *Retinóspora obtusa*, Sieb. & Zucc.). HINOKI CYPRESS. Tree, to 120 ft., with horizontal branches: branchlets frond-like arranged, flattened, pendulous: lvs. bright green and shining above, with whitish lines beneath, thickish, obtuse, and very closely appressed, with a gland on the back: cones globose, nearly  $\frac{1}{2}$  in. diam., brown. Japan. S.Z. 121. G.C. II. 5:236. R.H. 1869, p. 97. Gn. W. 20, suppl. April 25. Var. *álbo-spicata*, Beissn. Tips of branchlets whitish. Var. *aurea*, Beissn. (*Retinóspora obtusa aurea*, Gord.) Golden yellow. Gt. 25:19. Var. *breviramea*, Beissn. (*C. breviramea*, Maxim. *Thuja obtusa* var. *breviramea*, Mast.). Tree, of narrow pyramidal habit, with short branches: branchlets crowded, glossy green on both sides. Var. *compacta*, Beissn. Of dwarf and dense subglobose habit. Gn. M. 7:76. Var. *ericoides*, Boehmer (*Retinóspora Sánderi*, Sander. *Juniperus Sánderi*, Hort.). Of low subglobose habit with bluish gray linear spreading blunt lvs., marked with a green line above. G.C. III. 33:266;

36, suppl. April 25. M.D.G. 1900:589; 1903:291, R.H. 1903, p. 399. Beissner, 556. Var. *filicoides*. Beissn. Of slow growth with short and densely frond-like arranged branchlets. G.C. II. 5:235. Var. *filiformis*, Beissn. (*C. pendula*, Maxim. *Thuja obtusa pendula*, Mast., not *C. obtusa pendula*, Beissn.). Branches elongated, thick and thread-like, pendulous, with few distant branchlets. Var. *gracilis aurea*, Beissn. Graceful form, foliage bright yellow when young, changing later to greenish yellow. Var. *lycopodioides*, Carr. Low form, of somewhat irregular habit, with spreading, rigid branches and thick, nearly quadrangular, dark green branchlets. Var. *nana*, Carr. Low form, of slow growth, with short, deep green branchlets. R.H. 1882:102. Var. *pygmaea*, Carr. (*C. obtusa breviramea*, Hort., not Beissn.). Very dwarf form, with horizontal, almost creeping branches, densely frond-like branched. Exceedingly interesting form for rockeries. R.H. 1889, p. 376. Var. *formosana*, Hayata. Differs in its smaller and finer foliage, and much smaller cones. Formosa. J.C.T. 25, 19, p. 209.

*pisifera*, Sieb. & Zucc. (*Cupressus pisifera*, Koch. *Retinóspora pisifera*, Sieb. & Zucc.). SAWARA CYPRESS. Fig. 891. Tree, to 100 ft., with horizontal branches: branchlets flattened, distichously arranged and somewhat pendulous: lvs. ovate-lanceolate, pointed, shining above, with whitish lines beneath: cones globose,  $\frac{1}{4}$ – $\frac{1}{2}$  in. diam., brown. S.Z. 122. G.C. II. 5:237. C.L.A. 11:311.—This is, next to *C. thyoides* the hardiest species, and some varieties are much cult., while the type is less planted. Var. *aurea*, Carr. Yellow foliage. G.W. 1, p. 303. Var. *filifera*, Beissn. (*Retinóspora filifera*, Standish. *C. obtusa filifera*, Hort.). Branches elongated and slender, threadlike, gracefully pendulous, with distant branchlets and lvs. Very decorative form. G.C. II. 5:237. G.W. 1, p. 301;

892. *Chamæcyparis pisifera* var. *plumosa*.

893. *Chamæcyparis pisifera* var. *squarrosa*.

5, p. 17. Beissner 571, 572. Var. *plumosa*, Beissn. (*Retinóspora plumosa*, Veitch). Fig. 892. Of dense, conical habit: branches almost erect, with slender branchlets of feathery appearance: lvs. subulate, pointed and slightly spreading, bright green. Intermediate between the type and var. *squarrosa*. G.C. II. 5:236. Gn. M. 2:27. Beissner 569. Var. *plumosa*

*argentea*, Beissn. Tips of branchlets whitish. Var. *plumbosa aurea*, Beissn. (*Retinospora plumbosa aurea*, Standish). Young growth of golden yellow color. A very showy form. Var. *squarrosa*, Beissn. & Hochst. (*Retinospora squarrosa*, Sieb. & Zucc. *R. leptoclada*, Zucc.). Fig. 893. Densely branched, bushy tree or shrub, with spreading, feathery branchlets: lvs. linear, spreading, glaucous above, silvery below. A very distinct and beautiful variety. S.Z. 123. R.H. 1869, p. 95, and 1880, p. 37. Beissner 567. M.D.G. 1909:44. R.B. 2:189.

*C. formosensis*, Matsum. (*Cupressus formosensis*, Henry). Allied to *C. pisifera*. Tree, to nearly 200 ft. and 20 ft. diam.: branchlets dull green on both surfaces or slightly bloomy below: lvs. acute, ovate: cones ovoid,  $\frac{1}{2}$  in. across, with 10 or 11 scales. Formosa. G.C. III. 51:132, 133. — Recently intro. into England, but probably tender.

ALFRED REHDER.

**CHAMÆDAPHNE** (*chamai*, dwarf, and *daphne*, the laurel in ancient Greek, alluding to its dwarf habit and evergreen leaves). Syn., *Cassandra*. *Ericaceæ*. LEATHER-LEAF. Small plant, rarely cultivated for its early white flowers and evergreen foliage.

Low shrub, with evergreen alternate small lvs.: fls. nodding in terminal leafy racemes; calyx small, 5-lobed; corolla urceolate-oblong, 5-lobed, with 5 included stamens; anthers 2-pointed: fr. a depressed-globose, 5-lobed caps. with numerous seeds. — One species in the colder regions of the northern hemisphere. Low, hardy, ornamental shrub, valuable for the earliness of its pretty white fls. It thrives best in a peaty and sandy, moist soil. Prop. by seeds sown in sandy peat, only slightly or not covered, and kept moist and shady; also by layers and suckers and by cuttings from mature wood in late summer under glass.

*caliculata*, Moench (*Cassandra caliculata*, Don. *Lyonia caliculata*, Reichb. *Andrōmeda caliculata*, Linn.). Fig. 894. Bush with spreading or horizontal branches, 1–3 ft.: lvs. short-petioled, oblong, obtuse, slightly serrulate and revolute at the margins, dull green above and rusty-lepidote beneath: fls. short-peduncled, nodding; corolla white, oblong, about  $\frac{1}{4}$  in. long. B.M. 1286. L.B.C. 6:530; 15:1464; 16:1582. Mn. N. 1:125. Em. 423. Var. *angustifolia*, Rehd. (*Andrōmeda caliculata* var. *angustifolia*, Ait. *A. crisp*, Poir.). Lvs. linear-lanceolate, undulate and crisped at the margin.

Var. *nana*, Rehd. (*Andrōmeda caliculata* var. *nana*, Lodd. *A. vaccinioides*, Hort.). One foot or less high, with horizontal branches. L.B.C. 9:862. — Handsome little shrub, well suited for borders of evergreen shrubberies and for rockeries.

ALFRED REHDER.

894. *Chamædaphne caliculata*.  
( $\times \frac{1}{2}$ )

**CHAMÆDOREA** (Greek, *dwarf* and *gift*). *Palmaceæ*. Spineless, erect, procumbent or rarely climbing usually pinnatisect or pinnate palms.

Trunks solitary or cespitose, slender or reed-like: lvs. simple, bifid at the apex or variously equally-pinnatisect; lobes broad or narrow, straight or oblique, acuminate, plicate-nerved, usually callous at the base, the basal margins folded back or recurved; petiole usually cylindrical; sheath tubular, oblique at the throat: spadices among or below the lvs., simple or paniculately branched; spathes 3 or many, often appearing much below the lvs., alternate, sheathing, elongated, split at the apex, membranous or coriaceous, usually per-

sistent; pistillate fls. very small, solitary, in small pits in the spadix: fr. small, of 1–3 globose or oblong-obtuse carpels, coriaceous or fleshy. — Species about 60. Mex. to Panama. G.C. II. 23:410, and Dammer's articles in G.C. III. 38:42–44 (1905), and 36:202, 245 (1904).

Peat or leaf-mold, loam and sand in equal parts, with a little charcoal added, form the best soil. The species common in cultivation are quick-growing. They are well suited for planting out in greenhouse borders. The sexes are on different plants; therefore several should be planted in a group if the handsomely colored fruit is desired. All of the kinds require warm temperature in winter. Increased from seeds. Of the many species, only a few appear in the American trade. (G. W. Oliver.)

895. *Chamædorea glaucifolia*.

#### INDEX.

*Arenbergiana*, 8.  
*desmoncoides*, 2.  
*elatior*, 7.  
*elegans*, 5.

*Ernesti-Augusti*, 1.  
*glaucifolia*, 3.  
*Karwinskiana*, 7.  
*latifolia*, 8.

*Pringlei*, 9.  
*Sartorii*, 4.  
*Tepejilote*, 6.

#### A. Lvs. simple.

1. *Ernesti-Augusti*, Wendl. St. 3–4 ft., reedy, erect, radicate at base: blade obovate, cuneate at the base, deeply bifid, coarsely serrate along the margins; petiole shorter than blade; sheath amplexicaul: sterile spadix 8–9 in., the simple branches 6–8 in., attenuate, slender; fertile spadix simple; fls. red. Mex. B.M. 4837. F.S. 13:1357.

#### AA. Lvs. pinnate.

##### B. Plant becoming of climbing habit.

2. *desmoncoides*, Wendl. Lvs. 2–3 ft. long, with drooping, narrow lfts. a foot long, and glaucous petiole: plant tending to climb after it becomes a few feet high. Mex.

##### BB. Plant not climbing.

##### C. St. or trunk evident.

##### D. Lfts. 40–50, glaucous on both sides.

3. *glaucifolia*, Wendl. Fig. 895. St. 20 ft.: lvs. long, pinnate; lfts. 40–50, narrowed, long and slender, dark green, glaucous: fls. on a tall spadix which often exceeds the lvs. and comes out from between them. Guatemala. G.F. 8:507 (adapted in Fig. 895). — Horticulturally one of the best of all *chamædoreas*.

##### DD. Lfts. less than 40, bright green, at least above.

##### E. Spadix appearing among or with the lvs., not conspicuously cauline.

4. *Sartorii*, Liebm. St. 8–14 ft., ringed, clothed above with lf.-sheaths: lvs. 3–3½ ft. long; petiole terete, sulcate, dilated at the base; sheath, petiole and rachis white on the back; lfts. 12 in. long, 1½–2 in. wide, alternate, falcate, acuminate, narrowed at the base, sometimes almost confluent: spadix among or just below the lvs. Mex.

5. *élegans*, Mart. St. strict, 6 ft. high, scarcely more than 1–1½ in. thick, closely ringed, often sending out

roots from above the base: lvs. 6-8 in a cluster, broadly lanceolate; lfts. about 14, the upper pair sometimes confluent, acuminate, straight; fls. reddish orange: fr. globose. Mex. B.M. 4845.

EE. *Spadix appearing much below the lvs., conspicuously cauline.*

6. *Tepejilôte*, Liebm. St. 10 ft. high, closely ringed, about 1½ in. thick: lvs. 4 ft.; lfts. 20-30, 7-nerved, close alternate, falcate, acute, narrowly lanceolate, 13-15 in. long, 1½ in. wide; rachis convex on the back, canaliculate above: fls. yellow. Mex. B.M. 6030.

7. *elàtor*, Mart. (*C. Karwinskiàna*, Wendl.). St. 20-30 ft., bamboo-like: lvs. 6 ft. long, the sheath 18 in. long; lfts. 15 or 16, the lower very narrow, opposite or nearly so, the upper lanceolate, acuminate at each end; petioles 1½-3 ft. long; spadix simply branched, appearing at least 6 ft. below the lvs.; fls. reddish orange: fr. globose, ovoid. Mex.—Intro. by Franchesi in 1898.

8. *Arenbergiàna*, Wendl. (*C. latifolia*, Hort.). St. slender, 5-6 ft., green: lvs. usually only 5 or 6, erect-spreading; lfts. 10-15 pairs, alternate and drooping, very long-pointed, plicate and many-ribbed: fls. yellowish white. Guatemala. B.M. 6838.

cc. *St. or trunk none.*

9. *Pringlei*, Wats. Acaulescent or nearly so: lvs. usually rather stiff, erect, pinnate, 3 ft.; lfts. 12-15 on each side, linear-lanceolate, acuminate, 6-8 in. long, ¼-½ in. wide; rachis triangular: spadix simple, 8 in. long. San Louis Potosi, Mex.

*C. atrovirens*, Mart. St. bamboo-like, stiff and simple, about 9 ft. high: lvs. bright green, spreading, about 2½ ft. long. Mex. Not common in the trade but grown in fanciers' collections.—*C. bambusoides*, Hort.. Sts. tufted, thin, reed-like, with feathery light green lvs. Honduras.—*C. formosa*, Hort. A showy pinnate-lv. palm of unknown botanical status. G.C. II. 5:724.—*C. geomorphaformis*, Wendl. St. 4 ft.: lvs. simple, deeply cut, about 9 in. long; spadix from among the lvs. long-pendulous. Guatemala. Gn. 24, p. 244; 30, p. 593.—There are said to be a number of unidentified species scattered about Calif.

JARED G. SMITH.  
N. TAYLOR.†

**CHAMÆLIRIUM** (*dwarf or ground lily*, a Greek combination). *Liliacæ*. Sometimes spelled *Chamælrion*. Rhizomatous whitish flowered hardy plant, sometimes planted in the herbary.

Erect, tall unbranched herb 2-4 ft. high (or perhaps 2 species), inhabiting low grounds from Mass. to Fla. and W.: rootstock tuberous: dioecious, the sterile plant less leafy than the other: lvs. radical and cauline, the lowermost spatulate, the upper lanceolate, narrowed at the base: fls. small (¼ in. across), in a slender terminal raceme; segms. of perianth 6, white, narrow, 1-nerved, withering and persistent; sterile fls. with 6 stamens, and fertile fls. with rudiments of stamens; ovary 3-celled and 3-styled: fr. a 3-valved caps.

*luteum* Gray (*C. carolinianum*, Willd. *Chamælrion carolinia*, Hort.). BLAZING-STAR. DEVIL'S-BIT. Variable as to height (6 in. to 3 ft. or more), with most of the lvs. at the base: raceme spike-like, 4-12 in. long; fls. yellowish white, in effect, fruiting pedicels ½ in. or less long.—A good perennial, blooming May-July, thriving in moist shady places.—*C. obovate*, Small, by some considered not to be distinct, has larger fls. and fruiting pedicels ½ in. or more long. L. H. B.

**CHAMÆMELUM** (*small apple*, suggested by the odor of the fls.). *Compósitæ*. Under this name one plant is offered. The genus is by many included in *Anthemis*, however, the sub-group being distinguished by very short or absent pappus, sometimes making a 1-sided border, ray-fls. fertile, and other minor characters. *C. caucasicum*, Boiss. (*Pyræthrum caucasicum*, Bieb.), is listed, with white daisy-like fls. about the size of a marguerite, of trailing habit, very free-flowering,

recommended for the rockery: perennial, 1-1½ ft., smooth, not strong-scented: st. ascending from a rhizome or procumbent or sub-erect: lvs. oblong, pinnatisect, the segms., cut into linear-subulate parts: fl.-heads large, terminal; involucre-scales oblong-obtuse, margined. High mts. in the Caucasus; variable.

**CHAMÆPEÛCE**: *Carduus*.

L. H. B.

**CHAMÆRÁNTHENUM** (*dwarf and flower*, from the Greek). *Acanthacæ*. Three or 4 Brazilian small herbs, allied to *Eranthemum*, but readily distinguished by the 4 (instead of 2) stamens. Lvs. large and membranaceous, entire, variously marked: fls. showy, white or yellow, in bracteate clusters.—Grown chiefly for the beautiful foliage; greenhouse subjects. *C. igneum*, Regel (*Eranthemum igneum*, Lind.), is in the American trade. It is a low spreading warmhouse plant (cult. of *Eranthemum* and *Justicia*), with dark green lvs., with the veins and sometimes the margins richly banded with orange or yellow: fls. small. F.S. 17:1722.

N. TAYLOR.†

**CHAMÆROPS** (Greek for *dwarf bush*). *Palmacæ*, tribe *Sabalæ*. Low fan-leaved palms.

Caudices caespitose, branched from the base and clothed with the bases of the lf.-sheaths: lvs. terminal, rigid, semi-orbicular or cuneate-fanbellate, deeply

896. *Chamærops humilis*.

lacinate, the lobes narrow, bifid, plicate; no rachis; ligule very short; petiole slender, bi-convex, the margins smooth or rough; sheath split, reticulate, fibrous: spadices short, erect compressed; branches short, densely fld.: spathes 2-4, broad, thickly coriaceous, the lower ones split, the upper entire; bracts small, subulate; bractlets none: primary spadix branches bracted: fls. small, yellow: fr. globose or ovoid, 3-sided toward the base, brown or yellow.—Species 1 or perhaps 2. Medit. region. From *Rhapidophyllum*, an American relative, it may be distinguished by its bracted spadix. The common *C. humilis* is widely cult., and very variable. Many of specific-made names represent forms of this species. Of such cases are evidently the garden names *C. arborescens*, *C. argentea*, *C. canariensis*, *C. elata*, *C. elegans*, *C. farinosa*, *C. gracilis*, *C. littoralis*, *C. nivea*. G.C. II. 23:410.

The best soil for these palms is fibrous loam two parts, leaf-mold and sand one part, with good drainage. Propagated by suckers and by seeds. These are among the hardest of all palms, and are well suited to greenhouses where a high temperature is not kept up. (G. W. Oliver.)

*humilis*, Linn. Fig. 896. This is the only palm native to Eu. St. 1-1½ ft. high: lvs. ragged, fibrous; margins of the petioles armed with stout, straight or hooked spines; blade suborbicular, truncate or cuneate at the base, rigid, palmately multifid; segms. acuminate, bifid. Medit. B.M. 2152. R.H. 1892:84 (showing habit and a colored plate of the fr.).—Reaches 20 ft. in a rather arborescent variety. Var. *dactylocarpa*,

Becc., is interesting for its elongated frs. shaped like a date. Offered by Montarioso Nursery in 1912.

*C. Btroo*, Sieb.—*Livistona rotundifolia*.—*C. Bjrrho*, Hort.—*Livistona rotundifolia*.—*C. excelsa*, Thunb.—*Trachycarpus excelsus*.—*C. farinosa*, Hort.—*C. humilis*, Ling.—*C. Fortunei*, Hook.—*Trachycarpus*.—*C. h'milis x h'strix*, Hort. Said to be a "choice garden hybrid of Florida origin."—*C. h'strix*, Fraser.—*Rhapido-phyllum hystrix*.—*C. stauracantha*, Hort.—*Acanthorhiza aculeata*.

JARED G. SMITH.  
N. TAYLOR.†

CHAMOMILE: *Anthemis*.

**CHAPTÀLIA** (J. A. C. Chaptal, 1756–1831, agricultural chemist). *Compósitæ*. Low perennial herbs, with white or purplish fls. on naked scapes, blooming in spring and summer: heads radiate, the ray-fls. pistillate, and the disk-fls. perfect, but some or all of them sterile; involucre campanulate or turbinate, of appressed and imbricated bracts; pappus of soft capillary bristles: achenes oblong or fusiform, narrowed above, 5-nerved.—Twenty-five American species. The only species in the American trade is *C. tomentosa*, Vent. (*Thyránthema semiflosculare*, Kuntze), of N. C. and south. Of this the scape is 1 ft. or less high, and the heads are

purple-rayed: lvs. oblong or oblanceolate, more or less remotely denticulate, rather thick, white-tomentose beneath. Intro. as a border plant. B. M. 2257. N. TAYLOR.†

897. Chard, or sea-kale beet.

**CHARD** (*ch* pronounced as in *charge*). SWISS CHARD. SEA-KALE BEET. A form of the plant (*Beta vulgaris*) which has produced the common beet; known as *Beta Cicla* (p. 496). See *Beet* and *Beta*.

The beet plant has given rise to two general types of varieties: those varieties with thickened roots (the beet of America, the beet-root of European literature); and those with large and pulpy or thickened leaves (but whose roots are small and woody). The latter type is known under the general name

of leaf-beets. These leaf-beets may be arranged into two sub-groups: (1) Common or normal leaf-beets, or spinach beets, in which the leaf-blade is large and pulpy, and is used as spinach; chard, in which the petiole and midrib are very broad and thick, is a form of this, although the name is sometimes used as synonymous with the general edible leaf-beet group. (Fig. 897); (2) ornamental beets, of which the foliage is variously colored.

Chard is of the easiest culture. Seed is sown in spring, as for common beets. The broad petioles, or chards, may be gathered from midsummer until frost. These broad white stalks or ribs are used as a pot-herb; and, if desired, the leaf-blades may be cooked with them. The dish is usually more attractive, however, if only the chards are cooked. If cutting of the leaves is carefully performed, a succession may be had till cold weather. Chard is an attractive vegetable when well grown, but is little used in this country.

L. H. B.

**CHÁRIEIS** (Greek, *elegant*, from the pleasing flowers). *Compósitæ*. Attractive hardy flower-garden annual.

A small, branchy plant, 6–12 in. high, with blue or red aster-like fls., on long sts.: plant pubescent or hispid: lvs. oblong-spatulate or oblong-lanceolate, entire or remotely denticulate: heads many-fld., radiate, the ray-fls. pistillate, the disk-fls. perfect: achene obovate and compressed, those of the disk with plumose pappus: involucre scales in 2 rows.—One species, in the W. Cape region. Known as *Kaulfussia* in gardens. The genus *Kaulfussia* was founded by Nees in 1820; in 1817, however, the plant was described by Cassini as *Charieis heterophylla*.

898. *Charieis heterophylla*. (×1)

**heterophýlla**, Cass. (*C. Neesii*, Hort. *Kaulfussia amelloides*, Nees). Figs. 898, 899. Rays blue, disk yellow or blue. An excellent subject of easy cult. in any garden soil. Var. *atroviolacea*, Hort., has dark violet fls. Var. *kermesina*, Hort., has violet-red fls. Sow seeds where the plants are to grow; or they may be started indoors and the plants transplanted to the open. L. H. B.

**CHARLOCK**: *Brassica*; also *Raphanus*.

**CHARLWOODIA**: *Cordylone*.

**CHASTE TREE**: *Vitex*.

**CHAVICA**, kept distinct in part by recent authors, is accounted for under *Piper*.

**CHEAT**, or **CHESS**: *Bromus*.

**CHECKERBERRY**: *Gaultheria*.

**CHEESES**: Vernacular for *Malva rotundifolia*.

**CHEILÁNTHE** (Greek, *lip-flower*, alluding to the indusium). *Polypodiaceæ*. Semi-hardy or hothouse ferns of small size.

Plants often hairy or woolly, with the sori terminal on the veins and covered with a roundish indusium.—Some 60 or 70 species are known, nearly a third of which are natives of the W. and S. W. United States, one species as far east as Conn. They are of easy cult., enjoying a position near the glass, and disliking strong, close heat and syringing or watering overhead. Most of the

899. *Charieis heterophylla*.

species grow naturally in dry rocky situations. They are among the few ferns to be found in dry regions. Commercially valuable only from the fern collector's standpoint.

#### INDEX.

californica, 1.

meifolia, 2.

microphylla, 3.  
myriophylla, 12.  
tomentosa, 10.  
vestita, 6.  
viscida, 4.

A. Lvs. pentagonal-deltoid, the indusium confined to a single veinlet.

1. *californica*, Mett. (*Hypolepis californica*, Hook.). Lvs. densely cespitose from a short creeping rootstock, 2-4 in. each way, on stalks 4-8 in. long, quadripinnatifid; ultimate segms. lanceolate, incised or serrate. Calif.

2. *meifolia*, D. C. Eaton (*Hypolepis meifolia*, Baker). Lvs. cespitose, with slender brown stalks 5-7 in. long, the lamina 2-3 in. each way, 3-4-pinnatifid, with finely cut segms.  $\frac{1}{16}$  in. wide. Mex.

AA. Lvs. lanceolate or ovate-lanceolate.

B. Segms. flat: indusia extending over the apices of several veinlets, but not continuous.

c. Surface of lvs. smooth.

3. *microphylla*, Swartz. Lvs. 4-10 in. long, on stalks nearly as long, from a short, creeping rootstock, bi-tripinnate: sts. glossy, rusty-pubescent on the upper side. Fla. and New Mex. southward.

cc. Surface of lvs. viscid-glandular.

4. *viscida*, Davenport. Lvs. 3-5 in. long, on stalks of the same length, tripinnatifid; segms. toothed, everywhere glandular. Calif.

ccc. Surface of lvs. hairy, not woolly.

5. *hirta*, Swartz. Lvs. densely cespitose, with short, scaly stalks which are brownish, like the rachides; pinnae numerous, rather distant bipinnatifid, the segms. with much incurved margins. The lvs. are usually 6-15 in. long. Cape of Good Hope. Var. *Ellisiana*, is more commonly cult.

6. *lanosa*, Wats. (*C. vestita*, Swartz). Fig. 900. Lvs. cespitose, with stalks 2-4 in. long, slightly hairy, as are the segms., tripinnatifid, 4-10 in. long, 1-2½ in. wide, the pinnae lanceolate-deltoid: indusia formed of the ends of roundish or oblong lobes. Conn. to Kans. and Ala.—Hardy.

7. *Codperæ*, D. C. Eaton. Lvs. 3-8 in. long, bipinnate, the stalks covered with nearly white hairs, each tipped with a gland; pinnules roundish ovate, crenate and incised. Calif. to Mex.

BB. Segms. bead-like, minute: indusia usually continuous.

c. Lvs. hairy or woolly beneath, but not scaly.

D. Upper surface of segms. smooth.

8. *gracillima*, D. C. Eaton. LACE FERN. Lvs. cespitose, 1-4 in. long, borne on the nearly equal dark brown stalks, bipinnate; pinnae with about 9 pinnules, finally smooth above. Idaho to Calif.—Hardy

9. *Clélandii*, D. C. Eaton. Lvs. 4-8 in. long, tripinnate, dark brown beneath, with closely imbricate, ciliate scales, which grow on both the segms. and the rachides; segms. nearly round, the terminal larger. Calif.

DD. Upper surface of segms. pubescent.

10. *tomentosa*, Link. Lvs. 8-15 in. long, on stalks 4-6 in. long, everywhere covered with brownish white hairs, tripinnate; terminal segms. twice as large as the lateral. Va. to Ariz.

cc. Lvs. covered beneath with scales, but not woolly.

11. *Féndleri*, Hook. Lvs. 3-6 in. long, borne on the chaffy stalks, rising from tangled, creeping rootstocks, tripinnate; rachis with broadly-ovate white-edged scales, which overlap the subglobose segms. Texas, and Colo. to Calif.

ccc. Lvs. covered beneath with both scales and wool.

12. *myriophylla*, Desv. (*C. elegans*, Desv.). Lvs. densely cespitose from short, erect, scaly rootstocks, 3-9 in. long, borne on the chestnut-colored scaly stalks, triquadripinnatifid; ultimate segms. minute, innumerable. Texas, Ariz. and Trop. Amer.

A native species worthy of cult. is *C. leucopoda*, Link, from Texas, with broadly deltoid-ovate lvs.—*C. undulata*, Hope & Wright. Dark green fronds, softly pubescent. China. G.C. III. 34: 397 (desc.)

L. M. UNDERWOOD.

R. C. BENEDICT.†

**CHEIRÁNTHUS** (derivation in dispute, but probably from Greek for *hand and flower*). *Cruciferae*. Flower-garden perennials, with large purple, brown, orange or yellow fragrant bloom.

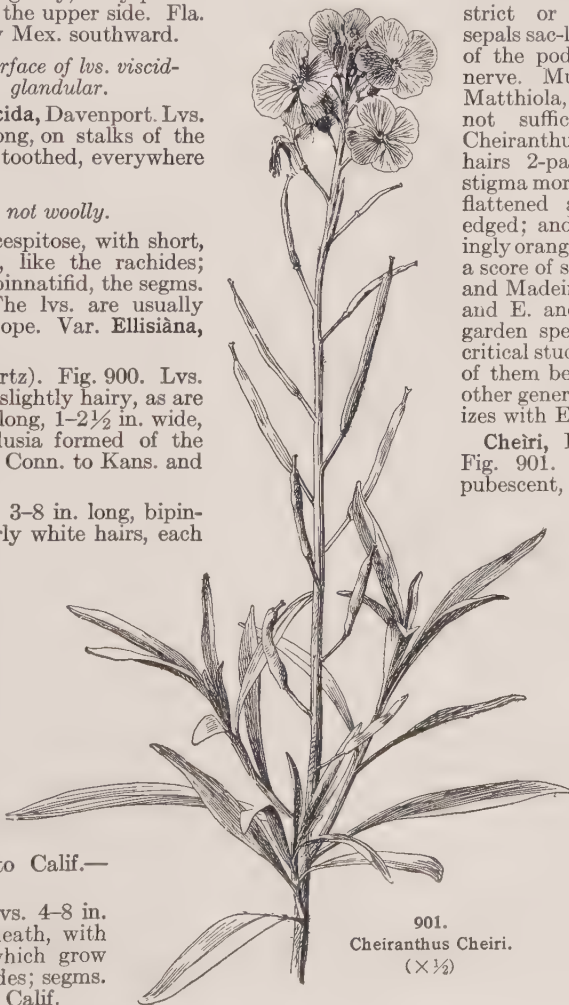

Leaves alternate, entire, on a strict or upright st.: lateral sepals sac-like at the base: valves of the pod with a strong mid-nerve. Much confounded with *Matthiola*, and the genera are not sufficiently distinct. In *Cheiranthus*, the lvs. are acute, hairs 2-parted and appressed, stigma more spreading, pod more flattened and seeds not thinned; and the fls. are prevailingly orange or yellow—Probably a score of species, in the Canary and Madeira Isls., Medit. region and E. and in N. Amer. The garden species are confused; a critical study may find that some of them belong to *Erysimum* or other genera. The genus hybridizes with *Erysimum*.

**Cheiri**, Linn. WALLFLOWER.

Fig. 901. Perennial, slightly pubescent, 1-2½ ft.: lvs. lanceolate and entire, acute: fls. large, mostly in shades of yellow, in long, terminal racemes, sweet-scented. S. Eu.—An old garden favorite, blooming in spring. Although a woody perennial, it is best to renew the plants from seed, for they begin to fail after having bloomed one or two years. Seedlings should bloom the second year; in England, Christmas bloom is secured from seeds sown in Feb. There are dwarf and double-fl. varieties,

900. *Cheilanthes lanosa*.  
(× ½)

901.  
*Cheiranthus Cheiri*.  
(× ½)

and innumerable forms in various shades of yellow, brownish, and even purple. Not prized so much in Amer. as in Eu. A common plant on walls in England.

**alpinus**, Linn. St. strict and simple, 1 ft.: lvs. lanceolate, somewhat dentate, stellate-pubescent: pods spreading on short pedicels: fls. lemon-yellow, spring. Norway, Lapland.

**mutabilis**, L'Her. More or less woody, 2-3 ft.: lvs. linear-lanceolate and pointed, obscurely serrate: fls. white, cream-colored or yellowish, becoming darker and striped. Madeira. B.M. 195.—It is doubtful whether the plant known in cult. as *C. mutabilis* is this species.

**Marshallii**, Hort. Perhaps a hybrid, 1-1½ ft.: lvs. spatulate and crowded below, more scattered and narrower above: fls. orange.

**Alliönii**, Hort. Said to be a hybrid: 12 in. or less: fls. brilliant orange, profusely produced in spring and summer and sometimes so freely that the plant exhausts itself and becomes practically biennial.

**kewensis**, Hort., is valuable as a winter-blooming greenhouse plant, prized for its fragrance and its dark-colored fls. In 1897 at Kew a cross was made between *C. mutabilis* of the Canary Isls. and a yellow wallflower, the cross being known as *C. hybridus*; and this in turn was crossed with a red wallflower, producing the plant known as *C. kewensis*. It has the bushy character of *C. mutabilis*; racemes upright; fls. about 1 in. across, brown in bud, or expanding brownish orange inside and reddish brown outside, all turning pale purple with age. Prop. by cuttings. G.C. III. 35:123. Gn. 65, p. 89.

*C. annuus*, Hort.=Matthiola, but early-blooming forms of *C. Cheiri* seem to pass under this name.—*C. Méziésii*, Benth & Hook.=Parrya.

L. H. B.

902. *Chelone glabra*. (×¼)

**CHELIDONIUM** (Greek for the swallow: the fls. appear when the swallow comes). *Papaveraceæ*. **Celandine Poppy**. One or two loose-growing herbs, sometimes seen in old gardens. Plant with fl.-buds nodding, and small yellow fls. in small umbel-like clusters; sepals 2; petals 4; stamens 16-24; style very short, the

stigma 2-lobed: pod slender, 2-valved, opening first at the bottom. *C. majus*, Linn., is a European plant, now run wild in waste places, and often seen in old gardens. It is biennial or perennial, with brittle hairy sts. and pinately-parted lvs., the lobes rounded and toothed (or, in var. *laciniatum* again dissected). The plant has bright orange juice which has been used for removing warts. Herb an old-time remedy, used for its cathartic and diuretic properties, for promoting perspiration, and as an expectorant. Lvs. light glaucous underneath.

L. H. B.

**CHELONE** (Greek for *tortoise* or *turtle*: the corolla fancied to resemble a reptile's head). *Scrophulariaceæ*. **TURTLE-HEAD**. Several North American perennial herbs, with showy flowers in short spikes or in panicles, some of which are now sold by dealers in native plants. Allied to *Pentstemon*.

Upright smooth branching plants: corolla more or less 2-lipped or gaping, white or red, the upper lip arched and conspicuous and notched; anthers 4, woolly, and a rudiment of a fifth stamen: seeds winged: lvs. opposite, serrate.—Four species, in N. Amer.

Half-shaded places are preferable for these easily cultivated plants. Very dry grounds should be avoided, from the fact that they are best in swampy places. In the ordinary border they should have a very liberal mulch of old manure in their growing season: 4-5 in. thick is none too much: the surface roots will feed in this compost, and the plants are not so liable to suffer from drought when thus protected. (J. B. Keller.)

A. Fls. in terminal and axillary close spikes.

B. Lvs. elliptic to broad-ovate, long-petioled.

**Lyonii**, Pursh. Plant, 2-3 ft. high: lvs. broad to nearly cordate at base, thin, evenly serrate: fl.-bracts minutely ciliate: fls. rose-purple. Mts., Va. and S.

BB. Lvs. lanceolate or oblong, short-petioled.

**obliqua**, Linn. Two ft. or less: lvs. 2-8 in. long, broad-lanceolate or oblong, very veiny, sharp- or deep-serrate or cut: fl.-bracts ciliate: fls. deep rose. Damp grounds, Ill., Va., S.

**glabra**, Linn. (*C. obliqua* var. *alba*, Hort.). Fig. 902. One to 2 or more ft. high, more strict: lvs. mostly narrower, acuminate, appressed-serrate, nearly sessile, not very veiny: fl.-bracts not ciliate: fls. white or rose-tinged. Wet grounds: common.

AA. Fls. in a loose thyrse or panicle.

**memorosa**, Douglas (*Pentstemon memorosus*, Trautv.). Two ft. or less high, of unpleasant odor: lvs. ovate and acute, sharp-dentate, sessile or nearly so: fl.-bracts none; corolla 1 in. long, violet-purple. Calif. and N. B.R. 1211.

*C. barbata* of gardens is *Pentstemon barbatus*.

L. H. B.

**CHENILLE PLANT**. A proposed name for *Acalypha hispida*, better known as *A. Sanderi*.

**CHENOPODIUM** (*goosefoot*, alluding to the shape of the leaves). *Chenopodiaceæ*. **GOOSEFOOT**. Widely dispersed weedy herbs, with very inconspicuous greenish flowers, some of which occur in gardens as oddities or for ornament, and others are pot-herbs of very minor importance. Spinach, beet, and orach are allied plants.

Plants of various habit, mostly erect: fls. perfect, bractless, sessile in small masses and these clusters arranged in spikes or panicles; calyx 4-5-parted, petals wanting; stamens usually 5; styles 2 or 3: seed lenticular: lvs. alternate. The calyx sometimes enlarges and becomes succulent and colored, inclosing the fr., and the glomerules may then look like berries.—Perhaps 60 species in all parts of the globe, annuals and perennials, sometimes woody. Many of them are field and garden weeds. They are mostly mealy or

glandular herbs, often with strong odor. Some of them are used as pot-herbs or "greens."

A. *Fls. in dense heads or glomerules which become berry-like and bright red in fr.*

**capitatum**, Aschers. (*Blitum capitatum*, Linn.). **STRAW-BERRY BLITE**. Annual, erect and becoming diffuse or spreading, branching, glabrous or nearly so: lvs. soft, hastate-ovate, toothed, stalked: fr.-clusters large and becoming fleshy, in an interrupted spike, the upper part leafless. Eu.—A frequent but not pernicious weed, and sometimes offered as a pot-herb.

AA. *Fls. not in dense separate heads, and the clusters not becoming prominently fleshy or colored.*

B. *Plant shrubby, spinescent.*

**nitrariaceum**, F. Muell. Rigid, much-branched, often prostrate shrub or undershrub, mealy-white: lvs. linear-oblong or linear-spatulate, obtuse, entire, 1 in. or less long, often clustered: fls. clustered in dense or more or less interrupted spikes and panicles, greenish. Austral.—Offered in Eu.

BB. *Plant herbaceous.*

c. *Species perennial: a pot-herb.*

**Bònus-Henricus**, Linn. (*Blitum Bònus-Henricus*, Reichb.). **GOOD KING HENRY**. **MERCURY** (by corruption, Markery). Stout and erect from a thick rootstock, to 2½ ft., glabrous: lvs. broad, triangular-hastate or ovate, with very long wide-spreading basal points, entire or undulate: fls. in panicle spikes. Eu.—Escaped now and then; and sometimes cult. for "greens."

cc. *Species annual.*

**purpurascens**, Jacq. (*C. Atriplicis*, Linn. f.). Vigorous, erect, 3 ft., the young parts and lvs. covered attractively with a rose-violet or violet-purple crystalline pulverulence: lvs. spatulate or rhomboid or oval, obtuse, long-petioled, the lower ones sinuate-dentate and the upper lanceolate and entire: fls. small and numerous, in dense pyramidal leafy reddish clusters. China.—An old garden plant, seldom seen in this country; grown for its colored character in summer. There are different forms, one with variegated foliage.

**amaranticolor**, Coste & Reyn. Very large, 8 ft., much like the preceding and perhaps derived from it: st. glabrous, striped white and red: lvs. triangular to rhomboid, 4 in. or less long, red-pulverulent: fls. in a long red panicle. S. France.—Differs from *C. purpurascens* in its greater size and its black shining somewhat sharp-edged seeds. The brilliant colors disappear as the plant matures.

**Quindà**, Willd. **QUINOA**. Erect, stout, st. furrowed, 4-5 ft.: lvs. triangular-ovate, sinuate, long-petioled, angulate-pinnatifid, glaucous: fls. small and green, in dense axillary and terminal farinose clusters arranged in panicles: seeds very large. W. slope of the Andes. B.M. 3641.—A very important plant in W. S. Amer., the seeds being used as food. There are white- and red-fruited forms. Sometimes cult. in this country as a curiosity. Allied to *C. album*, the common pigweed.

**Bòtrys**, Linn. **FEATHER GERANIUM**. **JERUSALEM OAK**. Erect, glandular-pubescent and viscid, aromatic, 1-3 ft. high, with pinnatifid long-petioled lvs. and long, feather-like, enduring spikes, for which it is used in vases and baskets; pretty. Eu., and widely naturalized although not usually becoming abundant.

Many weedy chenopods invade cult. grounds. *C. album*, Linn., the common pigweed or lamb's quarters, is a favorite for "greens." This species runs into many forms. *C. rìride*, of Eu. and Asia, has seeds that are said to be edible. *C. Vulgaris*, Linn., sparingly intro. from Eu., has the smell of stale fish. *C. ambrosioides*, Linn., Mexican tea, and var. *anthelminticum*, Gray, wormseed, are frequent; they contain strong essential oils. The weedy species are variable, and puzzling to the systematist.

L. H. B.

**CHERIMOYA, CHERIMOYER** (Quichua language of Peru, *chirimuya*, signifying cold seeds). (*Annona Cherimòla*, Mill.). Figs. 903-905. An important table fruit of warm countries. See p. 293, Vol. I, for botanical description.

The cherimoya is considered by many to be the finest of the subtropical fruits, and that not only by the natives of the countries in which it grows, but also by Europeans. It is somewhat like the pomme-cannelle, or sweet-sop, but differs from it in having a peculiar acidulous flavor most agreeable and grateful to the taste. For centuries the cherimoya has been cultivated

903. Cherimoya—smooth form. (×¼)

and several distinct varieties have resulted. One of these has smooth fruit devoid of protuberances, which has been confused with the inferior fruits of both *Annona glabra* and *A. reticulata*. The last two species, however, are easily distinguished by their leaves and flowers; *Annona glabra*, commonly known as the alligator apple or mangrove annona, having glossy laurel-like leaves and globose flowers with 6 ovate petals, and *A. reticulata* having long narrow glabrate leaves devoid of the velvety lining which characterizes those of the cherimoya. Both of these species, moreover, are essentially tropical, while the cherimoya is subtropical, growing in tropical countries only at considerable elevations, where the climate is cool and the soil well drained.

The origin of the cherimoya has been much discussed. De Candolle, however, is in all probability correct in attributing it to the mountains of Ecuador and Peru. The common name which it bears, even in Mexico, is of Quichua origin, as explained above; and terracotta vases modeled from cherimoya fruits have been dug up repeatedly from prehistoric graves in Peru. It was introduced at a very early date into Central America and Mexico and into Jamaica in 1786 by Hinton East. It is now of spontaneous growth in limited areas both in Central America and the mountains of Jamaica. In Madeira, the cherimoya has taken the place of the grape-vine on many of the estates on the warm southern slopes of the island. Here the cultivation is systematic. The two-year-old seedlings are budded or grafted. The trees are frequently trained on walls or on trellises, so that the fruit may hang in the shade while ripening, and manure is regularly supplied (see *Annona*). The result of careful selection is that there are varieties of fine flavor, comparatively few seeds, and great size, weighing from twelve to sixteen pounds. According to W. Fawcett, ordinary fruits weighing from three to eight pounds, have been sold in the London market at \$1.50; large ones at \$2.50 and even \$3. The cherimoya has been

successfully introduced into southern California where it finds the most favorable conditions in the foot-hills near the coast.

The cherimoya grows in the form of a small tree, usually about 15 or 20 feet high. The flowers are remarkably uniform, but vary somewhat in size. They are often solitary or in two's or three's, while those of the bullock's heart (*Annona reticulata*) and the sugar-apple (*A. squamosa*) are usually clustered. The leaves are always velvety on the lower surface. The following varieties, based upon the form of the fruit, are recognized:

(1) Finger-printed cherimoya (forma *impressa*), known in Costa Rica as "anona de dedos pintados." This form was the first to be figured (Feuillée, Pl. med. Journ. Obs. 3: append. 24, pl. 17, 1725). The fruit, conoid or subglobose in shape, has a smooth surface covered with concave U-shaped areoles resembling finger-prints in soft wax or putty. It is one of the best varieties, with sweet juicy pulp of good flavor, and with relatively few seeds.

(2) Smooth cherimoya (forma *laevis*), called in South America "chirimoya lisa" and in the market of Mexico City, "anon." Fig. 903. It is this form which is so often mistaken for *Annona glabra* and *A. reticulata* on account of the general appearance of the fruit and the common name "anon," which is also applied to the fruit of the last-named species. This is one of the finest of all the cherimoyas.

(3) Tuberculate cherimoya (forma *tuberculata*). Fig. 904. One of the commonest forms, in which the fruit is heart-shaped and bears small wart-like tubercles near the rounded apex of each areole. To this group belongs the "golden russet" cherimoya grown in the orchard of C. P. Taft at Orange, California. It is the form most frequently found in the Peruvian markets and is represented in prehistoric pottery from the graves of that country.

(4) Mammillate cherimoya (forma *mamillata*), called in South America, "chirimoya de tetillas."

This is the form successfully established on the ranch of Charles F. O'Brien, in the mountains of Santa Monica, southern California. It is also the common form of the Nilgiri Hills of India, and is one of the best forms grown on the Island of Madeira.

(5) Umbonate cherimoya (forma *umbonata*), called "chirimoya de puas" and "anona picuda" in Latin America. In this form the skin of the fruit is comparatively thick, the pulp more acid than in other forms, and the seeds more numerous. It has the flavor of pineapple and is one of the best for producing cooling drinks and sher-

bets. The fruit is oblong-conical in shape, with the base more or less umbilicate and the surface studded with protuberances, each of which corresponds to a component carpel. To this form should be referred the "Horton" cherimoya, grown in the vicinity of Pasadena, California.

Very recently there has been received from Florida an interesting fruit borne by a hybrid, the result of pollinating the stigmas of a cherimoya with the pollen of *Annona squamosa*. The leaves of this plant are very broad, resembling those of *A. Cherimola* in shape, but glabrous like those of *A. squamosa*. The fruit resembles that of *A. Cherimola* in form, but with the protuberances very distinct and covered with a glaucous bloom like that of *A. squamosa*. The seeds are distinct from both species, larger than those of *A. squamosa*, and much darker colored than those of *A. Cherimola*; and the pulp is very juicy, with the fine slightly acidulous flavor of the cherimoya.

For the propagation and culture of cherimoyas, see *Annona*.

W. E. SAFFORD.

#### CHERLÈRIA: *Arenaria*.

**CHERRY.** Several kinds or types of small stone-fruits ripening in late spring and in summer, widespread and popular in domestic and commercial use. Figs. 906-910. Plate XXI.

Sweet and sour cherries have been domesticated from two Old World species: cultivated sweet cherries having come from *Prunus avium* and the sour cherries from *Prunus Cerasus*. Varieties of these two species, and hybrids between them, now encircle the globe in the north temperate zone and are being rapidly disseminated throughout the temperate parts of the southern hemisphere. For centuries, probably from the beginnings of agriculture, cherries have been valuable fruit-producing trees in Europe and Asia,—inhabitants of nearly every orchard and garden as well as common roadside trees in temperate climates of both continents.

Coming from the Old World to the New, the cherry has played an important part in the orcharding in temperate regions of the western hemisphere. In North America, varieties of one or the other of the two cultivated species are grown from Newfoundland to Vancouver Island on the north, southward to the Gulf of California, Texas and Florida, probably yielding crops in a greater diversity of soils and climates on this continent than any other tree fruit.

Sour cherries are suited to many environments, thriving in various soils and withstanding rather better than most orchard fruits heat, cold and atmospheric dryness, and though they respond to good care, yet they thrive under neglect better than most other tree fruits. Sour cherries also have fewer insect and fungous troubles than other tree fruits, being practically immune to the dreaded San José scale. Sweet cherries, however, are much less easily grown. Sweet varieties are all somewhat fastidious as to soils, are lacking in hardiness to both heat and cold, are prey to more insects than sour cherries and subject to nearly all of the fungous ills to which stone-fruits are heir, suffering in America in particular from brown-rot and leaf-spot.

905. Flower of Cherimoya with two outer petals removed to show minute inner petals and essential parts; also an outer petal. ( $\times 1\frac{1}{2}$ )

904. Cherimoya, tuberculate form. ( $\times \frac{1}{2}$ )

Sweet cherries can be grown with commercial success in but few and comparatively limited regions, although the localities adapted to sweet varieties are rather widely distributed.

The cherry is probably the most popular of temperate climate fruits for the home yard, being planted more commonly than any other tree-fruit, in the many regions in which it is grown, in the dooryard, garden and along the roadside. The characters, other than those already named, that commend it for home plantations, are, early bearing after planting, early ripening in the season, regularity in bearing, great fruitfulness and ease of culture. It is more than a home fruit, however, and is largely grown for the markets, for canning and for preserving.

In America, the consumption of cherries is being greatly increased by the fashion of adding them preserved to many ices and drinks. The demand for canned cherries has also increased enormously in this country during the last few years. In Europe, wine is made from cherries, "kirschwasser," a spirit, is distilled from the fermented fruit pulp, and in the Austrian province of Dalmatia a cordial called maraschino is made by a secret process of fermentation and distillation. This liquor is imported to America in considerable quantities to flavor preserved cherries which become the well-known "maraschino cherries" of confection and delicatessen shops.

#### Other species.

Several species of cherries other than the two named have more or less horticultural value. *Prunus Padus* and *Prunus Mahaleb* of the Old World furnish fruits sometimes used for culinary purposes but much more cultivated, in their various forms, as ornamentals; the latter furnishes a stock upon which orchard varieties are now most commonly budded. *Prunus Besseyi*, *Prunus pumila* and *Prunus pennsylvanica* are species from North America, the first two having varieties cultivated for their fruits and all three being used as ornamentals and for stocks. *Prunus Pseudo-Cerasus* and *Prunus tomentosa* from Asia are much grown in China and Japan as ornamentals, for their fruits and as stocks, and should find favor in Europe and America for these purposes. In recent years many new species of cherries have been discovered in Asia. E. Koehne, one of the best authorities on the genus *Prunus*, places 120 species, nearly all from Asia, in the sub-genus *Cerasus* to which belong the orchard cherries (Mitt. Deut. Dendrol. Gesell., 1912:168-183). A few of these have already been introduced in America by the United States Department of Agriculture, and from them one is sure to find valuable horticultural species to be

used for their fruits, as ornamentals, as stocks, and for hybridization with species already domesticated.

#### Propagation.

Both orchard and ornamental cherries are commonly propagated in Europe and America by budding on Mazzard or Mahaleb stocks and in Japan, where cherries are much grown, on *Prunus Pseudo-Cerasus*. When exceptional hardiness is required, seedlings of the Russian sour cherries may be used or those of *Prunus Besseyi* or *Prunus pennsylvanica*. Undoubtedly the Mazzard is the best stock for regions in which cherries can be grown commercially. Upon the Mazzard, varieties of either sweet or sour cherries make larger, thriftier, longer-lived and more productive trees.

The Mahaleb, on the other hand, is the best stock from the nurseryman's point of view. It is more easily budded, hardier, freer from insects and fungi as it stands in the nursery before budding, and the buds more quickly develop into salable trees. But the advantages of the Mazzard are so much greater for the fruit-grower that he should accept only trees on this stock unless hardiness be a prime requisite. Cherries are set in the orchard at two years from the bud.

#### The cultivation and handling.

Sweet cherries are most profitably grown on high, comparatively light, sandy, gravelly or even stony loams, while sour cherries do best on somewhat heavier soils. The former are set 22 to 24 feet apart; the latter 16 to 20 feet. Both respond to care in cultivation which, in brief is: early spring plowing, frequent cultivation until the first of August with a cover-crop sown just before the last cultivation. Cover-crops are various—a favorite one in New York and Michigan is a half bushel of oats or barley, and twelve pounds of clover or twenty pounds of winter vetch. In Delaware and New Jersey the cowpea is much liked as a cover-crop.

Cherry trees are usually headed 2 or 3 feet from the ground with a tendency to head them lower—half the

907. Low-headed and spreading growth of sour cherry.

908. Old sweet cherry tree, on the Chesapeake peninsula.

above distances; in the lower-headed orchards there seems to be no inconvenience in tilling with modern implements. Nearly all commercial growers form the head with five to seven main branches about a central trunk, but some prefer to remove the central stem, especially in sweet varieties, leaving a vase-formed head. After the head is formed, the subsequent pruning is exceedingly simple, consisting of cutting out an occasional injured or crossed branch and now and then heading-in a long whip-like growth.

In soils well adapted to cherry-growing, commer-

cial fertilizers are little needed. Good cultivation, the yearly cover-crop and an occasional dressing of stable-manure furnish an abundance of food. If, with this treatment, the trees fail to make sufficient growth, and if the drainage be good, the grower should experiment with fertilizers containing potash, phosphoric acid or nitrogen to see which, if any, his trees may need.

Cherries are picked with stems on, the sweet a few days before fully ripe, the sour when practically

909. Napoleon cherry.—Sweet.  
( $\times \frac{1}{2}$ )

mature. Some growers guard against breaking the fruit-spurs for the next year by using picking scissors. Cherries are variously packed in boxes and baskets but the container is usually a small one and much art may be displayed in placing in layers, facing, and in making the package in all ways attractive. Fruit for canning must be carefully picked but is sent to the cannery in trays holding one or two pecks.

The chief commercial plantations in eastern America are found in New York, New Jersey, Delaware, northern Ohio and western Michigan. Sweet-cherry growing is precarious because of natural obstacles, and sour cherries are so easily grown that through very abundance their sale is often difficult. Yet with both success has been attained by many, the profits ranging as high as \$300 to the acre.

#### Special difficulties.

The cherry is attacked by a dozen or more fungi. Of these, three are serious pests. The brown-rot, *Sclerotinia fructigena*, attacks the flowers, leaves, twigs and most disastrously the fruits at ripening time. Leaf-blight, *Cylindrosporium Padi*, produces diseased spots on the leaves, which for the most part drop out, giving a shot-hole effect and eventually causing the foliage to drop prematurely. A common and striking disease of the cherry is black-knot, *Plowrightia morbosa*, characterized by wart-like excrescences on shoots and branches which at maturity are black; affected parts sooner or later die.

The text-books give no less than forty insect enemies of cherries, of which the plum-curculio, *Conotrachelus nenuphor*, the peach-borer, *Sanninoidea exitiosa*, and the San José scale, *Aspidiotus perniciosus*, on sweet

cherries, must be combated. All of the pests named, both fungi and insects, are more destructive to plums and peaches, and the reader is referred to these fruits for treatment which is much the same as for the cherry.

Sweet cherries suffer severely in the South and the Mississippi Valley, and somewhat in the North, from sun-scald, either directly from the sun's rays or from alternate freezing and thawing in winter or spring. The injury is manifested by the bursting of the bark and the exudation of gum on the south and west sides of the tree. Some immunity from such injuries may be obtained by protecting the trunks with boards or other screens. "Gummosis," or a flow of gum from the wood, often follows injuries of various kinds and the work of insects and fungi in both sweet and sour cherries.

#### Types and varieties.

There are now about 600 varieties of cherries grown in America and Europe, and the names of as many more that have passed from cultivation remain. These are variously grouped, but the following simple classification takes in the common orchard sorts:

##### A. *Prunus avium*

(1) *The Hearts*.—Large, heart-shaped, soft-fleshed, sweet cherries, light-colored as represented by Governor Wood and dark as in Black Tartarian.

(2) *The Bigarreaus*.—Large, sweet, heart-shaped and colored as in the previous group but with firm, crisp and crackling flesh. Well represented by Napoleon (Fig. 909) and Yellow Spanish as light-colored members of the group, and by Schmidt and Bing as dark sorts.

(3) *The Dukes*.—Somewhat smaller cherries than the Hearts and Bigarreaus, softer in flesh, light-colored and usually sour or nearly so. This group is placed under *Prunus avium*, but there can be no doubt but that the widely varying Dukes are hybrids between *Prunus avium* and *Prunus Cerasus*. May Duke and Reine Hortense serve as illustrations of the group.

##### AA. *Prunus Cerasus*.

(1) *The Amarells*.—Rather small, light-colored, sour cherries with colorless or nearly colorless juice, produced on upright trees, represented by Early Richmond and Montmorency (Fig. 910).

(2) *The Morellos*.—Also comparatively small and very sour but dark in color and with dark-colored juice and trees with a drooping habit, represented by English Morello and Louis Philippe.

In spite of the great number of varieties, the cherry, of all stone-fruits, seems most fixed in its characters. Thus, the difference between tree and fruit in the cherries of the several groups is comparatively slight and many of the varieties come nearly true to seed. So, too, cherries, although probably domesticated as long ago as any other of the tree-fruits, are now most of all like their wild progenitors. Notwithstanding this stability, there are probably rich rewards to be secured in breeding cherries by those who will put in practice the discoveries of recent years in plant-breeding, and will hybridize especially the various groups of the two species now cultivated and introduce wholly new blood from wild species. So little effort has been directed toward improving cherries, and the material seems so promising, that it would seem that with proper endeavor the coming generation may have a new and greatly improved cultivated cherry flora.

U. P. HEDRICK.

#### The cherry in California.

In commercial importance, the cherry is least of the fruits of the temperate zone grown in California on a commercial scale—not considering the quince and

XXVI. Sweet cherry in flower and fruit.

nectarine, of which the product is almost insignificant. This is not because the finest cherries cannot be grown, but because the avenues for the disposition of the product are not so wide as for other leading fruits. Recently there are indications that these avenues will be widened, for, in the year 1912, 244 carloads were profitably shipped in a fresh state to eastern markets, and in 1911 a product equivalent to 243,010 cases (each containing two dozen 2½-pound cans) of canned cherries were disposed of to advantage. In 1910, there was large shipment of barreled cherries in sulfur water to eastern bottlers who put up maraschino cherries in competition with importations, but this business seems to have transgressed the pure food laws and declined. Until it is demonstrated that such distant demands will increase, present plantations will not be largely extended. Cherries are costly in picking and packing, and the chance of low price in a local market, over-supplied whenever the trees do their full duty, the grower does not enjoy. Cherry-drying has never seemed warranted on a large scale, because of the large amount of labor required to the pound of product; and the grower has had no recourse when the canner and local consumer would pay only the cost of picking and boxing. A good shipping demand seems, therefore, the measure of the extension of California's cherry interest, and the early ripening of the fruit, which permits its sale during the blooming season of eastern cherry trees, is the leading surety of such demand. On several occasions early varieties have been shipped from the Vacaville district overland, on March 31, but the usual opening date is about two weeks later, and thence onward later varieties, and from later regions, may be shipped until July, if found profitable.

But, although there is plenty of good land upon which to multiply the present total of three-quarters of a million trees, the cherry regions of California are restricted. It is one of the most exacting of all trees, and is profitable only when its requirements are respected. About one-half of the present acreage lies in valleys opening upon the bay of San Francisco, where deep and moist, but well-drained alluvial soil fosters strong and sound root-growth, and modified atmospheric aridity favors leaf and fruiting. On similar deep and moist soils, however, the sweet cherry enters the hot interior valleys to certain limits, chiefly along the river bottoms. It abhors dry plains. In dry air it usually refuses to fruit, although, if the soil be moist, it may make stalwart tree-growth. In foot-hill valleys it sometimes does admirably, both in growth and fruiting, and in mountain valleys, above an elevation of 2,000 feet, on good soil, and in the greater rainfall, and even with the snow flurries, which are experienced every year at proper elevations, the tree becomes very thrifty and profitable to the limits of local markets. The tree seems to have no geographical limitations in California; wherever suitable soil and weather conditions occur, it accepts the situation—the Dukes and Morellos succeeding under conditions too trying for the Hearts and Bigarreus, but the latter, only, are of commercial account.

Cherry trees are grown by budding upon Mazzard and Mahaleb seedlings—both being largely imported. It is customary to plant out in orchards at the end of the first year's growth from the bud, though two-year-old cherry trees can be more successfully handled than other two-year-olds. The trees are headed at 1 or 2 feet from the ground, cut back to promote low branching for two years, and then allowed to make long branches, and not usually shortened-in, so long as thrifty and healthy. The tree, in a good environment, is, however, a very hardy tree, and will endure pruning to almost any degree. There are many trees which have made a very broad but not usually high growth, bearing 1,000 pounds of fruit to the tree, and a few others which have even doubled that figure, while others have been dwarfed and trained *en espalier*. The commercial orchards are, however, uniformly of low trees, approximately of vase form in exterior outline, and with branches curving outward without shortening.

The cherry is very readily grafted over by the usual top-grafting methods, and large orchards have been thus transformed into varieties more acceptable for canning or shipping. Comparatively few varieties are grown. Early Purple Guigne, Chapman and Knights Early Black are grown in early-ripening localities. Black Tartarian, Lewelling and Bing are the mainstay for black cherries. The Napoleon Bigarreau (locally known as Royal Ann) is the ideal for a white cherry, and almost excludes all others, although the Rockport Bigarreau has some standing. Of all the varieties grown, the Black Tartarian and Napoleon (Fig. 909) constitute 70 per cent of the crop, and probably 90 per cent of the amount marketed.

California-grown cherries attain large size; the canner's requirement for fancy fruit is a diameter not less than ⅞ of an inch, and for No. 1 not less than ¾ of an inch. Wholesale prices usually range from \$40 to \$60 a ton for black and \$80 to \$120 for white, but occasionally canners have paid as high as \$160 a ton for white cherries. The higher rates can be expected only in years of short crops.

EDWARD J. WICKSON

910. Montmorency cherry.—Sour. (×½)

**CHERVIL.** A term applied to two umbelliferous plants that produce edible parts, neither of which is well known in America. The name is sometimes applied, also, to the sweet cicely.

Salad chervil or leaf chervil is *Anthriscus Cerefolium*, Hoffm., a native of Caucasus, southern Russia and western Asia. It is annual, reaching 1½ to 2 feet high. The neat and aromatic leaves are used like parsley, which they much resemble. The leaves are decompose, with oval cut leaflets; and there are varieties with much cut and curled foliage. The cultivation of salad chervil presents no difficulties. Leaves are ready to use in six to ten weeks from seed-sowing, and any good garden soil is congenial. It thrives best in the cooler and moister part of the year. In hot weather, seeds would better be sown in a shaded place.

Tuberous or turnip-rooted chervil is *Cherophyllum bulbosum*, Linn., of southern Europe. (See *Cherophyllum*.) It is biennial or plur-annual, like the radish and carrot. The roots are like small carrots in shape (4 to 5 inches long), but are gray or blackish, and the

flesh is yellowish white and of different flavor. The roots are eaten as carrots are, either boiled or in stews. The one difficulty in the growing of tuberous chervil is the fact that the seeds germinate very tardily, or even not at all, if kept dry over winter. It is customary, therefore, to sow them in the fall, although they do not germinate until spring. If they are to be reserved for spring-growing, they should be stratified (see *Seedage*) or kept in sand. In four or five months after germination, the roots are fit to use, although they improve in quality by being left in the ground. The roots keep well in winter.

L. H. B.

**CHESS, or CHEAT:** *Bromus*.

**CHESTNUT.** Three species of tree or true chestnuts are cultivated in this country for their nuts,—the European *Castanea sativa*, the American *Castanea dentata*, the Japanese *Castanea crenata*. See *Castanea*. The horticultural characters that distinguish these three types are as follows:

*European chestnuts*.—Tree large, with a spreading but compact head, stocky, smooth-barked twigs and large glossy buds of a yellowish brown color; leaves oblong-lanceolate, abruptly pointed, with coarse sometimes incurved serrations, thick and leathery, generally pubescent beneath when young, but green on both sides when mature. Burs very large, with long branching spines, and a thick velvety lining. Nut larger than American chestnut, sometimes very large, shell dark mahogany-brown, pubescent at tip, thick, tough and leathery; kernel inclosed in a thin tough and astringent skin: quality variable from insipid, astringent to moderately sweet. The leaves remain on the trees until late in autumn, but are more susceptible to the attacks of fungi than the American and Japanese species. At least one variegated and one cut-leaved variety are grown as ornamentals. This species is variously known as European, French, Spanish and Italian chestnut (*Castanea sativa*), and sweet chestnut of English writers. It is an inhabitant of mountain forests in the temperate regions of western Asia, Europe and north Africa, and is esteemed for its nuts in Spain, France and Italy, where they have constituted an important article of food since an early day. Introduced to the United States by Irénée Dupont, at Wilmington, Delaware, in 1803, although recorded by Jefferson, under the designation "French chestnut," as grafted by him on native chestnut near Charlottesville (Monticello), Virginia, in 1773.

*American chestnut* (*Castanea dentata*).—Fig. 911. A tall straight columnar tree, in forests reaching a height of 100 feet and a diameter of 3 to 4 feet; when grown in the open, forming a low round-topped head of slightly pendulous branches. Leaves thinner than in *C. sativa*, oblong-lanceolate, acute, long-pointed at the apex, coarsely serrate except toward the wedge-shaped

base, green and glabrous on both surfaces, changing to bright clear yellow later in autumn. The staminate flowers open in June or July after leaves have attained full size, and exhale a sweet, heavy odor, disagreeable to many persons, and sometimes causing symptoms of hay-fever. The

912. Japanese chestnuts. ( $\times \frac{1}{2}$ )

They are of a bright brown color, covered at the apex with thick pale tomentum, which sometimes extends nearly to the base of the nut. The nuts are sweet and agreeable in flavor, the best among chestnuts, and are marketed in large quantities from the forests of the Appalachian region. Occurs in eastern North America, Maine to Georgia, westward to Michigan, Mississippi and Louisiana. Gradually receding from its southern areas from causes not yet understood. A few selected forms have been propagated by grafting.

*Japanese chestnut* (*C. crenata*).—Fig. 912. A dwarfish close-headed tree of slender growth, said to attain a height of 50 feet in Japan, with small buds: leaves smaller than other chestnuts, lanceolate-oblong, usually pointed, with a truncate or cordate base, finely serrated, with shallow sharp-pointed indentations, whitish tomentose beneath, pale green above, less subject to injury by fungi than other species. Burs small, with a thin papery lining and short widely branching spines. Nuts large to very large, glossy, usually three, sometimes five or seven in a bur, usually inferior to the other chestnuts in quality, although good when cooked, and in a few varieties excellent in the fresh state. Many cultural varieties are recognized. Introduced to the United States in 1876 by S. B. Parsons, Flushing, New York.

Aside from these three types, there are certain dwarf and small-fruited castaneas known as chinquapins. The two native chinquapins may be contrasted as follows (page 682):

*Common or tree chinquapin* (*C. pumila*).—Fig. 913. A shrub 4 or 5 feet tall, rarely a tree, attaining a height of 50 feet, with slender branchlets marked with numerous minute lenticels, and coated with a pale tomentum, which disappears during the first winter. Leaves oblong, acute and coarsely serrate at apex, bright yellowish green, changing to dull yellow before falling in autumn. Flowers strong-smelling, the catkins of staminate ones appearing with the unfolding leaves in May or June, the spicate androgynous aments later, with pistillate flowers in spiny involucre, producing solitary cylindrical nuts  $\frac{3}{4}$  to 1 inch in length and  $\frac{1}{8}$  inch in diameter, with sweet seeds. This species occurs in dry lands from southern Pennsylvania to Florida and Texas, and its nuts, which ripen earlier than the American chestnut, are esteemed for

911. Native wild chestnuts. ( $\times \frac{1}{4}$ )

food and marketed in considerable quantities. The species is sparingly introduced to cultivation and in its native region is being somewhat grafted upon in place with the choicer varieties of chestnuts. It has some promise as a dwarfing stock but is subject to the troublesome fault of suckering rather abundantly. Two named varieties, the Fuller and the Rush, have been published and somewhat propagated. (Upper part of Fig. 913 illustrates common chinquapin bur, and nut in natural size.) Apparent intermediates between this species and the American chestnut, probably of hybrid origin, are found in various localities from Pennsylvania southward and westward to southern Arkansas and eastern Texas, in some localities attaining truly arborescent proportions. (Lower figure in Fig. 913 illustrates bur of hybrid chinquapin.)

*Bush chinquapin* (*C. alnifolia*).—A shrub, rarely more than 3 feet in height, forming small thickets, by means of stolons, in sandy barrens. South Atlantic states, westward to Louisiana and Arkansas. Distinguished from *C. pumila* by larger, oval-lanceolate, mostly obtuse leaves, which are but slightly tomentose beneath, and by its larger nuts, which ripen earlier.

The cultural range of *Castanea* in America is not well defined, but extends from Florida and Texas to Massachusetts and Wisconsin, and on the Pacific slope. The three species cultivated in America thrive best on dry, rocky or gravelly ridges or silicious uplands, failing on heavy clays and on limestone soils unless deep, dry and rich.

#### Propagation of chestnuts.

Propagation of species is by seeds. Certain types reproduce their striking characteristics in their seedlings, but varieties are perpetuated by grafting, occasionally by budding. Seeds for planting should be free from insect larvæ, and should not be allowed to dry out before planting. They may be planted in drills in fall on deep and well-drained loam, or, to avoid damage by rodents, may be stratified in damp sand until spring. Nuts held in cold storage at 15° F. from October to April have germinated well at Washington, D. C. Young trees destined for removal to orchard should be transplanted in nursery at one year old, to promote symmetrical development of root system. Grafting may be done on any of the species of *Castanea*, and on some of the oaks, notably the chestnut oak, *Quercus Prinos*, though the durability of grafts on the oak is questionable. Where the chestnut is indigenous, bearing orchards of improved varieties are quickly secured by cutting down and removing the timber, and grafting the young sprouts which spring up in abundance about the chestnut stumps (Fig. 914). Recently the chinquapin has been similarly used with good success where chestnut does not occur. Grafting may be by splice method on one-year-old seedling roots; by splice or cleft at crown on two- or three-year trees in place; or by veneer, splice or cleft methods on one- to three-year-old sprouts or branches. Top-working of old trees is uncertain and practised only in special cases. Cions should be dormant, and work may be done at any time after freezing ceases, but in trunk- and branch-grafting best results are secured by most grafters if work is done after leaves begin to unfold. Two- or three-bud scions are preferred. The fitting of cion to cleft or splice and the waxing should be carefully done. If strips of waxed muslin are wrapped about the stubs, the danger of loss by summer cracking of wax is lessened. In cleft-grafting young sprouts or seedlings, the stub should be cut 2 or 3 inches above the departure of a branch, to prevent too deep splitting of cleft. Two or three weeks after growth begins the waxing should be inspected and repaired if cracked. If grafts make rank and brittle growth they should be checked by pinching, and if in exposed situations, tied to stakes to prevent breaking out of cions. Budding is sometimes

practised, usually by use of dormant buds inserted in shoots of previous year, when the bark "slips" after growth has begun in spring. There is a growing conviction in the minds of close observers that certain of the popular varieties, especially Paragon, under certain conditions do not find the American chestnut a congenial stock. In several orchards, Paragon, when grafted on native sprouts, although apparently making a good union at the start, has within eight to ten years developed weakness at the point of union, followed by loss of vigor and death of the top without other apparent cause than lack of congeniality of cion to stock. For this variety, at least, the grafting upon seedling stocks grown from nuts of the variety appears advisable.

The chestnut is admirably adapted to ornamental planting, either singly or in groups on suitable soils.

913. Chinquapin. (Nut and bur natural size.)

The native species is successfully used as a roadside tree in many sections outside of its natural range. It requires a space of at least 40 feet for development when thus used, the European species 30 feet, and the Japanese 20 feet. If in orchard, the last-mentioned may be planted as close as 20 feet, and thinned when the trees begin to crowd, thus securing several crops of nuts from land otherwise unoccupied.

#### Care of chestnut orchards.

Planted orchards are yet few in America, most of the extensive commercial efforts having consisted in the grafting of sprouts on rough lands where the American chestnut is indigenous. On such lands no cultivation is attempted, the brambles and undesired sprouts being held in check by occasional cutting in summer, or by pasturing with sheep. Much care is necessary

to protect against damage of the sprouts by fire on such land. Clean cultivation, at least during the first few years, is probably best in planted orchards, although heavy mulching may be found a satisfactory substitute. The Japanese and some of the American varieties of the European species require thinning of the burs on young trees to avoid over-bearing, with its consequent injury to the vitality of the tree.

#### *Special difficulties.*

Leaf diseases are apparently subject to control by bordeaux mixture, but for the weevils, which damage the nuts previous to maturity, no satisfactory remedy has yet been discovered except the yarding of poultry in sufficient numbers to destroy the adult insects and their larvæ when they reach the ground.

The most serious difficulty confronting the present or prospective chestnut-grower in North America is the chestnut-bark disease which, during the last decade, has worked havoc in the native chestnut forests throughout a region of country extending from central Connecticut through southeastern New York, New Jersey, and eastern Pennsylvania into northern Delaware, northeastern Maryland and northern Virginia. As this region contains most of the commercial plantings of improved chestnuts they have also suffered severely, especially since about 1908. The distribution of the native chestnut, together with the known distribution of the disease February 1, 1912, is shown on the accompanying map (Fig. 915), which was prepared by Metcalf to accompany a special report on the disease in response to a resolution of the United States Senate.

This disease, caused by a parasitic fungus (*Diaporthe* or *Endothia parasitica*), attacks trees of all ages and kills by girdling at various points. It is known to attack all species of chestnut and chinquapin grown in this country, although some, at least, of the Japanese varieties, are practically resistant, so far as observed. A few cases of the disease have also been found on living trees of the chestnut oak in Pennsylvania, though with less evidence of destructive effect than on chestnut.

914. Chestnut sprouts two years grafted. The cion was inserted where branching begins.

The disease is spread by the spores of the fungus, which are sticky, and are carried by rain, insects, and man, and probably by birds and small mammals. It is known to have been carried on nursery stock for long distances and is easily transported on newly cut

915. Distribution of the chestnut blight.

timber and cordwood from which the bark has not been removed. Infection frequently occurs through wounds made by bark-borers.

Although first attracting attention in New York City in 1904, it appears certain that it had secured a firm foothold in southeastern New York, including Long Island and adjacent portions of Connecticut and New Jersey, prior to that time, there being some indication that it was introduced from Japan, although satisfactory evidence of this is still lacking. The presence of the disease in chestnut forests in China was discovered by Meyer in 1913, where, upon an unidentified species of chestnut, it is reported to be less virulent than in American chestnut forests.

For several years after publication of the cause of the disease by Murrill, in 1906, little effort was made in a systematic way to accomplish its control until 1911, when the legislature of Pennsylvania appropriated \$275,000 for this purpose and inaugurated a state-wide, two-year campaign of eradication. The work is being done in cooperation with the Federal Department of Agriculture which, since 1907, has been investigating the disease with a view to developing effective methods of controlling it. Several other chestnut-producing states are also giving more or less attention to the problem. Up to the present time, systematic cutting out of infected trees coupled with destruction of their bark by fire has proved the only practicable control method. This is being vigorously applied in Pennsylvania and those portions of Maryland, West Virginia, and Virginia in which the disease has appeared.

In forests, the disease is exceedingly difficult to eradicate after it has once gained a foothold, owing to the minute examination of the entire tree which is required to locate infections in their early stages. In any district in which there is a general infection of the forests, the only practicable course is to clear off the timber while it is sufficiently sound to be merchantable.

The relative disease-resistance of the Japanese chestnuts, coupled with their precocity and productiveness, renders them now the most promising sorts for the American chestnut-grower. Planted in sections

outside of the native range of the American chestnut, they may reasonably be expected to remain practically free from the disease, especially if care is exercised to prevent its introduction from infested regions on nursery stock or cions. The poor flavor and eating quality of most of these varieties is their worst fault, but in view of their wide range of variation in this respect, the problem of producing resistant varieties of good quality appears relatively simple. The few trees of Korean and Chinese chestnuts thus far grown in the eastern United States are apparently quite resistant to the disease and therefore of much interest to the tree breeder as parents of possible resistant forms. Systematic work on the breeding of resistant varieties is being prosecuted in the Bureau of Plant Industry.

#### *Varieties of chestnuts.*

The varieties of the three species, although possessing many points in common, differ sufficiently in important characteristics to justify separate grouping for cultural discussion. As chestnut-culture is new in this country, it seems best to append descriptions of all the varieties which are in the American trade. For fuller discussion of cultivated chestnuts, see *Nut Culture in the United States* (Bull. Div. of Pomology, U. S. Dept. of Agric.), from which Fig. 913 is adapted; *Nut Culturist*, A. S. Fuller, 1896; *European and Japanese Chestnuts in Eastern United States*, G. Harold Powell (Bull. Del. Exp. Station), 1898; *Nut Culture for Profit*, Jno. R. Parry, 1897.

**AMERICAN GROUP.**—Although the wild nuts exhibit wide variations in size, form, quality, productiveness, and season of ripening, but few varieties have been dignified by names and propagated. Solitary trees are frequently sterile, although producing both staminate and pistillate flowers, apparently requiring cross-fertilization to insure fruitfulness. This is especially true of planted trees of this species on the Pacific slope, where productive trees are reported to be rare. The susceptibility of the species to injury by leaf diseases, as pointed out by Powell, and the injury to nuts by larvae of weevils, are drawbacks to its extensive culture.

The following varieties are propagated to some extent:

*Dulaney.*—Bowling Green, Ky. Large, and of fine quality. Original tree productive, though isolated.

*Griffin.*—Griffin, Ga. A large, very downy nut, of good quality.

*Hathaway.*—Little Prairie Ronde, Mich. A large, light-colored, sweet nut, annually productive, frequently having five to seven nuts to the bur.

*Keckham.*—Mountainville, N. Y. Above medium in size, oblong, tomentose, sweet. Tree productive and vigorous in heavy sod at fifty years of age.

*Murrell.*—Coleman's Falls, Va. A large, high-flavored nut, bearing three nuts to the bur.

*Otto.*—Otto, Tenn. Large, oblong, very downy at tip, very sweet, and rich.

*Rochester.*—Rochester, N. Y. First fruited at Alton, Ill. Nuts medium to large; somewhat rounded, usually three in a bur; of dull brown color, downy at tip; quality excellent. Tree a very rapid grower and a heavy bearer; ripens late.

*Watson.*—Fay, Pa. Medium to large, slightly downy, compressed, very good.

**EUROPEAN GROUP.**—It is a significant fact that, during the century that has elapsed since the introduction of this species, the imported named varieties of Europe have not found favor in eastern America. Seedling trees have been found productive and profitable at many points in New Jersey, Pennsylvania, Delaware, and Mary-

land, however, and these form the basis of the culture of the species east of the continental divide. West of the Rocky Mountains, several of the choice French "Marrons" are reported to succeed in California and Oregon. Among the more important varieties of the European group in America, are the following:

*Anderson.*—Flushing, N. J. Bur medium to small; nuts of medium size, bright reddish brown, pubescent at the tip and over half of the nut. Tree a strong grower, with medium to small leathery leaves. Very productive.

*Bartram.*—Milltown, Pa. Bur medium to small; nut medium, thickly pubescent at tip, dark reddish mahogany color; three in a bur; unusually free from insect attack; quality good. Tree vigorous, spreading, with large leaves; productive.

*Combale* (Marron Combale).—France. A large and handsome, bright brown striped nut, with but little tomentum at tip; usually two, sometimes but one in a bur. Somewhat grown in California, where it was introduced from France about 1870.

*Chalon* (syn., Marron Chalon Early).—France. Sparingly grown in California. Nut of medium size, early, productive, precocious.

*Corson.*—Plymouth Meeting, Pa. Bur large, with thin husk; nuts large, usually three in a bur; dark brown, ridged, heavily pubescent at tip; quality very good. Tree vigorous, spreading, very productive.

*Dager.*—Camden, Del. Bur medium; nut medium to large, dark brown, thickly tomentose, usually three in a bur; quality good. Tree vigorous, spreading, productive; a seedling of Ridgely.

*Darlington.*—Wilmington, Del. Bur medium to small; nut medium to large, usually three in a bur; dark, distinctly striped, thickly tomentose at tip; sweet, good. Tree vigorous. One of the earliest to ripen of this group.

*Lyon* (Marron de Lyon).—France. A large, round nut of fair quality, grown in a small way in California, but less productive than Combale, which it resembles.

*Marron.*—This term is used by the French to designate the larger cultivated chestnuts, most of which have relatively few nuts, often only one in a bur.

*Moncur.*—Dover, Del. A seedling of Ridgely. Bur medium; nuts medium, of light color, heavily tomentose. Tree vigorous, spreading, very productive.

*Nouzeillard.*—France. A large, handsome variety from central France, and there considered very productive and valuable. Has been tested in New Jersey, Pennsylvania and California without marked success in any locality.

*Numbo.*—Morrisville, Pa. Bur medium conical; nut large, from two to three in a bur; bright brown striped, thinly tomentose, of good quality. Tree compact and drooping, rather uncertain in bearing.

*Paragon* (syn., Great American; Sobers Paragon).—Germantown, Philadelphia, Pa. Bur very large; nut large, usually three in a bur, broad, plump, thickly tomentose at the tip, and thinly over two-thirds of surface, color dull brown, quality very good. Tree hardy, spreading, vigorous, with narrow, coarsely serrate leaves having a narrow base; subject to leaf-blight, but very productive. The most widely planted and most uniformly successful variety of chestnut yet cultivated in the United States. Possibly a hybrid with *C. dentata*.

*Quercy* (syn., Marron Quercy).—France. A beautiful, medium-sized nut, commended in portions of California for precocity, earliness, productiveness and quality.

*Ridgely* (syn., Du Pont).—Dover, Del. Bur medium; nut medium to large, moderately tomentose, dark, of very good quality. Tree vigorous, with narrow leaves free from blight, spreading, very productive, hardy.

*Scott.*—Burlington, N. J. Bur medium; nut medium, slightly pointed, usually three in a bur; glossy, dark brown, slightly tomentose at the tip. Tree open, spreading, very productive; said to be comparatively free from attacks of weevil.

*Styer.*—Concordville, Pa. Bur medium; nut medium pointed, dark brown, striped, tomentose at tip, 1 to 3 in a bur. Tree very vigorous, upright, with large, dark green leaves; free from disease.

**JAPANESE GROUP.**—Though most of the imported Japanese chestnuts have been found of poor quality for eating in the fresh state, the product of many imported seedling trees, and of a number of American-grown seedlings of this type, is equal to the European nut in this respect. The Japanese varieties in general have the advantage, also, of greater precocity and productiveness, larger size and earlier maturity of nut, greater freedom from injury

916. Successive stages in the ravages of the chestnut blight. 1909, 1910, 1911.

by leaf diseases and nut-eating insect larvæ. As productiveness and earliness are the most important points in chestnut-culture at the present time, this type is the most important to commercial nut-growers. Because of the ease with which chestnuts hybridize, the disease-resistance of varieties that have originated from seed produced within the habitat of the American chestnut must be regarded as doubtful until thoroughly tested. Information as to the place of production of the seed from which the several varieties

originated is therefore of importance in selecting varieties for planting. The more important named varieties are as follows:

*Alpha*.—New Jersey. Bur medium; nuts medium to large, generally three in a bur, dark, of fair quality, ripening very early. Tree upright, very vigorous and productive. Originated in New Jersey from seed of Parry.

*Beta*.—New Jersey. Bur small; nut medium, light brown, smooth, slightly tomentose at tip, good; ripening just after *Alpha*. Seedling of Parry.

*Biddle*.—New Jersey. First fruited in Maryland. Bur

medium; nut large, bright brown, broad, rather thickly tomentose, two to five in a bur; of medium season and fair quality. Tree regular, round-headed, vigorous. Grown from imported seed.

*Black* (syn., Dr. Black).—New Jersey. First fruited in Maryland. Bur large; nut medium to large; three to seven in a bur, consequently irregular in shape; dark brown, slightly tomentose, very early and of good quality. Tree round, close-headed, vigorous, productive. Grown from imported seed.

*Boone*.—Villa Ridge, Ill. Fig. 917. A hybrid between Giant and a native chestnut. Bur of medium size; nuts large, usually three in a bur; of light brown color, rather heavily tomentose; quality very good. Tree vigorous, precocious and productive, nuts ripening early. Considered difficult to propagate.

*Coe*.—California. A large, very sweet variety, but recently disseminated. Tree upright, somewhat spreading. Grown from imported seed.

*Felton*.—New Jersey. First fruited in Delaware. Bur small; nut medium, dark brown, slightly tomentose, rather early and of excellent quality. Tree round-headed and fairly productive. Grown from seed of an imported tree.

*Giant*.—Japan. A trade name, under which a number of varieties have been imported from Japan. See Parry.

*Hale* (syn., Eighteen Months).—California. A newly introduced variety, having a large, dark brown nut of excellent quality. Very precocious. Grown from imported seed.

*Kent* (syn., Extra Early).—New Jersey. First fruited in Delaware. Bur small, nut medium to large, dark, usually three in a bur; very early, of good quality. Tree round-headed, precocious, productive. Grown from seed of an imported tree.

*Kerr*.—New Jersey. First fruited in Maryland. Bur small; nut medium to large, dark brown, broad, three in a bur, early, and of excellent quality. Tree vigorous, symmetrical, round-headed, very productive. Grown from imported seed.

*Killen*.—New Jersey. First fruited in Delaware. Bur very large; nut very large, broad, light brown, slightly ridged, of excellent quality, midseason. Tree upright, open, spreading, moderately vigorous, productive. The largest chestnut yet brought to notice. Grown from seed of an imported tree.

*Mammoth*.—A trade name for the imported Japanese nuts and trees, not restricted to any particular variety.

*Martin* (syn., Col. Martin).—New Jersey. First fruited in Maryland. Bur large; nut large to very large, broad, bright reddish brown, slightly tomentose, three to five nuts in a bur. Midseason; of good quality for cooking. Tree vigorous, open, spreading, productive. Grown from imported seed.

*McFarland*.—California. Bur very large; nut large, and of fine quality; early. Tree spreading, very productive. A newly disseminated variety of great promise. Grown from imported seed.

*Parry*.—Japan. Bur very large; nut very large, one to three in a bur, broad, with apex sometimes depressed; dark brown, ridged, of fair quality. Tree moderately vigorous, open, spreading, with large leaves. One of the largest and most beautiful of this group. Selected for propagation as the best of 1,000 imported grafted Japanese chestnuts.

*Prolific*.—Japan. Bur small; nut medium, rather long, striped, three in a bur; early. Tree vigorous, compact, with small narrow leaves.

*Reliance*.—New Jersey. Bur medium; nut medium to large, rather long, light brown, ridged; midseason, and of fair quality. Tree dwarfish, spreading, drooping, very precocious and productive; inclined to overbear, and needs thinning. Seedling of Parry.

*Success*.—New Jersey. Bur very large; nut very large, usually

three in a bur; midseason; of rather poor quality until cooked. Seedling of Parry. Tree upright, productive.

*Superb*.—New Jersey. Bur large; nut large, broad, brown, usually three in a bur, early, and of fair quality. Tree vigorous and very productive. Seedling of Parry.

Wm. A. TAYLOR.

**CHEVALIÈRE, CHEVALIÈRIA, CHEVALLIÈRE, CHEVALLIÈRIA.** The species in the American trade are *Æchmeas*.

**CHICK-PEA:** *Cicer*.

**CHICKWEED:** *Cerastium* and *Stellaria*.

**CHICORY, or SUCCORY** (*Cichorium Intybus*, Linn.). *Compositæ* Fig. 918. A native of Europe, naturalized in America and familiar to many as a weed, is a pot-herb, a salad, and the leading adulterant of coffee. It came prominently before the public in the late nineties and the early years of this century as an American farm crop. Prior to that year, its cultivation as an adulterant and substitute for coffee was largely prevented by the prejudice of the principal consumers, our foreign-born population, who insisted that American was inferior to European root, and also by the low tariff, which allowed the root to enter duty free, or with a very small impost. During 1898 and 1899 advantage was taken of a protective duty, and several factories were erected, for which farmers grew the roots. For a few years our home market was supplied from American fields in part. But even the substitution of horse-power for manual labor, improved plows and cultivating implements for crude ones, machine-digging of the roots for hand-digging, efficient slicing machines, and improved evaporating kilns did not make the business satisfactory. There was not enough money in it either to growers or to manufacturers, so it has been abandoned.

Chicory will probably succeed wherever the sugar beet is grown in this country, the climatic requirements being similar. In general, it may be said to thrive upon all stone-free soils that will produce paying staple crops, except clays, lightest sands and mucks. The first are too hard, the second too dry, the third too rich in nitrogen and too sour. The surface layer of soil should be deep, the subsoil open and well drained. If the water-supply be sufficient, high land is as good as low land of the same texture, though if too dry for profitable grain-growing, the former may yet be made to produce chicory; but if too wet for cereals, the latter will generally be found unsuitable for this root. The fertilizing of the land should be the same as for other root-crops, nitrogen being used sparingly, potash and phosphoric acid rather freely—one and one-fourth to one and one-half times as much of the former and two and one-half times the latter as has been removed by the preceding crop. It is best to apply these fertilizers to preceding crops that do not make heavy demands upon them. In rotation, chicory is classed with root-crops, and should be preceded by a small grain, since this is harvested in time for fall plowing. Clover should not immediately precede, since it leaves too much nitrogen in the soil. The ground being warm, fairly moist, thoroughly

918. Improved chicory root. ( $\times \frac{1}{2}$ )

917. Boone chestnut.

prepared by deep plowing, harrowing and scarifying with a weeder, the seed, which must be fresh and clean, is sown rather thickly but covered thinly, in drills 18 inches apart.

There are but few well-defined varieties of this plant used for field culture, and even the garden sorts are not so stable as could be desired. Of the former group, Magdeburg, Brunswick and Schlesische are the principal; of the latter, Witloof (so-called), Red Italian, Broad-leaved, Improved Variegated and Curled-leaved are best known. Witloof and Barbe de Capucin can be produced from any variety, the difference being brought about by the method of growing.

Chicory has no specific enemies in this country, and is troubled by only a few of the general-feeding insects, such as cut-worms and wire-worms.

From six to ten tons is the general acre yield, although with good management fifteen tons may be produced. The cost of growing and the returns are about as follows: Rent, wear of tools, etc., \$5; preparation of land, \$4.50; seed, 75 cents; cultivating and tending, \$15; harvesting and delivering, \$12; total, \$37.25. Average price the ton, \$7.

From a purely horticultural standpoint, chicory is of interest as a root, a pot-herb, and a salad plant. The young tender roots are occasionally boiled and served with butter, pepper and salt, like young carrots, but they have never become widely popular in this form. As a pot-herb, the young leaves are equal to those of dandelion. They are cut when 6 to 8 inches long, boiled in two waters to remove the bitter flavor, and served like spinach. As a salad, chicory is famous in three forms: Common Blanched, Barbe de Capucin and Witloof. Barbe de Capucin is comprised of small blanched leaves. Witloof is a more solid head. The pink, red and curled varieties make a very pretty appearance, and, if well grown and served fresh, are delicious, there being only a slightly bitter flavor. The method of growing for salads is the same as for endive.

For Barbe and Witloof, well-grown roots are dug in October, trimmed of unnecessary roots and of all but an inch of top. For Barbe, the roots are laid horizontally in tiers in moist earth, the whole forming a sloping heap, the crowns of the roots protruding an inch or so. Since darkness is essential, a warm vegetable cellar is the usual place selected to grow this vegetable, which requires three or four weeks to produce its fine white leaves. These are cut when about 6 inches long, eaten as a salad, boiled like kale or cut up like slaw. If undisturbed, the roots will continue to produce for several weeks. The most rapid way to produce Witloof is to plunge the roots (shortened to 5 inches) in spent tanbark, or such material, and cover with 2 feet or more of manure, the space under a greenhouse bench being used. In about two weeks, heads resembling cos lettuce may be dug up, boiled like brussels sprouts, or served as salad. If the roots be left in place, protected from the light, but uncovered, a crop of leaves resembling Barbe may be gathered. Sowing and other cultural management is the same as for other garden roots, as beets and carrots. It is a pity that these vegetables are so little known in this country. Witloof is a popular winter vegetable in the larger cities of the East. Much of it is imported from Europe.

Chicory has run wild along roadsides and in dry fields in many parts of the country, and is considered to be a bad weed. However, the handsome sky-blue flowers (Fig. 962), which open only in sunshine, are very attractive.

M. G. KAINS.

**CHILDSIA WERCKLEI:** *Hidalgoa*.

**CHILIANTHUS** (*a thousand flowers*). *Loganiaceæ*. Four or 5 S. African trees or shrubs, very closely allied to *Buddleia*, from which it differs in having stamens

exserted from the short tube: lvs. opposite, entire or dentate, nearly always tomentose or scaly: fls. very numerous, in dense terminal cymes or panicles; calyx and corolla deeply 4-parted, the latter usually yellowish. Unknown to the American trade. The plants known as *Buddleia salicifolia*, Jacq., and *B. saligna*, Willd., are *Chilianthus arboreus*, Benth. (which is probably identical with *C. oleaceus*, Burch.).

**CHILÓPSIS** (Greek, *lip-like*). *Bignoniaceæ*. One deciduous shrub or low tree, often planted in southern California and other parts.

Allied to *Catalpa*: differs in having 4 anther-bearing stamens and 1 rudiment, a more trumpet-shaped corolla and with jagged lobes, and lvs. linear and often not opposite.

*linearis*, DC (*C. saligna*, Don). Slender-branched, 10-20 ft.: fls. handsome, bignonia-like, in a short terminal raceme; corolla 1-2 in. long, 5-lobed and crimped, the tube and throat lilac, and 2 yellow stripes inside. Dry districts from S. Texas to Calif., and in Mex.—From its narrow-lanceolate or linear lvs., it is known as desert willow; also called flowering willow and mimbrres. There is a white-fl'd. form.

L. H. B.

**CHIMÁPHILA** (Greek, *winter-loving*; green in winter). *Eri-caceæ*. PIPSSISSEWA. Perennial small plants, interesting for the white or pinkish flowers and the evergreen foliage, but little cultivated.

Half shrubby or herbaceous, with creeping st.: lvs. evergreen, serrate, in irregular whorls: fls. nodding, forming a terminal, few-fl'd. umbel, on a long naked peduncle; petals 5, spreading; stamens 10, the anthers opening with 2 pores at the apex, the filaments short, dilated; style short, with a peltate stigma: fr. a dehiscent, deeply furrowed, 5-celled caps. with numerous minute seeds.—Four species in N. Amer., Eu., and N. Asia to Japan; formerly united with *Pyrola*. Low evergreen plants, with pretty white or reddish fls. in summer. They grow best in a light, sandy soil, mixed with peat or leaf-mold, and prefer a half-shady position. Prop. by division of the creeping rootstock. Useful in wild borders.

A. Lvs. broadest above the middle.

**umbellata**, Nutt. (*C. corymbosa*, Pursh). Five to 12 in.: lvs. 3-6 in a whorl, short-petioled, cuneate-lanceolate to oblong-obovate, sharply serrate, dark green and shining above, 1-2 in. long: fls. 4-7, white or reddish,  $\frac{1}{2}$ - $\frac{3}{4}$  in. wide. N. Amer., from Canada to Mex., Eu., Japan. B.M. 778. L.B.C. 5:463. Mn. 7:161.—Lvs. said to be employed in rheumatic and kidney affections.

AA. Lvs. broadest below the middle.

**maculata**, Pursh. Fig. 919. Lower and less branched than the foregoing: lvs. usually in 3's, ovate or oblong-

919.  
*Chimaphila maculata*.  
( $\times \frac{3}{8}$ )

lanceolate, sparsely and sharply serrate, variegated with white along the nerves, 1-2 in. long; fls. 2-5, white,  $\frac{3}{4}$  in. wide. From Canada to Ga. and Miss. B.M. 897. Mn. 9:1. G.C. III. 32:318.

**Ménziesii**, Spreng. Slender plant, 3-8 in. high: lvs. alternate or in 3's, ovate to oblong-lanceolate, acute at both ends,  $\frac{3}{4}$ -1 $\frac{3}{4}$  in. long, sharply serrate, sometimes variegated: fls. 1-3, white,  $\frac{1}{2}$  in. across; filaments with a round dilated portion in the middle. Brit. Col. to Calif.

ALFRED REHDER.

**CHIMONÁNTHUS:** *Meratía*.

**CHINA ASTER:** *Aster*.

**CHINA-TREE:** *Melia*.

**CHINA WOOD-OIL:** *Aleurites Fordii*.

**CHINESE LANTERN PLANT:** *Physalis*.

**CHINESE LAUREL:** *Antidesma*.

**CHINESE SACRED LILY:** *Narcissus*.

**CHINKAPIN, CHINQUAPIN:** *Chestnut* and *Castanea*.

**CHIOCÓCCA.** *Rubiaceae*. SNOWBERRY (which the name means in Greek). Shrubs, mostly climbing or trailing, of Trop. Amer. (a half-dozen or so species), and 3 in extreme S. Fla. Fls. in axillary panicles, the corolla funnelliform and 5-parted; stamens 5, inserted on the base of the corolla, the filaments cohering at base; style filiform, the stigma club-shaped; ovary 2-3-loculed, becoming a small globular 2-seeded drupe. **C. racemosa**, Linn., of the Fla. Keys and S., is sometimes cult. in hothouses for its panicles of yellowish white fls. and the white frs.: lvs. ovate to lanceolate, thick and shining, entire: drupes  $\frac{1}{4}$  in. diam.: twining, glabrous. **C. anguifuga**, Mart. (*C. brachiata*, Ruiz & Pav.), of S. Amer., the root affording a native snake-bite remedy, has appeared in cult. (under the name var. *acutifolia*): woody, with erect branches: lvs. ovate, 3 in. or less long, sharp-acuminate: fls.  $\frac{1}{4}$  in. long with recurved lobes, in axillary panicles shorter than the lvs.—In S. Fla. or on the Keys, 2 other species occur, but they apparently are not in cult.: *C. alba*, Hitchcock. Large, erect or reclining: lvs. elliptic to ovate: fls. white, often becoming yellow. *C. pinetorum*, Brit. Small, trailing: lvs. mostly elliptic to oblong: corolla always white.

L. H. B.

**CHIÓGENES** (Greek, *snow*, *offspring*; referring to the snow-white berries). *Ericaceae*. SNOWBERRY. Creeping plant, rarely grown in rockeries for the carpeting effect of the evergreen foliage and for the attractive white berries; with small alternate 2-ranked lvs. and inconspicuous axillary fls.; corolla short-campanulate, 4-cleft; stamens 8, included, with short filaments, anthers opening by a slit: berry white, many-seeded.—Two species in the colder regions of N. Amer. and Japan. Slender trailing evergreens, in appearance much like the cranberry; rarely cult. Thriving best in moist and peaty soil, in a shaded position, creeping amongst growing moss. Prop. by seeds, by division or by cuttings in Aug. under glass. The American species, **C. hispídula**, Torr. & Gray (*C. serpyllifolia*, Salisb.), has hirsute branches and ovate or oval,  $\frac{1}{4}$ - $\frac{1}{2}$  in.-long ciliate lvs., greenish white fls. and white berries,  $\frac{1}{4}$  in. across, usually hirsute.

ALFRED REHDER.

**CHIONÁNTHUS** (Greek for *snow* and *flower*; alluding to the abundance of snow-white fls.). *Oleaceae*. FRINGE TREE. Woody plants grown for their profusely produced white flowers.

Shrubs or low trees, with deciduous, opposite and entire lvs.: fls. in loose panicles from lateral buds at the end of last year's branches, white, dioecious or only functionally dioecious; calyx 4-cleft; corolla divided nearly to the base in 4 narrow petals; stamens 2, short;

ovary superior, 2-celled; style very short with a 2-lobed stigma: fr. a 1-seeded oval drupe.—Two species in E. N. Amer. and China. Ornamental shrubs, with large, dark green foliage, and very showy white fls. in early summer. The American species is almost hardy N., but requires a somewhat sheltered position; the Chinese may be more tender, but has proved hardy at the Arnold Arboretum. They thrive best in a somewhat moist and sandy loam, and in a sunny position. Prop. by seeds sown in fall or stratified; increased also by layers and by grafting under glass or budding in the open air on ash seedlings (in Europe, *Fraxinus Ornus* is preferred); sometimes by cuttings from forced plants in early spring.

**virginica**, Linn. Fig. 920. Large shrub or slender tree, to 30 ft.: lvs. oval or oblong, acuminate, pubescent beneath when young, mostly glabrous at length, 4-8 in. long; panicles 4-6 in. long, pendulous; fls. functionally dioecious; petals 1 in. long: fr. dark blue, ovoid,  $\frac{3}{4}$  in. long. May, June. From Pa. to Fla. and Texas. L.B. C. 13:1264. Gt. 16:564. Mn. 2:154. G. F. 7:325. A.G. 22:362. F.E. 29:733. Gng. 16:306. G.M. 31:527. V. 10:227. G.W. 8, p. 293. M.D.G. 1899:412, 413; 1900:413; 1907:73, 337.—Variable in shape and pubescence of the lvs., and several varieties have been distinguished, but none of them sufficiently distinct for horticultural purposes. The staminate plants are showier in flower on account of their larger panicles and broader petals, but lack the attractive pendulous blue frs. in autumn. Root-bark tonic, febrifuge, laxative; reputed narcotic.

920. *Chionanthus virginica*.

( $\times 12$ )

**retusa**, Lindl. (*C. chinensis*, Maxim.). Shrub, with spreading branches, or small tree, to 20 ft.: lvs. obovate or oval to oval-oblong, acute or obtuse, sometimes emarginate, pubescent on the veins beneath, at least when young, and reticulate; petioles densely pubescent: fls. dioecious, fragrant, in panicles 2-4 in. long; petals about  $\frac{1}{2}$  in. long; narrow oblong: drupe ovoid, dark blue,  $\frac{1}{2}$  in. long. China. P.F.G. 3, p. 85. G.C. II. 23:821; III. 47:328, 329. Gt. 35, p. 667. A.G. 13:374; 20:107; 22:363. Mn. 2:157. G.F. 7:327. G. 29:347; 33:521. Gn. W. 8:453.—Young plants have the lvs. serrulate.

ALFRED REHDER.

**CHIONODÓXA** (Greek, *snow* and *glory*). *Liliaceae*. GLORY-OF-THE-SNOW. Very early-blooming hardy bulbs, flowers and leaves appearing together.

Closely allied to *Scilla*, but differs, among other characters, in having a short tube to the corolla: fls. blue (running into white and red forms), with recurved-spreading acute segms., dilated filaments, and small or capitate stigma.—Four species, Crete to Asia Minor.

These are among the best of early-flowering plants, blooming in February, March and April, according to the locality, with the early snowdrops and scillas. Since their introduction to cultivation by Maw in 1877, they have been widely cultivated under the popular name of "glory-of-the-snow," in allusion to their early-blooming habit. *C. Luciliae* is the most widely cultivated species. This varies much in color, the type having flowers whose petals are more or less deeply tipped with blue, shading to white at their bases. *C. Luciliae* also occurs with pure white flowers, and in reddish and pink forms. *C. sardensis* has smaller flowers of a deeper tone of blue and without the white markings of the petals. There are two varieties of this, one with white

and the other with black stamens. *C. grandiflora* is the largest-flowered of the group, the type being slaty blue with dark lines down the center of the segments; however, like others of the genus, there are pink and white forms sometimes found in collected bulbs, although somewhat rare. *C. Tmolusii*, one of the kinds sent out by Whittall of Smyrna some years ago, is very like *C. Luciliae* in form but of a deeper blue and a distinctly later flowering habit. Chionodoxas hybridize with Scilla, and the hybrids are sometimes known as chionoscillas.—Chionodoxas thrive in any fertile soil, well drained and not too heavy, and in any exposure, the main requisite for growth being that they have light and an adequate supply of moisture while growing and until the foliage is ripened. The bulbs should be planted about 3 inches deep, and closely, say an inch or less apart. Lift and replant about the third year. They need no winter covering. They flower well in pots in winter in a coolhouse temperature. Must be forced only gently, and given abundance of air, light and moisture. They are increased by offsets and seeds, which they produce freely. Under favorable conditions they increase rapidly by self-sown seeds. Preferably, seeds should be sown in a frame, and may be expected to germinate the following winter. Under ordinary conditions, self-sown seeds germinate early in the year, or late winter. (J. N. Gerard.)

*Luciliae*, Boiss. Fig. 921. Bulb ovoid, brown-coated: lvs. long and narrow, 2 or 3 with each st.: scape 3-6 in. high, bearing a dozen or less bright blue, more or less hanging, white-centered fls. Asia Minor and Crete. B.M. 6433. Gn. 28, p. 179.—Runs into many forms, one of which has white fls. *C. gigantæa*, Hort., is a larger form of it, distinct in habit. *C. grandiflora*, Hort., is a large garden form, with fls. violet-blue and white in the throat. Var. *Förbesii*, Hort., somewhat taller and bearing more fls. *C. amabilis Leichtlinii*, Hort., is a very handsome form, 2 weeks later than the others: fls.  $1\frac{3}{4}$  in. across, with broad full segms. of soft creamy white shaded rose-purple. *C. Tmolusii*, Hort., is a late-blooming form, bright blue and white, apparently a variant of *C. Luciliae*.

*sardensis*, Drude. Fls. 2-6, smaller, much darker blue with no white in the eye, the perianth-limb twice longer than the tube: lvs. channeled. Sardis. Gn. 28:178.—Probably a form of *C. Luciliae*.

*crética*, Boiss. & Held. Slender: fls. smaller and fewer (1-2 on a scape) than *C. Luciliae*, white or very pale blue. Crete.—Of little horticultural value.

*Allenii*, Hort. (*Chionoscilla Allenii*, Hort.). Perianth segms. cut to

the base: habit of *C. Luciliae*, but the white eye is indistinct. Supposed natural hybrid of *Scilla bifolia* and *Chionodoxa Luciliae*. G.C. III. 21:191. There is said to be another *C. Allenii* that is a direct selection probably from *C. Luciliae*, very like var. *grandiflora*. *Chionoscilla Penryi* is another Chionodoxa × Scilla hybrid, the exact parentage not being stated.

L. H. B.

**CHIONOSCILLA:**  
Hybrids of Chionodoxa and Scilla; consult these genera.

**CHIRANTHODENDRON** (Greek, signifying *hand-flower-tree*). *Sterculiaceæ*. Odd-flowered ornamental tree of Mexico and to be expected in West Indies and elsewhere in cultivation.

A monotypic genus, which together with the Californian *Fremontodendron* forms the remarkable group *Fremontieæ*. The fls. are devoid of a corolla, but in its place have a large deeply 5-parted cup-shaped calyx, concave at the base, in which there are 5 glands which secrete an abundance of honey; stamens united together for about one-third their length, above which they separate into 5 rays bearing linear anthers which dehisce by a longitudinal groove; style issuing from the center of the stamens and terminating in a pointed stigma: fr. a woody caps. with 5 valvate dehiscent lobes: foliage linden-like and densely clothed with stellate hairs.

*platanoides*, Baill. (*Cheirostemon platanoides*, Humb. & Bonpl.). The celebrated MACPALXOCHIQUAHUITL, or HANDFLOWER TREE of the Mexicans; also called MANO DE MICO, MONKEY'S HAND, and DEVIL'S HAND. Fig. 922. The remarkable feature of the fl. is the form of the bright red stamens, which resemble the fingers of a human hand and are tipped with appendages like claws; from the base of the fingers issues the style which is more or less like a thumb. A single tree growing near the city of Toluca was known to the ancient Mexicans, who regarded it with superstitious veneration. It was of great age and was supposed to be the only tree of its kind in the world. But an entire grove of the trees was discovered in Guatemala on the slope of the Volcano de Agua, near the town of Antigua, whence in pre-Columbian times the specimen had been brought. This established itself on the slope of the volcano of Toluca, where the conditions of soil and climate were similar to those of its original habitat.

W. E. SAFFORD.

**CHIRITA** (Hindustani name). *Gesneriaceæ*. Plants much like gloxinias and streptocarpuses. A genus of 100 species, none of which is in the American trade. They are natives of E. Asia and are herbs or low undershrubs with opposite, often unequal lvs.: fls. in shades of purple and blue, tubular, in clusters on the tops of short scapes. For cult., see *Gloxinia*.

*C. barbata*, Sprague. Perennial: fls. pedicellate; corolla funnel-shaped, bluish lilac, with yellow band in front. India. B.M. 8200.—*C. rupestris*, Ridl. Bushy, compact annual. Malay Peninsula. B.M. 8333.—*C. sinensis*, Lindl., is the best known

922. *Chiranthodendron platanoides*.  
The hand-flower. ( $\times \frac{1}{2}$ )

921. *Chionodoxa Luciliae*. ( $\times \frac{1}{2}$ )

species and is well worth cult. It has bright green lvs. and scapose cymes of blue and white fls., the yellow anthers of which add attractiveness. B.R. 30:59.—A variegated form is known.

N. TAYLOR.†

**CHIRÒNIA** (classical mythological name). *Geniandaceae*. A dozen or so soft perennial herbs or shrubs of Afr., rarely seen in collections of greenhouse material. Fls. in shades of red and purple, terminal, with a salver-form corolla and short tube: lvs. opposite, sessile, on single or branching sts. Most of them are from the Cape region.

**CHIVE, or CHIVES** (written also Cive). *Allium Schenóprasum*, Linn., a perennial plant native to Europe and the northern borders of the United States and northward. See *Allium*. The leaves of chive are used green as seasoning in soups, salads and stews. Chive grows 6 to 8 inches high, making dense mats of narrow hollow leaves, and blooming freely in violet-colored heads, which scarcely overtop the foliage; bulbs small, oval. The plant makes an excellent permanent edging, and is worth growing for this purpose alone. It is easily propagated by dividing the clumps; but, like other tufted plants, it profits by having the stools broken up and replanted every few years. It rarely seeds. It thrives in any garden soil. The leaves may be cut freely, for they quickly grow again.

L. H. B.

**CHLIDÁNTHUS** (*delicate flower*, from the Greek). *Amaryllidaceae*. Tropical American summer-flowering bulbs. Allied to *Zephyranthes*.

Flowers erect, yellow, fragrant, in a small 2-bracted umbel, terminating a solid scape, long-tubed, with wide-spreading segms.; stamens 6, inserted at the throat, the filaments unequal and dilated at base: fr. a 3-valved caps.: lvs. long and strap-shaped; bulb tunicate.—Three or four species. Mex., and S. Amer.

Chlidanthuses are increased by offsets or by seeds. The bulbs should be kept dry and cool during winter and in spring started in a moderately warm house. After flowering, care must be taken to have the bulbs make their annual growth. They may either be grown in pots plunged in ashes, or planted out where they can be watered occasionally during dry weather. Like other similar plants, they will benefit by a mulching of spent hops or rotted manure. (G. W. Oliver.)

**frāgrans**, Herb. (*C. luteus*, Voss). Bulb large and ovoid: lvs. about 6, appearing in spring or early summer with the fls., narrow, glaucous, obtuse: fls. 4 or less in each umbel, 3 in. or less long, nearly sessile, erect, on a 2-edged scape or peduncle 10 in. or less high. Andes. B.R. 640. F.S. 4:326.—A good summer-blooming plant.

**Ēhrenbergii**, Kunth. Somewhat taller: fls. yellow, nearly horizontal, distinctly stalked, the 3 outer segms.

wider than the inner. Mex.—Perhaps a form of the above.

L. H. B.

**CHLORÁNTHUS** (*green flower*). *Chloranthaceae*. Tropical herbs, shrubs or trees, one of which is sometimes grown under glass in the North.

Perennial aromatic herbs or evergreen shrubs, with jointed sts. opposite simple lvs., and small, inconspicuous fls., in slender terminal spikes: perianth represented by a single scale, in the axil of which is the 1-loculed ovary and mostly 3 united stamens (the side stamens sometimes obsolete).—Some 10 species in the eastern tropics. Two other genera (*Ascarina* and *Hedyosmum*) comprise the family *Chloranthaceae*, of the pepper-like series of plants.

**brachystachys**, Blume. Shrub used for pot-growing, reaching a height of 1-2 ft., bearing glossy foliage and small yellow berries: stamen single in each fl.: lvs. long-lanceolate, acuminate, serrate.—Tropics and subtropics, Ceylon eastward. There is a variegated-leaved form.

L. H. B.

**CHLÒRIS** (the goddess of flowers). *Gramineae*. FINGER-GRASS. Annual or usually perennial grasses, some-

times grown for decoration.

Plants with flat blades, compressed sheaths and digitate unilateral spikes: spikelets with 1 perfect fl. and 1 or more rudimentary sterile lemmas on the prolonged rachilla.—Species about 40, in the warmer regions of the world. A few are cult. for ornament on account of the attractive infl. Of simple treatment.

**élegans**, HBK. Fig. 923. Annual, 1-3 ft.: uppermost sheaths usually inflated around the base of the infl.; spikes 6-12, pale or dark, 1-3 in. long; lemma fusiform, 1 line long, short-pilose at base and along the lower half of the keel, long-pilose on the margins near the apex, the awn about 5 lines long; rudiment cuneate, twice as long as broad, the single awn somewhat shorter than the awn of the perfect floret. Mex. Dept. Agric., Div. Agrost., 7:192; 20:102.

**polydactyla**, Swartz (*C. barbata*, Nash). Fig. 924. Perennial, 1-3 ft.: spikes several; awns 2-3 lines; rudiment triangular-truncate, the 2 awns about as long as the awn of the perfect floret. Tropics of both hemispheres.

**verticillata**, Nutt. WINDMILL-GRASS. Perennial, 4-15 in.: spikes several, slender, in 1-3 whorls, 2-4 in. long; awns 2-3 lines; lemma 1 line long, nearly glabrous; rudiment oblong-truncate, 1-awned. Dept. Agric., Div. Agrost. 7:191. Kan. to Texas.

**radiata**, Swartz. Perennial, 2-3 ft.: spikes several, about 3 in. long; spikelets slender; lemma slightly ciliate on callus and near apex, the awn 6 lines long; rudiment narrow, acute, the single awn about half as long as the awn of the perfect floret. W. Indies.

**gayana**, Kunth. RHODES-GRASS. Robust perennial, with abundant foliage and terminal umbels of 6-15 spikes.—An African species at present under experimentation in U. S. in dry regions. Cult. in Austral. (See Agr. Gaz. New S. Wales 19:19, 118, 389 [1908]).

923. *Chloris elegans*. ( $\times \frac{1}{2}$ )

924. *Chloris polydactyla*. ( $\times \frac{1}{2}$ )

*truncata*, R. Br. (*C. barbata vera*, Host., not *C. barbata*, Swartz or Nash). STAR-GRASS. A stoloniferous perennial, with erect culms 1-3 ft.: spikes 6-10, 3-6 in., becoming horizontal or reflexed; spikelets  $1\frac{1}{2}$  lines, dark at maturity, the awns 3-6 lines long. Austral. Turner, Austr. Grasses 1:17.—Cult. for ornament.

*C. gracilis*, Dur.=*Leptochloa virgata*, Beauv. This has been recommended as an ornamental.—*C. petraea*, Swartz, and *C. glauca*, Vasey, both handsome species from Fla., have been recommended for cult. as ornamentals.

A. S. HITCHCOCK.

**CHLORÓCODON** (Greek for green and bell, alluding to the flowers). *Asclepiadaceæ*. Twiners, one of which is planted far South.

Large plants with opposite cordate entire heavy lvs., notched stipules and purplish or greenish fls. in axillary panicles: calyx 5-parted; corolla deeply 5-lobed; corona of 5 lobes coming from the base of the filaments, the lobes obcordate or broader, sometimes with an erect or incurved projection or horn on the back; pollen granular.—Two species in Trop. and S. Afr. *C. ecornutus*, N. E. Br., is apparently not in cult.

**Whiteii**, Hook. f. Strong woody twiner, with large opposite cordate-ovate thick lvs. and axillary clusters of odd fls.  $\frac{3}{4}$ -1 in. diam.; corolla rotate-bell-shaped, thick; segms. ovate and acute, purple and with margins and central stripe green, and bearing long-notched lobes; corona-lobes horned; anthers connivent over the capitate stigma. Guinea to Natal. B.M. 5898. G.C. III. 18:243.—It is now cult. in S. Fla. and S. Calif. The roots are used medicinally in Natal, under the name of mundi. The plant is an interesting greenhouse climber, but not handsome. L. H. B.

**CHLORÓGALUM** (green and milk, from the Greek, referring to the juice of the plant). *Liliacæ*. Hardy West American bulbs, allied to *Camassia*.

Tall plants with a tunicated bulb: lvs. at base of st. long-linear, wavy-margined, those on the st. very small: fls. white or pink, in a panicle terminating a nearly leafless st., on jointed pedicels; segms. of perianth 6, 3-nerved, at length twisting over the ovary; stamens 6, not exceeding segms.; style long and deciduous. Plants of easy cult., to be treated like *camassias* or *ornithogalum*s. Three species, in Calif.

A. *Pedicels nearly as long as the fls.: segms spreading from near the base.*

**pomeridiānum**, Kunth (*Anthericum californicum*, Hort.). SOAP-PLANT. AMOLE. St. reaching 5 ft., many-branched, from a very large bulb: fls. small (1 in. or less long) and star-like, numerous, white with purple veins, on spreading pedicels, opening in the afternoon (hence the specific name: *pomeridianus*, *post-meridian*).—Bulb used by Indians and Mexicans for soap-making. Has been catalogued as *Anthericum californicum*. Bulb 4 in. long and half as thick, covered with coarse brown fibers.

AA. *Pedicels very short: segms. spreading from above the base.*

**parviflorum**, Wats. Bulb small (1 in. diam.): st. 1-3 ft., slender-branched; lvs. narrow and grass-like: fls. pinkish,  $\frac{1}{4}$  in. long; ovary broad and acute.

**angustifolium**, Kellogg. Low, about  $1\frac{1}{2}$  ft. Resembles the last, but fls. white and green-lined and somewhat larger, the ovary acute above; perianth funnel-form campanulate, the segms. narrow-oblong.

*C. Leichtlinii*, Baker=*Camassia Leichtlinii*.

L. H. B.

**CHLORÓPHORA** (Greek, referring to the fact that the fustic-tree bears a green dye). *Moracæ*. Two milky-juiced alternate-leaved trees, one in Trop. Afr. and one in Trop. Amer. Lvs. entire or toothed: dioecious; male fls. in cylindrical spikes, the females in nearly globular or oblong heads, these clusters solitary in the axils; perianth of male fls. 4-parted, the segms.

broad and obtuse; stamens 4; ovary a minute rudiment in the males; perianth of female fls. 4-parted or -divided, the segms. concave-thickened at the apex; style lateral on the oblique-ovoid ovary; achene equaling the perianth or somewhat exserted, covering the receptacle. *C. tinctoria*, Gaud. (*Maciara tinctoria*, Don) is the fustic of the W. Indies. It reaches a height of 50 ft., and a diam. of trunk of 2 ft.: usually not thorny: lvs. nearly entire, oblong, acuminate. Variable. The handsome yellow wood yields a yellow dye, which is used also in the making of browns and greens; it is also a strong and resistant timber.

L. H. B.

**CHLORÓPHYTUM** (name means, in Greek, green plant). *Liliacæ*. Rhizomatous herbaceous plants, one of which is familiar in greenhouses.

Very like *Anthericum*, but differing in the thickened filaments of the stamens and the 3-angled or 3-winged caps.: infl. often denser: lvs. broader, often oblanceolate and petiolate: seed disk-like.—Some 60 or more species, in warm parts of Asia, Afr., and Amer. *Consult Anthericum and Paradisea.*

**elatum**, R. Br. (*Anthericum variegatum*, A. *vittatum*, A. *picturatum*, A. *Williamsii*, Hort.). Root fleshy and white: lvs. freely produced from the crown, often 1 in. wide, flattish and bright green, or in the garden varieties with white lines along the margins, and often (*var. picturatum*) also with a yellow band down the center: scape terete and glabrous, 2-3 ft. high, branched; fls. white,  $\frac{1}{2}$  in. long, with revolute oblanceolate segms., which are obscurely 3-nerved on the back. S. Afr. F.S. 21:2240-1.—A valuable and common plant for vases and pots, and sometimes used in summer borders.

Three species that recently have been mentioned in horticultural literature are: *C. amanienae*, Engler, from German E. Afr.; 10 in.: lvs. lanceolate-acuminate, 16 in. long and  $3\frac{1}{2}$  in. or less broad, somewhat fleshy, bronze, with white margin: fls. greenish white, in cluster 6 in. long.—*C. comosum*, Wood (Natal Plants, fig. 279), from Lake Albert. Cent. Afr.; profliferous: lvs. radical, linear, deep green, 2 ft. long: fls. small, white, soon fading, usually in 4's, in a branched cluster 3 ft. long.—*C. Huygheii*, De Wild, Congo; lvs. in a basal tuft, lanceolate, petioled, about 18-20 in. long, 2-2½ in. broad: fls. greenish white, about  $\frac{1}{4}$  in. long, in a bracted raceme 2-3 ft. long.

L. H. B.

**CHLORÓPSIS BLANCHARDIANA**: *Trichloris*.

**CHLORÓXYLON** (green wood: Greek). *Rutacæ*. One species of moderate-sized tree of India, slightly intro. in this country, *C. Swietenia*, DC. (*Swietenia Chloroxylon*, Roxbg.). Young parts gray-puberulent: lvs. abruptly pinnate, the lfts. 20-40, oblique and obtuse and entire: fls. small, 5-merous in terminal and axillary pubescent panicles; calyx deeply lobed; petals clawed, spreading; stamens 10; disk a 10-lobed pubescent body, in which the stamens are inserted: fr. a coriaceous 3-celled caps. Heartwood fragrant, with a beautiful satiny luster, whence the name "Indian Satin-wood." An interesting tree for trial on the southern borders of the U. S.

L. H. B.

**CHOCOLATE**: *Theobroma*.

**CHOÍSYA** (J. D. Choisy, Swiss botanist, 1799-1859). *Rutacæ*. One Mexican shrub, *C. ternata*, HBK., grown in S. Calif. and S. Fla., and sometimes under glass. It grows 4-8 ft. high, making a compact free-blooming bush, with opposite ternate lvs., the lfts. lance-obovate or oblong, thick and entire, with pellucid dots: fls. in a terminal, forking cluster, white, fragrant, orange-like (whence the vernacular name "Mexican orange"), 1 in. across, with pellucid dots. R.H. 1869:330. Gn. 50, p. 203. J.H. III. 34:253.—A handsome shrub, worthy of greater popularity. It will endure several degrees of frost, and should succeed in the open in many of the southern states. Blossoms in S. Calif. at different seasons; it can be made to bloom, it is said, every two months by withholding water and then watering liberally, as is done with roses in S. France. Hardy against a wall in parts of S. England.

L. H. B.

**CHOKE-CHERRY:** *Prunus demissa* (West) and *P. virginiana* (East).

**CHONDROBOLLEA** (compounded from *Chondrorhyncha* and *Bollea*). A genus established to contain hybrids between these genera. See also *Bolleo-Chondrorhyncha*.

**CHONDROPÉTALUM:** hybrids of *Chondrorhyncha* and *Zygopetalum*; see those genera.

**CHONDRORHYNCHA** (*cartilage* and *beak*). *Orchidaceæ*. Three species of S. American epiphytal orchids, practically unknown in the American trade. Cult. as for *Odontoglossum crispum*. They are short-stemmed herbs without pseudobulbs, and oblong, plicate, petioled lvs., the simple scape bearing a single large, odd, yellowish fl. *C. Chéstertonii*, Reichb. f. (O.R. 11:305; 16:57), *C. fimbriata*, Reichb. f., and *C. rosea*, Lindl., are the species. Keep cool and moist. A garden hybrid is reported between *C. Chéstertonii* and *Zygopetalum Mackayi* under the name of *Chondropetalum Fletcheri*. O.R. 1908, 56, f. 8.

GEORGE V. NASH.

**CHORÍSIA** (Ludwig Choris, born 1795, artist of Kotzebue's expedition). *Bombacææ*. Spiny trees of S. Amer. (3 species), one of which is somewhat cult. Lvs. alternate, digitate, of 5-7 entire or serrate lfts.: fls. large, with 5 linear or oblong petals, the peduncles axillary or racemose; staminal tube double, the outer one short and with sterile anthers; ovary 5-loculed and many-ovuled: fr. a pear-shaped caps. with many silky seeds. *C. speciosa*, St. Hil., of Brazil, the "floss silk tree," is cult. in S. Calif., and is adapted to warm glasshouses. It is a medium-sized tree, allied to *Ceiba* and *Bombax*. Lfts. lanceolate, acuminate, dentate; calyx irregular, shining outside, but silky inside; petals obtuse, yellowish and brown-striped at the base, pubescent on the back. The soft silk or cotton of the seed-pods is used for pillows and cushions. L. H. B.

**CHORÍZEMA** (fanciful Greek name). Sometimes spelled *Chorozema*. *Leguminosæ*. Evergreen coolhouse small shrubs grown for the showy pea-like yellow orange and red, usually racemose flowers; spring- and summer-blooming.

Woody plants of diffuse or half-climbing habit, with thick and shining simple often spiny-toothed lvs. and pea-like red or yellow fls.: calyx-lobes 5, the 2 upper ones mostly broader; petals clawed, the standard very broad, keel short; stamens not united: pod short, not constricted.—About 15 species, in Austral., 3 of which

925. *Chorizema ilicifolium*. (× 1/3)

appear to be chiefly concerned in the garden forms. Handsome plants for the cool greenhouse, less popular in this country than abroad. When not grown too soft, they will stand slight frost at times. Grown in the open in S. Calif. and S. Fla. They are grown in a rather peaty soil, after the manner of azaleas, and usually rested in the open in summer. They are excellent for training on pillars and rafters.

Chorizemas are among the most attractive spring-flowering plants, and they are not difficult to grow. Cuttings should be secured in March from medium-ripened wood and may be either potted singly in small pots, or several placed together in larger pots. The

former method has the advantage, because when cuttings are well rooted in the small pots, they may be shifted along without so much disturbance to the roots. The cuttings root readily in a mixture of two parts sharp sand and one of peat, sifted through a fine sieve. They should be placed in a tight case or covered with a bell-glass in a temperature of 58° to 60° by night. A rise of 10° in the day will be sufficient. The inclosure that protects them from drafts should be opened a few minutes now and then to change the air. For potting chorizemas in the early stages, equal parts of good peat and sharp sand is about right. When a 5- or 6-inch pot is reached, much less sand should be used,—just enough to give the earth a gritty feeling and the peat may be in a rather rough state, just small enough to be conveniently used in potting. The potting should be firm, as loose potting is bad for all kinds of hardwood plants. Keep the plants shaded from the sun during the hot months, and use the syringe freely. Also pinching must be attended to from their early stages to insure a good bushy plant. It is best not to stop the plants after August, as they will begin then to set buds. A plant in a 5- or 6-inch pot may be grown the first year if properly attended to. The plants should be wintered in a night temperature of 40° with a rise of 10° or 15° during the day. The second summer, and from that on as long as the plants are kept, they do better if plunged in a bed of clean coal-ashes out-of-doors, provided there is no danger from frost; by so doing, a much shorter-jointed growth will be the result. Plants well established in their pots may be fed with liquid manure until they set buds. A 3-inch potful of cow- or horse-urine to two and one half or three gallons of water, will be sufficient, and for a change a handful of soft-coal soot to the same amount of water; but always water twice with clean water between applications. Brown scale sometimes gets a foothold on chorizemas and it may be eradicated by fumigation with cyanide of potassium. Red-spider may be kept down with the syringe. (George F. Stewart.)

**varium**, Benth. (*C. elegans*, Hort.). The common cult. species, in several forms: erect, 4-6 ft., pubescent on under side of lvs. and on branches: lvs. cordate-ovate, undulate and prickly-toothed, 2 in. or less long: fls. in many pubescent racemes; standard light orange, wings and keel handsome purple-red. B.R. 25:49.—Garden forms are *C. Chandleri*, with yellow-red standard, and blood-red wings, the fls. large and numerous; and such names as *grandiflorum*, *macrophyllum*, *latifolium*, *floribundum*, *multiflorum*. *C. Löwii*, Hort., is a form of this species, with larger and brighter-colored fls.

**cordatum**, Lindl. (*C. superbum*, Lem.). Tall slender glabrous shrub (7-10 ft.), with weak branches: lvs. cordate-ovate to ovate-lanceolate, 2 in. or less long, small-toothed and more or less prickly: fls. many; standard scarlet-red, wings and keel purple-red. B.R. 24:10. I.H.:29. Var. *rotundifolium*, Hort., has roundish lvs. Var. *splendens*, Hort., is offered.

**ilicifolium**, Labill. Fig. 925. Low and diffuse, weak, glabrous, the branches slender and erect or drooping: lvs. ovate to lanceolate, 1 in. long, often cordate at base, thick, coarsely veined, strongly undulate and with prickly teeth or lobes: fls. in few-fld. loose racemes, orange-red in spring and summer. B.M. 1032 (as *C. nanum*). B.R. 1513 (as *C. triangulare*). L. H. B.

**CHRISTMAS FLOWER:** *Euphorbia pulcherrima*.

**CHROSPÉRMA:** *Zygadenus*.

**CHROZÓPHORA** (Greek, *color-bearing*, on account of their use). *Euphorbiææ*. Dye-yielding herbs. Lvs. alternate, stellate hairy: fls. monœcious; staminate calyx 5-parted, valvate; petals free; styles biparted;

ovary 3-celled, 3-ovuled.—Nine, species chiefly of Old World deserts. *C. tinctoria*, Juss. (*Crōton tinctorius*, Linn.), TURNSOLE, a Medit. annual, formerly used for its blue dye, is listed in some European catalogues.

**CHRYSALIDOCÁRPUS** (Greek for *golden fruit*). *Palmaceæ*, tribe *Arécæ*. Spineless stoloniferous feather palms, with medium fasciculate ringed stems.

Leaves pinnatisect, long-acuminate; segms. about 100, bifid at the apex, the lateral nerves remote from the midrib; fr. usually violet or almost black.—Species 1, which is a popular florist's plant. Madagascar. Treated

926. *Chrysalidocarpus lutescens*.

as a part of *Hyophorbe* by Engler and Prantl, but here kept distinct, as it is commonly known as *Chrysalidocarpus* by cultivators.

*lutescens*, Wendl. (*Hyophorbe indica*, Gaertn. *H. Commersoniana*, Mart. *Aréca lutescens*, Bory). Fig. 926. St. 30 ft. high, 4-6 in. diam., cylindrical, smooth, thickened at the base; lvs. very long; segms. almost opposite, lanceolate, 2 ft. long, 2½ in. wide, acute, with 3 prominent primary nerves, which are convex below and acutely 2-faced above. Bourbon. A.G. 13: 141. A.F. 4:566.—In growing *Chrysalidocarpus* (or *Aréca*) *lutescens* in quantity, it will be found a good plan to sow the seeds either on a bench, in boxes or seed-pans, so prepared that the seedlings will remain in the soil in which they germinate until they have made 2 or more lvs. The first lf. made above the soil is small, and if plants are potted off at this stage they must be very carefully watered in order not to sour the soil. In the preparation of the receptacles for the seed, a little gravel in the bottom will be found good, as the roots work very freely through it, and when the time comes to separate the plants previous to potting, it is an easy matter to disentangle the roots without bruising them. Probably the plan which works best is to wash the soil and gravel entirely from among the roots. Pot in soil not too dry, and for the next few days keep the house extra warm and humid, and the plants shaded from the sun without any moisture applied to the soil.

JARED G. SMITH and G. W. OLIVER.

**CHRYSANTHEMUM** (Greek, *golden flower*). Including *Pyrethrum*. *Compósitæ*. Plate XXX. A diverse group of herbaceous and sub-shrubby plants, mostly hardy, and typically with white or yellow single flowers, but the more important kinds greatly modified in form and color, grown in the open or flowered under glass in fall.

Annual or perennial herbs, sometimes partly woody, glabrous or loosely pubescent or rarely viscid, usually heavy-scented: lvs. alternate, various, from nearly or quite entire to much dissected: heads many-fl., terminating long peduncles or disposed in corymbose clusters, radiate (rays sometimes wanting); disk-fls. perfect and mostly fertile; ray-fls. pistillate, mostly fertile, the ray white, yellow, rose-colored, toothed or entire; receptacle naked, flat or convex; involucre-scales imbricated and appressed, mostly in several series, the margins usually scarious: achene of disk- and ray-fls. similar, striate or angled or terete or more or less ribbed, those of the ray-fls. often 3-angled; pappus 0, or a scale-like cup or raised border.—Probably nearly 150 recognizable species, in temperate and boreal regions in many parts of the globe, but mostly in the Old World.

The genus *Chrysanthemum*, as now accepted by botanists, includes many diverse species so far as general appearance is concerned, but nevertheless well agreeing within themselves in systematic marks and by these same marks being separated from related groups. The marks are in large part set forth in the preceding paragraph. Bentham and Hooker make twenty-two sub-groups (of which about six include the garden forms), based chiefly on the way in which the seeds are ribbed, cornered, or winged, and the form of the pappus. The garden pyrethrums cannot be kept distinct from chrysanthemums by garden characters. The garden conception of *Pyrethrum* is a group of hardy herbaceous plants with mostly single flowers, as opposed to the florists' or autumn chrysanthemums, which reach perfection only under glass, and the familiar annual kinds which are commonly called summer chrysanthemums. When the gardener speaks of pyrethrums, he usually means *P. roseum*. Many of the species described below have been called pyrethrums at various times, but they all have the same specific name under the genus *Chrysanthemum*, except the most important of all garden pyrethrums, viz., *P. roseum*, which is *C. coccineum*. The feverfew and golden feather are still sold as pyrethrums, and there are other garden species of less importance. The botanical conception of *Pyrethrum* is variously defined; the presence of a rather marked pappus-border on the achene is one of the distinctions; the pyrethrums are mostly plants with large and broad heads either solitary or in loose corymbose clusters, the rays usually conspicuous and commonly not yellow, and the fruits five- to ten-ribbed. Hoffmann, in Engler & Prantl "Natürlichen Pflanzenfamilien," adopts eight sections, one of them being *Tanacetum* (tansy) which most botanists prefer to keep distinct.

Although the genus is large and widespread, the number of plants of interest to the cultivator is relatively few. Of course the common garden chrysanthemum, derived apparently from two species, is the most useful. The insect powder known as "pyrethrum," is produced from the dried flowers of *C. cinerariæfolium* and *C. coccineum*. The former species grows wild in Dalmatia, a long narrow mountainous tract of the Austrian empire. "Dalmatian insect powder" is one of the commonest insecticides, especially for household pests. *C. cinerariæfolium* is largely cultivated in France. *C. coccineum* is cultivated in California, and the product is known as buhach.

There are over one hundred books about the garden chrysanthemum, and its magazine literature is probably exceeded in bulk only by that of the rose. It is the flower of the East, as the rose is the flower of the West.

Aside from oriental literature, there were eighty-three books mentioned by C. Harman Payne, in the Catalogue of the National Chrysanthemum Society for 1896. Most of these are cheap cultural guides, circulated by the dealers. The botany of the two common species has been monographed by W. B. Hemsley in the *Gardeners' Chronicle*, series III, vol. 6, pp. 521, 555, 585, 652, and in the *Journal of the Royal Horticultural Society*, vol. 12, part I. The great repositories of information regarding the history of the chrysanthemum, from the garden point of view, are the scattered writings of C. Harman Payne, his "Short History of the Chrysanthemum," London, 1885, and the older books of F. W. Burbidge and John Salter. For information about varieties, see the Catalogues of the National Chrysanthemum Society (England) and the *Liste Descriptive*, and supplements thereto, by O. Meulenaere, Ghent, Belgium.

927. *Chrysanthemum carinatum*, the form sold as *C. Burridgeanum*. ( $\times \frac{1}{2}$ )

There are a number of rather expensive art works, among which one of the most delightful is the "Golden Flower: Chrysanthemum," edited by F. Schuyler Mathews, Prang, Boston, 1890. "Chrysanthemum Culture for America," by James Morton, Clarksville, Tenn., published in New York in 1891, was the first authentic American work. Within the past few years have appeared "The Chrysanthemum," by Arthur Herrington, "Smith's Chrysanthemum Manual," by Elmer D. Smith, and recently "Chrysanthemums and How to Grow Them," by I. L. Powell.

Aside from the florist's chrysanthemum (*C. hortorum*), no particular skill is required in the growing of these plants, although great perfection is attained by some gardeners in the handling of individual plants of the marguerites (*C. frutescens*). The hardy border perennial chrysanthemums may be either small-flowered rugged forms of *C. hortorum*, as the "hardy pompons" and also the "artemisias" of old gardens, or they may be other species. Some of these other species are the "pyrethrums" of gardens, and some (as the *C. maximum* and *C. uliginosum* class) are the "moon daisies" and "moonpenny daisies" of the hardy perennial plantation. Some of the very dwarf tufted kinds (as *C. Tchihatchewii*) make excellent edging plants. The moon daisies deserve to be better known for mass planting and bold lines when a great display of heavy white bloom is wanted. Most of them bloom the first season from early-sown seed. The Shasta daisy and its derivatives are of the moon daisy group. They all profit by a covering of coarse mulch in the fall. See *Pyrethrum* and *Marguerite*.

The annual chrysanthemums are easily grown flower-garden subjects, suitable for a bold late display in places where delicate and soft effects are not desired.

*C. carinatum*, *C. coronarium* and *C. segetum* are the common sources of these annuals. They are hardy and rugged; and they need much room.

#### A. Plant annual (at least so treated in cult.): the "summer chrysanthemums."

##### B. Rays typically white.

1. *carinatum*, Schousb. (*C. tricolor*, Andr. *C. matricaroides*, Hort.). Fig. 927. Glabrous annual, 2-3 ft. high; st. much branched; lvs. rather fleshy, pinnatifid: fls. in solitary heads which are nearly 2 in. across, with typically white rays and a yellow ring at the base; involucre bracts carinate (keeled). Summer. The two colors, together with the dark purple disk, gave rise to the name "tricolor." The typical form, intro. into England from Morocco in 1798, was pictured in B.M. 508 (1799). By 1856 signs of doubling appeared (F.S. 11:1099). In 1858 shades of red in the rays appeared in a strain intro. by F. K. Burridge, of Colchester, England, and known as *C. Burridgeanum*, Hort. (see B.M. 5095, which shows a ring of red on the rays, adding a fourth color to this remarkably brilliant and varied fl., and F.S. 13:1313, which also shows *C. venustum*, Hort., in which the rays are entirely red, except the original yellow circle at the base). G. 2:307. Gn.W. 24:675. *C. annulatum*, Hort., is a name for the kinds with circular bands of red, maroon, or purple. R.H. 1869:450. *C. Dunnettii*, Hort., is another seed-grower's strain. There are full double forms in yellow margined red, and white margined red, the fls. 3 in. across (see R.H. 1874:410), under many names. See, also, Gn. 26, p. 440; 10, p. 213; 21:22. R.H. 1874, p. 412. S.H. 2:477. G.W. 14, p. 99.—The commonest and gaudiest of annual chrysanthemums, distinguished by the keeled or ridged scales of involucre and the dark purple disk.

##### BB. Rays typically tight yellow.

2. *coronarium*, Linn. (*Anthemis coronaria*, Hort.), Annual, 3-4 ft.: lvs. bipinnately parted, somewhat clasping or eared at the base, glabrous, the segms. closer together than in *C. carinatum*: involucre scales broad, scarious; rays lemon-colored or nearly white. July-Sept. Medit. Gn. 26:440. G.C. II. 19:541.—The full double forms, with rays reflexed and imbricated, are more popular than the single forms. This and *C. carinatum* are the common "summer chrysanthemums." This is common in old gardens, and is also somewhat used for bedding and for pot culture.

##### BBB. Rays typically golden yellow.

3. *segetum*, Linn. CORN MARIGOLD. Annual, 1-1½ ft.: lvs. sparse, clasping, oblong to oblanceolate, variable, the lower petioled and the upper clasping incisions coarse or fine, deep or shallow, but usually only coarsely serrate, with few and distant teeth, the lower ones less cut; bracts of involucre broad, obtuse; rays obovate and emarginate, golden yellow. June-Aug. Eu., N. Afr., W. Asia. Escaped in waste places. Gn. 18, p. 195. R.H. 1895, pp. 448, 449. Var. *grandiflorum*, Hort., is a larger-fl. form of this weed, which is com-

mon in the English grain fields. Forms of the plant are cult.; the var. *Cloth of Gold*, J.H. III. 12:445, is one of the best. Var. *pumilum*, Hort., very compact, 8 in. high. This species is much less popular than *P. carinatum* and *P. coronarium*. It is forced to a slight extent for winter bloom.

4. *multicaule*, Desf. Glabrous and glaucous annual, 6-12 in. high: sts. numerous, simple or branched, stout, terete: lvs. fleshy, variable, usually linear-spatulate, 1-3 in. long and  $\frac{1}{2}$ - $\frac{3}{4}$  in. broad, very coarsely toothed or lobed, sometimes shorter, with few narrow-linear, acute, entire segms. about 1 line broad: rays much shorter and rounder than in *C. segetum*, golden yellow. Algeria. B.M. 6930.—Rarer in cult. than the last. Said to be useless as a cut-fl.

AA. Plant perennial.

B. The florist's chrysanthemum, and wild progenitors or near relatives, grown as pot or bench subjects because the seasons are not long enough, in the N., for full maturity in the open: heads often double: lvs. usually lobed or strongly notched.

5. *morifolium*, Ram. (*C. sinense*, Sabine). Fig. 928. Perennial, one of the sources (with *C. indicum*) of the large florist's chrysanthemums: wild plant shrubby, erect and rigid, 2-3 ft., branching, few-lvd.: lvs. thick and stiff, 2 in. long, densely white-tomentose beneath, variable in shape from ovate to lanceolate, cuneate at base, margin entire or coarsely toothed: outer bracts of involucre thick, linear, acute, white-tomentose; fl.-heads small, with yellow disk and white rays somewhat exceeding the disk. China. G.C. III. 31:302 (adapted in Fig. 928). Var. *gracile*, Hemsl. Lvs. thin or only moderately thick, palmately lobed or pinnately lobed, dentate, the teeth often mucronate: outer involucre bracts herbaceous, linear and acute, varying in pubescence; rays white, pink or lilac, equaling or exceeding the disk. China, Mongolia, Japan.

6. *indicum*, Linn. Fig. 929. Much like the last, but lvs. thin and flaccid, pinnately parted, with acute or

929. Wild form of *Chrysanthemum indicum*, as grown in England.

mucronate teeth: outer involucre bracts broad and scarious except the herbaceous midnerve; rays yellow, shorter than diam. of the disk. China and Japan. B.M. 7874. G.C. III. 8:565; 28:342; 31:303 (adapted in Fig. 929).—This species is not native to India, and therefore Linnaeus' name is inappropriate. Abroad, *C. indicum* is often used in a wide sense, to include *C. morifolium*. In recent years, both *C. morifolium* and *C. indicum* have been grown in England from wild stock, and from such studies of them the present descriptions and figures are drawn. From these plants it is supposed, by endless variation and by hybridization, the highly developed glasshouse or florist's chrysanthemums have come, a group that may be distinguished as *C. hortorum*, Figs. 938-50.

7. *ornatum*, Hemsl. (*C. marginatum*, Hort.). Allied to the above two species, and perhaps a form of *C. morifolium*: bushy plant, 3-4 ft.: lvs. palmately lobed, ovate in outline, white-tomentose beneath and on the margin,  $1\frac{1}{2}$ -2 in. long: fl.-heads loosely corymbose, 2 in. or less across, the disk yellow and rays white and broad; bracts of involucre in about 3 series, all similar, white in center, purple-brown on margin: achenes small, oblique, glabrous. B.M. 7965. G.C. III. 35:51. Gn. 71, p. 53; 73, p. 90.—A recent introduction; grows well in the open in England, but does not bloom unless taken indoors.

BB. The garden pyrethrums and others; heads usually not highly doubled and modified.

c. Lvs. cut to the midrib or nearly so.

D. Heads borne in corymbs, i.e., flat-topped, dense clusters.

EE. Rays yellow.

8. *achilleæfolium*, DC. (*Achillea aurea*, Lam.). Perennial, 2 ft.: st. usually unbranched, except along the creeping and rooting base: sts. and lvs. covered with fine soft grayish white hairs, oblong in outline, about 1 in. long,  $\frac{1}{4}$  in. wide, finely cut: rays 7-8, short, a little longer than the involucre. Siberia, Caucasus.—Rare in cult. Less popular than the achilleas, with larger fl.-clusters.

EE. Rays white.

9. *corymbosum*, Linn. (*Pyræthrum corymbosum*, Willd.). Robust perennial, 1-4 ft.: st. branched at the apex: lvs. sometimes 6 in. long, 3 in. wide, widest at middle and tapering both ways, cut to the very midrib, the segms. alternating along the midrib. Eu., N. Afr., Caucasus. G.C. II. 20:201.—Rare in cult. Segms. may be coarsely or finely cut, and lvs. glabrous or vilous beneath.

928. Wild form of *Chrysanthemum morifolium*, as grown in England.

10. *Parthénium*, Pers. (*Pyrèthrum Parthénium*, Smith. *Parthénium Matricària*, Guedl.). **FEVERFEW**. Fig. 930. Glabrous strong-scented perennial, 1-3 ft., much branched in the taller forms; lvs. ovate or oblong-ovate in outline, pinnatisect or bi-pinnatisect, smooth or lightly pubescent; segms. oblong or elliptic-oblong, pinnatifid or cut, the uppermost more or less confluent.; fl.-heads small, many, stalked, corymbose; disk yellow; rays white, oblong, equaling or exceeding the disk. Eu. to the Caucasus.—Some authors regard this as one widely variable species; others make at least two species, one of them (*C. præaltum*, Vent.) being the Caucasian form, distinguished by more deeply cut lvs., longer-peduncled heads, and rays longer than the disk rather than equaling it (as in *C. Parthenium* type).—There are double-fl. and also discoid forms. Var. *aureum*, Hort. (*P. aureum*, Hort.), is the **GOLDEN**

930. *Chrysanthemum Parthenium*. Feverfew.  
( $\times \frac{1}{2}$ )

**FEATHER** commonly used for carpet-bedding. It has yellow foliage, which becomes green later in the season, especially if fls. are allowed to form. It is used for edgings and cover. Var. *aureum crispum*, Hort., is dwarf, compact, with foliage curled like parsley. Var. *selaginoides*, and var. *laciniatum*, Hort., are distinct horticultural forms. Var. *glaucum*, Hort., has dusty white foliage, and does not bloom until the second year. Intro. by Danman & Co., 1895. All these varieties are prop. by seeds. The feverfew is common about old yards, and is much employed in home gardens as edging. In its undeveloped and prevailing forms, it is one of the "old-fashioned" plants.

DD. Heads borne singly on the branches or sts. (or at least not definitely clustered).

E. Height less than 1 ft.

11. *Tchihatchewii*, Hort. (*C. Tchihatcheffii*, Hort.). **TURFING DAISY**. Densely tufted perennial for carpet-

ing dry, waste places; height 2-9 in.: sts. very numerous, rooting at the base: foliage handsome dark green, finely cut, the segms. linear, persisting into winter: fl.-heads solitary on axillary peduncles, borne profusely for several weeks; rays white, disk yellow. Asia Minor. R.H. 1869, p. 380, desc., and 1897, p. 470. Gn. 26, p. 443.—Prop. by division of roots or simply by cutting the rooted sts., but chiefly by seeds. Highly recommended abroad for spring and early summer bloom in edgings and low formal plantings. Said to thrive in dry places and under trees.

EE. Height more than 1 ft.

F. Group of greenhouse plants (at the N.), shrubby at the base: sts. branched at the top: rays white or lemon.

G. Foliage not glaucous.

12. *frutescens*, Linn. **MARGUERITE**. **PARIS DAISY**. Figs. 931, 932. Usually glabrous, 3 ft. high, perennial: lvs. fleshy, green: heads numerous, always single; rays typically white, with a lemon-colored (never pure yellow or golden) form. Canaries. G.C. II. 13:561; III. 35:216. Gn. 12, p. 255; 17, p. 5; 26, p. 445; 70, p. 310.—Intro. into England. 1699. This is the popular florists' Marguerite, which can

931. *Chrysanthemum frutescens*.  
The Marguerite or Paris daisy.  
( $\times \frac{1}{2}$ )

be had in flower the year round, but is especially grown for winter bloom. Var. *grandiflorum*, Hort., is the large-fl. prevailing form. The lemon-colored form seems to have originated about 1880. Under this name an entirely distinct species has also been passing, yet it has never been advertised separately in the American trade. See No. 13.

GG. Foliage glaucous.

13. *anethifolium*, Brouss. (*C. feniculaceum*, Steud. *P. feniculaceum* var. *bipinnatifidum*, DC.). **GLAUCOUS MARGUERITE**. Fig. 932. Perennial: rarer in cult. than *C. frutescens* (which see), but distinguished by its glaucous hue, and by the way in which the lvs. are cut. The segms. are narrower, more deeply cut, and more distant than in No. 12. The lvs. are shorter petioled. Canaries.—This species is doubtless cult. in American greenhouses as *C. frutescens*. A lemon-fl. form is shown in R.H. 1845:61 but called *C. frutescens*.

FF. Group of hardy outdoor herbs: sts. usually unbranched: rays white or red, never yellow.

G. Foliage not glaucous: fls. sometimes double.

14. *coccineum*, Willd. (*Pyrèthrum roseum*, Bieb., not Web. & Mohr. *P. hybridum*, Hort.). Fig. 933. Glabrous perennial, 1-2 ft. high: st. usually unbranched,

932. Leaves of *Chrysanthemum frutescens* (left) and *C. anethifolium* (right). ( $\times 1$ )

rarely branched at the top: lvs. thin, dark green, or in dried specimens dark brown: involucre scales with a brown margin; rays white or red in such shades as pink, carmine, rose, lilac, and crimson, and sometimes tipped yellow, but never wholly yellow. Caucasus, Persia. F.S. 9:917. Gn. 26, pp. 440, 443. Gng. 2:7; 5:309. R.H. 1897, p. 521. Not B.M. 1080, which is *C. coronopifolium*. The first picture of a full double form is R. H. 1864:71.—This species is the most important and variable of all the hardy herbaceous kinds. There have been perhaps 700 named horticultural varieties. There is an anemone-fl'd. form with a high disk. The species is also cult. in Calif. and France for insect powder. *C. atrosanguineum*, Hort., is said to be a good horticultural variety with dark crimson fls. The *C. roseum* of Weber & Mohr being a tenable name, Hoffmann proposes Ascherson's name, *C. Marshallii*, for the *P. roseum* of Bieberstein; but Willdenow's *C. coccineum* is here retained.

gg. Foliage glaucous: fls. never double.

15. *cinerariæfolium*, Vis. Glaucous perennial, slender, 12-15 in. high: sts. unbranched, with a few short, scattered hairs below the fl.: lvs. long-petioled, silky beneath, with distant segms.: involucre scales scarious and whitish at the apex. Dalmatia. B.M. 6781.—Said to be chief source of Dalmatian insect powder. Rarely cult. as border plant. Common in botanic gardens.

cc. Lvs. not cut to the midrib, pinnatifid or coarsely toothed (except perhaps in No. 22).

d. Heads borne in clusters, mostly flat-topped

16. *Balsámíta*, Linn. (*Tanacetum Balsámíta*, Linn. *Pyrèthrum Balsámíta*, Willd. *Balsámíta vulgaris*, Willd.). COSTMARY. MINT GERANIUM. Sometimes erroneously called "lavender," from its sweet agreeable odor. Tall and stout perennial: lvs. sweet-scented, oval or oblong, obtuse, margined with blunt or sharp teeth, lower ones petioled, upper ones almost sessile, the largest lvs. 5-11 in. long,  $1\frac{1}{2}$ -2 in. wide: pappus a short crown. W. Asia.—Typically with short white rays, but when they are absent the plant is var. *tanacetoides*, Boiss. Fig. 934. Rayless. This has escaped in a few places from old gardens: it seems to be the prevailing garden form.

DD. Heads borne singly on the branches or sts., or at least not in definite clusters; rays large, white.

17. *lacústre*, Brot. (*C. latifolium*, DC.). Fig. 935. Perennial; endlessly confused with *C. maximum* in gardens, and the two species are very variable and difficult to distinguish; the fls. can hardly be told apart. *C. lacustre* is a taller and more vigorous plant, and sometimes it is branched at the top, bearing 3 heads, while *C. maximum* is always 1-headed, and the lvs. in that species are much narrower. Height 3-6 ft.: st. sparsely branched: lvs. partly clasping, ovate-lanceolate, with coarse, hard teeth: rays about 1 in. long; pappus of the ray 2-3-eared. Portugal, along rivers, swamps and lakes. R.H. 1857, p. 456.

18. *máximum*, Ramond. Fig. 936. This perennial species has narrower lvs. than *C. lacustre*, and they are narrowed at the base: height 1 ft.: st. more angled than the above, simple or branched at the very base, always 1-headed and leafless for 3-4 in. below the head: lower lvs. petioled, wedge-shaped at the base, or long-ob lanceolate; the upper lvs. becoming few, lanceolate but usually not very prominently pointed, the teeth not very large or striking: pappus none: involucre scales narrower and longer, whitish-transparent at the margin, while those of *C. lacustre* are broader, more rounded at the apex, and with a light brown scarious margin. Pyrenees. J.H. III. 5:251. Gn. 26, p. 437; 73, p. 567. G. 5:445. G.M. 46:676. Var. *Róbinsonii*, Hort., has finely cut or fringed rays, giving the bloom the appearance of a Japanese chrysanthemum.

R. H. 1904:515. Var. *Dávidsii*, Hort., has sts. of great length, suitable for cutting. Var. *filifórmis*, Hort., has deeply serrate long and drooping rays. There are many other forms, differing in time of bloom as well as in habit and in form of fl. The *Shasta daisy* (said to be a

933. *Chrysanthemum coccineum*. The *Pyrèthrum roseum* of gardens. ( $\times \frac{1}{2}$ )

934. *Chrysanthemum Balsámíta* var. *tanacetoides*. Costmary or mint geranium. ( $\times \frac{1}{2}$ )

hybrid) is an early-flowering very floriferous race, with several strains of fls., mostly large and pure white, although in one form the buds are reported as lemon-yellow but opening white; various sub-varieties are now offered. It is a good summer and autumn bloomer, and usually hardy in the northeastern states.

935. *Chrysanthemum lacustre*. A short-rayed form. ( $\times \frac{1}{2}$ )

19. *uliginosum*, Pers. (*Pyrethrum uliginosum*, Waldst.). GIANT DAISY. Stout, erect bushy leafy-stemmed perennial, 4-7 ft. high, with light green foliage: st. nearly glabrous, striate, branching above, roughish: lvs. long-lanceolate, prominently pointed, with large coarse sharp teeth: heads often several together and not long-stalked, 2-3 in. across, white, late. Hungary. B.M. 2706. A.F. 4:523; 8:813. Gng. 2:375; 5:183. A.G. 19:403. R.H. 1894, p. 82. Gt. 46, p. 103. G.C.H. 10:493. Gn. 26, p. 442; 38, p. 523; 62, p. 180. G.W. 15, p. 316. G.M. 51:453. Gn. W. 23:415.

—It blooms the first year from seed or division, and has been forced for Easter somewhat as *Hydrangea paniculata* can be

treated. Excellent for cut-fls. The blossoms should be cut soon after opening, as the disks darken with age. The plant needs a rich moist soil; it deserves a greater popularity.

20. *Leucanthemum*, Linn. (*Leucanthemum vulgare*, Lam.). WHITEWEED. OX-EYE DAISY. Fig. 937. Glabrous perennial erect weed, 1-2 ft. high: root-lvs. long-petioled, with a large, oval blade and coarse, rounded notches; st.-lvs. lanceolate, becoming narrower toward the top, serrate, with few distant and sharper teeth. (Var. *pinnatifidum*, Lec. & Lam., has more divided lvs.): heads terminal, showy white. June, July. Eu., N. Asia. Gn. 70, p. 176. —One of the commonest weeds in the eastern states, being characteristic of worn-out meadows. The daisies are not cult., but they are often gathered for decoration, and make excellent cut-fls. The plant is very variable, and forms adapted to fl.-garden uses will probably be developed. Rayless plants are sometimes found.

21. *nipponicum*, Hort. (*Leucanthemum nipponicum*, Franch.). Differs from others of this set in being shrubby at base and lvs. broadest above the middle: to 2 ft., the sts. strong, simple, few-fl.: lvs. thick, oblong-spatulate to oblanceolate, sessile, irregularly denticulate but entire at base, 3-4 in. long, pale beneath: fl.-heads 2-3½ in. across, with a hemispherical involucre of oval

obtuse bracts; rays bright white, linear, minutely 5-toothed; disk pale greenish yellow. Japan. B.M. 7660. R.H. 1905, p. 47. F. E. 20:434.—Hardy in the N., in the root, but the sts. killed down by frost; has the general appearance of *C. lacustre*. A beautiful large-fl. species, producing its large blooms in late autumn.

22. *arcticum*, Linn. Low perennial, 3-15 in., glabrous or nearly so: lvs. cuneate, long-tapering at base, toothed or cut at the apex, sometimes 3-5-lobed, the uppermost ones small and very narrow and nearly entire: involucre-bracts broad and brown-margined; rays clear white, about 1 in. long: pappus wanting. Arctic Eu., Asia and Amer. —An attractive very hardy species, making a clump of dark green foliage and producing in autumn many large white fls., sometimes tinged lilac or rose.

*C. coronopifolium*, Willd. = *C. roseum*. — *C. grande*, Hook. f. (*Plagius grandiflorus*, L'Her.). Stout erect perennial of Algeria, 2-3 ft.: lvs. oblong to linear-oblong, often lyrate, coarsely toothed: fl.-heads large, solitary, rayless, golden yellow, to 2 in. across. B.M. 7886. — *C. grandiflorum*, Willd. Shrubby, smooth, from the Canaries, with cuneate lobed lvs., the parts lanceolate or linear and toothed or entire: fl.-heads solitary, the rays white and disk yellow: allied to *C. frutescens*; variable. — *C. inodorum*, Linn. = *Matricaria inodora*. — *C. macrophyllum*, Waldst. & Kit. Perennial herb, 3 ft.: lvs. very large, nearly sessile, pinnatisect, the lobes lanceolate and coarsely toothed: heads very many, corymbed; rays white with yellowish tinge, the disk yellow. June, July; an outdoor plant. Hungary. G.W. 12, p. 410. — *C. Mawii*, Hook. f. Herbaceous, with woody rootstock, 1½ ft.: lvs. about 1 in. long, triangular to oblong, pinnatifid: fl.-heads 1½ in. diam., long-stalked; rays 3-toothed, white with reddish backs. Mts. Morocco; summer in the open. B.M. 5997. — *C. multiflorum*, Hort. Fls. greenish white: said to be a cross between a single-fl. chrysanthemum and *C. Pallasianum* (*Pyrethrum Pallasianum*, Maxim., of N. Asia, apparently not a garden species). — *C. ochroleucum*, Masf. Glabrous undershrub of the Canaries: lvs. obovate-cuneate, coarsely toothed: rays pale yellow. — *C. parthenioides*, Willd., a form of *C. Parthenium*. — *C. parthenioides*, Voss. One of the feverfew forms; probably *C. præaltum*. — *C. roseum*, Web. & Mohr. (*C. coronopifolium*, Willd., not Vill.), not Bieb. Perennial herb, 2½ ft.: lvs. once-pinnate: fl.-heads solitary; rays rose-red or flesh-color. Caucasus. — *C. tomentosum*, Loisel. An alpine Corsican species: tufted, 2 in. high when in bloom: lvs. pinnatifid, densely tomentose: fl.-heads ¾ in. across, white-rayed, on sts. 1 in. long. — *C. viscosum*, Desf. Annual: disk orange-yellow, rays sulfur-yellow. Medit. — *C. vulgare*, Bernh. = *Tanacetum vulgare*. — *C. Zawadskii*, Herbach, of Galicia, is a tufted plant with rose-tinted fls. all summer.

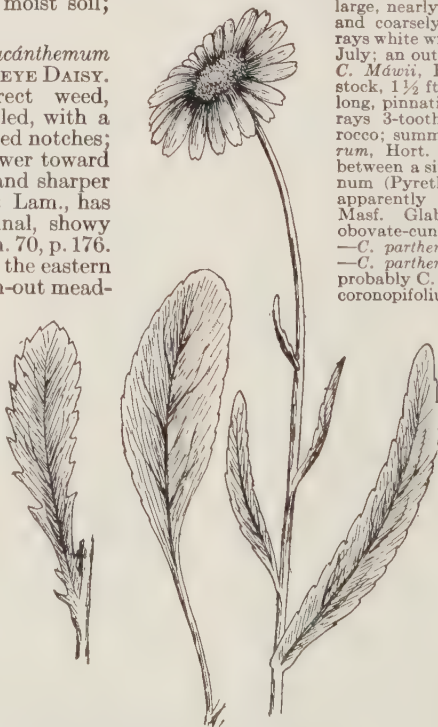

WILHELM MILLER.  
L. H. B.†

#### Types of the common chrysanthemum.

The common chrysanthemums of the florists (*C. hortorum*) are often called "large-flowering," and "autumn chrysanthemums," to distinguish them from the hardy outdoor kinds, although

937. *Chrysanthemum leucanthemum*. Ox-eye daisy, or whiteweed. ( $\times \frac{1}{2}$ )

936. *Chrysanthemum maximum*. ( $\times \frac{1}{2}$ )

neither of these popular names is entirely accurate or distinctive. They are the blended product of *C. indicum* and *C. morifolium*, two species of plants that grow wild in China and Japan. The outdoor or hardy chrysanthemums are derived from the same species, being less developed forms. The florist's chrysanthemum is not necessarily a glasshouse subject; but it is bloomed under glass for protection and to secure a longer season. Ten to fifteen dominant types of chrysanthemums have been recognized by the National Chrysanthemum Society of England. The words "types," "races," and "sections," have always been used by horticulturists to express much the same thing, but types can always be defined clearly, while sections cannot, and the word race should be restricted to cultivated varieties that reproduce their character by seed, which is not the case with the large-flowering chrysanthemums. The following explanation and scheme, it is hoped, will clearly set forth the main types, and explain some of the many terms that confuse the beginner. The horticultural sections are wholly arbitrary, being chiefly for the convenience of competitors at exhibitions, and therefore changing with the fashions. The present classification is based on the form of the flower, as each type can be had in any color found in the whole genus.

**A. Single forms: rays in 1 series, or few series: disk low and flat.**

**1. The Small Single Type.**—Fig. 950. Fls. about 2 in. across, star-like, i. e., with the rays arranged in one series around the yellow disk. "Single," however, is a relative term, and in Fig. 950 there is more than one series of rays, but this does not destroy the "singleness" of effect. All fls. are either single, semi-double, or double, but all the intermediate forms tend to disappear, as they are not desired.

**2. The Large Single Type.**—Like the preceding, but the fls. 4 in. or more across, and fewer. The large and small single types are practically never grown outdoors and are best suited for pot culture, each specimen bearing 20–80 fls. They are also grown by florists in considerable quantity for cutting.

939. Japanese anemone chrysanthemum when fully expanded.

938. The small and regular anemone type.

**AA. Anemone-fl'd. forms: rays as in A: disk high and rounded.**

**B. Fls. (florets) small, numerous, regular.**

**3. The Small Anemone Type.**

—Commonly called "Pompon Anemone." Fig. 938. Fls. 2–3 in. across, and usually more numerous than in the large anemone type. All the anemone forms are essentially single, but the raised disk, with its elongated tubular fls., usually yellow but often of other colors, gives them a distinct artistic effect, and they are, therefore, treated as intermediates in character between the single and double forms. Like the single forms, they are less popular than the double kinds, and the varieties are, therefore, less numerous and more subject to the caprices of fashion.

**BB. Fls. large, fewer, regular.**

**4. The Large Anemone Type.**—Fls. 4 in or more across and fewer. Heads must have large size, high neatly formed centers, and regularly arranged florets, the disk being composed of long tubes or quills and the rays flat and horizontally arranged.

**BBB. Fls. large, few, irregular.**

**5. The Japanese Anemone Type.**—Fig. 939. Fls. 4 in. or more across, and irregular in outline; fantastic and extreme anemone forms.

**AAA. Double-fl'd. forms: rays in many series: disk absent or nearly so.**

**B. Fls. small; rays short.**

**6. The Pompon Type.**—Figs. 940, 949. Fls. 1–2 in. across. The outdoor kinds are likely to be small, flat and buttonlike, while those cult. indoors are usually larger and nearly globular. Fig. 940 shows the former condition. It is from one of the old hardy kinds long cult. in the gardens as "Chinese" or "small-flowered" chrysanthemums, and commonly supposed to be the product of *C. indicum*, as opposed to the "Japanese" or "large-flowered" kinds intro. in 1862, which marked a new era by being less formal and more fanciful than any of the preceding kinds. Pompoms are little cult. under glass in Amer., being regarded mostly as outdoor subjects.

**BB. Fls. large.**

**c. Blossoms hairy.**

**7. The Hairy Type.**—Fig. 941. Also called "Ostrich Plume" and "Japanese Hairy." The famous prototype is the variety Mrs. Alpheus Hardy, pictured in Gn. 35, p. 307, which was sold for \$1,500 in 1888, and started the American chrysanthemum craze. White fls. with long hairs are very delicate and pretty, but the hairs are often minute, and on many of the colored fls. they are

940. Type of pompon chrysanthemum. Grown outdoors, with no special care.

considered more curious and interesting than beautiful. So far, nearly all hairy chrysanthemums are of the Japanese Incurved type. Since the hairs are on the backs of the florets, they show best in incurved types.

cc. Blossoms not hairy.

d. Rays reflexed.

8. *The Reflexed Type.*—

Also called "Recurved." Fig. 942. The reflexed forms can be easily broken up into 3 types. (a) the small and regular, (b) the large and regular, and (c) the large and irregular types. The latest standard requires that reflexed flowers have hemispherical heads, with no trace of thinness in the center, and broad overlapping florets.

dd. Rays incurved.

e. Form absolutely regular.

9. *The Incurved Type.*—

Fig. 943 shows the general idea, but such a fl. would hardly win a prize at an English show, where anything short of absolute regularity is relegated to the "Japanese Incurved" section (No. 10). This form is by far the most clear-cut ideal of any of these types, and for many years this ideal of the florists so completely dominated the English chrysanthemum shows that the incurved section came to be known there as the "exhibition" or "show type." In America the Japanese types, which are less formal and fanciful, early prevailed, but in England this has been the most important section of all.

ee. Form more or less irregular.

10. *The Japanese Incurved Type.*—This section and the next have been the most important in America. There are many variations of this type. It often happens that the outer 4 or 5 series of rays gradually become reflexed, but if most of the rays are incurved, the variety may be exhibited in this section. Fig. 943.

ddd. Rays of various shapes: forms diverse.

11. *The Japanese Types.*—The word "Japanese" was originally used to designate the large-fl. fantastic kinds, intro. by Robert Fortune from Japan in 1862. It has never been restricted to varieties imported directly from Japan, but has always included seedlings raised in the western world. Before 1862, all florists' fls. in England were relatively formal and small. The informal, loose, grotesque, Japanese chrysanthemums, intro. by Fortune broke up the conventional era, and the demand for large specimen blooms that resulted in fl.-shows all over the world reached Amer. in 1889. The "Japanese section" now means little more than "Miscellaneous." The 10 types previously mentioned can be rather accurately defined, but the Japanese section is purposely left undefined to include everything else. All the tubular and quilled sorts are now included in it, although formerly kept distinct.

942. Reflexed type.

941. Hairy type.

*Relative importance and uses of the foregoing types.*—

In general, the large-flowered forms are more popular than the small-flowered forms, especially at exhibitions, where great size is often the greatest factor in prize-winning. Types 9, 10 and 11 are the most important in America, especially the Japanese section. The flowers of types 9 and 10 are likely to be more compact and globular, and hence better for long shipments than the looser and more fanciful types. Types 9, 10 and 11 are those to which most care is given, especially in disbudding and training. They are the ones most commonly grown by the florists for cut-flowers, and whenever one large flower on a long stem is desired. The anemone-flowered forms are all usually considered as curiosities, especially the Japanese anemones, which are often exhibited as freaks and oddities. The single and anemone-flowered forms are used chiefly for specimens in pots with many small flowers, but all the other types are used for the same purpose. For outdoor culture, the hardy pompons, with their numerous small flowers, are usually better than the large-flowering or Japanese kinds.

As an indication of the constant change in standards of appreciation, may be cited the present popularity

943. Type of Japanese incurved chrysanthemum.

of short-stemmed chrysanthemums (Fig. 944) as distinguished from the greatly elongated stem that was exclusively desired some years ago; and also the demand for bushy many-flowered plants, producing small bloom as compared with the former excessively large detached flowers.

*The current English classification.*

The Floral Committee of the National Chrysanthemum Society (of England) in 1912 published the following "new classification of Chrysanthemums" (published also in *American Florist*, Sept. 21, 1912, by Elmer D. Smith):

SECTION I. INCURVED (Fig. 945).

The distinguishing characteristics of this section are the globular form and regular outline of the blooms. The flower should be as nearly a globe as possible, as depth is an important point in estimating its value. The florets ought to be smooth, rounded, or somewhat pointed at the tip, of sufficient length to form a graceful curve, and be regularly arranged. A hollow center or prominent eye are serious defects, as also are a roughness in the blooms, unevenness of outline and a want of freshness in the outer florets.

The section is now subdivided into:

Sub-section (a).—Large-flowered varieties.

Sub-section (b).—Medium- and small-flowered varieties.

## SECTION II. JAPANESE (Fig. 946).

Japanese varieties include a wide range of form, size and color. Their florets may be either flat, fluted, quilled or tubulated, of varying length, from short, straight, spreading florets, to long, drooping, twisted or irregularly incurved. In breadth the florets may vary greatly, ranging from those an inch in width to others scarcely broader than a stout thread. Some also either have the tips of the florets cupped, hollowed, curved or reflexed.

### Sub-section I. Japanese.

- (a) Large-flowered varieties.
- (b) Medium-flowered varieties.
- (c) Small-flowered varieties.

### Sub-section II. Incurved Japanese.

- (a) Large-flowered varieties.
- (b) Medium- and small-flowered.

### Sub-section III. Hairy Japanese.

Reflexed section to be deleted as these varieties are now referred to other sections.

944. New type with short stem, which is becoming very popular with commercial growers.

## SECTION III. ANEMONES (Figs. 947 and 948; also Figs. 938, 939).

The distinctive characteristics of anemone varieties are their high, neatly formed centers and regularly arranged ray-florets. There are two distinct sets of florets, one quilled and forming the center or disk, and the other flat and more or less horizontally arranged, forming the border or ray. The flowers may have the ray or guard florets broad or twisted, or narrow, and forming a fringe, but should be so regularly arranged as to form a circle round the center, the latter should be a hemispherical disk, with no trace of hollowness and every floret in its place.

- (a) Large-flowered, i. e., with a diameter of 3 inches and upwards.
- (b) Small-flowered, i. e., with a diameter of less than 3 inches.

## SECTION IV. POMPONS (Fig. 949; also Fig. 940).

Pompon varieties have blooms that may be somewhat flat or nearly globular, very neat and compact, formed of short, flat, fluted or quilled florets, regularly spreading or erect, the florets of each bloom being of one character.

- (a) Large-flowered, i. e., with a diameter of 2 inches and upwards.
- (b) Small-flowered, i. e., with a diameter of less than 2 inches.

## SECTION V. SINGLES (Fig. 950).

Single varieties may be of any size and form; but the florets, whether short and rigid or long and drooping, should be arranged sufficiently close together to form a regular fringe.

### Sub-section I. Varieties with one or two rows of ray florets.

- (a) Large-flowered, i. e., with a diameter of 3 inches and upwards.
- (b) Medium and small-flowered, i. e., with a diameter of less than 3 inches.

### Sub-section II. Varieties with three to five rows of ray florets.

- (a) Large-flowered, i. e., with a diameter of 3 inches and upwards.
- (b) Medium and small-flowered, i. e., with a diameter of less than 3 inches.

### Sub-section III. Anemone-centered varieties.

## SECTION VI. SPIDERY, PLUMED AND FEATHERY.

Varieties in this section have small or medium-sized flowers of

eccentric shape, but most frequently of a light and graceful character; some have threadlike florets, but they may be either erect, horizontal or drooping and of various shapes and colors.

Market, Decorative and Early-flowering varieties will be deleted as such, but lists will be drawn up under each heading for general guidance.

WILHELM MILLER.

## Culture of the florist's chrysanthemum (*C. hortorum*)

The first step towards success in chrysanthemum-culture is good healthy cuttings, and as they become established plants they should receive generous culture throughout their entire growing season. This requires close attention to watering, airing, repotting, and a liberal supply of nutriment.

Chrysanthemums are propagated in four ways,—by cuttings, division, seeds, and grafting. By far the most important is the first, because it is the most rapid. It is the method of the florists. In localities in which the plants can remain outdoors over winter without injury, they may be increased by division. This system is practised more by amateurs than florists, being the easiest method for the home garden but not rapid enough for the florist. Propagation by seeds is employed only to produce new varieties, and is discussed at length elsewhere (page 764). Grafting is seldom practised. Skilful gardeners sometimes graft a dozen or more varieties on a large plant, and the sight of many different colored fls. on the same plant is always interesting at exhibitions.

### Section I.—Culture of chrysanthemums for cut-flowers.

This account is intended to describe the method chiefly employed by florists, the plants being grown in benches under glass.

1. *Propagation by cuttings.*—Plants of the preceding year afford stock from which to propagate the following season. They produce quantities of stools or suckers, which form excellent material

for the cuttings. These are usually taken from 1½ to 3 inches in length, the lower leaves removed, also the tips of the broad leaves, then placed in propagating-beds close together, where they are kept continually wet until rooted. To insure a large percentage, the condition of the cuttings should be moderately soft. If the stock plants are allowed to become excessively dry, the cuttings are likely to harden, and thus be very slow in producing roots. Single-eye cuttings may be used of new and scarce varieties when necessary. These are fastened to a tooth-pick with fine stemming wire, allowing half of the tooth-pick to extend below the end of the

947. Japanese anemone type.

945. Incurved type.

946. Japanese type.

948. Pompon anemone type.

cutting, and when inserted in the cutting-bed the end of the cutting should rest upon the sand. It requires more time to produce good plants by this system than when fair-sized cuttings can be taken, but it is often of service when stock is limited. The propagating-

house should be well aired, and it is advisable to change the sand after the second or third batch of cuttings has been removed, to avoid what is termed cutting-bench fungus. The cuttings should never be allowed to wilt, and this is avoided by giving abundance of air, and when the temperature reaches over 70° from sun heat, by shading with some material, either cloth or paper. Fig. 951 shows a good form of chrysanthemum cutting.

2. *Planting.*—Cuttings should not be allowed to remain in the cutting-bench after the roots are  $\frac{1}{2}$  inch in length, or they will become hardened, which will check the growth. As soon as rooted, they should be potted into 2- or 2½-inch pots, using good mellow

soil, with a slight admixture of decomposed manure. Most of the large flowers are produced under glass, and the bench system is generally employed, which consists of 4 or 5 inches of soil placed upon benches. In these benches the small plants are planted 8 to 12 inches apart each way, from the latter part of May to the middle of July. Those planted at the first date usually give the best results. The soil should be pounded rather firm either before planting or after the plants have become established.

3. *Soil.*—There are many ideas as to what soil is best suited for the chrysanthemum, but good blooms may be grown on clay or light sandy loam, provided the cultivator is a close observer and considers the condition of the soil in which they are growing. Clay soil, being more retentive of moisture, will require less water and feeding than soil of a more porous nature. The chrysanthemum is a gross feeder, and, therefore, the fertility of the soil is very important in the production of fine blooms. Each expert has a way of his own in preparing the soil, but as equally good results have been secured under varied conditions, it is safe to conclude that the method of preparing the soil has little to do with the results, provided there is sufficient food within their reach. All concede that fresh-cut sod, piled late the preceding fall or in early spring, with one-fourth to one-fifth its bulk of half-decomposed manure, forms an excellent compost. Many use 1 or 2 inches of manure as a mulch after the plants have become established. Others place an inch of half-decomposed manure in the bottom of the bench. This the roots find as soon as they require it. Good blooms have been grown by planting on decomposed sod and relying on liquid applications of chemicals.

4. *Feeding.*—No definite rule can be given for this work, as so much depends on the amount of food

incorporated in the soil. If the soil be very rich, the liquid applications should be only occasional and very dilute. There is more danger of overfeeding by the use of liquids than by using excessively rich soil. Each grower must depend on his own judgment as to the requirements, being guided by the appearance of the plants. When the leaves become dark-colored and very brittle, it is safe to consider that the limit in feeding has been reached. Some varieties refuse to bud when overfed, making a mass of leaves instead. Others show very contorted petals, giving a rough unfinished bloom. Still others, particularly the red varieties, are likely to be ruined by decomposition of the petals, called "burning," especially if the atmosphere is allowed to become hot and stuffy. The same result will follow in dark weather, or when the nights become cool, if the moisture of the house is allowed to fall upon the blooms. Under such conditions, the ventilation should remain on during the night, or heat be turned in according to the outside temperature.

5. *Watering and shading.*—Let the foliage be the index to watering. If it appears yellow and sickly, use less water, and see that the drainage is perfect. There is little danger of over-watering as long as the foliage is bright green. A little shading at planting time is not objectionable, but it should be removed as soon as the plants are established. It is often necessary to shade the pink and red flowers, if the weather continues bright for some time, to prevent their fading.

6. *Training.*—When the plants are 8 inches high, they should be tied either to stakes or to jute twine. In the former system, use one horizontal wire over each row, tying the stake to this after the bottom has been inserted into the ground. Two wires will be necessary when twine is used, one above the plants and the other a few inches above the soil to which the twine is fastened. From the first of August until the flowers are in color, all lateral growths should be removed as soon as they appear, allowing only the shoots intended for flowers to remain. The above remarks refer to the training of benched chrysanthemums as grown by florists for cut-flowers. Other kinds of training are described under Section II, pages 763-4.

7. *Disbudding.*—No special date can be given for this work, as much depends on the season and the earliness or lateness of the variety to be treated. Buds usually begin to form on the early sorts about August 15, or soon after, and some of the late varieties are not in condition before October 10. Golden Glow and Smith Advance among the large-flowering, and several of the early-flowering of the hardy varieties, are exceptions to the foregoing, as they will set buds in June and July that will develop very good blooms during the month of August and later. The advent of these kinds has advanced the flowering season four to six weeks. The object of removing the weak and small buds and retaining the best is to con-

949. A pompon chrysanthemum. ( $\times \frac{1}{2}$ )

950. Single type.

951.  
One kind of chrysanthemum cutting.

concentrate the whole energy of the plant and thereby increase the size of the flower.

There are two forms of buds, crowns and terminals. A crown bud (Fig. 952) is formed first, never coming with other flower-buds, and is provided with lateral growths which, if allowed to remain, will continue their growth and produce terminal buds later. Terminal buds come later, always in clusters (Fig. 954), are never associated with lateral growths, and terminate the plant's growth for that season. If the crown bud is to be saved, remove the lateral growths as shown by Figs. 952, 953, and the operation is complete. If the terminal bud is desired, remove the crown and allow one, two or three (according to the vigor of the plant) of the growths to remain. In a few weeks these will show a cluster of buds, and, when well advanced, it will be noticed that the largest is at the apex of the growth (the one saved, if perfect, as it usually is), and one at each of the leaf axils (see Fig. 955). The rejected buds are easiest and safest removed with the thumb and forefinger. Fig. 956. Should the bud appear to be one-sided or otherwise imperfect, remove it and retain the next best. In removing the buds, begin at the top and work down. By so doing there are buds in reserve, in case the best one should accidentally be broken, while if the reverse course were taken, and the best bud broken at the completion of the work, all the labor would be lost. A few hours' disbudding will teach the operator how far the buds should be advanced to disbud easily. Early and late in the day, when the growths are brittle, are the best times for the work. Some growers speak of first, second and third buds. The first is a crown, and usually appears on early-propagated plants from July 15 to August 15. If removed, the lateral growths push forward, forming another bud. In many cases in which the crowns are removed early, the next bud is not a terminal, but a second crown, which is termed the second bud. Remove this, and the third bud will be the terminal. Plants propagated in May and June usually give the second and third bud, not forming the typical crown. Those struck in July and planted late give the terminal only. Most of the best blooms are from second crown and terminal. Pink, bronze and red flowers from first crowns are much lighter in color than those from later buds. They are large, but very often abnormal to such an extent as to be decidedly inferior. This is doubtless due to the large amount of food utilized in their construction, owing to the long time consumed in development. The hot weather of September and October must have a detrimental effect upon the color.

**Enemies.**—Green aphid (*Aphis rufomaculata*) and the black aphid (*Macrosiphum sanboni*) are sometimes very troublesome. They may be controlled by spraying with "Black Leaf 40" tobacco extract, one part to 800 parts water with soap added. Fumigation with hydrocyanic acid gas is also widely practised by commercial growers. In moderately tight greenhouses, use one ounce potassium cyanide for each 3,500 cubic feet of space for all-night fumigation. For details, see *Fumigation*. Red Spider (*Tetranychus bimaculatus*) becomes injurious if neglected. It may be easily controlled by spraying with water, using much force and little water to avoid drenching the beds. The use of sulfur has also a beneficial effect.

**Thrips.** (See *Carnation*).

Leaf-tyer (*Phlyctenia ferrugalis*) is frequently very abundant in some parts of the country. It is essentially a greenhouse pest although it can live out-of-doors. The greenish whitish striped caterpillars,  $\frac{3}{4}$  inch in length when full grown, feed on the under side of the leaves which they roll or tie together. The moth is pale brownish with an expanse of about  $\frac{3}{4}$  inch. The leaf-tyer is most destructive during the summer months when the temperature is highest. It can be controlled by spraying with arsenate of lead. It is advisable to

begin the work early in the season when the insects are less numerous and the plants are small. Care should be taken to hit the under surface of the leaves.

The tarnished plant-bug (*Lygus pratensis*) often injures the blossom buds by its feeding punctures. This causes wilting and blind growths. The bugs may be excluded from greenhouses with screens. Out-of-doors no satisfactory means of control has been devised. But it has been noticed that plants growing in partial shade are less subject to injury.

Grasshoppers are sometimes injurious. They may be controlled by the use of arsenate of lead or by hand-picking.

**Diseases.**—Damping-off in the cutting-benches is not uncommon. See *Damping-off*, page 961. Rust (*Puccinia chrysanthemi*) is the only serious fungous disease of the chrysanthemum. It is characterized by the reddish brown pulverulent masses on the foliage consisting of the spores of the fungus. The disease is usually not destructive but may make the foliage unsightly. Any leaves appearing diseased should be removed promptly. In watering care should be taken not to wet the foliage, as moisture on the leaves allows new infections. Leaf-blight (*Cylindrosporium*) and leaf-spot (*Septoria*) occur on mature or languishing foliage and usually do little damage.

#### Section II.—Culture of chrysanthemums in pots.

The same principles are employed in pot culture as when planted upon the bench, with the exception that the plants are generally allowed to produce more blooms. The most popular type of pot-plant for home growing, or for sale by florists and intended for home use, is a compact, bushy plant,  $1\frac{1}{2}$  to 2 feet high, branched at the base, and bearing four to twenty flowers averaging 3 to 4 inches across.

They are here called "market plants." "Single-stem plants" are also popular. Great quantities of large flowers (say twenty to one hundred) are rarely grown on a potted plant, except for exhibitions. Such plants are commonly called "specimens," and the three leading forms are the bush, the standard and the pyramid, the first mentioned being the most popular.

1. *Market plants.*—Dwarf plants of symmetrical form, with foliage down to the pots, are the most salable, and when thus grown require constant attention as to watering and stopping, allowing each plant plenty of room to keep the lower leaves in a healthy condition. Cuttings taken June 1 and grown in pots, or

952. The crown bud

953. Crown bud after it has been selected or taken.

planted on old carnation benches or in spent hotbeds (light soil preferable), and lifted by August 15, will make very good plants 1 to 1½ feet high. The reason for lifting early is to have them well established in their flowering pots before the buds are formed.

2. *Single-stem plants*.—Same culture as market plants, except that they are restricted to one stem and flower. Those from 1 to 2 feet in height are more effective and useful than tall ones. For this reason, many prefer plunging the pots out-of-doors where they have the full benefit of the sun and air, making them more dwarf than when grown under glass.

954. The terminal bud.

3. *Pot-plants for cut-flowers*.—Culture same as for specimen plants, except that the nipping should be discontinued July 1 to give sufficient length to the stems. If large flowers are desired, restrict the plants to eight or ten growths. Such plants can be accommodated in less space than specimens,

when the chief object is symmetry.

4. *Bush plants*.—For large bush plants, the cuttings should be struck early in February, and grown along in a cool airy house, giving attention to repotting as often as necessary. The final potting into 10- or 12-inch pots generally takes place in June. They are potted moderately firm, and watered sparingly until well rooted. As soon as the plants are 5 or 6 inches high the tips should be pinched out, to induce several growths to start. As the season advances and the plants make rapid growth, pinching must be attended to every day up to the latter part of July, to give as many breaks as possible and keep them in symmetrical form. By the middle of August (if not previously attended to), staking and getting the plants in shape will be a very important detail. If stakes are used, they must be continually tied-out, as the stems soon begin to harden, and this work can be best accomplished by looking them over daily. Light stakes of any material may be used. Many other methods are in use, such as wire hoops and wire framework, to which the growths are securely tied.

5. *Standards* differ from bush plants in having one stout self-supporting stem, instead of many stems. They require the same culture as bush plants, with the exception that they are not stopped, but allowed to make one continuous growth until 3, 4 or 5 feet high, and are then treated the same as bush plants. They require the same attention as to stopping and tying to secure symmetrical heads.

6. *Pyramids* are only another form of bush plants, and it is optional with the grower which form he prefers.

### Section III.—Culture of chrysanthemums for the production of new varieties.

The object of seed-saving is the improvement of existing varieties. It is not conclusive, however, that all seedlings will be improvements; in fact, it is far from this, as the greater proportion are inferior to their antecedents. Only those who give the most careful consideration to cross-fertilization are certain of marked success. Hand-hybridized seeds possess value over those haphazardly pollinated by wind and insects only according to the degree of intelligence employed in the selection of parents. What the result will be when a white flower is fertilized with a yellow one, the operator cannot determine at the outset. It may be either white, yellow, intermediate, or partake of some antecedent, and thus be distinct from either. Improvements in color can be secured only by the union of colors,

bearing in mind the laws of nature in uniting two to make the third. Red upon yellow, or vice-versa, may intensify the red or yellow—give orange or bronze, as nature may see fit. The operator is more certain of improving along other lines, such as sturdiness or dwarfness of growth, earliness or lateness of bloom, or doubleness of flowers. The selection of those most perfect in these particulars is very sure to give similar or improved results. Always keep a record of this work showing the parents of a seedling. The satisfaction of knowing how a meritorious variety was produced more than pays for the trouble, and may lead to further improvements along certain lines.—The operation begins when the flower is half open, cutting the petals off close to their base with a pair of scissors, until the style is exposed. Should the flower show signs of having disk or staminate florets, remove these with the points of the scissors and thus avoid self-fertilization. When the styles are fully grown and developed, the upper surface or stigma is in condition to receive the pollen. By pushing aside (with the thumb) the ray-florets of the flower desired for pollen, the disk-florets which produce the pollen will become visible. The pollen may be collected on a camel's-hair pencil or toothpick and applied to the stigma of the flower previously prepared. If a toothpick be used, never use it for more than one kind of pollen. By allowing the camel's-hair pencil to stand in an open-mouthed vial of alcohol a few moments after using, it may be again used, when dry, upon another variety without fear of the pollen of the former operation affecting the present.—Cuttings struck in June and July and grown to single bloom in 4-inch pots are the most convenient for seeding. Such flowers, if not given too much food are more natural and furnish an abundance of pollen, as well as being easier to trim than the massive blooms produced for the exhibition-table. The pollinating should be done on bright, sunny days, and as early in the day as possible. As soon as the seed plants are trimmed, they should be placed by themselves to avoid fertilization by insects, and should there remain until the seeds are ripe. Keep the plants rather on the dry side, and give abundance of air. Seeds, which ripen in five to six weeks, should be saved without delay, and carefully labelled. In sowing seeds,

955. Terminal buds of chrysanthemum at an early stage. None too early for disbudding.

they should be covered very lightly and kept in a temperature of 60°. When the seedlings are large enough to handle easily, remove to small pots, or transplant farther apart in shallow boxes. Chrysanthemums flower the first season from seed.

### Section IV.—Varieties.

Of the long list of new varieties sent out each year, but few are retained after the second year's trial. This is probably due to the fact that most American growers are more interested in the commercial value of the flower than the curious forms or striking colors they present. Exhibitions have not reached the people here

as in England and France. There are a few varieties that have stood the test for several years; such as Ivory, 1889; Geo. W. Childs, 1892; Golden Wedding, 1893; Major Bonnaillon, 1894; Yanoma, 1896; W. H. Chadwick, 1898; John K. Shaw and Nagoya, 1899; Monrovia, Col. D. Appleton and White Bonnaillon, 1900. There are many other varieties that have stood the test for four or five years.

It is not the purpose of this article to recommend varieties of chrysanthemums, but the following list includes the best varieties known in North America at the present time. The list will be valuable as showing a serviceable classification, and also for reference when other varieties have come into existence:

*Selection of varieties based on main types.*—(1) *Incurved*: *Æsthetic*, Emberta, Major Bonnaillon, Pink Gem, Mary Donellan, Naomah, Smith's Sensation, William Turner. (2) *Japanese*: Pacific Supreme, Crocus, Ramapo, December Gem, F. S. Vallis, Glen Cove, Golden Robin, Reginald Vallis. (3) *Japanese Incurved*: Chrysolara, Col. D. Appleton, W. H. Chadwick, Mlle. Jeanne Nonin, Artistic Queen, Christy Mathewson, Elberon, Nakota. (4) *Hairy*: Arvede Barine, Beauty of Truro, Frison d'Or, Leocadie Gentils, Louis Boehmer, L'Enfant des Deux Mondes, R. M. Grey, White Swan. (5) *Reflexed*: Smith's Advance, Dick Witterstaetter, Harvard, Yanoma, Mrs. J. Wells, Rose Pockett, Thanksgiving Queen, Madison. (6) *Large Anemone*: Satisfaction, Surprise, Ernest Cooper, Geo. Hawkins, Gladys Spaulding, John Bunyan. (7) *Japanese Anemone*: Eleanor, Mrs. F. Gordon Dexter, Zoraida. (8) *Pompons*: Alma, Baby, Clorinda, Fairy Queen, Helen Newberry, Minta, Julie Lagraverre, Quinola. (9) *Pompon Anemone*: Diantha, Ada Sweet, Gertrude Wilson, Lida Thomas, Vayenne, Bessie Flight. (10) *Large-flowering Singles*: Arlee, Catherine Livingstone, Felicity, Itaska, Lady Lu, Red Light. (11) *Small-flowering Singles*: Ladysmith, Anna, Blazing Star, Little Barber.

*Selection of varieties based on color.*—*White*: Smith's Advance, Chadwick Improved, Christy Mathewson, Mrs. Gilbert Drabble, Naomah, William Turner. *Yellow*: Chrysolara, Comoleta, Golden Glow, Golden Eagle, Ramapo, Lenox. *Pink*: Pacific Supreme, Unaka, Patty, Glen Cove, Morristown, Smith's Sensation. *Crimson*: Dick Witterstaetter, Harvard, Intensity, J. W. Molyneux, Pockett's Crimson, Mrs. Harry Turner. *Bronze and buff*: Glenview, Mrs. J. A. Miller, Mrs. H. Stevens, Ongawa, Rose Pockett, William Kleinheinz. *Crimson, golden reverse*: Harry E. Converse, Howard Gould, Mrs. O. H. Kahn, W. Woodmason. *Amaranth or purplish crimson*: George J. Bruzard, Mrs. G. C. Kelly, Reginald Vallis, T. Carrington, Leslie Morrison.

*Selection based on special uses.*—*Bush plants*: Golden Age, Brutus, Dick Witterstaetter, Dr. Enguehard, Garza. *Single stemmed pot-plant*: Naomah, Chrysolara, *Æsthetic*, President Roosevelt, Ben Wells, Glen Cove, Mrs. George Hunt, Mrs. O. H. Kahn, Pockett's Crimson. *Exhibition blooms*: Artistic Queen, Christy Mathewson, Chrysanthemiste Montigny, F. S. Vallis, George J. Bruzard, Glen Cove, Glenview, Harry E. Converse, Lady Hopetoun, Lenox, Elberon, Morristown, M. Loiseau-Rousseau, Mrs. Gilbert Drabble, Mrs. H. Stevens, Mrs. Harry Turner, Naomah, Pockett's Crimson, Rose Pockett, William Turner, W. Woodmason, Ben Wells, Merza, Reginald Vallis. *Commercial blooms*.—*Extra-early-flowering, July to October*: Golden Glow, Smith's Advance. *Second-early-flowering, last of September into October*: Early Snow, Glory of Pacific, Monrovia, October Frost, Roserie. *Early-midseason-flowering, middle of October*: Chrysolara, Comoleta, Gloria, Ivory, Pacific Supreme, Unaka, Virginia Poehlmann. *Midseason-flowering, last of October to November 10*: Col. D. Appleton, Crocus, Dick Witterstaetter, Pink Gem, Ramapo, Mrs. W. E. Kelley. *Late-midseason-flowering, November 10 to Thanksgiving*: Dr. Enguehard, Emberta, Golden Eagle, Golden Wedding, Major Bonnaillon, Patty, President Roosevelt, Timothy Eaton, W. H. Chadwick, Mrs. Jerome Jones, White Bonnaillon. *Late-flowering, Thanksgiving and later*: December Gem, Harvard, Helen Frick, Intensity, John Burton, Mlle. Jeanne Nonin, Thanksgiving Queen, Yanoma.

#### Section V.—Culture of chrysanthemums for exhibition.

This branch in which the highest standard must be attained if the slightest hope of success at the exhibitions is entertained, requires a thorough knowledge of the most suitable kinds for the purpose and the ability to bring them to the highest state of perfection. The methods are not very different from those employed in the production of high-grade commercial blooms. The most successful growers usually propagate earlier, and if grown on benches they are also planted earlier to secure all the vigor possible. The finest blooms are those produced on the private estates, where one man has charge of a few hundred plants, giving them his undivided attention, so that every need is provided at the proper time. During the past few years, the majority of such expert growers have adopted a system of growing in pots, each plant restricted to one bloom, which is practically the same method as the one used

throughout England for many years. Here they are kept under glass the entire season, while in England the climate permits them to be grown out-of-doors during the summer months. By this method, the roots are more closely confined, which has a tendency to produce short-jointed plants with stronger stems, and gives the grower perfect control, so that each variety may be treated according to its needs, especially when liquid fertilizers are necessary to promote the maximum in size and finish. The other factors necessary to the successful exhibitor are full consideration of the requirements of the schedules, so as to select the best varieties for the various classes, and a complete knowledge of packing and staging the blooms. During the past decade, those originating new varieties have scrutinized more closely in making a decision, and, as the commercial and exhibition varieties are considered from

956. Terminal bud after the disbudding operation.

an entirely different standpoint, these two sections are drifting farther and farther apart. Size is the foremost quality from the exhibition point of view.

At the present time (1912), the varieties generally shown in prize-winning exhibits are: *White*.—Beatrice May, Lady Carmichael, Merza, Mrs. David Syme, Naomah, Wm. Turner. *Yellow*.—F. S. Vallis, Lenox, Mrs. Geo. Hunt, Mrs. J. C. Neill, Yellow Miller. *Pink*.—Lady Hopetoun, M. Loiseau-Rousseau, Mrs. C. H. Totty, O. H. Broomhead, Wm. Duckham, Wells' Late Pink. *Bronze*.—Glenview, Harry E. Converse, Mrs. O. H. Kahn, Mrs. H. Stevens. *Red*.—J. W. Molyneux, Pockett's Crimson, W. Woodmason.

A few of the commercial section are suitable for this purpose, especially when the schedule calls for twelve or more blooms of a kind for one vase and at exhibitions at which artificial supports are prohibited. The best are as follows: *White*.—Lynnwood Hall, Timothy Eaton, Chadwick Improved, Mrs. Jerome Jones. *Yellow*.—Col. D. Appleton, Golden Eagle, Golden Wedding, Yellow Eaton, Golden Chadwick, Major Bonnaillon. *Pink*.—Dr. Enguehard, Mayor Weaver, Maud Dean. *Red*.—Dick Witterstaetter, Geo. W. Childs.

#### Section VI.—Culture of chrysanthemums out-of-doors.

The kinds most suitable for out-of-door culture are those making abundance of rhizomes or underground stems, which withstand the winter and furnish the new growths for the successive years. The Pompons are more hardy than the large-flowering sorts, and, as hardiness is of vital importance to those interested in this subject, especially north of the Ohio River, it should be fully considered in selecting for this purpose. It is more practicable to choose varieties which perfect their flowers early, during August, September and October when grown in the northern states, as the buds are less likely to be injured while in a soft growing state by frost. In the South many of the later varieties will live over and be satisfactory, owing to the continuance of mild weather. In the past few years, some improvements in this section have been attained, many of which are the results of crosses between the Pompons and the large-flowering Japanese, in which the progeny have combined the hardiness and dwarf habit of the former with the larger and more irregular-formed flowers of the latter, producing aster-like flowers rather than the symmetrical form of the pompons. All of the types may be successfully grown out-of-doors if provision is made to protect the bud, blooms and roots from severe frost. A temporary covering of cloth or sash in early autumn will protect the blooms, but the roots will require artificial heat or should be removed to the greenhouse or frame where the temperature can be maintained a few degrees above freezing. In growing exhibition blooms out-of-doors, all the important details, such as watering, airing, disbudding, feeding

staking and tying, must be complied with, if the grower expects to be rewarded for his efforts.

The oldest of the outdoor types are the Pompons, which produce from forty to one hundred buttons an inch or two across, with short and regular rays. Such plants can be left outdoors all winter.

Since the large-flowering or Japanese types have come in, numberless attempts have been made to grow them outdoors, but with poor results. The greenhouse varieties are not so hardy. In the North they are likely to be killed by the winter. Their flowers usually lack in size, depth and symmetry, largely because there are more of them on a plant than a florist allows for his best blooms, but chiefly because they do not have so much care in general as is given to plants under glass, where space is precious. For the very best results, chrysanthemums must be flowered under glass, and they need the greatest care and forethought practi-

957. Suggestion for protecting chrysanthemums that are to bloom outdoors.

cally all the year round. Half-way measures are unsatisfactory. Thus it happens that the Japanese varieties are usually unsatisfactory out-of-doors, and the Pompons are chosen by those who can give very little care to plants and would rather have many small flowers than a few large ones. This also partly explains why no two dealers recommend anything like the same list of Japanese varieties for outdoor culture. Nevertheless, it is possible to grow excellent flowers 4 and 5 or even 6 inches across outdoors, but it requires staking, disbudding, and some kind of temporary protection, as of a tent or glass, during frosty weather. Fig. 957 shows a cheap and simple structure of coldframe sashes resting on a temporary framework. In severe weather a canvas curtain can be dropped in front, and the window of a warm cellar in the rear opened to temper the air. For general outdoor culture, however, when no special care is given to the plants, the Japanese kinds are usually less satisfactory than the Pompons. These Pompons are a much-neglected class since the rise of the large-flowered Japanese kinds, but they are unlike anything else in our garden flora. Their vivid and sometimes too artificial colors harmonize with nothing else at Thanksgiving time, and they are so strong and commanding that they should have a place by themselves. It is not uncommon for the flowers to be in good condition even after several light falls of snow, and they may be considered the most resistant to frost of any garden herbs. In fact, their peculiar merit is blooming after the landscape is completely desolated by successive frosts. The flowers are not ruined until their petals are wet and then frozen stiff. They are essentially for mass effects of color, and great size is not to be expected. Masses of brown and masses of yellow, side by side, make rich combinations. The whole tribe of crimsons, amaranths, pinks, and the

like, should be kept by themselves, because their colors are variable and because they make a violent contrast with yellow, which few persons can find agreeable.

WILHELM MILLER.  
ELMER SMITH.†

**CHRYSOBACTRON** (*golden wand*, from the Greek). *Liliaceæ*. Two New Zealand rhizomatous herbs, usually classed with "bulbs" by gardeners, bearing many small yellow fls. in a long raceme on the top of an elongated scape: plant often dioecious or polygamous: perianth 6-parted, the segms. nearly equal; stamens 6: caps. 3-celled and 3-valved. The genus is now commonly united with the S. African *Bulbinella*, the combined species becoming 13 or 14. **C. Hoökeri**, Colenso (*Bulbinella Hoökeri*, Benth & Hook., now the accepted name. *Anthericum Hoökeri*, Colenso) is in cult. in this country. It is a hardy plant 2-3 ft. high, with sword-like foliage: fls.  $\frac{1}{2}$  in. diam., bright yellow, perfect, on slender pedicels, the segms. linear-oblong, and obtuse and spreading. B.M. 4602.—Cult. in the ordinary border, and treated like the asphodel, they do well. But they are improved in rich, deep and rather moist soil; strong clumps, 4-6 years old, are then at their best and are very excellent plants. After that they should be divided. Prop. by division or seed. Blooms in June and July.

J. B. KELLER and L. H. B.

**CHRYSOBALANUS** (*golden acorn*, from the Greek, referring to the fruit). *Rosaceæ*. Bushes or trees, planted far south for ornament; fruit often edible.

Leaves thick and coriaceous, entire, glabrous: fls. white, rather small, in axillary or terminal short cymes; calyx 5-parted; petals 5, clawed; stamens 15 to many, some of them perhaps sterile: fr. a dryish-pulpy drupe, with stone pointed at base and ridged.—Two species in tropics of Amer. and Afr., reaching Fla., and another one in S. U. S.

**ICACO**, Linn. **COCOA-PLUM**. **ICACO**. On coasts and along streams in S. Fla., to S. Amer., and also in Afr., and is sometimes planted in the extreme S. (and in the tropics) as an ornamental shrub and for its sweetish but insipid and dry plum-shaped frs. which are sometimes used for preserves. It is a mere bush on the northern limits of its distribution, and on elevations, but in extreme S. Fla. it reaches a height of 25-30 ft. Lvs. glossy, thick, obovate (sometimes obovate): fls. small and white, in axillary erect racemes or cymes; calyx 5-cleft, pubescent; petals 5; stamens about 20: fr. 1-seeded, 1-1½ in. long, varying from nearly white to almost black, globular or nearly so. Wood close-grained and heavy, hard, brown or reddish. It is best prop. by seeds, but may also be had from cuttings of half-ripened wood. *C. pellocarpus*, Meyer, the small-fruited cocoa-plum, is a smaller plant, with smaller lvs., petals spatulate, drupe obovoid or oblong, about half the size of that of *C. Icaco*; it grows in extreme S. Fla. and farther south; probably not planted. *C. oblongifolius*, Michx., occurs from Ga. to Fla. and Miss. It is a low shrub, spreading widely by means of underground sts.: lf.-blades longer than broad, sharp-tipped: fr. ovoid or obovoid, about 1-1½ in. long; not in cult.

L. H. B.

**CHRYSOCOMA**: *Linosyris*.

**CHRYSODIUM**: *Elaphoglossum*.

**CHRYSOGONUM** (Greek-made name, *golden knee* or *joint*). *Compositæ*. A few composites, of which *C. virginicum*, Linn., is a perennial yellow-fl. plant of S. Pa. and south; sometimes cult. as a border plant. It blooms in spring or early summer on sts. which become 1 ft. high, the heads being solitary and pedun-

cled in the axils or some of them terminal: lvs. opposite and basal, ovate and mostly obtuse, crenate. Prop. by creeping rootstocks and runners. Of little merit horticulturally.

**CHRYSOPHYLLUM** (Greek, *golden leaf*, in reference to the color of the under surface of the leaves). *Sapotaceæ*. Handsome trees, grown far south for fruit and for ornament.

Juice milky: lvs. alternate, thick and stiff, usually shining and copper-colored or golden beneath with

958. *Chrysophyllum Cainito*. ( $\times \frac{1}{2}$ )

silky pubescence, with many parallel cross-veins: fls. small, sessile or stalked, clustered at the nodes or in the axils; calyx mostly 5-parted; corolla tubular-campanulate or somewhat rotate, mostly 5-lobed, without appendages; stamens as many as the corolla-lobes, and staminodia 0; ovary 5-10-celled: fr. fleshy and usually edible, 1- to several-seeded.—About 60 species in tropics, the larger part American.

The various species of *Chrysophyllum* have beautiful broad green leaves, with under surfaces of a silky texture, varying in color from a silvery white through golden to a russet-brown, and are well worth a place in the conservatory as ornamental trees. By giving them sufficient room, they will bear fruit in the course of a few years, under glass, which in the case of *C. Cainito*, the star-apple of tropical America, is edible, and well liked even by people of a temperate clime. All species are strictly tropical, and cannot be grown where frosts occur unless properly protected. Propagation is ordinarily effected by seed, which readily germinate if planted when fresh, and it is stated that all species may be grown from cuttings of well-ripened shoots placed in strong, moist heat. The soil most suited for their growth is of a sandy character, and if not of a good quality should be well manured, using a considerable proportion of potash in the fertilizer for fruiting specimens. They seem to do well on a great variety of soils, however, that are sufficiently well drained, wet land not agreeing with them. (E. N. Reasoner.)

**Cainito**, Linn. **STAR-APPLE**. **CAIMITO**. Fig. 958. Thick-headed evergreen, to 50 ft.: lvs. oval or oblong, silky-golden beneath: corolla-tube twice as long as the calyx; stigma 8-10-crenate or -lobed; fls. purplish white. W. Indies, Panama, Cent. Amer. I.H. 32:567. A.G. 11:405.—The fr. is the size of an apple, symmetrically globular and smooth, hard; a cross-section shows the star-shaped core, whence the common name; it varies from white to purple in color of skin and also of flesh. The pulp is delicious (used uncooked) if the fr. is allowed to remain on the tree until ripe. It has large, pumpkin-like dark seeds. It is very impatient of frost.

**olivifforme**, Lam. (*C. monopyrenum*, Swartz). **SATIN-LEAF**. To 35 ft.: lvs. like those of *C. Cainito*: fls. white; stigma 5-crenate: fr. ovoid-oblong or oval, 1-seeded by abortion of ovules, blackish,  $1\frac{1}{2}$  in. long,

said to be insipid. S. Fla. and S. B.M. 3303.—Sparingly transferred to grounds as an ornamental tree.

**imperiale**, Benth. (*Theophrasta imperialis*, Lind.). Plant strict and simple, to 20 ft. or more, unarmed: lvs. obovate-oblong to oblong-oblancoelate, 3 ft. long, on large plants very sharply serrate: fls. yellowish green, small, in clusters along the trunk, the cluster sessile but the fls. pedicellate; corolla rotate, 5-lobed, thick: fr. 5-angled, nearly globular, size of a small apple, with a hard thick flesh; seeds 1 in. long and  $\frac{3}{4}$  in. wide, compressed. Brazil. B.M. 6823. I.H. 21:184. Gt. 1864:453.—This species was grown 30 years before its genus was determined, but upon flowering in European gardens it was found to be a *Chrysophyllum* (by some referred to *Martiusella*, which see). L. H. B.

**CHRYSTOPOGON**: *Sorghastrum*.

**CHRYSOPSIS** (*golden appearance*, from the heads). *Compositæ*. Mostly low and hairy perennials, sometimes planted in borders: heads of medium size and many-fl., usually with numerous yellow rays; involucre bell-shaped or hemispherical, of imbricated narrow bracts: achenes compressed, bearing a pappus of numerous hair-like bristles. About 20 species of *Chrysopsis* are known. Mex. and N. **C. villosa**, Nutt. (*C. Bolanderi*, Gray), is one of the species in the trade. It is widely distributed from Ill., west, north, and south: 1-2 ft., grayish pubescent: lvs. oblong to lanceolate, entire or few-toothed: heads usually at the ends of leafy branches, aster-like in shape. Extremely variable, and has several named forms. Mn. 7:101. Var. **Rütteri**, Rothr., is larger and later. Of value as a border plant. Cult. the same as aster. Perennials, but bloom the first year from seed, if sown early.

**C. mariâna**, Nutt. Differs from *C. villosa* in having corymbose-paniculate fl.-clusters. E. N. Amer. Aug.-Sept. Offered by dealers in native plants. It has showy yellow fls. and prefers dry sandy places.

N. TAYLOR.†

**CHRYSOPLËNIUM** (name from *golden* and *spleen*, referring to some old medicinal tradition). *Saxifragaceæ*. **GOLDEN SAXIFRAGE**. Low semi-aquatics, sometimes used in bog-planting.

**C. americanum**, Schw., is a native plant creeping in mud. Sts. forking, bearing roundish or cordate small mostly opposite lvs., with very small, nearly sessile, greenish, inconspicuous fls. Scarcely known in cult. and, except for wet places where a cover or carpet is wanted, of no value horticulturally.

**CHRYSURUS**  
**CYNOSUROIDES**:  
*Lamarckia*.

**CHUFA**. The edible subterranean tubers of *Cyperus esculentus*, Linn.; (which see) much prized in the South. Fig.

959. *Chufa*—*Cyperus esculentus*. ( $\times \frac{1}{2}$ )

959. Chufas are eaten raw or baked, or used for the making of coffee. The plant is sometimes cultivated in the North, but it will not withstand the winter. The tubers are oblong,  $\frac{1}{2}$  to  $\frac{3}{4}$  inches long, cylindrical, hard. The plant is grass-like, and in the North does not flower. Tubers are planted in the spring, and the new crop is ready for digging in the fall. It thrives easily in loose and warm soils. The nutty flavor of the hard tubers is very agreeable.

**CHUSQUËA:** *Bamboo*, p. 449, Vol. I.

**CHYSIS** (Greek for *melting*, in allusion to the pollen-masses). *Orchidaceæ*. Orchids, pendulous from trees; grown in hothouses.

Stems fusiform, leafy, thickening after the lvs. drop: fls. fleshy, in short racemes, which are produced freely in the axils of the young growths; dorsal sepal and petals similar in shape, the lateral sepals with the foot of the column forming a long foot; lip jointed to the column foot, lamellate longitudinally, the lateral lobes upright, loosely surrounding the column; pollinia 8.—About 6 species in Trop. Amer. Cult. as for Vanda, in baskets, pans or pots. They require tropical temperature when growing, then cooler.

A. Ground-color of fls. yellow.

**auræa**, Lindl. Fls. 5–8, about 2 in. across; sepals and petals yellow, oblong-oval; lateral lobes of lip yellow, the middle lobe white, downy, spotted with red and yellow. S. Amer. B.R. 1937. B.M. 3617.

**lævis**, Lindl. Fls. 8–12, about  $2\frac{1}{2}$  in. across; sepals and petals yellow, tinted above with lines of purple-carmine; sepals oblong, the dorsal one inflexed, the lateral falcate; lip yellow, marked with red. Mex.

**Chelsonii**, Hort. Fls. 5–7, about  $2\frac{1}{2}$  in. across; sepals and petals yellow, with a large blotch of reddish fawn at the apex; lip yellow spotted with red. Hybrid: *C. bractescens*  $\times$  *C. lævis*. F.M. 1878:297.

AA. Ground-color of fls. white.

**bractescens**, Lindl. Fig. 960. Fls. 3–5, about 3 in. across; sepals and petals ivory-white; lip with the lateral lobes white outside, the inner surface yellow, streaked red, the middle lobe yellow, streaked and stained with red. Mex. B.M. 5186. R.H. 1859, pp. 294, 295. I.H. 27:398. O.R. 9:371; 13:236; 19:201. J.H. III. 28:263. C.O. 1. A.F. 28:747.

**Limminghei**, Lindl. & Reichb. Fls. 4–7,  $1\frac{1}{2}$ –2 in. across; sepals and petals white, with an apical blotch of purple; lip with lateral lobes yellow, marked with reddish purple on the inside, the middle lobe white, streaked with bright purple. Mex. B.M. 5265. I.H. 7:240. C.O. 3.

**Sedenii**, Hort. Fls. 3–6; sepals white; petals white with an apical rose-purple blotch; lip with the side

lobes sulfur-yellow, purple-streaked within, the middle lobe white, streaked with amethyst. Hybrid: *C. Limminghei*  $\times$  *C. bractescens*. GEORGE V. NASH.†

**CIBOTIUM** (Greek, *a little seed-vessel*). *Cyatheaceæ*. A small group of tree-ferns from Mexico and Polynesia,

with bivalved coriaceous indusia, differing from *Dicksonia* in having the outer valve entirely distinct from the leaf. For culture, see *Dicksonia*.

*C. Barometz* is the plant that gave rise to the wonder stories of the Barometz or Scythian lamb (Fig. 961), which, according to Bauhin, 1650, had wool, flesh and blood, and a root attached to the navel. The plant was said to resemble a lamb in every respect, but grew on a stalk about a yard high, and turning about and bending to the herbage consumed the foliage within reach, and then pined away with the failure of the food until it died. In 1725 Breyne, of Dantzic, declared that the Barometz was only the root of a large fern, covered with its natural yellow

down and accompanied by stems, which had been placed in museums in an inverted position, the better to represent the appearance of the legs and horns of a quadruped.

Young plants of *C. Schiedei* and *C. regale* are frequently offered by florists at a stage before the trunk has developed and when the leaves are about four or five feet long. They require greenhouse conditions for successful culture.

A. Outer valve of the indusium larger, or the valves subequal.

**gladucum**, Hook. & Arn. Lvs. ovate-lanceolate, tripinnate; pinnules about 6 in. long, taper-pointed; segms. close: outer valve of indusium larger, broader than the inner: veins once- or twice-forked. Hawaiian Isls.

**Barometz**, J. Smith. **SCYTHIAN LAMB**. Trunkless: lvs. scented, tripinnate, the lower pinnae ovate-lanceolate; pinnules short-stalked, 4–6 in. long, with falcate segms.: valves of the indusium nearly equal: veins prominent, rarely forked. China.

961. The Scythian Lamb; reproduced from an old book. See *Cibotium Barometz*.

AA. Outer valve of the indusium smaller than the inner.

**Schiedei**, Hook. Trunk 10–15 ft. high: lvs. oblong-deltoid, tripinnate, with pinnae 1–2 ft. long; segms. falcate, sharp-pointed: sori sparse: veins forked, on the lowest pinnate. Mex.

**regale**, Lind. Trunk 10–12 ft. high: lvs. oblong-deltoid, tripinnate, with pinnae 18–24 in. long; pinnules sessile, with close, falcate, deeply incised segms.; veins pinnate in the lobes. Mex.

L. M. UNDERWOOD.  
R. C. BENEDICT.†

CICCA: *Phyllanthus*.

**CICER**, (old Latin name for the vetch). *Leguminosæ*. Pea-like annual or perennial herbs, with 5-parted calyx, the lobes being nearly equal or the 2 upper ones somewhat shorter and connivent, oblong turgid 2-valved pod, mostly 1-flid. peduncles, odd-pinnate lvs. and toothed lfts.: standard ovate or nearly orbicular, wings obovate and free, keel rather broad and incurved: fls. white, blue or violet: terminal lft. often represented by a tendril or spine.—A dozen or more species, with a Mediterranean-Asian range. **C. arietinum**, Linn., the CHICK-PEA or GARBANZO, is sometimes cult. in vegetable-gardens for the edible ripe seeds. It is an annual and is cult. the same as bush beans. It withstands dry weather well. It grows 2 ft. high, making a bushy, hairy plant; seeds are planted as soon as warm weather comes, usually in drills, the plants standing 8-12 in. apart. Lvs. with small, roundish lfts.: fls. white or reddish, small, axillary. Seed roundish, but flattened on the sides, with a projection on one side, shaped like a miniature ram's head (hence the name *arietinum*, in vars. of red, black and white. Much cult. in S. Eu. and Asia; and widely known in Calif. and in Mex., and other Spanish-American regions. The peas are eaten boiled, or roasted like peanuts, often used for soup or as a substitute for coffee; and some kinds are used for horse-feed. It is a promising crop for some purposes; yield sometimes 500 to 1,000 lbs. to the acre.

L. H. B.

**CICHORIUM** (from an old Arabic name). *Compósitæ*. Seven or eight herbs, one of which is chicory and one endive.

Perennial, biennial or annual, branching and diffuse when in bloom, mostly with deep hard roots, milky juice and alternate lvs., and sessile axillary and terminal fl.-heads: fls. several to many in the head, all ligulate and perfect, blue, purple or white; involucre double; pappus of bristle-like scales.—Mostly in the Mediterranean region and to Abyssinia.

**Intybus**, Linn. **CHICORY**. **SUCCORY**. Fig. 962. Stout deep-rooted tall perennial (3-6 ft.): lvs. broadly oblong, oblanceolate or lanceolate, hairy, rapidly becoming very small toward top of plant so that the branches appear nearly naked and wand-like, more or less clasping and the lower ones runcinate: fls. bright azure-blue,  $1\frac{1}{2}$  in. or more across, closing about noon; pappus about 8 times shorter than fr. July-Oct.—Now a widespread weed of hard roadsides and fields but producing one of the clearest of light blues and worthy a place in the fl.-garden. Recent experiments promise attractive color forms. For cult. for the root and for the salad lvs. see *Chicory*.

**Endivia**, Linn. **ENDIVE**. Annual or biennial: lvs. many at the base, oblong, lobed and cut, smooth: st. 2-4 ft., branching, grooved: fls. pale blue; pappus about 4 times shorter than fr. India; but by some thought to be a derivative of *C. Intybus*, or of *C. divaricatum* of the Medit. region. For cult. as a salad plant. see *Endive*.

L. H. B.

CLENKOWSKIA: *Kaempferia*.

962. Flowers of chicory.—Cichorium Intybus. ( $\times \frac{1}{2}$ ). A familiar weed along roadsides in the eastern part of the country.

**CIMICIFUGA**, Linn. (*cimex*, a bug; *fugere*, to drive away). *Ranunculaceæ*. **BUGBANE**. Tall hardy herbaceous perennials, ornamental, but bad-smelling, suited for the back of plantings or for partially shaded places in the wild garden. The leaves and tall plants are admired in the hardy border.

Leaves large, decomposed: fls. white, in racemes; sepals 2-5, petaloid, deciduous; petals 1-8, small, clawed, 2-lobed or none: follicles 1-8, many-seeded, sessile or stalked; stigma broad or minute. Allied to *Actæa*.—About 10 species, natives of the north temperate zone, practically all of which have been used in gardens.

*Cimicifugas* thrive in half shady or open places in any good garden soil, but are much taller and more showy if the soil is very black and rich. Propagated by seeds and division of roots in fall or early spring. Seeds should be sown in cool moist soil soon after ripening.

**americana**, Michx. (*Actæa podocarpa*, DC.). Slender, 2-4 ft. high: lvs. pale beneath: fls. in elongated raceme; petals 2-horned; pedicels nearly as long as the fl.: follicles 3 or 5, stalked; seeds in 1 row, chaffy; stamens and pistils usually in same fl. Aug.-Sept. Moist woods N. Y. and S.

**foetida**, Linn. Lvs. bipinnate, terminal lft. 3-lobed: petals of the white fls. often tipped with anthers; no staminodia: follicles 3-5; seeds very chaffy. Summer. Siberia.—Following forms are more commonly cult.

**racemosa**, Nutt. (*C. serpentaria*, Pursh). Fig. 963. St. 3-8 ft. high: lvs. 2-3 times 3-4-parted; lfts. mostly ovate, firm texture: racemes few, rigidly erect, often becoming 2 ft. long: follicles rather shorter than the pedicel, nearly  $\frac{1}{4}$  in. long, short style abruptly recurved. July, Aug. Ga. to Canada and westward. Intro. 1891. Gt. 13:443. Gn. 46, p. 269. G.C. II. 10:557; III. 48:218.—Very pretty in fr., with its 2 rows of oval follicles always extending upward from the lateral branches. The commonest in gardens. Rhizome and roots valued in medicine.

Var. **dissecta**, Gray (*C. spicata*, Hort.). Lvs. more compound than the type: small white fls. closely packed on lateral and terminal branches. Lasting until Sept. Conn. to S. Pa. J.H. III. 33:381.

Var. **simplex**, Regel (*C. simplex*, Wormsk.). Tall and handsome: fls. short-pedicelled, forming a fine, dense raceme, and at first pubescent: follicle short-stalked. Kamtschatka. Gn. 67, p. 8. Gn.W. 21:115; 23:899.

*C. cordifolia*, Pursh. Lvs. very broadly ovate or orbicular. U. S. B.M. 2069.—*C. dahurica*, Hutt. Higher and more branched than former. Cent. Asia.—*C. elata*, Nutt. (*C. foetida*, Pursh. *Actæa Cimicifuga*, Linn.). Used in medicine. Ore., Wash.—*C. japonica*, Spreng. 3 ft. high: lvs. very large. F.S. 22:2363 (as *Pithyosperma acerinum*).—*C. palmata*, Michx.—*Trautvetteria carolinensis*, Vail.

K. C. DAVIS.

**CINCHONA** (from the Countess Cinchon, wife of a Spanish Viceroy of Peru, who was cured of fever in 1638 by the use of Peruvian bark). *Rubiaceæ*. Plants widely known as yielding a remedy, in the bark, for malaria.

Some of the species are lofty trees, others are mere shrubs. They grow isolated in various districts of the Andes, at elevations ranging from 2,300–9,000 ft., and between 22° south and 10° north latitude. Lvs. opposite, with deciduous stipules; fls. much frequented by humming-birds, fragrant, white and pink in color, growing in terminal panicles; calyx small, 5-toothed,

963. *Cimicifuga racemosa*.  
(Lfts.  $\times \frac{2}{3}$ )

and persistent; corolla has a long tube with 5 short spreading valvate lobes, hairy at the margins; stamens 5, included in the corolla; ovary 2-celled, with very numerous ovules inserted on linear axile placenta: caps. opening septicidally from the base upwards; seeds small, numerous, flat and surrounded with a wing.—There are 30–40 confused species. Specimens are sometimes seen in collections of economic plants, but they are not horticultural subjects.

From the pharmacopœial point of view there are two distinct kinds of cinchona bark: (1) *Cinchona*, also called yellow cinchona and calisaya bark, which is probably the bark obtained from *Cinchona Ledgeriana*, Moens, and hybrids of this with other species of *Cinchona*. The bark secured from these sources is said to contain 6 to 7 per cent of alkaloids, of which one-half to two-thirds is quinine. (2) *Cinchona rubra*, or red cinchona, which is obtained from *Cinchona succirubra*, Pavon, or its hybrids. In this bark the alkaloid cinchonidine exists in greater proportion.

The cinchona trees are considered to yield the maximum of alkaloids at six to nine years of age. The bark of the trunk and roots is removed; the latter is used mostly in the manufacture of quinine. Effort has been made to adopt the spelling Chinchona, although Linnaeus, in founding the genus, used only one h: see

Clements R. Markham "A Memoir of the Lady Ana de Osorio, Countess of Chinchon and Vice-Queen of Peru (A.D. 1629–39), with a Plea for the Correct Spelling of the Chinchona Genus," London, 1874.

The febrifuge reached Spain as early as 1639. Knowledge of it was spread by the Countess of Chinchon, hence it was called Countess' powder and Peruvian bark, and also Jesuits' bark, from the knowledge of it spread by Jesuits. The word quinine is derived from the name by which it was known in Peru, *quinaquina*, or "bark of barks." In 1849, trees were sent by the Jesuits to Algeria, but the experiment was not successful. In 1852–4, Hasskarl successfully introduced living plants into Java. In 1859, Clements R. Markham was entrusted by the government of India with the task of collecting plants and seeds on the Andes, and establishing them in India. In his fascinating book "Peruvian Bark: a popular account of the introduction of *Cinchona* cultivation into British India" (1880), Markham recounts the difficulties in South America and his final success. *Cinchona* is now grown commercially in India and also in Jamaica, but most of the commercial product is secured from trees grown in Java; it is also cultivated in New Zealand and Australia. *C. Ledgeriana*, Moens (*C. Calisaya*, Wedd., var. *Ledgeriana*, How.), is a small tree with small thick elliptical lvs., reddish beneath, and with yellowish not fragrant fls., and a short caps. *C. succirubra*, Pav., has large and thin broad-elliptic lvs., purple-red calyx and rose-colored petals, and an elongated caps. *C. officinalis*, Hook. f., has oval-lanceolate acute shining lvs., and rose-colored silky fls. It is sometimes seen (in some of its forms) in collections. Var. *Condaminea* (*C. Condaminea*, Humb. & Bonpl.) is one of these forms and has been intro. in S. Calif. and said to be easily grown there. L. H. B.

#### Cultivation of cinchona. (By Wm. Fawcett.)

The seedlings may be raised either in boxes or in beds. The boxes should not be more than 3 or 4 inches deep. Three-quarter-inch drainage-holes should be made in the bottom, about 6 inches apart. Whitewash the boxes or dust them inside with lime. Put pieces of broken flower-pots over the drainage holes, and cover the bottom with gravel to a depth of 1 inch. The soil should be made up of one-third leaf-mold, one-third good soil and one-third fine river gravel. These should be thoroughly mixed and passed through a  $\frac{1}{4}$ -inch sieve. Fill the boxes to within  $\frac{1}{4}$  inch of the top, and slightly water. Sow the seed evenly, and sprinkle over it some of the sifted soil, only just covering it. The boxes should be under shade, sheltered from rain, and watered every day with a very fine spray from a watering-can. The seedlings will appear in three or four weeks. If the seeds are sown in beds, they require the protection of a roof sloping south, and supported by posts 4 feet 6 inches high on the north, and 3 feet 3 inches on the south side. The sides may also have to be covered in. The breadth of the beds is 3 feet. The roof projects beyond the south posts sufficiently to keep off direct sunlight, and in the summertime, at any rate, a narrow north roof must be added at right angles. If the sheds are built under the shade of tall trees, the roof is needed only for shelter from rain.

When the seedlings are  $1\frac{1}{2}$  to 2 inches high, they should be transplanted into nursery beds, made up in the same way as for seeds. In transplanting, use a wooden peg 4 or 5 inches long,  $\frac{3}{4}$  inch thick at one end and tapering to a dull point. A seedling is picked up with the left hand from a bundle brought from the seed-beds, a hole is made with the peg in the right hand, big enough to receive the roots without bending or crushing them. The soil is then pressed closely over the rootlets with the peg. Two inches between each plant is enough room. At first the plants should be shaded, but

when they are twice or thrice as high as when transplanted the shading may be gradually removed to harden them for putting out in their permanent positions.

The soil and subsoil should be free and open to insure good drainage; newly cleared forest land on a hillside is the best for Cinchona trees. In Jamaica, *Cinchona officinalis* flourishes best at an elevation of about 5,500 feet, with a mean annual temperature of about 60° F., ranging from a minimum of 46° to a maximum of 75° and with a total annual rainfall of 120 to 150 inches.

The distance when planted out in their permanent positions is 3 by 3 feet, and as soon as they begin to interfere with each other's growth they should be thinned out just sufficiently at first to prevent this. The bark of those cut down may be worth stripping if the price of bark is high.

Several methods have been used in taking the bark from the trees. In South America, the tree is uprooted, and the whole of the bark may be taken from both root and stem. A second plan is used if shoots spring from the root; the trunk is cut through above the ground, the bark stripped, and the stump left to coppice, one or two of the shoots being allowed to grow. The third method is to make the same tree yield bark in successive seasons; for this purpose longitudinal layers of the bark are removed from the trunk, and the exposed surface is sometimes covered with moss; the bark renews itself, and the "renewed bark" is as rich (or richer) in alkaloids as the original. In this way, by taking successive strips of bark in different years, the tree yields a continuous supply of bark. L. H. B.†

**CINERARIA** (ash-colored, from the Latin, referring to the gray foliage). *Compósitæ*. Herbs or undershrubs, closely allied to *Senecio*, from which they are separated chiefly by technical characters of the achene. The genus is variously understood by different authors. As limited by Bentham & Hooker, and also by Engler & Prantl, it comprises about 25 South African species, and the common garden Cineraria becomes a *Senecio* (*S. cruentus*, DC.). The genus Cineraria differs from *Senecio* in having a cone-like rather than branched style, and a usually flattened or many-angled rather than terete achene; the species are herbs or subshrubs with yellow fl.-heads.

The cineraria of the florists (Fig. 964) is now much modified by cultivation. There are two views of its origin, one holding that it is a direct development of *C. cruenta*, Mass. (*Pericallis cruenta*, Webb. & Berth.), B.M. 406; the other that it is a hybrid, into which *C. cruenta*, *C. Heritieri*, *C. populifolia*, and perhaps others, have probably blended. These are all natives of the Canary Islands. For important literature respecting the origin of the garden cineraria, see Nature, 51:461, 605; 52:3, 29, 54, 78, 103, 128; 55:341. G.C. III. 3:654, 657; 17:588, 655, 742; 18:89, 186; 29:297

The florists' cinerarias run in white, and in shades of blue, pink and purple-red. There is promise of yellow-flowered strains by hybridizing with yellow *senecios* or related plants.

See *Senecio* for *Cineraria acanthifolia*, *C. candidissima*, and *C. maritima*. To the garden or florists' cineraria (*C. cruenta*) belong the horticultural names *C. grandiflora*, *C. kewensis*, *C. nana*, *C. stellata*, and others. There are full-double forms (see R.H. 1874, p. 47; 1886, p. 41. F.S. 22:2347-8. I.H. 32:556).—*C. flavescens*, Hort., is a garden hybrid between Cineraria "Feltham Beauty" and *Senecio auriculatissimus*. G.C. III. 45, 322. Gn. 73:252. It is a compact grower, originating with James Veitch & Sons, giving promise of a new strain of winter-blooming plants: fls. creamy yellow, the younger blooms almost canary yellow; lf. peculiarly constricted at the middle and much enlarged at the top.—*C. hybrida*, Hort., is a hybrid between *Senecio cruentus* and *S. tussilaginis*, with white fls. having pale blue tips on the rays and purplish centers. G.M. 55:337.—*C. stellata*, Hort., now a popular race of florists' cineraria, has open spready panicles of star-like single fls. Fig. 965. Most excellent.

The true yellow-fl. South African cinerarias seem not to be in cultivation, although *C. pentactina*, Hook. f., has been recorded in horticultural literature within recent years: slender and climbing, with lax paniculate inflorescence, pale red flower-stems and five golden yellows rays in each head. B.M. 7799. Elegant greenhouse climber.

L. H. B.

#### Culture of the florists' cineraria.

The single hybrid cinerarias are among the most useful and beautiful of all greenhouse flowering plants.

The ease with which they can be raised, the little heat required, together with their free-blooming qualities, brilliant and various-colored flowers, which last for a considerable time in blossom, make them popular with most people possessing even only a small greenhouse. Though they are herbaceous in character and may be propagated by cuttings or division of the roots, the single varieties are best treated as annuals, raising them from seed each year and throwing away the plants after flowering. Although one may save one's own seed, the cinerarias, like most hybrids, will deteriorate both in size and quality of the flower after one

or two generations unless they are crossed; therefore, unless one cares to cross one's own plants, it is best to purchase fresh seed from some reliable firm that secures its stock from hybridists. For florists' use, or when a succession of

964. Small plant of the florists' cineraria.—  
Botanically *Senecio cruentus*.

these flowers is required, two sowings of seed should be made—the first about the middle of August, and the second a month later. The seed should be sown in pans or shallow boxes 1 foot square; these should be well drained, and the soil should consist of one part fine loam, one part leaf-mold, and one part clean sharp silver sand. The surface should be made very fine and pressed down evenly. The seed should then be sown evenly and rather thinly, and covered with sand about the eighth part of an inch. This will in a great measure prevent the seedlings from what gardeners term “damping off,” which they are very apt to do if the atmospheric conditions become at all stagnant. The seed-pans or boxes should be carefully watered with a fine rose and then placed in some cool shaded

place, such as a frame placed on sifted coal-ashes on the north side of a wall or building, where they will germinate in about a week or ten days. As soon as large enough to handle conveniently, the seedlings should be potted into thumb-pots and grown on as rapidly as possible, shifting on into larger size pots as often as required, never allowing them to become the least pot-bound, or suffer in any way during the season of growth. The soil should consist of half leaf-mold and half fine fibrous loam, with a good sprinkling of silver sand, until the final shift into their flowering pots, when the soil should be three parts fibrous loam and one part well-decayed cow-manure or pulverized sheep-manure. About the first of October the plants should all be removed to the greenhouse, where the atmosphere should be kept cool and moist, but not stagnant. If a rainy spell should set in, a little artificial heat should be given to cause a circulation of the atmosphere, and as autumn advances the temperature should be kept about 45° at night, with a rise of 10° by day. Liquid stimulants should not be given until the flower-buds begin to appear, when they are greatly benefited by an occasional watering of clear liquid cow- or sheep-manure. The plants should be well in bloom after the holidays.

If bloom is wanted in late fall or early winter, seed may be sown in May; keep the plants growing all summer, but do not let them bloom till they are established in 5- or 6-inch pots.

The Star cineraria (Fig. 965), now popular, is an open grower, 2 feet, not having the large solid masses of flower-heads of the older larger-flowered kinds. The blooms are single and mostly smaller, and the rays are separated as in a wild aster. These plants go under the

name of *C. stellata*. They are very free flowering, and as pot plants are more decorative than the large-flowered types; they meet the present demand for simplicity. In color they have the same range as the ordinary florists' cinerarias; and there are cactus-flowered strains, with narrow rolled petals. The star cinerarias require the same handling and treatment as the others.

Double-flowered varieties of cineraria are not commonly grown, neither are they so beautiful as the single varieties. They may be propagated by seed or by cuttings, the latter being the best method, as a large percentage of seedlings are sure to turn out single, which will be inferior in size of flower as compared with the best single varieties. Double-flowering varieties must be propagated each year to secure the best results. As

soon as the plants have finished blossoming, the flower stalks should be cut away to induce the plants to make fresh growth, which, as soon as large enough for cuttings, should be taken off and inserted in an ordinary propagating bed, where they will soon root, after which they should be potted and shifted on as often as required, growing them during the hottest months in as cool and shaded a position as can be provided.

Cinerarias are very subject to the attacks of greenfly. To keep these in check, the house in which they are grown should be fumigated with tobacco about once in ten days, or tobacco stems placed among the plants if fumigating is objectionable; or the cyanide treatment used. See *Diseases and Insects*.

Of the different species of Cineraria from southern Europe (properly Senecios), *C. maritima* is perhaps the best. It is of

965. *Stellata*, a popular form of cineraria. ( $\times \frac{1}{2}$ )

dwarf habit, with tomentose, silvery, pinnatifid leaves, and is a most useful subject for edging flower-beds. It is not hardy in the North, consequently must be treated as an annual, sowing the seeds early in March in the greenhouse, afterward treating it as an ordinary summer bedding plant. The other species from south and eastern Europe do not prove hardy North, and if grown should be treated as tender annuals, planting them in the herbaceous borders for the summer. The species from the Cape of Good Hope require greenhouse treatment, the culture being the same as for the common cineraria, although, from an ornamental point of view, most of them would hardly pay for the room they would occupy.

EDWARD J. CANNING.

**CINNA** (old Greek name for a kind of grass). *Gramineæ*. Tall perennials with flat leaf-blades. Spikelets 1-fl., numerous, in nodding panicles, the

XXVII. Coconut in flower and fruit, Southern Florida.

rachilla prolonged; lemma short-awned below the apex. There are two species, *C. arundinacea*, Linn., with contracted panicle, the spikelets  $2\frac{1}{2}$  lines long, (Dept. Agric., Div. Agrost. 7:140; 20:79) and *C. latifolia*, Griseb. (*C. péndula*, Trin.), with open panicle, the spikelets 2 lines long. Both species are native in cooler parts of N. Amer.

A. S. HITCHCOCK.

**CINNAMOMUM** (the ancient Greek name). *Laurææ*. Evergreen trees and shrubs of Asia and Australia, with aromatic leaves and wood, of which a few are cultivated in the extreme southern United States.

Leaves usually thick, mostly opposite, strongly 3-nerved or pinnate-nerved; buds not scaly (exception in *C. Camphora*): fls. usually perfect, with 9 (or less) perfect stamens in 3 unlike rows and a row of imperfect ones; perianth short-tubed, segms. 6 and nearly equal: fr. a small 1-seeded berry, in the cup-like perianth.—Upward of 50 species, among which are plants yielding cinnamon (*C. zeylanicum*), camphor (*C. Camphora*), cassia-bark (*C. Cassia*), and other aromatic and medicinal products. Various species may be expected in collections of economic plants, but most of them are not strictly horticultural subjects. It is not known whether some of the species in cult. in this country are passing under the proper names; possibly *C. Tamala*, Fr. Nees, widely distributed in the Far East, may be confused in our cultures.

The genus *Cinnamomum* embraces tropical and semi-tropical shrubs and trees, which are mostly of economic value, and in one or more cases are valuable shade trees for lawn and street planting. The leaves are evergreen, usually of a rich shining green, and in *C. Camphora* have a silvery blue color on the under surfaces. *C. Camphora*, the camphor tree, is hardy in the lower Gulf states, and is now being extensively planted, both for shade and extraction of gum. *C. Cassia* is not quite so hardy, but withstands a temperature of 20° F. without injury, and has been planted in Florida for manufacture of its various products,—oil, gum, buds and cinnamon bark. *C. zeylanicum*, is likely to be extensively grown in Mexico and the West Indies.—The various species are usually propagated by seeds, which are sown as soon as ripe in a shaded bed, the seedlings being transplanted when very small into pots and kept thus growing until permanent planting out. The species, without exception, are very difficult to transplant from the open ground, and hence pot-grown plants are almost a necessity. Cuttings of half-ripened wood of some species may be rooted in the spring in moderate heat, following the usual method of preparation, and planting in coarse sand. The soil best suited to cinnamomums in general, and *C. Camphora* in particular, is sandy loam, although a heavy loam, when well prepared, answers fairly well. The sandy soil of Florida, when moderately manured, suits all species so far tried admirably. (E. N. Reasoner.)

**Camphora**, Nees & Eberm. (*Camphora officinarum*, Nees. *Laurus Camphora*, Linn.). CAMPHOR TREE. Stout tree with enlarged base, to 40 ft.: lvs. alternate, ovate-elliptic, acuminate, not large or very thick, pinkish on the young growths, with a pair or more of strong side veins: buds scaly: fls. small, yellow, in axillary panicles; perianth membranaceous: fr. a drupe the size of a large pea. China, Japan. B.M. 2658.—A handsome dense-topped tree when young, becoming bare below with age; withstands some frost. The young growth is very attractive. It is hardy in central peninsular Fla., where it thrives well if attention is given to fertilizing and cultivating; it does not thrive in wet soils. Camphor is a common roadside planting in S. Calif. Commercial camphor is extracted from the wood.

**zeylanicum**, Nees. CINNAMON TREE. Small tree (20–30 ft.): lvs. very stiff, 4–7 in. long, ovate to lance-ovate, glossy, 3–5-nerved, obtuse or somewhat acute, reticulate on under side: fls. small ( $\frac{1}{4}$  in. long), yellow-

white, in loose somewhat silky clusters, which often exceed the lvs.: fr.  $\frac{3}{4}$  in. long, dry, pointed. India, Malaya, and widely dispersed in tropical countries as a cult. plant. B.M. 2028. L.B.C. 1:91.—Variable; and many forms have been described.

**Cássia**, Blume. CASSIA-BARK TREE. Handsome tree: lvs. stiff, 3–6 in. long, oblong to nearly lanceolate, long-acuminate, glossy, 3-ribbed; petiole slender: fls. very small, in terminal or axillary silky-tomentose panicles 3–6 in. long: fr. size of a pea. China.—Young branches somewhat 4-angled. Hardy and successful in central peninsular Fla. (Nehrling), thriving best in moist and rich land, and making specially fine specimens near residences where now and then it receives applications of fertilizer and water.

**pedunculatum**, Presl. Glabrous tree: lvs. thick, oblong-lanceolate, acuminate, 3-nerved, glossy above; petiole to  $\frac{3}{4}$  in. long; blade 2–5 in. long and somewhat glaucous or areolate beneath: fls. very small ( $\frac{1}{2}$  in. or less long), in axillary corymbs that about equal the lvs.; perianth glabrous outside and whitish-puberulent inside, the lobes oval-obtuse: berry globose-ovoid,  $\frac{1}{4}$  in. long. Japan.—This species is said to have been intro. at Los Angeles some 35 years ago, where a handsome tree still exists, seedlings of which are to be found in other parts of S. Calif. In central peninsular Fla., this species and *C. Lourerii* are hardy and attractive, thriving particularly well in rich and rather moist land.

**Lourerii**, Nees. CASSIA-FLOWER TREE. Middle-sized tree, glabrous: lvs. opposite or alternate, rigid, elliptic or oblong, attenuate-acuminate; petiole to  $\frac{1}{2}$  in. long, the blades 3–5 in. long: fls. very small (there is a variegated-lvd. form). China, Japan.—Perhaps a form of the last, with nerves on upper side of lf. less prominent or sunken, and other minor differences.

L. H. B.

CINNAMON FERN: *Osmunda*.

CINNAMON VINE: *Dioscorea*.

CINQUEFOIL: *Potentilla*.

**CIPURA** (origin of name unexplained). *Iridææ*. Four Trop. American bulbous plants, rarely grown under glass. Allied to *Nemastylis*: fls. with 6 parts or petals, the inner 3 being much smaller, white or light blue, borne in terminal heads, short-tubed. The only species likely to be in cult. is *C. paludosa*, Aubl., with white fls. and radical linear-lanceolate lvs.; bulb conical-globose. B.M. 646 (as *Marica*). Prop. by seeds and offsets; to be kept on the dry side through winter.

**CIRCÆA** (Circe, the enchantress). *Onagrææ*. ENCHANTER'S NIGHTSHADE. Six or seven herbs of low or moist woods in North America and other temperate and cold regions of the northern hemisphere, two of which have been offered for growing in shady places and about garden bogs.

Perennials, small and soft: lvs. opposite and stalked: fls. perfect, small, and white, in terminal and lateral racemes; calyx-tube hairy, prolonged beyond the ovary, 2-lobed; petals 2, notched: fr. a small, bristly bur. They are interesting little plants, but not showy. Of easy cult. in shady, damp spots.

**Lutetiàna**, Linn. Erect and branching, 1–3 ft., the st. swollen at the nodes: lvs. ovate-acuminate, more or less rounded at the base, somewhat toothed: pedicels slender, reflexed in fr.: fr. 2-celled, bristly. Woods, E.

**pacifica**, Aschers & Mag. From 6–12 in., from a little tuber; smaller than the above, lvs. less acuminate, fls. smaller, fr. 1-celled and less bristly. Wyo., west.

L. H. B.

**CIRRHÆA** (from *Cirrhos*, a tendril). *Orchidææ*. About a half-dozen Brazilian orchids, of no special importance, one of which, *C. viridipurpurea*, Lindl., is sparingly offered abroad, and two or three others of

which are mentioned in horticultural literature. Allied to Gongora; cultured as for Cymbidium; warmhouse. Fls. mostly greenish and red (or purple), on long pendulous racemes that arise from base of the pseudobulbs.

**CIRRHOPE TALUM** (*tendrill petal*, alluding to the narrow lateral sepals). *Orchidaceæ*. Epiphytes, grown in baskets or on blocks in a warmhouse.

Pseudobulbs from a creeping st.: dorsal sepal free; lateral sepals much longer than the dorsal, cohering excepting at the base; petals much shorter, often ciliate; lip entire, usually recurved; column short, 2-winged at the apex; pollinia 4.—About 90 species in Trop. Asia, Mascarene Isls., and Australia.

Being of rambling habit, with creeping rhizomes, cirrhopetalums should be grown in baskets sufficiently large to afford plenty of growing surface, and suspended from the roof where they will get abundant light and free access of air to the roots, which is equally essential. Liberal allowance must be made for drainage, which should consist of either broken potsherds or charcoal, the latter being preferable, as it is light, durable and contains nothing detrimental. Two-thirds osmundine, or other clean fiber, and one-third chopped live sphagnum moss, well mixed together, afford a good compost; and after this has been carefully tucked in about the roots and interstices, the plant should be held firm with brass or copper wire until reestablished. The compost should be used rather sparingly to prevent over-watering. Many of the smaller-growing species do very well on orchid blocks, firmly attached, with a small quantity of compost beneath them. During the winter months, little or no shade is required. The temperature may range from 58° to 65° F. by night, with about 10° rise through the day, or even a little more, with sun-heat, will do no injury. No artificial heat is necessary in summer, except in extreme cold or wet weather, but a shaded moist location should be chosen, such as is afforded in the cattleya or palm department. When the plants are dormant, light syringing overhead will keep the compost moist and the plants in healthy condition, but as the growing season advances, a liberal quantity of water and copious syringing in bright weather will be necessary. The stock is increased by division, the most judicious method being to cut nearly through the rhizome with a sharp knife, about three pseudobulbs behind the lead, just before growth action, allowing the part to remain until the dormant eyes start to grow, when it may be removed and treated as an established plant. A little extra heat and moisture at this period will prove beneficial with the weak plants. All are of moderately easy culture. (Robert M. Grey.)

**Medusæ**, Lindl. Pseudobulbs ovoid, ribbed; lvs. 5-8 in. long, oblong-elliptic; scapes with large sheathing bracts; umbel many-fld.; fls. creamy, yellow-spotted; dorsal sepal lanceolate; lateral sepals with long pendent tails, 4-5 in. long; petals and lip minute. Singapore. B.R. 28:12. B.M. 4977. I.H. 39:154. G.C. III. 21:25.

**picturatum**, Lindl. Pseudobulbs ovoid, about 2 in. long, angled; lvs. 3-5 in. long, linear-oblong; scape with sheaths pale yellowish-green, red-speckled; umbel 10-15-fld.; sepals and petals green, the dorsal sepal erect, obtuse, red-spotted, with a thread-like purple-knobbed summit, the lateral sepals linear; petals small, rounded, curved; lip blood-red, obtuse. India. B.M. 6802.

*C. Andersonii*, Kurz. Dwarf habit; fls. in umbels; lateral sepals whitish, with fine rose dots; dorsal sepal marked with purple lines. Sikkim.—*C. appendiculatum*, Rolfe. Dorsal sepals and petals pale yellow; lip rosy purple. E. Indies.—*C. biflorum*, J. J. Smith. Sepals purple-spotted, the dorsal elliptic, about 1½ in. long, including the seta, the lateral sepals linear-lanceolate, 3-3½ in. long. Java. B.M. 8321.—*C. breviscapum*, Rolfe. Dorsal sepal oblong-lanceolate, about ¾ in. long, dull purple, the lateral sepals yellow, spotted red-brown, about 1 in. long, the lip rose-purple, broadly cordate, ovate-cuneate, hairy at base. Perak. B.M. 8033.—*C. caudatum*, King & Pantl. Dwarf species; dorsal sepals short;

lateral sepals tail-like, about as long as scape. Himalayas.—*C. chinense*, Lindl. Fls. pale fawn-color, the dorsal sepal hooded, crimson-spotted, the lateral sepals linear-lanceolate, the lip crimson-spotted. China. B.R. 29:49.—*C. chrysæum*, Kränzl. Scape filiform, 1-fld.; fls. yellow. Philippines.—*C. Cumingii*, Lindl. Umbel 9-12-fld.; fls. purple, the dorsal sepal glandular-ciliate, the lateral sepals 1 in. long, linear-oblong; lip with 2 erect processes. Philippines. B.M. 4996.—*C. Hookeri*, Duthie. Fls. 1 in. long, yellow, the dorsal sepal about ¼ in. long, obtuse, purple-streaked, the lateral linear-lanceolate, acuminate. Himalayas. B.M. 7869.—*C. lepidum* (*Bulbophyllum lepidum*, J. J. Smith). Dorsal sepal, erect, ciliate, ½ in. long, brownish yellow; lateral sepals united, spreading, bright brownish yellow, somewhat red-flushed, at base, the upper portion pale yellow, marbled with brown-red, about 1 in. long; petals ½ in. long, ciliate. Java.—*C. longissimum*, Riddell. Fls. whitish, rosy-streaked, the dorsal sepal lanceolate, ¾-¾ in. long, the lateral sepals linear, 8-12 in. long, with slender tails; petals falcate, ciliate. Siam. B.M. 8366.—*C. Micholitzii*, Rolfe. Umbels 8-12-fld.; lateral sepals deep yellow; dorsal sepal and petals blotched with dark purple on a pale ground. Annam.—*C. minusculum*, Rolfe. Fls. vermilion-colored with hairs of dorsal sepal and petals yellow; lateral sepals caudate, almost thread-like. Annam.—*C. papillosum*, Rolfe. Umbels usually 6-fld.; dorsal sepals and petals lined with dark purple on a pale ground; lateral sepals speckled with red-brown. Siam.—*C. pilchrum*, N. E. Br. I.H. 33:608. O.R. 17:328. A.F. 6:609.—*C. retusiusculum*, Reichb. f. Fls. ¼ in. length; upper sepals dark purple; lower coherent, yellow, marked with dark red. China.—*C. Roxburghii*, Lindl. Small, with ovate reddish green lvs. and almost globose umbels of cream-white fls. tinged with rose or purple. India. A pretty dwarf species.—*C. Thoursii*, Lindl. Umbel of 10-12 fls.; sepals and petals tawny yellow, the dorsal ovate, cuspidate, with purple warts, the lateral lanceolate, acute, stained claret; petals small, ovate-lanceolate, pale yellow, purple-spotted, with a thread-like tail at apex; lip oblong. Madagascar, Java, Philippines, Society Isls. B.R. 24:11. B.M. 4237.—*C. sinense*—*C. chinense*. GEORGE V. NASH.

**CIRSIIUM** (old Greek name, referring to the use of the plant in an ailment). *Compositæ*. THISTLE. Prickly-leaved plants (largely biennial) of bold habit and showy purple, pinkish, white or even yellowish heads, sometimes planted in wild gardens.

The thistles are botanically confused. By some authors, Cirsium is combined with Carduus, but others keep it distinct because of the plumose or feathery pappus (which is most constant on the inner florets); and this disposition is here accepted. The cirsiums are herbs or subshrubs, more or less spiny; lvs. alternate, sessile, often pinnatifid; fl.-heads large, mostly terminal; involucre ovoid or spherical, with many rows of imbricated often spiny-tipped scales, many-fld.; florets all tubular and alike (seldom more or less diœcious).—More than 120 species of annuals, biennials or perennials, widely spread in the northern hemisphere.

Other generic names partaking in the confused usage are Carbenia, now a synonym of Cnicus; Chamæpeuce, now a section of Cirsium; and Cnicus (which see), a genus of one species, distinguished by sterile marginal florets, pappus of ten long bristles and equal numbers of shorter ones and of hornyteeth, and achene attached obliquely near the base rather than squarely on the base.

A number of the thistles are field and pasture weeds. The most peniculous of these weeds is the Canada thistle, *C. arvense*, Scop. (*Carduus arvensis*, Rebs.), Fig. 795. The common bull thistle or pasture thistle (Fig. 966) is a stately biennial, and very decora-

966. Head of pasture or bull thistle. (×½)

tive. It is *C. lanceolatum*, Hill (*Carduus lanceolatus*, Linn.). Both these species are introduced from Eu., as well as two or three others of lesser distribution in this country. There are a number of showy native species, one of which, *C. muticum*, Michx., (*Carduus muticus*, Pers.) is shown in Fig. 967. This purple-fl. species occurs in low grounds from Newfoundland to W. Va.

A few species of *Cirsium* (as the genus is here defined) may be expected to occur in cult. *C. oleraceum*, Scop., (*Carduus oleraceus*, Vill.), of Eu., has very decorative foliage, and thrives in the moister parts of a garden; the fls. are not very handsome, whitish or yellowish; 3 ft. The *Chamæpeuces* are sometimes grown for the large prickly spreading rosettes of lvs. that are produced the first year, the bloom appearing the second year. They combine well with plantings made for subtropical effect: *C. Casabonæ*, DC. (*Chamæpeuce Casabonæ*, DC. *Carduus Casabonæ*, Linn.), has lvs. deep green veined white, spiny, the fl.-heads pale purple; *C. Diacantha*, DC. (*Chamæpeuce Diacantha*, DC. *Carduus Diacantha*, Labill.), has thick lvs. shining green with silvery lines, white beneath, linear-lanceolate, the principal nerve or rib terminated by a single spine and the lateral nerves usually 2-spined, and dense clusters of purple heads; *C. afrum*, DC. (*Chamæpeuce afra*, DC. *Carduus afer*, Jacq.), has dark green blotched white linear-lanceolate lvs. tomentose beneath, and large bright purple heads; *C. Sprengeri*, Hort., a garden hybrid, perennial, with dark green white-veined spiny lvs., and white fragrant heads; *C. tauricum*, Hort., is probably *C. Diacantha*.

L. H. B.

**CISSAMPÉLOS** (Greek for *ivy* and *vine*). *Menispermaceæ*. Mostly twining plants, shrubs and herbs, one of which is cultivated far south.

Leaves various, mostly cordate or reniform, often peltate, alternate: fls. in axillary racemes or clusters, the plant dioecious; sterile fls. with 4 sepals and 4 petals united, the anthers 2-5 on a staminal column or disk; fertile fls. with 2 united fleshy sepals, subtended by a sepal-like bract, and solitary ovary, with 3 styles: fr. a subglobose drupe, with a flattened and tuberculate stone. Many species or distinct forms in tropical regions, but many of them are evidently forms of the widely distributed *C. Pareira*, Linn. This plant, as *C. heterophylla*, DC., and under other names, is cult. in S. Fla. and the tropics. It is known as VELVET-LEAF and FALSE PAREIRA. It is an exceedingly variable vine, with downy round-cordate or peltate entire or lobed lvs., the very small sterile fls. in stalked corymbs and the fertile in large-bracted clusters, and a hairy or glabrate nearly globular red drupe. It occurs in all tropical countries. "*Pareira brava*" of the pharmacopœas is derived from the root of the related perennial climber, *Chondrodendron tomentosum*, of Peru and Brazil. Whether the genus *Cissampelos* contains 20 or 70 species depends mostly on the rank given to the many forms of the cosmopolitan *C. Pareira*.

L. H. B.

**CISSUS** (Greek name of *ivy*). *Vitaceæ*. Mostly tendril-climbing shrubs, a few of which are grown in the open, and others under glass for the handsome often colored foliage.

Very like *Vitis* (with which some authors unite it): at best a mixed group botanically, and capable of good definition only when certain groups or subdivisions are removed from it. For the characters of related genera, see *Ampelopsis*, *Parthenocissus*, *Vitis*. As constituted by Gilg in Engler & Prantl's "Pflanzenfamilien," the genus includes *Cayratia* but which might well be kept distinct. This subgenus, of which two or three interesting species from China and Japan are in cult., differs from *Cissus* proper in the always compound lvs., which are usually pedate, the axillary infl., the thin or even membranous disk, the 2-4-seeded fr., and the plants mostly herbaceous. Excluding *Cayratia*, *Cissus* is known by usually simple lvs., 1-seeded fr., and the disk being deeply 4-lobed or separated into 4 gland-like bodies. From *Ampelopsis*, as that genus is characterized in this work, *Cissus* differs in the 4-merous fls., often herbaceous, and fleshy st., the 1-seeded rather than 2-4-seeded fr. and in the disk not being cup-like and not irregularly lobed. From *Vitis*, it differs in its 4-merous fls., its expanding petals (the corolla not falling off as a cap), the 4-parted disk, its 1-seeded mostly dry and inedible fr., and other characters. *Cissus* comprises probably 200 species, widely dispersed in tropical regions and a few of them reaching extra-tropical areas (as in the southern U. S.): mostly climbers by means of tendrils without enlarged or disk-like ends, rarely erect shrubs or even perennial herbs, sometimes with greatly thickened sts. either under ground or above: lvs. alternate, simple or compound, with tendril (if present) opposite or at same node: fls. usually perfect, in mostly umbel-like cymes that are terminal or axillary; parts of the fl. in 4's, the petals at length spreading and falling separately; disk around the ovary 4-parted or -separated; style long and mostly slender rather than conical: fr. typically a dryish 1-seeded berry (2-4-seeded in *Cayratia*).

In cultivation there are very few species of *Cissus*, and these are mostly the tendril-climbing *Vitis*-like species grown under glass for the handsome foliage. The best known is *C. discolor*, although other species are likely to become widespread and popular in greenhouses. The fleshy-stemmed erect species are sometimes grown in botanical collections for the cactus-like forms and for illustrations in adaptive morphology. The species are readily propagated by cuttings.

## INDEX.

acida, 4.	gongyloides, 6.	ovata, 10.
adenopodus, 3.	incisa, 5.	Rocheana, 5.
antarctica, 9.	japonica, 1.	sicyoides, 10.
argentea, 10.	mollis, 8.	striata, 7.
Baudiniiana, 9.	oligocarpa, 2.	velutinus, 8.
discolor, 8.		

A. *St. herbaceous*.

1. *japonica*, Willd. (*Cayratia japonica*, Gagnep.). Herbaceous, glabrous or minutely puberulent, the branches striate, climbing by tendrils: lvs. pedately 5-foliolate, long-stalked, the lfts. lanceolate or obovate-oblong, serrate: fls. in a long-peduncled 2-3-forking cyme, greenish; petals ovate-triangular, blunt: berry size of a small pea, 2-4-seeded, the seeds 3-angled-ovate, keeled. Japan, Java, Austral.—Appears to be root-hardy N., when covered.

2. *oligocarpa* (*Vitis oligocarpa*, Lev. & Van. *Cayratia oligocarpa*, Gagnep.). Differs from the above in the acuminate and more sharply and closely serrate lfts., which are puberulous when young: anthers orbicular. China.—Very recently intro.

3. *adenopodus*, Sprague. Herbaceous, climbing by tendrils, slender, terete root tuberous: lvs. red and decorative, 3-foliolate, petioled, 3-6 in. long, hairy;

lfts. stalked, ovate, abruptly acuminate, coarsely serrate, green with sunken nerves above and red with prominent nerves beneath: fls. light yellow, in a loose panicle or cluster about 4 in. long, the pedicels recurved after flowering; petals oblong, much reflexed (about  $\frac{1}{2}$  in. long); berry globose,  $\frac{2}{3}$  in. diam., dark purplish black. Trop. Afr. (Uganda). B.M. 8278.—A quick-growing plant requiring greenhouse conditions. Readily prop. by cuttings or seeds, and of very easy cult. Thrives well in sunlight. A recent intro.

AA. *St. not herbaceous at maturity, although perhaps fleshy.*

B. *Lvs. fleshy, 3-lobed or 3-foliolate.*

4. *ácida*, Linn. Low glabrous climber, with slender and striate somewhat fleshy branches and long stout tendrils: lvs. rigid, petiolate; lfts. or lf.-divisions rather small, broad-cuneate and sharply toothed near the apex: fls. small, in corymb-like or umbel like clusters: fr. an ovoid and abruptly pointed dark purple berry, with 1 or 2 large seeds, the pedicel being recurved at maturity. S. Fla., and Trop. Amer.; also, in Ariz. and S.—Sometimes planted.

5. *incisa*, Desm. (*C. Rocheana*, Planch.). Climbing 20–30 ft., the sts. warty and very fleshy and the tendrils root-like: lvs. pale green, very fleshy; lfts. or divisions wedge-ovate, notched on both sides and top, the middle one sometimes again lobed and the lateral ones 2-lobed: fls. in umbel-like mostly 3-forking cymes opposite the lvs.: fr. an obovoid blackish berry, with 1 or 2 seeds, the pedicel being strongly recurved. Fla., to Ark. and Texas. R.H. 1884, pp. 272–3.—Often planted in the extreme S. Sometimes called “marine ivy.”

BB. *Lvs. not fleshy.*

C. *The lvs. 3–5-foliolate.*

6. *gongylodes*, Planch. (*Vitis gongylodes* and *V. pterophora*, Baker). Vigorous tendril-climber with 4-angled branches, desirable for large greenhouses where tropical effects are desired, sending down long bright red aerial roots: lvs. large, stalked, 3-foliolate; lfts. rhomboid or the middle one often 3-lobed, the lateral ones sometimes lobed on the outside at the base, hairy on margin and nerves: fls. red-brown, in pedunculate cymes opposite the lvs.: a tuber (reaching 5–6 in. long) is borne at the end of each branch when the season's growth has ceased, and this drops and produces new plants. Brazil. B.M. 6803. Gt. 37:1273. R.H. 1908:203.

7. *striata*, Ruiz & Pav. (*Ampelopsis sempervirens*, Hort.). Low, shrubby evergreen vine, tendril-climbing, the branches striate and usually lightly hairy: lvs. small, 3–5-foliolate, with cuneate-obovate or lanceolate coriaceous lfts., serrate above the middle: fls. yellowish, in many-fl. pedunculate cymes opposite the lvs.: fr. depressed-globose, size of small pea, often 2-celled and 2–4-seeded. Chile, S. Brazil.—Graceful small climber for the cool greenhouse; robust in S. Calif.

CC. *The lvs. not compound although perhaps lobed.*

8. *discolor*, Blume. Fig. 968. Tendril-climber, smooth, but not glaucous, the branches slender and with 4 or 5 ribs or angles, red: lvs. oblong-ovate or cordate-ovate, acuminate, bristly serrate, reddish beneath, velvety green and mottled with silvery white

above: fls. small and yellowish, in dense and very short axillary peduncled clusters: fr. globular, 1-seeded. Java. B.M. 4763. Lowe 13. F.S. 8:804–5.—One of the best of greenhouse foliage plants. Easily grown. Prop. by cuttings. It must have a season of rest, usually in spring or early summer. If wanted for winter growth, temp. must be about 75°. It thrives in rich somewhat moist soil and responds to small applications of fertilizer now and then. The plant is very susceptible to root-knot. Variable.

Known to some as “trailing begonia.”

Var. *mollis*, Planch. (*C. velutinus*, Lind.). Pubescent or velvety: lvs. green and boldly veined with white above, blood-red beneath: fls. intense bright red, in large laxer and longer-peduncled cymes. Habitat unknown. B.M. 5207.

9. *antártica*, Vent. (*C. Baudiniæna*, Brouss.). KANGAROO VINE. Upright shrub, but the branches climbing by tendrils, hairy: lvs. rather thick, glossy, ovate to oblong, sometimes more or less cordate, very short-acuminate, mostly toothed or notched,

green: fls. green, in few-fl., axillary clusters: fr. a globular- or few-seeded berry, said to be edible. Austral. B.M. 2488.—Valuable for cool greenhouses, but does not withstand frost. Grows well on walls in darkish and neglected places.

10. *sicyoides*, Linn. Tall, tendril-climbing, pubescent, the branches terete or compressed, tuberculate or smooth, striate: lvs. ovate or oblong, often cordate at base, margin more or less serrate with bristle-tipped teeth or even cut, thickish, green: infl. corymb-like, opposite the lvs., the fls. small, and varying from greenish to white and purplish: fr. an obovoid, 1-seeded black berry. Very widely distributed in Trop. Amer., and exceedingly variable, and extending into Fla. The *C. argentea* of horticulturists is var. *ovata*, Baker, which has glabrous ovate or ovate-oblong remotely serrate and somewhat glaucous lvs. Called “season vine” in tropics.

It is probable that some of the plants listed as *Cissus* belong to other genera, and some of the trade names are unidentifiable botanically.—*C. albo-nitens*, Hort. Lvs. oblong-acuminate, more or less cordate at base, silvery white and shining over the upper surface. Brazil. Warmhouse climber.—*C. amazónica*, Lind. Lvs. glabrous and glaucous, oval-acuminate and narrower, reddish beneath and silvery veined above. Brazil. Warmhouse climber.—*C. Davidiana*, Carr., is a *Vitis* (which see).—*C. Lindenii*, André (I.H. 17:2), has large ovate-cordate silver-blotched lvs.: a glabrous climbing shrub, with terete branches. Colombia.—*C. porphyrophylla*, Lindl., is a Piper.—*C. Verticillii*, Hort., is *Parthenocissus*.

L. H. B.

**CISTUS** (ancient Greek name). *Cistaceæ*. Rock ROSE. Low shrubs grown for their red or white hairy flowers.

Plants usually with villous and glandular tomentum, aromatic: lvs. opposite, mostly persistent, entire, the opposite petioles connate at the base: fls. large, in terminal and axillary cymes at the end of the branches, rarely solitary, white to purple; sepals 3 or 5; petals 5: stamens numerous; style elongated or short with a

large 5-10-lobed stigma: caps. many-seeded, splitting into 5 valves.—About 20 species in the Medit. region and many natural and garden hybrids. Monograph by Grosser in Engler, Pflanzenreich, hft. 14, pp. 10-32 (1903) and an illustrated monograph by R. Sweet, Cistineæ (1825-30) quoted below as S.C.

The cistuses are ornamental, free-flowering shrubs, usually only a few feet high, with very showy purple or white flowers similar to a small single rose, appearing in early summer. They are hardy only in warmer temperate regions, but many of them will stand 10° of frost without injury, and *C. laurifolius* and *C. villosus* var. *tauricus* even more. They thrive best in a well-drained light soil, mostly preferring limestone soil, and in a sunny position; the dwarfer species are well adapted for rockeries with southern aspect. They do not bear transplanting well, and should be grown in pots until planted out. Some species yield ladanum, a resin used in perfumery. Propagated by seeds sown in spring in pans or boxes and the young seedlings shaded; increased also by layers and cuttings in spring or late summer, inserted in sandy peat under glass. In the Old World, the cistuses are important garden plants, but they are little known in America.

## INDEX.

<i>albidus</i> , 5.	<i>incanus</i> , 1.	<i>purpureus</i> , 3.
<i>cordifolius</i> , 11.	<i>ladaniferus</i> , 7.	<i>rotundifolius</i> , 1.

<i>heterophyllus</i> , 2.		

## A. Color of fls. purple or red.

## B. Fls. 1½-2 in. wide; petals imbricate.

## C. Lvs. penninerved, 3-nerved only at the base.

## D. Petals without a dark blotch at the base.

1. *villösus*, Linn. (*C. incanus*, Linn.). Erect shrub, 3-4 ft., villous or tomentose: lvs. penninerved, roundish-ovate or oblong, narrowed into a very short petiole, rugose above and grayish green, tomentose or villous beneath, 1-2 in. long: fls. 1-3, long-peduncled, reddish purple, 2 in. wide; petals light pink or yellowish at the base. May, June. Medit. region. B.M. 43. S.C. 35. Gn. 27, p. 571.—A very variable species. Var. *creticus*, Boiss. Lvs. smaller, more spatulate at the base, very rugose, undulate at the margin: fls. purple. S. E. Eu., Asia Minor. Sibthorp, Fl. Græca 5:495. S.C. 112. Gn. 27, p. 571; 33, p. 490.

Var. *rotundifolius*, Loud. Dwarfer, with more roundish lvs. S.C. 75. Garden form. Var. *tauricus*, Grosser (*C. tauricus*, Presl). Lvs. obovate-spatulate, the upper ones lanceolate, scarcely undulate: pedicels twice as long as sepals. Asia Minor. Var. *undulatus*, Dunal. Lvs. linear-oblong, acute, undulate: fls. solitary. S.C. 63. Garden form.

2. *heterophyllus*, Desf. Erect, to 2 ft.: lvs. short-petioled, elliptic- or oval-lanceolate, green on both sides and slightly hairy, ½-1 in. long: fls. 1-3, 2 in. wide; petals red, yellow at the base. N. Afr. S.C. 6.—More tender.

## DD. Petals with a dark blotch at the base.

3. *purpureus*, Lam. (*C. ladaniferus* × *C. villösus*). Shrub to 4 ft., somewhat glutinous: lvs. nearly sessile, lanceolate or oblong-lanceolate, acute, rugose above, slightly undulate and revolute at the margin, 1-2 in. long: fls. usually 3, lilac-purple, 3 in. across, the petals yellow at the base and with a maroon blotch. Of garden origin. Gn. 31:326; 45, p. 33; 53, p. 134. B.R. 5:408. S.C. 17. G.C. III. 48:118-19.—One of the most beautiful rock roses.

## CC. Lvs. 3-nerved to the apex.

4. *crispus*, Linn. Compact shrub, to 2 ft., villous: lvs. sessile, linear-lanceolate or oblong-elliptic, undulate,

rugose above, villous beneath: fls. 3-4, nearly sessile, 1½-2 in. wide, deep rose-colored. June-Aug. S.W. Eu. S.C. 22. Gn. 34:252.

5. *albidus*, Linn. Shrub to 4 ft., the young parts white-tomentose: lvs. sessile, elliptic or ovate-oblong, revolute at the margin, reticulate beneath, whitish tomentose, ½-2 in. long: fls. 3-6, lilac or rosy, 2½ in. across; style longer than stamens. S.W. Eu. N. Afr. S.C. 31. G.C. III. 45:117. G.M. 51:783.

## BB. Fls. 1 in. wide; petals not imbricate.

6. *parviflorus*, Lam. Much-branched shrub, 1-2 ft.; tomentose: lvs. 3-nerved, elliptic-ovate, undulate, rugose above, reticulate beneath, twisted, 1 in. long: fls. 3-5; petals pale rose, yellow at the base. June. Greece, Crete. S.C. 14.

## AA. Color of fls. white: lvs. 3-nerved.

## B. Sepals 3.

C. Lvs. nearly sessile: plant very glutinous: fls. usually solitary.

7. *ladaniferus*, Linn. Shrub, to 4 ft., glutinous: lvs. lanceolate, glabrous and viscid above, whitish tomentose beneath, 1½-4 in. long: fls. usually solitary, long-peduncled, 3-3½ in. wide; petals yellow at the base. June. S. W. Eu. S.C. 84. F.S.R. 2, p. 44. G. 22:213. Gn. 58, p. 171; 66, p. 257. F. 1874, p. 160. Var. *maculatus*, Sweet. Petals with a dark brownish crimson spot above the base. Gn. 30:30; 33, p. 490. S.C. 1. G. 26:598. Grosser 23.—Probably the most beautiful of all cistuses.

## CC. Lvs. distinctly petioled: fls. several.

8. *cyprius*, Lam. (*C. ladaniferus* × *C. laurifolius*). Erect shrub, to 6 ft., somewhat glutinous: lvs. oblong-lanceolate, glabrous above, villous-tomentose beneath: fls. 5-7, nearly 3 in. wide; petals blotched purple at the base. June. Garden origin. S.C. 39. Gn. 76, p. 438. B.M. 112 (as *C. ladaniferus*).

9. *laurifolius*, Linn. Fig. 969. Shrub to 6 ft.: lvs. petioled, ovate or ovate-lanceolate, glabrous above, whitish or brownish tomentose beneath, 1-2½ in. long: fls. 3-8, 2-3 in. wide; petals with yellow blotch. June-Aug. S. W. Eu. Gn. 53, p. 131; 64, p. 234. G.M. 34:95. S.C. 52.—The hardiest species.

## BB. Sepals 5.

10. *salvifolius*, Linn. Shrub, to 2 ft., sometimes procumbent: lvs. petioled, oval to ovate-oblong, rigid, very rugose above, tomentose on both sides, ½-1¾ in. long; bracts deciduous: fls. solitary or several, white, 1½ in. across. S. Eu., N. Afr., Orient. S.C. 54. Gn. 76, p. 352. G. 30:593.—A very variable species.

969. *Cistus laurifolius*. (× ½)

11. *populifolius*, Linn. (*C. cordifolius*, Mill. *C. Cupaniæ*, Presl). Shrub to 6 ft.: lvs. long-petioled, cordate-ovate, acuminate, penninerved, rugose, glabrous, 2-3½ in. long: fls. 2-5, white, 2 in. across. S. W. Eu. S.C. 23, 70.

*C. algarvensis*, Sims=Helianthemum ocyroides.—*C. candidissimus*, Dun.; S.C. 3=C. symphytiifolius, var.—*C. canescens*, Sweet (C. villosus var. canescens, Nichols. C. albidus×C. villosus), lvs. short-petioled, narrow-oblong or lanceolate, 3-nerved, obtuse, undulate: fls. dark purple. Of garden origin. S.C. 45.—*C. Clusii*, Dur.=C. rosmarinifolius.—*C. corbariensis*, Pourr. (C. populifolius×C. salviifolius). To 5 ft.: lvs. slightly cordate, glutinous: fls. 1-5, white, 1½ in. S.C. 8.—*C. florentinus*, Lam. (C. monspeliensis×C. salviifolius). Dwarf: lvs. lanceolate: fls. white, 2 in. S.C. 59. G. 11:183; 14:241. G.M. 32:277; 31:587. Gn. 27:570; 38, p. 177; 53, p. 130, 134; 75, p. 422. F.S.R. 2, p. 43.—*C. formosus*, Curt.=Helianthemum formosum.—*C. glaucus*, Pourr. (C. Ledon, Lam. C. laurifolius×C. monspeliensis). 1-2 ft.: lvs. lanceolate, glossy above: fls. 5-10, white, 1½ in. S. France.—*C. hirsutus*, Lam. 1-3 ft., clothed with spreading and glandular hairs: lvs. sessile, lanceolate: fls. 1-5, white. S.W. Eu. S.C. 19.—*C. latifolius*, Sweet, S.C. 15=C. populifolius var.—*C. laxus*, Ait.=C. nigricans.—*C. Ledon*, Lam.=C. glaucus.—*C. longifolius*, Lam.=C. nigricans.—*C. Loréti*, Rouy & Fouc. (C. ladaniferus×C. monspeliensis). Habit like C. monspeliensis: lvs. linear-lanceolate, revolute, grayish beneath, glutinous: fls. 1-5, white, 2 in. across. Of garden origin; also found spontaneous. Var. *maculatus*, Rouy & Fouc. Fls. with 5 dark red blotches. Gn. 75, p. 633; 76, p. 439.—*C. monspeliensis*, Linn. To 5 ft.: lvs. sessile, lanceolate: fls. white, cymose, 1 in. S. Eu. S.C. 27.—*C. nigricans*, Pourr. (C. longifolius, Lam. C. laxus, Ait. C. monspeliensis×C. populifolius). 2-4 ft., glandular: lvs. oblong-lanceolate, glossy above: fls. white, 1½ in. S.W. Eu. S.C. 12. Variable.—*C. oblongifolius*, Sweet; S.C. 67=C. nigricans var.—*C. obtusifolius*, Sweet, S.C. 42=C. nigricans var.—*C. rosmarinifolius*, Pourr. (C. Clusii, Dun.) Allied to C. ladaniferus. Lvs. linear, strongly revolute at the margin, viscid above while young, tomentose beneath: fls. 4-6, white, 1-1½ in. across. W. Medit. region. S.C. 32. G.M. 31:587; 32:277.—*C. symphytiifolius*, Lam. (C. vaginatus, Dry. Rhodocistus Berthelotianus, Spach). To 2 ft.: lvs. petioled, ovate, acuminate: fls. cymose, deep rose-colored, yellow in center. Canary Isls. S.C. 9. B.R. 3:225. F.S. 15:1501.—*C. vaginatus*, Dry.=C. symphytiifolius.

ALFRED REHDER.

**CITHARÉXYLUM** (*Zither-wood*: used for the making of certain musical instruments). *Verbenacæ*. Shrubs or trees, sparingly planted in southern California, and perhaps elsewhere South for ornament.

Spiny or unarmed, tomentose or glabrous, with opposite entire serrate often spinose-dentate lvs.: fls. white or sometimes yellow, odorless, small, in spiciform terminal or axillary racemes; calyx 5-toothed or -lobed; corolla-tube cylindrical, the limb broad and 5-lobed, the lobes spreading and obovate; stamens 5, included, one of them abortive, the 4 polliniferous ones didynamous; ovary more or less 4-celled, each cell 1-seeded; style often 2-lobed: fr. a fleshy drupe, partly included in the calyx.—About 20 species, Mex. to S. Amer.

*cinereum*, Linn. Tree, to 20 ft., the branches 4-angled and becoming cylindrical: lvs. elliptic-oblong or lance-oblong, usually obtuse, glabrous or nearly so beneath: fls. white, in long lax and nodding spike-like racemes; calyx unequally lobed; corolla-tube twice as long as calyx: fr. nearly globular, red becoming black. W. Indies. L.D. 7:493.

*quadrangulare*, Jacq. Larger tree, the branches permanently 4-angled: lvs. elliptic-oblong: fls. white; calyx nearly truncate. W. Indies.—These two species are here defined as understood by Grisebach, as it is probable that the plants in cult. were determined on that basis. Schulz, however (*Symbolæ Antillanæ*), refers *C. cinereum*, Linn., to *C. fruticosum*, Linn.; and *C. quadrangulare*, Jacq., to *C. spinosum*, Linn. *C. quadrangulare* of Grisebach, at least in part, he refers to *C. fruticosum*; and *C. cinereum*, Jacq., to *C. spinosum*. What are the plants catalogued cannot be determined without a bringing together of material.

*ilicifolium*, HBK. Low shrub, very branchy, not spiny, the branches 4-angled: lvs. elliptic-oblong, narrowed into a short petiole, entire or spinose-dentate, thick, the margin revolute, shining above and punctate beneath: fls. white, in a short terminal raceme; calyx 5-toothed; corolla scarcely exceeding the calyx, the lobes pilose: drupe size of a pea. Ecuador.

*barbinerve*, Cham. Spiny shrub, the branches 4-angled: lvs. obovate or elliptic-lanceolate, acute or obtuse or retuse, narrowed into a petiole, nearly entire, glabrous and shining above and paler and somewhat pilose beneath, bearded at the axils of the nerves: fls. white, in a terminal laxly-fld. raceme. Brazil, Uruguay. L. H. B.

**CITRANGE** (from *Citrus trifoliata* and orange by synecopation: *Citrus* [trifoliata] [or]ange). *Rutacæ*. A hybrid between the common orange and the hardy trifoliolate orange, *Poncirus trifoliata* (*Citrus trifoliata*).

Citranges have trifoliolate lvs., but the lateral lfts. are much smaller than the terminal one: lvs. semi-deciduous, falling completely only during a very severe winter: fls. borne on new wood in spring, very large, white, sometimes over 2½ in. diam., but with long and narrow petals, which vary much in size in different citranges: frs. variable, from 1-4 in. diam., globose, or depressed-globose, red-orange or lemon-yellow, smooth or hairy, the pulp abundant and very juicy, acid or subacid, with an agreeable aromatic flavor; peel often full of a disagreeably flavored essential oil.

The citranges are very cold-resistant if in a dormant condition, being able to stand temperatures as low as 15° or even 10° F. without injury. They are not adapted to commercial culture but are of much interest for home use in the cotton-belt of the southern states where the winters are too severe to permit of the culture of oranges or other citrus fruit. The flowers are showy and fragrant and the handsome fruits are used for making ade and for culinary purposes. The first successful hybrids between these plants were made by the writer at Eustis, Florida, in March, 1897, where eleven were secured. These remarkable hybrids were named citranges by H. J. Webber and the writer in 1905 (Yearbook, Department of Agriculture for 1904).

The principal varieties now grown in the southern states are:

*Rusk* (Fig. 970).—This is the most precocious of the citranges and has the smallest fls. and smallest (1½-2 in. diam.) and reddest frs. Young grafted trees often bear in 3 years. The foliage is dense and dark green. The frs. are thin-skinned, aromatic, juicy, and almost seedless. The peel contains a disagreeable oil and care must be taken to keep this out of the juice of the fr. Many thousand trees of this variety are now growing in the southern states and are prolific bearers.

*Colman*.—This is very unlike all the other citranges. The frs. are large, 3-3½ x 2¾-3½ in., flattened, light yellow, and with a thick fuzzy peel, usually nearly seedless; the pulp is greenish, juice abundant, strongly acid, agreeably aromatic. It can be used for ade.

*Morton*.—The largest of the citranges, fr. often weighing more than 1 lb. Fr. round, resembling a large orange, rind medium, pulp sprightly acid, with a peculiar taste, usually seedless. Tree a vigorous grower, cold-resistant.

*Saunders*.—A small-fruited variety. Frs. 2-2½ in. diam. with 5-10 seeds, orange-yellow, peel thick with prominent oil-glands. The thick skin of this hybrid makes it keep well.

970. Rusk citrange. (×½)

The juice is sharply acid. This is probably the most cold-resistant of the citranges tested as yet.

*Etonia*.—This hybrid is remarkable for its profuse bloom. The large white fragrant fls. make this a good ornamental in the cotton-belt; frs. small, very few.

*Cunningham*.—This resembles the Colman in having fuzzy frs. which are, however, small and nearly spherical. The juice is sharply acid, aromatic, and makes very good ade.

*Savage*.—Fr. similar to an orange in appearance, 2-3 x 2½-3½ in., light yellow, rind medium thick, bitter, pulp tender, translucent, juice with a sprightly acid flavor, aroma pleasant. Tree very vigorous and prolific. Foliage dense.

WALTER T. SWINGLE.

**CITRON** (*Citrus Medica*, Linn.). *Rutaceæ*. Fig. 971. A large lemon-like fruit with a very thick peel and a small amount of very acid pulp; the peel is candied and used in confectionery and for culinary purposes.

The citron is grown in the Mediterranean regions, especially in Corsica, and large quantities are preserved in brine and shipped to the United States to be candied. The Corsican citron of commerce was introduced into this country in 1894 by David Fairchild for the Division of Pomology of the United States Department of Agriculture, and it has been grown to some extent in California.

The plant usually is propagated by cuttings but it can be grafted on rough lemon or other stock. In the region of Valencia, in eastern Spain, the citron is used in propagating oranges, since citron cuttings strike root more easily than oranges. A piece of citron twig is grafted into branches of orange which are afterwards set as cuttings whereupon the citron strikes root and later on the orange.

Then the roots are exposed and the citron roots cut away, leaving the orange growing on its own roots.

The citron can be planted and cultivated much as the lemon in cool equable climates, such as in the coastal region of southern California. In Corsica, the trees are kept low and trained in vase form, but otherwise treated like lemons.

There are but few citron orchards in the United States; one at West Riverside, California, about 10 acres in extent, is perhaps the largest.

The Etrog or sacred Jewish citron, used by the Jews at the Feast of Tabernacles, has small greenish yellow fruits which, if they are of exactly the prescribed size, form and color, may bring as much as \$5 or \$10 each. This variety is grown principally in the island of Corfu. See *Citrus* and *Etrog*.

The word citron is also applied to the preserving watermelon: see *Citrullus* and *Melon*, *Water*.

WALTER T. SWINGLE.

971. Citron—*Citrus Medica*, Corsican variety. (×%)

**CITRÓPSIS** (*Limonia* § *Citropsis*, Engler). *Rutaceæ*. AFRICAN CHERRY ORANGE. Very interesting and as yet little-known citrus trees, of interest for use in hybridizing and for stocks, also promising as ornamentals.

Small spiny trees: lys. compound, 3-12 in. length; lfts. 3, 5 or even 7, coriaceous; petioles and rachis usually very broadly winged; fruiting twigs sometimes with unifoliate lvs.: spines usually paired, sometimes single: fls. large, white, in the axils of the lvs., tetramerous (rarely 5-merous), with 8 free stamens: frs. small, ¾-1½ in. diam., borne in tufts in the axils of the lvs., bright orange-colored, with an agreeable odor and a pleasant flavor, 3-4-celled, with a single seed in each cell; cells in some species filled with pulp-vesicles full of pleasantly flavored juice.

There are several species of this interesting genus in the tropical forests throughout central Africa. These plants, because of their sweet high-flavored fruits borne in tufts like cherries and their unusually large compound leaves, should prove very interesting for use in hybridizing. Tests made in the greenhouses of the Department of Agriculture, at Washington, have shown that at least two species of *Citropsis* can be budded readily and grow very well on the common citrus stocks. This genus is undoubtedly closely related to *Citrus*. See descr. in Journ. Ag. Research, 1:419-436, w. figs.

**Preüssii**, Swingle & M. Kellerman (*Limonia Preüssii*, Engler. *L. Demeusei*, De Wild?). Lvs. 3-5-foliate, with very broadly winged petioles and rachis; lfts. large, broadly oval: fls. large, axillary; style long, slender, broad at the base: frs. small, apiculate. Kamerun. W. Congo. Ill. Engler & Prantl, Nat. Pflanzf. III. 4:189, fig. 109, E. H. De Wildeman, Etudes Fl. Congo, pl. 41.

**Schweinfurthii**, Swingle & M. Kellerman (*Limonia Schweinfurthii*, Engler. *Limonia ugandensis*, Baker). Fig. 972. A species named from sterile leafy twigs collected by Schweinfurth at Uando at the headwaters of the Ghazal branch of the Nile. Lvs. 3-5-foliate; lfts. narrowly lanceolate, acute at both ends: fls. large, usually 4-merous; style rather short and thick: frs. lime-like, 1½ in. diam., sweet. Sudan, Uganda, Congo.

**gabonensis**, Swingle & M. Kellerman (*Limonia gabonensis*, Engler). Lvs. of medium size, sometimes unifoliate like orange lvs., sometimes 5-7-foliate; rachis narrowly winged; lfts. caudate: fls. small, borne on long pedicels, 4-merous; style not broad at base: frs. globose, small, about 1 in. diam., almost dry, having only rudimentary pulp-vesicles; seeds large. French Congo, Kamerun.

WALTER T. SWINGLE.  
MAUDE KELLERMAN.

**CITRÚLLUS** (diminutive of *Citrus*, said to be in allusion to the shape of fruits and color of flesh resembling those characters in fruits of the orange or citron). *Cucurbitaceæ*. Annual or perennial tendril-bearing herbs of three or four species, one yielding the watermelon and one the colocynth.

Climbing or long-trailing, hispid or rough, with 2-3-parted tendrils, often with a strong odor: lvs. alter-

972. *Citropsis Schweinfurthii*. ( $\times \frac{1}{4}$ )

nate, petiolate, mostly round-cordate in general outline, deeply 3-5-lobed, and the divisions often again lobed, and the segms. commonly obtuse: fls. monœcious, solitary and peduncled in the lf.-axils, the corollas 5-lobed; stamens 3, included and united or cohering by the anthers, and rudiments of stamens in the pistillate fls.; pistil 1, the ovary ovoid or globose, bearing a short style and 3-lobed stigma: fr. a globular pepo, morphologically 3-celled, usually smooth and with a hard rind.—Trop. Afr. and Asia, 2 of the species now widely distributed in warm and tropical countries.

**vulgaris**, Schrad. **WATERMELON** (see *Melon*, for culture). Annual, glabrous or pubescent: lvs. not rough, either deeply or moderately divided, the sinuses open and obtuse: fr. in the wild state from the size of an apple to that of a man's head, sweet or slightly bitter. Trop. and S. Afr.—When the fr. is sweet and edible (*C. Cáffer*, Schrad.), it is the watermelon, or "kaffir watermelon" of S. Afr.; when bitter (*C. amarus*, Schrad.), it is the "bitter-apple" of S. Afr. The fr. now varies widely in cult., in size, season, shape and quality. The soft pink flesh is much prized in its natural state for eating. A form with hard and inedible white flesh is known as "citron," and the rind is used for the making of preserves (as is the rind of the true citron).

**Colocynthis**, Schrad. (*Colocynthis officinalis*, Schrad. *Cucumis Colocynthis*, Linn.). **COLOCYNTH. BITTER-APPLE**. Perennial (in the wild), the st. angular and rough: lvs. rough, 2-4 in. long, 3- or 7-lobed, the middle lobe sometimes ovate, the sinuses open and the lf. in general form like that of *C. vulgaris*: ovary villous: fr. globose, green-and-yellow variegated, about 3-4 in. diam., intensely bitter; seeds small ( $\frac{1}{4}$  in. or less long), smooth. Trop. Asia and Afr., now widely distributed in

Afr. and the Medit. region.—The dried frs. are used in medicine (as purgative), being imported from Turkey and Spain. Sometimes cult in this country as a curiosity or in collections of economic plants; culture for official purposes has been attempted in New Mex., but the frs., although larger than the official product, are reported to be less active. L. H. B.

**CITRUS** (ancient name of a fragrant African wood, afterward transferred to the Citron). *Rutaceæ*. **CITRON. LEMON. ORANGE**. Small evergreen, more or less spiny trees or shrubs, grown for their edible fruits, and also attractive in foliage and flower.

Leaves glandular-dotted, persistent, apparently simple (in reality unifoliate compound lvs.), borne on more or less winged or margined petioles, which are usually articulated with the blade and at their attachment to the twig: spines usually present, borne singly at the side of the bud in the axils of the lvs.: fls. clustered or rarely solitary in the axils of the lvs., or in small lateral or terminal cymes or panicles, white or pinkish purple in the bud; petals 5 (rarely 4 or 6) thick, strap-shaped, not clawed at the base, imbricated; stamens numerous (16-60, usually 20-40) at least four times as many as the petals, polyadelphous, cohering toward the bases in a few bundles; ovary 8-15-celled, with a prominent usually deciduous style containing as many tubes as there are cells in the ovary: fr. a hesperidium, globose, oval or oblate-spheroid, the segms. filled with juicy pulp composed of stalked pulp-vesicles; seeds 1-8 in a cell, oval or oblong,  $\frac{1}{4}$ - $\frac{3}{4}$  in. long, with a pergameneous testa and thick fleshy cotyledons, usually with adventive embryos arising as buds from the nucellar tissue of the mother plant. Natives of Trop. and Subtrop. Asia and the Malayan Archipelago.—Half a dozen species are commonly cult. and have given rise to very many varieties as well as numerous hybrids, making the delimitation of the species exceedingly difficult. See *Citrange, Citron, Etrog, Grapefruit, Lemon, Lime, Limequat, Orange, Pomelo, Tangelo*.

The nomenclature here followed is based on the writer's treatment of the species of *Citrus* in "Plantæ Wilsonianæ." The fewest possible number of changes have been made consistent with presenting a clear account of the genus. A careful study of *Citrus* and the genera most nearly related to it has shown that the trifoliate orange differs in so many and such important characters that it seems necessary to recognize it as a separate genus (*Poncirus*). The same is true of the kumquats and the Australian limes.

#### KEY TO THE SPECIES.

- A. Winged petiole nearly as large as the blade of the lf.: seeds very large, thick: fr. rough, oval, lemon-yellow when ripe: fls. solitary. . . . . 9. *ichangensis*
- AA. Winged petiole much smaller than the blade of the lvs.: seeds small or medium sized: fls. usually in clusters.
  - B. Lvs. apparently not jointed between blade and petiole, oblong-serrate: petiole wingless: fl.-buds tinted reddish: fr. with a very thick peel, fragrant, pulp acid . . . . . 1. *Medica*
  - BB. Lvs. with an obvious joint between the blade and petiole, crenate: peel thin or only moderately thick.
    - c. Fl.-buds tinted reddish on outside: petioles merely margined: lvs. crenate: frs. oval, more or less apiculate. . . . . 2. *Limonia*

CC. Fl.-buds white: petioles more or less winged.

D. Frs. oval, often slightly papillate, small, 1-1½ in. diam., greenish-yellow when ripe, thin-skinned, smooth: fls. small: petioles plainly winged: lvs. small, pallid above, crenate, more or less punctate, obtuse: spines short, very sharp..... 3. *aurantifolia*

DD. Frs. globose, depressed globose, rarely oval or pyriform, never papillate, orange-colored, or if yellow, frs. large and thick-skinned.

E. Size of fr. very large, pale yellow when ripe: twigs pubescent when young: petioles broadly winged..... 4. *grandis*

EE. Size of fr. medium or small, orange or orange-yellow.

F. The frs. with a solid core and a light skin; pulp sweet: petioles slightly winged... 6. *sinensis*

FF. The frs. with a hollow core when fully ripe, skin loose or, if tight, pulp acid and petioles broadly winged.

G. Skin tight: petioles broadly winged: pulp acid.... 5. *Aurantium*

GG. Skin loose: petioles only narrowly winged or margined.

H. The fr. borne singly at tips of branches, small; segms. 7-10, pulp very acid: lvs. pale beneath..... 8. *mitis*

HH. The fr. borne in axils of the lvs.; segms. 8-15, pulp sweet: lvs. dark green below..... 7. *nobilis*

1. *Médica*, Linn. (from *Media* whence the species first came to the notice of the ancient Greeks and Romans). CITRON. Fig. 971. A shrub or small tree, with long irregular branches: thorns short, stout and stiff: lvs. rather pale green, large, oblong, 4-6 or 7 in. long and 1½-2 in. wide, bluntly rounded at the tip with serrate margins, not articulated with the petioles, which are wingless: fls. large, reddish tinted when in the bud, usually in terminal panicles, or clustered, in the axils of the lvs.; petals large, white above, reddish purple below; stamens numerous, 30-40 or more; ovary tapering gradually into the often persistent style: fr. large, oval or oblong, 6-10 x 4-6 in., bluntly apiculate, often rough or bumpy, lemon-yellow when ripe; skin very thick, fragrant; pulp scanty, acid; seeds oval, smooth, white inside.—The citron is

very sensitive to cold because of its ability to grow at low temperatures, which causes it to start into a fresh and very tender growth after a few days of warm weather in winter. It is cult. in the Medit. region, especially in Corsica, whence large quantities of the peel are exported in brine to Amer. to be candied. The candied peel is much used in confectionery and in cakes. Sparingly cult. in Calif. and Fla. A number of ill-defined varieties are grown, the most important being the Corsican, intro. from Corsica in 1894 by David Fairchild. The Etrog or sacred Jewish citron is grown in Corfu. See *Citron*.

Var. *sarcodactylis*, Swingle (*Citrus sarcodactylis* v.

973. Fingered citron.—*Citrus medica* var. *sarcodactylis*. (× ½)

Nooten. *C. Médica* var. *digitata*, Auct., not Lour.). Fo SHU KAN (Chinese). BUSHUKAN (Japanese). Fig. 973. Differs from the common citron in having the segms. of the fr. separated into finger-like processes. The frs. are very fragrant and are used by the Chinese and Japanese for perfuming rooms and clothing. It is sometimes grown as a dwarf potted plant for ornament. It should be intro. into this country.

2. *Limònia*, Osbeck (from Arabic *limūn*, a lemon) (*C. Médica* var. *limon*, Linn. *C. limonium*, Risso).

LEMON. Fig. 974. A small tree with long irregular branches: thorns short, stout and stiff: lvs. rather pale green, elongate-ovate, pointed at the tip, with serrate or sub-serrate margins; petioles wingless but sometimes narrowly margined, articulated both with the blade and the twig: fls. rather large, solitary or in small clusters in the axils of the lvs., reddish-tinted in the bud; petals white above, reddish purple below; stamens 20-40; ovary tapering into the deciduous style: fr. oval or oblong, with an apical papilla, 3-5 x 2-3 in. with 8-10 segms., lemon-yellow when ripe, with a prominently glandular-dotted peel, often more or less rough and moderately thick; pulp very abundant, very acid; seeds small, ovate, smooth, often few or none, white inside.

974. *Citrus Limonia*. (× ¼, fr. ¼)

—The lemon is very sensitive to cold as, like the citron and the lime, it is readily forced into new growth by a few days of warm weather in winter. It is found in all tropical and warm subtropical regions and is cult. on a large scale in the Medit. region, especially in Sicily, whence large quantities of the frs. are exported to the U. S. In this country the lemon is widely cult. in Calif. and to a much smaller extent in Fla. The frs. are gathered just before they ripen while still green in color and often before they attain their full size and are then ripened in curing-houses, in which temperature and humidity are artificially controlled. The juice is used for making lemonade, for cooking, and the arts; the peel is used in cooking and the oil extracted from it is used in cooking and in perfumery. The principal cult. varieties have rather small smooth frs. The more important varieties are listed here: *Eureka*. Frs. oval-oblong, medium size, usually seedless, ripening early: tree small, nearly thornless. *Genoa*. Frs. oval, pointed at base and tip, ripening early, seedless: tree dwarf. *Lisbon*. Frs. oblong, with a large papilla at the tip, few-seeded: tree of medium size, thorny; a vigorous grower. *Villa Franca*. Frs. oval-oblong, medium to large, apex abruptly papillate, seeds numerous: tree of good size, nearly thornless. *Kennedy*. Frs. oval, with a very small papilla, thin-skinned, nearly seedless. *Ponderosa*. Frs. very large, sometimes weighing 2½ lbs., with a neck at the base; seeds numerous. *Everbearing*. Frs. large, abruptly papillate at the tip, with a narrowed neck at the base, rough all over; seeds rather numerous: everbearing, borne on a straggling bushy tree that sprouts from the roots. Grown for home use in Fla. *Rough* (Florida Rough). A tree of doubtful origin, occurring wild in the Everglades of S. Fla.: frs. round-ovate, very rough, apical papilla surrounded by a depressed ring; seeds numerous: tree large and vigorous. The frs. of this variety are useless for commercial purposes, but the seeds are in considerable demand by

nurserymen as the tree makes an excellent stock for very poor sandy or calcareous soils. See *Lemon*.

3. *aurantifolia*, Swingle (*Limonia aurantifolia*, Christmann. *C. limetta* Auct. not Risso). **LIME.** A small tree, with rather irregular branches: spines very sharp, short, stiff; lvs. small, 2-3 in. long, elliptic-oval, crenate, rather pale green; petioles distinctly but narrowly winged; fls. small, white in the bud, occurring in few-fl. axillary clusters; petals white on both surfaces; stamens 20-25; ovary rather sharply set off from the deciduous style; fr. small, oval or round-oval,  $1\frac{1}{4}$ - $2\frac{1}{2}$  in. diam., often with a small apical papilla, with 10 segms., greenish yellow when ripe; peel prominently glandular-dotted, very thin; pulp abundant, greenish, very acid; seeds small, oval, smooth, white inside.—The lime is perhaps the most sensitive to cold of any known species of *Citrus*. Even a few days of moderately warm weather in winter suffice to force it into a tender and succulent growth that is killed by the slightest frost. It is found in all tropical countries, often in a semi-wild condition. It is cult. in the warmest parts of Fla., especially on the Keys. Large quantities of the fr., picked when still green and often not full-sized, are packed in barrels and shipped to the cities of the N. U. S., where they are extensively used for making limeade. Large quantities of bottled lime juice are exported from Montserrat and Dominica Isls. in the W. Indies, and used on shipboard for preventing scurvy. Limes are too thin-skinned to keep well and are not processed as are lemons. It is usually prop. from seed—rarely from cuttings. The principal varieties grown in the U. S. are: *Mexican* (West Indian). Frs. small, smooth, often with a slight apical papilla; seeds few: tree small, very spiny, usually branching from the base. This variety, almost always grown from seed, is the only one planted on any considerable commercial scale. *Tahiti* (Persian?). Frs. large, smooth, with a broad apical papilla; seedless, about the size and shape of an ordinary lemon: poor keepers. See *Lime*. Hybrids: *Sweet* (*C. limetta*, Risso?). Frs. about the size of a lemon, with a sweet and insipid pulp. Commonly grown in the W. Indies and Cent. Amer. Limequats are new hardy hybrids between the common Mexican lime and a kumquat; these hybrids vary much in size, shape and flavor, but some are about the size of a lime and have abundant very acid pulp. See description under *Limequat*.

4. *grândis*, Osbeck (*C. Aurantium* var. *grândis*, Linn. *C. Aurantium* var. *decumâna*, Linn. *C. decumâna*, Linn.). **GRAPEFRUIT** (or **POMELO**). **SHADDOCK.** **PUMMELO.** Fig. 975. A large round-topped tree, with regular branches: spines, if present, slender and flexible, rather blunt; lvs. large, dark glossy green above, oval or elliptic-oval, with a broadly rounded base; petiole broadly winged, more or less cordate; fls. axillary, borne singly or in clusters, large, white in the bud; petals white on both sides; stamens 20-25, with large linear anthers; ovary globose, sharply delimited from the deciduous style; fr. very large, 4-6 in. diam., globose, oblate spheroid or broadly pear-shaped, smooth, with 11-14 segms., pale lemon-yellow when ripe, peel  $\frac{1}{4}$ - $\frac{1}{2}$  in. thick, white and pithy inside; seeds usually very numerous, large, flattened and wrinkled, white inside.—The grapefruit (or pomelo) is now one of the most appreciated citrus frs. grown in the U. S. The culture of this delicious fr. was limited to the Fla. pioneers until some 25 years ago, when the first commercial plantations were made. Since then, there has

been a steady increase in the area devoted to this fr. in Fla., and plantings have been made in Calif., Ariz., and the West Indies. The pummelo of India, called shaddock in Fla., is not grown on a commercial scale, but occurs in many tropical countries. The grapefruit is usually served as a breakfast fr. cut in half and seeded. It is a vigorous grower, even on light sandy loam soils and is coming increasingly into use as a stock upon which to graft other citrus frs. The young trees are tender, but the mature ones are well protected by a dense canopy of lvs. and may stand more cold than an orange tree. The grapefruit is much like the orange in its ability to resist cold and is much less easily forced into a new growth by a few warm days in winter than the lime or lemon. The varieties of grapefruit grown in the U. S. have almost all originated in Fla., where the early settlers prop. this tree from seed, thereby originating many slightly different varieties, the more important of which are listed here: *Duncan*. Fr. large, keeps well on the tree, seeds few: tree rather hardy. *Hall* (Silver Cluster). Frs. medium size, produced in large clusters; seeds numerous. *Triumph*. Fr. small or medium size, early: tree rather tender. Does not succeed well when budded on sour orange stock. *McCarty*. Fr. large, late borne singly; seeds numerous. A variety recently found in the Indian River region of Fla. Besides these standard varieties of grapefruit of the Fla. seedling type a large number of other similar varieties are cult. locally in the state, such as the Bowen, Excelsior, Josselyn, Leonardy, Manville, May, McKinley, Standard (or Indian River), Walters, and many others. The following varieties differ more or less widely from the old Fla. seedling type. *Marsh*. Frs. large, depressed globose, often seedless; pulp subacid, less bitter than in the other varieties. This variety, though it originated as a seedling in Fla., is best adapted to cult. in Calif., where many of the ordinary Fla. varieties do not succeed well. *Pernambuco*. Frs. large, skin very smooth, light-colored, late; seeds abundant. Intro. from Pernambuco, Brazil, to the U. S. by the U. S. Dept. of Agric.—The shaddocks or pummelos are seldom cult. in the U. S. The Tresca variety from the Bahama Isls. has large pyriform frs., with pink flesh of good flavor and abundant seeds: the tree is tender. A pummelo from near Canton, China, is imported into San Francisco on a small scale by the Chinese resident there. The frs. are pyriform, very thick-skinned, not pink within; seeds numerous. Some seedlings of this variety are to be found at various points in Calif. They are very leafy and of vigorous growth, and make excellent stocks upon which to graft other citrus frs. Many other sorts of pummelos are known from Asia and the Malayan Archipelago and some have been intro. for trial by the

Office of Foreign Seed and Plant Introduction of the U. S. Dept. of Agric. The true grapefruit seems to be scarcely known outside of U. S. and the W. Indies. See *Grapefruit* and *Pomelo*.

5. *Aurantium*, Linn. (*C. vulgâris*, Risso. *C. Bigarâdia*, Risso. *C. Aurantium* var. *Bigarâdia*, Hook. f.). **SOOR** or **SEVILLE ORANGE.** Fig. 976. A medium-sized tree, with a rounded top and regular branches: spines long but flexible and blunt; lvs. light green when young, medium-sized, 3-4 in. long, tapering to the somewhat wedge-shaped base, and more or less acuminate at the tip; petiole broadly winged; fls. medium-sized, axillary, single or clustered, white in the bud; petals white on both sides, very fragrant; stamens 20-24; ovary globular, sharply delimited from the deciduous style; fr.  $2\frac{3}{4}$ - $3\frac{1}{4}$  in. diam., globose, slightly flattened at the

975. *Citrus grandis*. ( $\times \frac{2}{3}$ )

976. *Citrus aurantium*. ( $\times \frac{2}{3}$ )

tip, with a hollow core when fully ripe; pulp acid, membranes with a bitter taste, segms. 10-12; seeds cuneate-oval, flattened, with raised lines, white inside.—The sour or Seville orange is grown all over the world. It is able to withstand more cold than most of the other citrus frs. and is rarely forced into new growth by warm weather occurring in winter. The sour orange is found in a thoroughly naturalized condition in many parts of Fla. where it doubtless was brought by the Spaniards. Most of these wild sour orange trees were dug up and transplanted for use as stocks when orange-culture was being rapidly extended some 25-30 years ago. The Seville orange, as its name would indicate, is grown on a commercial scale in the vicinity of Seville, Spain, whence the frs. are shipped in large quantities to England and Scotland for use in making orange marmalade, for which this species is best adapted. The petals yield a valuable perfume, oil of Neroli, which is produced in the south of France and the Italian Riviera. The peel of the fr. is sometimes candied and, when fresh, yields an essential oil. The sour orange is grown in a small way in Fla. for home use, the frs. being used for making "orangeade." In the U. S. the sour orange is used almost exclusively as a stock on which to bud other citrus fr. trees. The seeds are in demand by nurserymen at a good price for this purpose. The sour orange is well adapted to grow on a great variety of soils but is especially well fitted for low wet soils, where it is valuable because it is immune to the *mal di gomma* or foot-rot so destructive to the common orange and lemon on such soils. There are no named varieties of the sour orange in cult. in the U. S.—Mutations: The so-called *Citrus myrtifolia*, a narrow-lyd. form with spineless twigs and short internodes, bearing small flattened sour oranges is a mutation arising from the root of the sour orange. *Chinotto* (the Chinese of the French confectioners). This is a broader-lyd. form of the above described mutation. It is cult. along the northern shore of the Medit. from Genoa to Toulon, yields the small green frs. used for candying. This variety, which should be called the Chinotto, is being tested in the U. S. and may prove adapted for commercial culture on a small scale in this country. Hybrids: *Bittersweet*. A good-sized tree occurring wild in Fla., is undoubtedly a hybrid between this species and the following. Frs. oblong, flattened at the ends; pulp sweet, but the membranes separating the segms. have a bitter taste. The fr. ripens very late on some trees and keeps well on the tree.

6. *sinensis*, Osbeck (*C. Aurantium* var. *sinensis*, Linn. *C. Aurantium*, Lour. et Auct., not Linn.). COMMON OR SWEET ORANGE. Fig. 977. A medium-sized tree, with a rounded top and regular branches: spines, when present, slender, flexible, rather blunt: lvs. medium-sized, rounded at the base, pointed at the apex; petiole narrowly winged, articulated both with the blade and the twig: fls. medium-sized, smaller than those of the sour orange, white in the bud; petals white on both surfaces; stamens 20-25; ovary subglobose, clearly delimited from the deciduous style: fr. subglobose or oval, pith solid, pulp sweet, membranes not bitter in taste, segms. 10-12 or 13 in number; seeds cuneate-ovoid with rugose margined plane surfaces, white inside.—The common or sweet orange is widely cult. in all the tropical and subtropical regions of the world. It is rather tender, not so hardy as the sour or Seville orange, but much more cold-resistant than the lemon or lime. A very few orange trees occur in a semi-wild state in S. Fla. Sweet oranges were doubtless intro. into Fla. by the Spaniards nearly four centuries ago and, as they were prop. by seeds until within the last half-century, many local varieties have arisen there. Orange-culture has reached its highest development in S. Calif., where it constitutes one of the most important agricultural industries. Fla. is second only to Calif. in the extent and value of the orange groves,

while some oranges are grown in favored spots in La., Texas, and Ariz.—Oranges are the best known and probably the most highly esteemed dessert fr. A few are used in cooking and the peel is sometimes candied. An essential oil is also pressed from the peel. The sweet orange is commonly used as a stock on which to graft other species of citrus frs. It grows well on light well-drained loam or sandy loam soil. On heavy soil it

977. *Citrus sinensis*. ( $\times \frac{2}{5}$ )

is subject to the *mal di gomma* or foot-rot. Very many varieties are in cult. Some of the principal sorts grown in the U. S. are listed here. (1) Florida seedlings—varieties originated in Fla. as a result of prop. oranges from seed, mostly strong-growing trees: *Parson Brown*. Frs. medium-sized, very early. *Pineapple*. Frs. medium or large, very juicy; seeds rather numerous: midseason: tree a strong grower. *Homosassa*. Frs. medium-sized, very juicy: a good bearer and keeper; tree nearly thornless. *Madam Vinous*. Frs. medium or large; pulp coarse-grained, juicy; midseason. *Nonpareil*. Frs. rather large, flattened; pulp fine-grained, juicy: tree vigorous. Also *Arcadia*, *Summit*, *Foster*, *Hick*, *Magnum Bonum*, *May*, *Old Vini*, *Osceola*, *Stark*, *Whittaker*, and very many others of the same general type. (2) Florida mutations or hybrids—new sorts originated in Fla., usually differing in some striking way from the old Fla. seedling oranges, perhaps through hybridization with foreign varieties. *Boone* (Boone's Early). Frs. medium size, strongly oval or oblong, very juicy, very late, keeping well on the tree: lvs. with petioles varying in width. *Lue Gim Gong*. Frs. oval, juicy, ripening very late and holding very well on the tree, even until late summer. A variety newly intro. into cult. *Drake Star*. A rare variety with variegated foliage; usually a poor bearer but sometimes bearing a good crop of excellent fr. (3) Mediterranean varieties, largely intro. into Fla. by Sanford and Lyman Phelps, about 30-40 years ago: *Ruby*. Frs. small or medium-sized; peel red-orange; pulp streaked with red when fully ripe, juicy; seeds rather few: rather late: tree vigorous, nearly thornless, prolific. *St. Michael*. Frs. medium-sized, oblong, red-blotched when ripe; flesh wine-red; seeds few; rather early. *Jaffa*. Frs. large, oblong, juicy; seeds few. Possibly not the same as the celebrated orange of Jaffa, Palestine. *Mediterranean Sweet*. Frs. large, oval, juicy, late: tree nearly thornless. *Majorca*. Frs. round or slightly flattened, juicy: rather late. *Hart* (Hart's Tardiff). Frs. round or slightly oval, medium to large size, juicy; seeds few; ripens very late: similar to the next and thought by some to be identical. *Valencia* (Valencia Late). Frs. medium to large, oval or rounded, juicy, nearly seedless, very late. A prolific variety, largely grown in Calif. and held in cold storage until early autumn. There are many other Medit. varieties of nearly or quite as much value as some of the above, such as, *Centennial*, *Du Roi*, *Joppa*, *Paper Rind*, *Prata*, *Saul Blood*, *St. Michael* (Blood), etc.—The navel oranges all show a second smaller more or less included fr. formed at the tip of the main fr. Many varieties are of foreign origin. *Washington* (Bahia, Washington Navel). Fr. large, rounded slightly, pointed at apex; flesh firm, juicy; skin

very tough; seedless; early midseason. The most famous variety of oranges intro. from Bahia, Brazil, by Wm. Saunders of the U. S. Dept. of Agric. in 1870. Its cult. has steadily extended in Calif. until it is the principal variety grown there. It does not succeed well in Fla. *Thompson* (Thompson's Improved Navel). A smooth-skinned hard-fleshed variety found by A. D. Shamel to arise as a mutation from the preceding, to which it is inferior in quality though better in appearance. *Australian*. Frs. large, coarse; tree vigorous, but a shy bearer. Also found by Shamel as a variation of the Washington Navel (Bahia). *Surprise*. Fr. medium-sized, rounded or even slightly flattened, juicy, early, seedless. A variety originated by E. S. Hubbard, of Fla. *Double Imperial*. Fr. small or medium-sized, navel hidden; pulp firm; seeds few or none. A Brazilian variety, said to fruit well in Fla. when budded on trifoliate orange stock. There are many other varieties of navel oranges occasionally grown on a commercial scale. In Calif., among others, Golden Nugget and Navelencia; in Fla., Egyptian, Melitensis, and Sustain are known. There are doubtless many more navel oranges which should be tested. See *Orange*. Hybrids: Citranges are hardy hybrids between the common sweet orange and the trifoliate orange, *Poncirus trifoliata*. The principal varieties are the Rusk, Morton, Colman, Savage, Cunningham and Saunders. See description under *Citrang*.

978.  
*Citrus ichangensis*.  
( $\times \frac{5}{8}$ )

Magee, of Riverside, Calif., in 1880, from Saigon, Cochinchina, which introduction became known as the King orange. It has frs. of large size, very juicy, and of delicious vinous flavor. Its rough skin seems to be no obstacle to its ready sale at good prices.

Var. *deliciosa*, Swingle (*C. deliciosa*, Tenore). MANDARIN ORANGE. A small tree, with slender branches, willow-like lvs., with merely margined petioles: fls. small: frs. depressed globose, bright orange-yellow or reddish orange, with a very loose peel; seeds small, beaked, bright green within.—This variety comprises the many varieties of Mandarin oranges, including the so-called tangerine varieties. These are delicious dessert frs., attractive in appearance and easy to handle because of the loose skin and the easily separable segms. Aside from the greater ease of preparing them for the table, Mandarin oranges are used exactly as are common oranges. The principal varieties grown in the U. S. are the following: *Mandarin* (China, China Mandarin, Willow-leaved). Fr. medium-sized, 2–3 in. diam., depressed-globose, early, orange-yellow; very juicy; sweet; seeds abundant. *Oneco*. Fr. medium to large, orange-yellow, midseason. Intro. from India in 1888. *Tangerine* (Dancy's Tangerine). Fr. red-orange, medium size, depressed-globose, juicy; seeds rather

abundant: midseason: tree of good size: lvs. much broader than those of the Mandarin variety. Other Mandarin oranges are occasionally grown, especially in Fla., such as the Beauty, Cleopatra, Kino Kumi, and Mikado. Hybrids: Tangelos, are a striking new group of citrus frs. *Sampson*, the first tangelo to be grown commercially, was obtained by the writer in 1897 by crossing the tangerine with Bowen grapefruit; it is unlike either parent in quality, being more like a choice sprightly flavored sweet orange. Many other tangelos are now being tested. See *Tangelo*.

Var. *unshiu*, Swingle (*C. nobilis* subsp. *genuina* var. *unshiu*, Makino). SATSUMA or UNSHIU ORANGE. A small spineless tree, with a spreading dwarf habit: lvs. broad, abruptly narrowed toward the apex, with strongly marked veins on both faces: fls. small, very abundant: fr. depressed-globose, 2–3¼ in. diam., deep orange; pulp orange, very juicy, of a peculiar but agreeable flavor; pith hollow; segms. 9–13; seeds often lacking, when present only few in number, broadly top-shaped, not beaked as in the Mandarin oranges, greenish within.—This very marked orange seems to constitute a botanical variety distinct from the King or the Mandarin oranges. It is commonly grown in Japan, whence it was intro. into Fla. by Geo. R. Hall in 1876, according to H. H. Hume, "Citrus Fruits and Their Culture," p. 112. 1909. The Satsuma orange is one of the hardiest of all edible citrus frs. Budded on the trifoliate orange, it can be grown in many parts of the Gulf Coast region, where all other citrus frs. except citranges are killed by cold. The Satsuma can be grown best on the trifoliate orange stock. It grows on sweet stock but does not produce as much nor as good fruit and is not so hardy. It makes only a stunted growth on sour orange stock and soon dies. It cannot be grown satisfactorily on light sandy land or on black waxy lands with a marly subsoil where the trifoliate orange does not grow well. It could be grafted on Rusk citrange for the black waxy lime soils of Texas.

8. *mitis*, Blanco. CALAMONDIN ORANGE. A small tree, with upright branches: lvs. broadly oval, pale green below like those of kumquat; petiole narrowly winged: fls. small, angular in the bud, borne singly at the tips of the twigs: fr. small, depressed globose, deep orange-yellow when ripe, loose-skinned; segms. 7–10, easily separable; pulp very acid; seeds few, small.—This tree, a native of the Philippine Is., is commonly cult. in Hawaii, where it is wrongly called "China orange." It was intro. into Fla. by the U. S. Dept. of Agric. from Panama, and was for a time distributed by nurserymen under the erroneous name of To-Kumquat. It is very hardy, probably as hardy as the Satsuma, or even more so. It can be budded on sour orange or on trifoliate orange stock. A promising fr. for home use, for culinary purposes and for making ade.

9. *ichangensis*, Swingle. Fig. 978. A small tree, with long slender spines: lvs. narrow, with oblong broadly winged petioles nearly or quite as large as the blade: fls. white; stamens 20, cohering in bundles: fr. lemon-shaped, 3–4 in. long, with a very broad low apical papilla surrounded by a shallow circular furrow; segms. 8–11; pulp acid, of good flavor; seeds very large, thick, cuneate-ovate, ½–¾ in. long and ¼–¾ in. thick, white within.—This interesting new species, not closely allied to any other of the known members of the genus *Citrus*, is native in highlands of S. W. China. It is the northernmost evergreen tree of the citrus group and grows at high altitude, 3,000–5,000 ft. It is able to withstand considerable cold in winter, so it is very likely to prove of value in breeding new types of hardy substitutes for the lemon. E. H. Wilson, who collected excellent material of this plant for the Arnold Arboretum, is endeavoring to secure it for trial in U. S.

*C. bergamia*, Risso. BERGAMOT. A small tree: lvs. oblong-oval, with long, winged petioles: fls. small, white, very fragrant: frs.

pyriform, 3-4 in. diam., thin-skinned, pale yellow when ripe; pulp acid; seeds oblong, many. Extensively cult. in Calabria for the essential oil which is expressed from the peel and used in making Eau de Cologne and other perfumes.—*C. hirsuta*, see Papeda.—*C. japonica*, see Kumquat.—*C. taifensis*, Risso. OTAHEITE ORANGE. A dwarf plant, having lemon-like fls. and lemon-shaped fr. orange in color with a mawkish taste. Commonly grown by florists as an ornamental pot-plant. Rarely used as a stock for dwarfing common citrus frs. This plant is not a native of Tahiti as the name would indicate, but is probably of hybrid origin.—*C. trifoliata*=*Poncirus trifoliata*.

WALTER T. SWINGLE.

CIVE: *Chive*.

**CLADÁNTHUS** (Greek, *klados*, branch, and *anthos*, flower; alluding to the branching, which distinguishes this genus from *Anthemis*). *Compósitæ*. An annual yellow-rayed herb, sometimes planted in the open garden. Plant branched from the base in a forking manner; a fl. terminates each branch, whereupon 2 new branches start from directly beneath the fl.; each of these is temporarily stopped by a fl., and so on: involucre hemispherical; receptacle conical or oblong, with scales about fls; ray-fls. pistillate, disk-fls. perfect.—One species; allied to *Achillea* and *Anthemis*.

**arábicus**, Cass. (*C. proliferus*, DC. *Anthemis arábica*, Linn.). Glabrous, 2-3½ ft. high: lvs. alternate, pinnately parted; lobes linear, trifid: fl.-heads solitary, bracted. S. Spain and Morocco.—A free-flowering heavy-scented plant of easy culture. L. H. B †

**CLADOTHÁMNUS** (*klados*, branch, and *thamnos*, bush, from the Greek). *Ericaceæ*. Shrubs, rarely cult. for their handsome pink fls. Erect, with many virgate branches: lvs. deciduous, alternate, entire: fls. pink, terminal, 1-3, nodding; corolla divided to the base or nearly so into 5 oblong petals; stamens 10: caps. 5-6-celled.—One or 2 species in Pacific N. Amer., from Alaska to Wash. Hardy, with handsome rather large pink fls. in summer; rarely cult. They will probably grow best in peaty and sandy soil, in a half-shady position; prop. by seeds or by cuttings of soft wood under glass, and by layers.

*C. pyrolæiflorus*, Bong. Shrub, 4-10 ft.: lvs. nearly sessile, obovate-lanceolate, mucronulate, glabrous, pale green, 1½-2½ in. long: fls. solitary, with 5 separate petals, 1 in. across. Alaska to Ore. G.F. 10:215. B.M. 8353.—*C. campanulatus*, Greene. According to Greene, this species differs from the preceding chiefly in the petals being united at the base and the anthers opening with a pore at the apex, and occurs in Wash., while *C. pyrolæiflorus* is restricted to Alaska, but the specimens from Ore. and Wash. do not differ from *C. pyrolæiflorus*; possibly *C. campanulatus* was based only on an abnormal form.

ALFRED REHDER.

**CLADRÁSTIS** (Greek, *brittle branch*). *Virgilia* of gardens. *Leguminosæ*. YELLOW-WOOD Trees grown chiefly for their large panicles of white flowers and for their handsome foliage.

Deciduous: winter-buds naked, several superposed and concealed during the summer in the enlarged base of the petiole: lvs. alternate, odd-pinnate, with few rather large entire short-stalked lfts.: fls. in long, usually paniced racemes, white, papilionaceous; calyx campanulate, 5-toothed; stamens 10, nearly free: pod narrow-oblong, compressed, 3-6-seeded, with thin membranous valves.—Four species in N. Amer. and E. Asia. Hardy ornamental trees of medium size, with showy fls. and handsome foliage, turning bright yellow in fall. They thrive in almost any soil. Prop. by seeds, sown in spring, or by root cuttings, dug up in fall and kept in sand or moss, moderately moist and cool, until spring.

**lútea**, Koch (*C. tinctoria*, Raf. *Virgilia lútea*, Michx.). Tree, with yellow wood and smooth bark, sometimes 50 ft.: lfts. 7-9, oval or ovate, glabrous, bright green, 3-4 in. long: panicles loose, drooping, 10-20 in. long; fls. white, fragrant, over 1 in. long. June. Ky., Tenn., and N. C. S.S. 3:119-20. B.M. 7767. Mich. Hist. Arb. III. 266. Gng. 2:401; 5:98. F.E. 8:427. G.F. 1:92. Gn. 24, pp. 96-7; 34, p. 329. G.C. III. 42:186-7. M.D.G. 1899:444-5. G.W. 12, p.

397. V. 4:307. A.G. 15:270.—One of the most beautiful flowering native trees, with wide, graceful head and a short trunk, well adapted as single tree on the lawn. Hardy north to New England and Ont. The wood yields a clear yellow dye. There is a var. *aureo-variegata* with lvs. variegated with yellow.

**sinénsis**, Hemsl. Tree, to 80 ft.: lfts. 9-13, oblong to oblong-lanceolate, usually rounded at the base, yellowish green, pubescent beneath along the midrib, 2-4 in. long; rachis and petiole pubescent: fls. in loose, upright, much-branched panicles, 5-12 in. long and 4-8 in. across, white or pinkish, about ½ in. long. June, July. W. and China.

*C. amurénsis*, Koch = *Maackia amurensis*.—*C. platycarpa*, Makino (*Sophora platycarpa*, Maxim.). Tree: lfts. 9-15, ovate to elliptic-lanceolate, 2-3½ in.: panicles broadly pyramidal, upright; fls. ½ in. long, white; standard with yellow spot at the base; pod narrowly winged. Japan. S.I.F. 2:32. Very rare in cult.—*C. Tashiroi*, Yatabe = *Maackia Tashiroi*.—*C. Wilsonii*, Takeda. Tree, to 50 ft.: lfts. 7-9, elliptic-ovate to ovate-oblong, usually broadly cuneate at the base: panicles upright, 5-8 in. long; fls. ¾ in. long; ovary pubescent. Cent. China.

ALFRED REHDER.

**CLÁRKIA** (Capt. Wm. Clark, companion of Lewis, explorer of the Rocky Mt. region and beyond, 1806). *Onagraceæ*. Flower-garden annuals.

Herbs, with alternate mostly entire lvs., and showy fls. in the upper axils or in terminal racemes: fls. regular, the calyx tubular, the petals 4, narrow at the base and entire or lobed, wide-spreading; stamens 8, the alternate ones short or rudimentary; stigmas 4, large and spreading: pod oblong or linear, 4-sided.—Half dozen or more species in W. N. Amer. See also *Eucharidium*.

Clarkias are hardy annuals of easy cultivation. They thrive in a warm, light soil, either fully exposed to the sun or in partial shade. They are useful for low masses or for edgings; also for vases and baskets. They have been much improved by domestication.

A. Stamens (8) all perfect: lvs. broad.

**élegans**, Douglas (*C. unguiculata*, Lindl. *C. nerifolia*, Hort.). Fig. 979. From 1-6 ft. high, glabrous or nearly so, the sts. reddish and glaucous, simple or sparingly branched: lvs. broad-ovate to linear, remote-dentate: fls. purple or rose-colored, running into white vars.; double forms in cult.; claw of the petal about as long as its rhomboidal entire limb: caps. sessile. B.M. 3592. B.R. 1575. R.H. 1845:385. Mn. 1:22.—One of the commonest annual fls.

**rhomboídea**, Douglas. Not so tall and more slender: lvs. thin, lance-oblong or ovate-oblong, entire: claw

979. *Clarkia elegans*. (× ¾)

often toothed, shorter than the rhomboidal limb: caps. stalked. B.R. 1981. R.H. 1864:151(?).—Not much cult.

AA. *Stamens 4 perfect and 4 rudimentary: lvs. very narrow.*

**pulchella**, Pursh. Fig. 980. One ft. to 18 in. high, branchy, often tufted and dwarf, the sts. mostly puberulent: lvs. narrowly lance-oblong to linear, narrowed into a petiole, entire: fls. lilac, running into white vars.; petals  $\frac{3}{4}$  in. or less long in wild plants, with 3 wide-spreading lobes and a pair of recurved teeth on the claw: caps. stalked. B.M. 2918. B.R. 1100. R.H. 1845:385; 1886, p. 557.—Common in cult. There are semi-double and dwarf forms. Var. **holopétala**, Voss (*C. integripétala*, Hort.) is a garden form or race with entire petals. There are also dwarf forms of it. The garden names *kermesina* and *limbata* belong with *C. pulchella*. L. H. B.

**CLARY**. The dried leaves of *Salvia Sclarea*, which are used for seasoning. Other species of *Salvia* have been used for the same purpose. See *Salvia*.

**CLAUCÈNA** (a personal name). *Rutaceæ*. Small inermous trees: lvs. pinnate: fls. in terminal panicles or loose racemes; ovary raised on a short disk, 4-5-celled, with 1-2 ovules in each cell; style short, deciduous; stamens 8-10; fr. 4-5-celled, with usually 1 seed in each cell; cotyledons aerial in germination, first foliage-lvs. opposite or alternate.

**Lánsium**, Skeels (*Clau-sèna Wámpi*, Oliver. *Quin-ària Lánsium*, Lour. *Cookia Wámpi*, Blanco). **WAMPI**. Low spineless tree, with spreading branches: lvs. spirally arranged, pinnate; lfts. 5-9, ovate-elliptical, 3-5 in. long, petiolate, light green, shiny above: fls. 4-5-parted, small, white, in large terminal panicles; ovary villous, 5-celled, with 1 ovule in each cell; style short; stamens 10; fr. ovate-globose, about 1 in. long; skin glandular, pubescent; seeds green.—The wampi is a native of S. China, where it is commonly grown for its frs. It is cult. to some extent in Hawaii and could probably be grown in the warmer parts of Fla. and Calif. It can be grafted on grape-fruit and other species of *Citrus*, which makes it desirable to test it as a stock for common citrous frs.

980. *Clarkia pulchella*.  
(X1)

WALTER T. SWINGLE.

**CLAVIJA**, (Don José de Viera y Clavijo, of Madrid). Syn., *Horta*. *Myrsinacæ*; by Mez separated in the family *Theophrastacæ*. Thirty and more tropical American evergreen unbranched trees or shrubs, a few of which are sometimes grown in the warmhouse. The sts. are simple, often spiny, bearing at the top a cluster of large rigid, simple, entire or spiny-toothed lvs.: fls. polygamous-dioecious in axillary racemes; calyx 4-5-parted, the segms. round; corolla white, yellow or orange, the tube short and fleshy, the limb mostly spreading and 4-5-lobed; stamens 4 or 5, the filaments often united in the sterile fls.; staminodia 4 or 5, being scales in the throat; ovary fusiform, narrowed into a short style, the stigma obtuse or capitate; fr. several-seeded, berry-like. The clavijas thrive in a

peaty potting soil, and prop. by cuttings of half-ripened growths. They are odd plants. The features are here given as apparently understood by horticulturists.

A. *Lvs. entire, or only repand.*

**nóbilis**, Mez, (*C. clavata*, Decne). Plant 4-5 ft.: lvs. long-petioled thick,  $1\frac{1}{2}$  ft. or less, elliptic or oblong or oblanceolate, entire, acute or semi-acute: fls. yellow, with a very large disk,  $\frac{3}{4}$  in. long, the corolla fleshy, in drooping racemes 2-4 in. long. Venezuela. B.M. 6928 (as *C. Ernstii*, Hook., f.).

**integrifolia**, Mart. (*Theophrasta integrifolia*, Pohl). Allied to *C. longifolia*, differing chiefly in the less rigid, broader and entire leaves, longer petioles and larger fls. Lvs. distinctly petioled (petioles  $\frac{1}{2}$ -1 in. long), obovate-oblong to lanceolate-oblong, acute and mucronate, cuneate at the base, quite entire or slightly undulate, 8-18 in. long: racemes erect, 5-7 in. long; fls. larger than in *C. ornata*, on slender pedicels, 5-merous; appendages of the corolla rounded, short. Brazil.

**grándis**, Decne. (*Theophrasta macrophylla*, Lind., not Link. *T. grándis*, O. Kuntze). Lvs. large (to 3 ft.), long-oblong, narrowly pale-margined, entire or sinuate-repand; petiole thick and dark violet, the secondary nerves slender and simple or forked: fls. orange-yellow, in short and erect racemes; calyx-lobes orbicular and nearly glabrous, the corona 5-lobed. Colombia.

AA. *Lvs. serrate, often spiny-toothed.*

**longifolia**, Mez. (*C. ornata*, Don, *Theophrasta longifolia*, Jacq.). Plant 10-20 ft.: lvs. many, in a crowded head or tuft at the top of the st. oblong-spatulate to lanceolate, leathery, narrowed at base and stalked, acute, spiny-toothed,  $1\frac{1}{2}$  ft. or less long: fls. orange- or saffron-colored, fragrant, in drooping racemes 4-10 in. long. Venezuela, Colombia. B.M. 4922. B.R. 1764. Blooms in June and July.

**spinosa**, Mez (*C. Riedeliàna*, Regel). Plant 5-6 ft., glabrous, stout and erect: lvs. obovate-lanceolate, sessile, 20 in. or less long, spinose-serrate: fls. orange-yellow, in slender racemes 5-8 in. long. Brazil.

**fúlgens**, Hook. f. Plant 3 ft. or more, very stout: lvs. spatulate-obcuneate, narrow, remotely toothed near the apex, narrowed into a very short petiole, very coriaceous, 1 ft. or so long: fls. deep red, with yellow disk, handsome, in erect racemes 4 or 5 in. long. S. Amer. B.M. 5626.

*C. latifolia*, Radlk. (*Theophrastus latifolia*, Willd.). Lvs. gracefully elliptic, petioled, narrowed at both ends, mucronate-serrate: racemes erect. Colombia.

L. H. B.

**CLAYTONIA** (after John Clayton, of Virginia, one of the earliest American botanists upon whose collections Gronovius based the *Flora Virginica*). *Portulacacæ*. **SPRING BEAUTY**. Little smooth succulent herbs sometimes transferred to gardens for their bright flowers. Perennials with slender, 2-lvd. sts. from a deep, globular corm, and loose racemes of white or rose-colored fls. with deeper veins, appearing among the first wild fls. and lasting only a few days. The genus is characterized by its oval, persistent sepals and 5 stamens. Plants can be secured from dealers in native plants. They can be naturalized in moist places, and do well in half-shady spots at the bottom of a rockery. For *C. parvifolia*, *C. parviflora* and *C. perfoliata*, see *Montia*.

**virginica**, Linn. Plant 4-8 in. long, often forcing an irregular way through the leaf-mold of damp, rich woods; lvs. linear-lanceolate or linear, 2-6 in. long, including the gradually tapering base: fls. larger and more numerous than in *C. caroliniana*, whitish, tinged with pinkish. Colo. to Atlantic and south to Gulf. B.M. 941. L.B.C. 7:643.

**caroliniana**, Michx. Lower and fewer-fl'd.: lvs. 1-2 in. long, oblong, oblong-lanceolate, somewhat spatulate, or even ovate-lanceolate, with a blade 1-2 in. long, abruptly contracted into a marginal petiole: fls. smaller than in the preceding and more deeply colored. Minn. to Atlantic and south to mts. of N. C.—Should be grown only in cool places above 1,000 ft.

**lanceolata**, Pursh. About 4 in. high: lvs. oblong or lanceolate,  $\frac{1}{2}$ -1 $\frac{1}{2}$  in. long, the base broad or narrow; petiole as long as the blade: raceme short-peduncled; petals emarginate or almost orbiculate. N. W. N. Amer.—Considered by some to be a mere form of the preceding.

WILHELM MILLER.  
N. TAYLOR.†

**CLEISÓSTOMA** (Greek, *closed mouth*, referring to the structure of the spur). *Orchidaceæ*. Epiphytic orchids, adapted to the warmhouse.

Stems leafy: lvs. coriaceous, flat or nearly terete: sepals and petals adnate to the column, spreading; labellum with a large saccate spur; column short, thick; pollinia 2. From E. Asia and Austral.—A genus comprising in the neighborhood of 40 species, which suggest *Saccolabium*. The plants are little known in Amer. They require the treatment usually given *Aërides*. The leading species are *C. crassifolium*, Lindl., from India, with small green rosy-lipped fls. in nodding panicles, and thick recurved lvs. 10 in. long. J.F. 4:397; and *C. ringens*, Reichb. f., Philippines, with yellowish white purple-lipped fls. with orange spot on side lobes, spur large, in few-fl'd. racemes: lvs. 3-4 in. long. *C. Dawsonianum*, Reichb. f., is a *Trichoglottis*; *C. multiflorum*, Hort., is probably *Aërides multiflorum*. *C. secundum*, Rolfe, a recent introduction from Burma, has light rose-pink fls. that are turned sidewise, the front lobe of the lip rose-purple, borne on a scape 3-4 in. long: lvs. lance-oblong, about 4-5 in. long and  $\frac{1}{2}$  in. broad.

**CLEISTÁNTHUS COLLÏNUS**: *Lebidieropsis*.

**CLEISTOCÁCTUS** (*closed Cactus*, referring doubtless to the peculiar flowers). *Cactaceæ*. Slender columnar cacti, with few branches and many-ribbed: fls. short and narrowly curved, orange-red; ovary covered with small appressed bracts bearing hairs in their axils; filaments somewhat exserted and grouped together near the upper lip: fr. spineless; pulp white; seeds slightly punctate.—About 14 species have been described in this genus.

**Baumannii**, Lem. (*Cereus Baumannii*, Lem. *C. colubrinus*, Otto). Sts. dark green, slender, flexuose, columnar, reaching a height of 6 ft. and a diam. of 1-1 $\frac{1}{2}$  in., the few branches ascending, slender, parallel with the main st.: ribs 12-16, rounded: areoles close together, brown: spines fine, slender, very sharp, 15-20, fascicled, white to yellow or dark brown, about  $\frac{1}{4}$  in. long; sometimes a single one from the center reaches a length of  $\frac{3}{4}$  in.: fls. numerous, tubular, zygomorphous, 2 $\frac{1}{2}$ -3 in. long by about  $\frac{1}{2}$  in. diam. throughout, red or sometimes with orange-red petals and red tube. Uruguay, Paraguay and Argentina. J. N. ROSE.

**CLÉMATIS** (Greek name of a climbing plant). *Ranunculaceæ*. Familiar garden plants, prized for their handsome and often very showy flowers followed in many species by attractive feathery-tailed fruits.

Climbing vines, or erect or ascending perennial herbs, more or less woody: lvs. opposite, mostly slender-

petioled, usually pinnately compound, lobed, or in some species entire and rarely sessile: sepals usually 4 or 5, sometimes more, valvate in the bud, rarely imbricate, petaloid; petals none (or small in *Atragene* section, usually considered as petaloid staminodes); stamens many; pistils many: achenes in a head, 1-seeded; style persistent, long, plumose, silky or naked. Fig. 983.—About 150 species of very wide geographical distribution, most abundant in temperate regions. About 20 species found native in N. Amer. and about 80 in E. Asia. Les Clematites, Alphonse Lavallée, Paris, 1884; referred to below by "Lav."—The Clematis as a Garden Flower, Thomas Moore and George Jackman, London, 1872; referred to below by "M. & J."—Clematises, Dr. Jules le Bele, in Bull. de la Societe d'Hort. de la Sarthe; republished in The Garden (vol. 53), June-Oct., 1898.—O. Kuntze, Monogr. der Gattung Clematis in Verh. Bot. Ver. Brandenb. 26 (1885).—A. Gray, Fl. N. Amer. 1:4-9, 1895.—Finet & Gagnepain, Contrib. Fl. As. Orient 1:1-42 (1905).

*The culture of clematises.* (K. C. Davis.)

A rich soil of a light, loamy character is the best for clematises, and a little mixture of lime will make it better. The soil must be well drained, and must be kept rich by at least annual applications of horse- or cow-manure. On dry, hot soils cow-manure is best, while on heavy soils a thorough dressing of rich leaf-mold would best serve the purpose. Mulching with half-rotted manure on the approach of winter tends to increase the strength of the plants and the size of the flowers. In dry seasons, spraying is always helpful during the growing period.

Clematises belonging to the *Montana*, *Patens*, *Florida*, and *Lanuginosa* types should be pruned in February or March, by cutting away all weak, straggling and overcrowded branches. The first three mentioned flower from the ripened wood; it is essential, therefore, that in order to secure blossoms, enough of the strong one-year-old wood should be retained. *Viticella*, *Jackmanii* and *Lanuginosa* should be vigorously cut back, say in November; they blossom from the new shoots. Those of the *Patens* type should be pruned very little, soon after the flowers have disappeared, by simply trimming off useless branches and seed-bearing peduncles.

Clematises of the vigorous climbing varieties are used in many places to cover walls, root-fences, mounds, arbors, balconies, trellises, small buildings, and, in fact, many other places the ingenious gardener will think of. For pot culture in the greenhouse, and for conservatory walls, the less vigorous species are best suited. All the many varieties and hybrids of the *Patens* and *Lanuginosa* types, including *Henryi* and the forms of *Jackmanii*, are well adapted to this use, as well as for outdoor purposes. The dwarfier and more bushy species are used in greenhouses to some extent, but are found principally in borders or on large rockeries. Of the latter J. B. Keller says: "Their flowers are not so large as we see them in most of the climbers, yet they are indispensable in the flower-garden, being prolific bloomers and free growers in ordinarily rich, deep garden soil. There is room for improvement in this class, however, and specialists, who hitherto have done so much for the climbers, ought to direct their efforts now to the long-neglected bush clematises. A noble beginning has been made, resulting in the large-flowering *C. Durandii*, but we expect more of them in the future." See special notes on culture and hybrid-forming qualities after the descriptions of some of the species and varieties.

The most common method of propagation is by grafting. Roots of *C. Flammula* or *C. Viticella* are used; the cions are taken from plants that have been grown under glass, and are used before the wood is entirely ripe. Cions taken from plants grown in the

garden in summer are rarely successful. The grafts, in pots or trays, are grown in a moist coolhouse, over gentle bottom heat. Another method of propagation, involving less labor but usually successful, is to take cuttings of nearly ripe wood, grown under glass, and treat them as the cions first above mentioned, without the roots. The latter method is practised preferably in summer in gentle hotbeds; shading, spraying, and later on airing, must be strictly attended to. Layering is practised when large old stools are at hand. The knife is not used in the operation, but a twist of the stem will split the inner bark lengthwise. Every other joint is thus treated, pegged down, and covered with soil. It is best to leave the layers undisturbed until the following spring. Many of the species are often propagated by seed, and many new varieties have thus been secured. The number of hybrids is almost countless; in this account are carefully recorded those in the American trade which are traceable to their origin.

The clematis is subject to a very serious disease, due to the depredations of a nematode worm in the roots. This trouble is most serious under glass and alongside buildings where the ground does not freeze deep. The parasite is probably distributed in the soil adhering to pot-grown plants. It is probable that hard freezing kills the parasite. There is no remedy, so far as known, for affected plants. Using only soil which has been frozen is to be recommended to the propagator.

*The kinds of clematis.* (Jackson & Perkins Co.)

The hybrid varieties of *Clematis*, commonly known as the large-flowering sorts, are, when successfully grown, among the most beautiful of hardy climbing plants. The commercial propagation and growing of most of the large-flowering varieties, however, is attended with so many difficulties and disappointments that it has never been very generally attempted by nurserymen or florists in this country. At the present time there are scarcely half a dozen houses on this continent who attempt the propagation of clematis to any considerable extent, and it is only within the past thirty years that clematises have been commercially grown even by this limited number. Prior to that, practically all of the large-flowering clematises planted in this country were imported from Europe, the major part being supplied by Holland, whose moist atmosphere and black soil produces large, vigorous plants, but whose climatic conditions are so entirely different from those usually found in this country that the plants often failed to adapt themselves to their new surroundings, and did not thrive to the extent that their good size and vigorous condition seemed to give promise.

The propagation of clematis throughout Europe is usually effected by grafting pieces of well-ripened, year-old wood upon roots of almost any of the more

vigorous-growing species, *Clematis Flammula* being most commonly used. In this country, on the contrary, the method commonly pursued is by means of cuttings from young wood, stuck in sand, with gentle bottom heat, usually during May or June. So far as concerns the comparative vigor and desirability of plants produced by these two methods, there is small choice between them. Propagation by cuttings is, in this country, the more rapid and economical way, and further, it removes the possibility, sometimes realized in grafted plants, of sprouts being thrown up from the roots, and, if in the hands of an uninformed amateur, entirely "running out" the variety grafted in; thus considerable annoyance is avoided.

Clematises hybridize so readily that the number of varieties resultant from various crosses forms a long list. But while so many have been dignified with names and places in the catalogues of nurserymen, yet the varieties of large-flowering clematis that have proved so valuable as to secure permanent places for themselves in popular demand can almost be counted upon one's fingers. There are many varieties possessing most beautiful shades and variations of coloring that fail to attain popularity, chiefly on account of deficiency in two essential characteristics—vigorous habit of growth and abundance of bloom. *Clematis Jackmanii*, purple, originated in 1862, by Mr. George Jackman, was one of the first hybrid clematises introduced, and still stands as the most popular, and, of its color, the most valuable variety yet known. The variety, Madame Edouard André, a deep rich crimson, is distinct and novel, being at this time about the best large-flowering sort of a truly crimson shade. It is not quite so vigorous habit as the *Jackmanii*, but its flowers are similarly massed, though not produced in quite such profusion. *Clematis Madame Baron Veillard* is a distinct variety. It is of exceedingly vigorous habit, and the flowers are quite freely produced, though, being more dispersed over the plant, they do not make so much of a show as do varieties whose flowers are closely massed. The flowers are of very large size and of a light rose-color, shaded with lilac. Of white varieties, *Henryi*, Mrs. George Jackman and *Lanuginosa Candida*, all of them introduced long ago, still remain about the most desirable ones known. *Ramona*, deep sky-blue, is a variety which originated some twenty-five years ago. It is of extra-large size, often 9 to 10 inches across, of very vigorous habit and free-flowering.

Of double-flowered varieties, *Duchess of Edinburgh*, white, is the best known in this country, and about the most desirable. John Gould Veitch is a double sort with flowers of lavender-blue, but has seemed a shy bloomer and of weak habit. *Mme. Grange* (purplish violet), *Star of India* (purple), *Velutina Purpurea* (purple), and *Viticella Venosa* (reddish purple), are all desirable varieties.

Although they are in reality slightly less hardy than the Florida and Patens types, varieties of the *Lanuginosa*, *Viticella* and *Jackmanii* types, which produce their flowers from young growing wood, are recommended for northern localities. Plants of these types, even if frozen back to the ground, will still produce a good show of flowers, since, as stated, they bloom from the recent vigorous wood, even if the old tops are killed. Indeed, they need to be pruned back considerably anyway to induce a free growth of young vigorous blooming wood. With plants of the Patens and Florida types, however, which blossom from year-old wood, a severe freezing back of the plants would destroy the crop of flowers for the year.

Of the small-flowering varieties, *Clematis paniculata* (white), introduced from Japan, has proved to be a wonderfully valuable acquisition in this country, and has become exceedingly popular. It is of remarkably vigorous habit, often making a growth of 20 to 25

feet in a season. It seems thus far to be entirely free from disease, is delightfully fragrant, and so floriferous that the blossoms form a dense sheet of bloom, remaining in full beauty for several weeks. The foliage is very thick and heavy, thus making it very desirable for covering porches and arbors.

*Crispa* (blue) and *texasensis* (red) are species with very pretty, bell-shaped flowers. They are easily grown and do well in almost all situations.

The perennial, non-climbing varieties of clematis are most pleasing border plants, succeeding well in all ordinary soils and making a rich show of bloom at their flowering season. *Davidiana* (blue) and *recta* (white) are about the best known and most desirable varieties of this class.

To grow clematis most successfully, they should be given a good depth of loamy soil, with a fair supply of well-rotted manure spaded in and thoroughly distributed through the soil. In hot, dry weather, the plants should be regularly watered in order to obtain the greatest number of flowers possible, for the plants are very susceptible to injury by drought. A point of great importance, especially in caring for newly set plants, is to provide a firm support for them to climb upon. A solid wooden or metal trellis is preferable, for the reason that it prevents the plants from being whipped about by the winds, which often results in breaking the stalks just above the ground or else in cracking the outer bark of the stalks and rendering them more liable to the attacks of insects and fungous diseases. Training the vines upon strings, or a pliable support of any kind, is not to be advised for this reason. Propagation of the hybrid varieties is effected both by cuttings and by grafts. All of the type varieties grow readily from seed.

## KEY TO THE SPECIES.

- A. Sepals upright, forming a tubular or urceolate fl.; stamens upright, appressed, pubescent; or sepals more spreading and fls. with petaloid staminodes.  
 B. Fls. without petaloid staminodes.  
 C. Lvs. simple: herbaceous, not climbing.  
 D. Color of fls. purple or blue.  
 E. The lvs. thin, acute, sessile . . . 1. *integrifolia*  
 EE. The lvs. subcoriaceous, reticulate, obtusish, short-petioled. . . . . 2. *Fremontii*  
 DD. Color of fls. yellow . . . . . 3. *ochroleuca*  
 CC. Lvs. compound.  
 D. Lfts. entire: fls. solitary.  
 E. Plants upright, herbaceous.  
 F. Shape of lfts. lanceolate: lvs. bipinnate or ternately compound . . . . . 4. *Douglasii*  
 FF. Shape of lfts. ovate: lvs. pinnate . . . . . 5. *aromatica*  
 EE. Plants climbing, shrubby.  
 F. Styles not plumose in fr.  
 G. The lvs. not reticulate, usually with terminal lft. . . . . 6. *crispa*  
 GG. The lvs. reticulate, usually without terminal lft. . . . . 7. *Simsii*  
 FF. Styles plumose in fr.  
 G. Fls. axillary, with the pedicels much longer than the fls.  
 H. Sepals outside pubescent, dull.  
 I. Lfts. subcoriaceous, reticulate. . . . . 8. *reticulata*  
 II. Lfts. membranous, indistinctly veined. 9. *Viorna*  
 HH. Sepals outside glabrous, bright scarlet. 10. *texasensis*  
 GG. Fls. terminal and axillary, the latter with the pedicels shorter than the fls. . . . . 11. *fusca*  
 DD. Lfts. serrate: fls. usually clustered or panicle.  
 E. Plants herbaceous, upright: fls. clustered, often nearly sessile.  
 F. Fls. blue or violet, in axillary clusters . . . . . 12. *heracleæfolia*  
 FF. Fls. whitish, usually in an elongated terminal panicle . . . . . 13. *stans*  
 EE. Plants climbing, shrubby.  
 F. Lvs. pinnate.  
 G. Fls. yellowish white, in panicles . . . . . 14. *nutans*  
 GG. Fls. reddish purple, 1-3, axillary . . . . . 15. *lasiandra*  
 FF. Lvs. bipinnate; lfts. small, deeply lobed, usually less than 1 in. long: fls. whitish. . . . . 16. *æthusifolia*  
 BB. Fls. with petaloid staminodes; sepals more or less spreading; stamens upright, appressed pubescent.  
 C. Lvs. always 3-foliate; lfts. ovate, subcordate . . . . . 17. *verticillaris*  
 CC. Lvs. partly biternate; lfts. ovate to ovate-lanceolate . . . . . 18. *alpina*  
 AA. Sepals spreading; stamens more or less divergent.  
 B. Stamens glabrous or only with a few hairs below the anthers (or hairy at the base only in No. 19).  
 C. Fls. solitary or in 3's or in axillary fascicles, blue, violet, red or white, usually large.  
 D. Lfts. entire: fls. on the new growth after the lvs., solitary or in 3's.

- E. Plant herbaceous, upright; sepals imbricate in bud; stamens pubescent at the base.....19. *Stanleyi*
- EE. Plants woody, climbing; sepals valvate; stamens glabrous.
- F. Achenes with short style; pedicels longer than the sepals.
- G. Number of sepals 4; fls. open campanulate, usually 1-2 in. across.
- H. Style glabrous; fls. 1-2 in. across, often in 3's.....20. *Viticella*
- HH. Style pubescent except at the apex; fls. 1 in. or less across....21. *campaniflora*
- GG. Number of sepals usually 5-6; fls. flat, 2-4 in. across.....22. *florida*
- FF. Achenes with long plumose style.
- G. Pedicels shorter than sepals; lvs. simple or ternate.....23. *lanuginosa*
- GG. Pedicels longer than sepals; fls. from last year's wood in spring or early summer; lvs. ternate or pinnate....24. *patens*
- DD. Lfts. or lvs. serrate; fls. in axillary clusters, or solitary on last year's branches with the lvs. in spring, white or pink.
- E. The sepals with a small involucre below their base; fls. nodding, open campanulate.
- F. Lvs. simple; fls. whitish...25. *cirrhusa*
- FF. Lvs. ternate; fls. greenish yellow, spotted red inside.26. *balearica*
- EE. The sepals without involucre.
- F. Lvs. pinnate; lfts. small, about 1/2 in. long.....27. *gracilifolia*
- FF. Lvs. ternate; lfts. 1-3 in. long.
- G. Lfts. glabrous or sparingly pubescent.....28. *montana*
- GG. Lfts. densely silky pubescent beneath, less so above.....29. *Spooneri*
- CC. Fls. in terminal or axillary panicles or cymes, rarely 3 (if solitary, with bracts about the middle of the pedicel) white, rarely pinkish; sepals 4 (sometimes 4-6 in No. 37), usually small (except in No. 37).
- D. Lvs. 3-foliate; lfts. always entire, often sub-coriaceous or coriaceous.
- E. The fls. from the old wood from scaly buds.....30. *Armandii*
- EE. The fls. from the new growth.
- F. Lfts. ovate or ovate-oblong.
- G. Filaments as long or shorter than anthers; lfts. rounded or subcordate at the base....31. *Meyeniana*
- GG. Filaments longer than the anthers; lfts. cuneate at the base.....32. *crassifolia*
- FF. Lfts. narrow-lanceolate or oblong-lanceolate.....33. *Pavoliniana*
- DD. Lvs. pinnate or bipinnate (if 3-foliate, lfts. lobed or dentate or fls. diæcious).
- E. The fls. perfect.
- F. Lfts. entire or nearly entire, or 3-lobed; anthers linear, much longer than broad.
- G. Plant herbaceous, upright.....34. *recta*
- GG. Plant climbing, half-woody.

- H. The lvs. pinnate....35. *paniculata*
- HH. The lvs. bipinnate....36. *Flammula*
- FF. Lfts. serrate, occasionally nearly entire; anthers oval or oval-oblong, not more than twice as long as broad (longer in Nos. 37 and 38).
- G. The fls. 1-3, long-stalked, 2-3 in. across; lvs. pinnate.....37. *Fargesii*
- GG. The fls. in panicles or cymes, not exceeding 1 in. diam.
- H. Lvs. ternate or biternate; fls. 1/2 in. across, in many-fld. cymes.....38. *apiifolia*
- HH. Lvs. usually bipinnate; lfts. ovate-lanceolate; tails of fr. about 3/4 in. long...39. *brevicaudata*
- HHH. Lvs. pinnate; tails longer.
- I. Sepals glabrous inside; lfts. pubescent beneath....40. *grata*
- II. Sepals pubescent inside and outside; lfts. glabrous or nearly so.....41. *Vitalba*
- EE. The fls. diæcious.
- F. Foliage deciduous; sepals 4.
- G. Fls. appearing on the young wood in summer, less than 1 in. across.
- H. Lvs. ternate; lfts. 2-3 in. long.....42. *virginiana*
- HH. Lvs. pinnate; lfts. 1-2 in. long.
- I. Plant glabrous; lfts. rounded or subcordate at the base.43. *ligusticifolia*
- II. Plant pubescent; lfts. truncate or cuneate at the base....44. *Drummondii*
- GG. Fls. on last year's branches from scaly buds in early spring, 1 1/2 in. across.....45. *lasiantha*
- FF. Foliage evergreen; lvs. ternate; sepals 5-7.....46. *indivisa*
- BB. Stamens pubescent; fls. yellow or yellowish, nodding; achenes with plumose tails.
- C. Lvs. pinnate or bipinnate.
- D. Fls. usually several, 1-2 in. across, pale yellow; lvs. bluish or grayish green; lfts. usually entire, often lobed.
- E. Lfts. often oblong or lanceolate; sepals pubescent inside.....47. *orientalis*
- EE. Lfts. usually ovate or oval, pale bluish green; sepals glabrous inside.....48. *glauca*
- DD. Fls. solitary, 2-3 in. across, on stalks to 10 in. long; sepals glabrous inside; lfts. usually lanceolate, serrate, green....49. *tangutica*
- CC. Lvs. biternate; lfts. serrate, green; fls. solitary.....50. *serratifolia*

## Section VIORNA.

## Group CRISPÆ.

1. *integrifolia*, Linn. Herbaceous, erect, becoming 2 ft. high; lvs. rather broad, entire, ovate-lanceolate; fls. solitary, nodding; sepals 4, rather narrow, blue, coriaceous, 1-2 in. long. June-Aug. Eu. and Asia. B.M. 65.

The following are supposed to be hybrids of this species: *C. cylindrica*, Sims (× *C. crispæ*, *C. integrifolia* var. *diversifolia*, Hort. *C. integrifolia* var. *pinnata*, Hort.). Lvs. more or less irregularly lobed or pinnate; fls. solitary, cylindric-campanulate with the sepals more or less recurved from the middle, blue or bluish-violet. B.M.

1160. Lav. 13. G.W. 14, pp. 562-3. R.H. 1856:341. Here also belongs probably *C. divaricata*, Jacq., with short-petioled pinnate lvs. and blue, less spreading sepals.

2. *Frémontii*, Wats. Fig. 981. Closely allied to *C. ochroleuca*, but with lvs. 3-4 in. long, nearly sessile, either entire or with a few coarse teeth: fls. often drooping; sepals thick, purple, nearly glabrous, except the tomentose edges; styles when young downy rather than feathery. July, Aug. Mo. to Colo. G.F. 3:381 (adapted in Fig. 981). G.W. 14, p. 563.

3. *ochroleuca*, Ait. Herbaceous, 1-2 ft. high, silky-pubescent, becoming glabrate: lvs. ovate, entire: fls. erect, solitary, terminal; sepals yellow outside, cream-colored within; styles becoming somewhat plumose. July, Aug. Dry grounds, N. Y. to Ga. L.B.C. 7:661.—Intro. 1883.

4. *Douglasii*, Hook. Has habit of *C. integrifolia*, about 2 ft. high: st. and petioles angled and ribbed: lvs. twice pinnately or ternately compound; lfts. narrow-linear or lanceolate: fls. tubular or bell-shaped, 1 in. long; sepals recurved, deep purple within, paler without. June. In mts., Mont. to New Mex.—Intro. 1881. Var. *Scottii*, Coulter, has the lfts. ovate- or oblong-lanceolate. A hybrid of *C. Douglasii* var. *Scottii* × *C. texensis* is *C. globulosa*, Hort., with deep purple pitcher-shaped fls. Gn. 75, p. 472.

5. *aromatica*, Lenné & C. Koch (*C. cærulea* var. *odorata*, Hort.). Slender, herbaceous or somewhat climbing, reaching 6 ft. high if supported: lvs. of 3-7 ovate, nearly entire lfts.: fls. solitary, terminal, very fragrant, 1½-2 in. across; sepals 4, spreading, reflexed, reddish violet; stamens white. July-Sept. Nativity, perhaps S. France. It is thought by some to be an old garden hybrid, probably *C. Flammula* × *C. integrifolia*. R.H. 1877, p. 15. Lav. 9.

6. *crispa*, Linn. A slender climber, reaching 3-4 ft.: lvs. very thin; lfts. 3-5 or more, variable in outline and sometimes undivided, often 3-5-lobed: fls. purple, varying to whitish, cylindrical or bell-shaped, 1-2 in. long; points of sepals recurved; styles of fr. hairy but not plumose. June-Sept. Va. to Texas. B.R. 32:60. B.M. 1892. I.H. 2:78 (as *C. campaniflora*). G. 30:503; 34:147. V. 6:379. Lav. 14.—This and the allied species are fragrant. A hybrid of this species is *C. cylindrica*, Sims (× *C. integrifolia*). See No. 1. A number of hybrid forms, the offspring of a cross between this species and *C. texensis* are figured and described in M.D.G. 1898:500 and one as "blue bells" in Gn. 49, p. 189.

7. *Simsii*, Sweet (*C. Pitcheri*, Torr. & Gray). High climbing: branchlets pubescent: lvs. of 3-4 pairs of lfts. and a terminal lft. reduced almost to a midrib; lfts. coarsely reticulated, lobed or 3-parted, usually mucronate: fls. 1 in. long and ¾ in. diam., with swollen base; sepals dull purple, recurved at the tips: achenes pubescent, styles not plumose. June-Aug. S. Ind. to Mo., southward to Mex. Lav. 15. B.M. 1816 (as *C. cordata*). Var. *Sargentii*, Rehd. (*C. Sargentii*, Lav.). Fls. smaller, paler: lfts. rarely lobed. Lav. 18.—A hybrid of this species with *C. texensis* is figured in R.H. 1893:376.

8. *reticulata*, Walt. A slender climber, allied to *C. crispa*: lfts. much reticulated and very coriaceous: fls. solitary in the axils of the lvs., nodding, bell-shaped; sepals recurved, crisp at the margin: mature fr. with plumose tails. June, July. S. C. to Ala. and Fla. B.M. 6574. Lav. 16.

9. *Viorna*, Linn. Fig. 982. Climbing, 8-10 ft., sparingly pubescent or glabrous: lvs. not glaucous nor coriaceous; lfts. subcordate-ovate to ovate-lanceolate, slightly reticulated: fls. solitary, on long peduncles, pitcher-shaped; sepals 4, 1 in. long, variable in color, often dull purple, thick and leathery, finely pubescent outside, tips often recurved; styles plumose when

mature, 1 in. long. June-Aug. Pa. to Ala. and westward. Lav. 17. Gn. 45, p. 240.

10. *texensis*, Buckl. (*C. coccinea*, Engelm. *C. Viorna* var. *coccinea*, Gray). Climbing, to 6 ft.; glabrous: lvs. glaucescent, subcoriaceous; lfts. broadly ovate, often obtuse, subcordate, 1½-3 in. long: fls. solitary, pitcher-shaped, nodding, carmine or scarlet, glabrous outside: achenes with plumose style, 1-2 in. long, glabrous at the tip. Texas. Lav. 19. B.M. 6594. Gn. 19:284. G.W. 10, p. 498. G.C. II. 15:405. W.G.Z. 2:111. F. 1880, p. 115. Gt. 32:86. R.H. 1878:10; 1888:348.—Much superior to the preceding because of its beautiful fls. Some of the garden hybrids of this species, which have been classed under *C. pseudo-coccinea*, Schneid. (× *C. Jackmanii*), are found under the names: *Countess of Onslow*, deep scarlet. Gn. 57, p. 376. M.D.G. 1898:481. G.M. 37:381. G.C. III. 16:9. *Countess of York*, white, tinted with pink. *Duchess of Albany*, clear pink. Gn. 52:304. See also No. 6 for hybrid forms of *C. crispa* with this species and No. 7 for a hybrid with *C. Simsii*.

982. *Clematis Viorna*. (× ¼)

11. *fusca*, Turcz. Climbing, to 15 ft.; sparingly pubescent: lvs. pinnate; lfts. usually ovate, to ovate-oblong, acute, glabrous or pubescent beneath and ciliate, 1½-2½ in. long, the terminal one usually wanting: fls. on rather short villous pedicels, nodding, urceolate, about 1 in. long; sepals with recurved tips, densely brownish pubescent outside, violet inside: pubescence of achenes and plumose tails fulvous. June-Aug. E. Siberia, Japan. Lav. 20. Var. *violacea*, Maxim. (*C. janthina*, Koehne). Less pubescent: fls. violet. Gt. 13:455.

#### Group TUBULOSÆ.

12. *heracleæfolia*, DC. (*C. tubulosa*, Hook.). Stout, erect, woody only at the base: lvs. ternate, large, bright green; lfts. broadly ovate, rounded at the base, slightly pubescent, mucronately toothed, 4-6 in. long: fls. numerous, in corymbs, either axillary or terminal, polygamous, tubular in form, with 4 light blue sepals, becoming reflexed; peduncles and pedicels downy; recurved stigmas club-shaped. Aug., Sept. China. M. & J. 17. B.M. 4269; 6801 (as var. *Hookeri*). P.M. 14:31. F.S. 3:195. R.H. 1858, p. 42.—Prop. by root division. Var. *Davidiana*, Hemsl. (*C. Davidiana*, Decne.). About 4 ft. high, hardly strong enough to stand without support: lvs. usually cuneate at the base, nearly glabrous: fls. brighter blue, fragrant, in clustered heads, 6-15 together, and also singly or clustered in the lf.-axils. R.H. 1867, p. 90. Gn. 31, p. 145; 45, p. 241; 49, p. 99; 68, p. 273. G.M. 37:48. G.W. 6, p. 124. Mn. 9:76. A.F. 25:1055. Var. *ichangensis*, Rehd. & Wilson. Lfts. broad at the base, sparingly pubescent above, densely beneath: achenes densely villous. Cent. China.

A hybrid of this species is *C. Joviniæana*, Schneid. (var. *Davidiana* × *C. Vitalba*). Half-climbing, to 6 ft.: fls. in large panicles, bluish white, first tubular with the sepals finally spreading. G.C. III. 51:34. Another hybrid is *C. Davidiana hybrida*, Lem. (var. *Davidiana* × *C. stans*) of which Lemoine advertises several named forms varying from light to deep blue; very floriferous.

13. *stans*, Sieb. & Zucc. (*C. heracleæfolia* var. *stans*, Hook.). Herbaceous, upright, to 6 ft.: branches grayish pubescent: lfts. broadly ovate, lobed and coarsely

toothed, more or less pubescent: fls. in terminal panicles sometimes 2 ft. long and in axillary clusters, whitish or bluish white, tubular, with revolute sepals, less than  $\frac{1}{2}$  in. long, dioecious. Sept., Oct. Japan. B.M. 6810.—Used chiefly because of the striking foliage and its late-blooming qualities. Var. *Lavallei*, Schneid. (*C. Lavallei*, Decne.). Fls.  $\frac{1}{2}$ – $\frac{3}{4}$  in. long, monocious.

#### Group CONNATÆ.

14. *nütans*, Royle. Slender woody climber: lvs. pinnate; lfts. ovate-oblong or lanceolate, deeply 3–5-lobed, rarely entire, 1–3 in. long: fls. nodding in many-fld. panicles, yellowish white, tubular,  $\frac{1}{2}$ – $\frac{3}{4}$  in. long, pubescent outside; filaments silky pubescent below the middle: achenes silky with plumose tails. July–Oct. Himalaya. Var. *thyrsoides*, Rehd. & Wilson. Climbing to 20 ft.: lfts. broadly ovate, usually cordate at the base, silky pubescent beneath: panicles larger and more compact, on upright stout peduncles 3–6 in. long. W. China. G.C. III. 48:310. Gn. 75, p. 557 (as *C. nutans*). R.H. 1905, p. 438 (as *C. Buchaniana vitifolia*). See page 3567.

15. *lasiandra*, Maxim. Climbing, to 12 ft.: young growth viscid: lvs. pinnate with 3-foliate or 3-fid segms.; lfts. ovate to ovate-lanceolate, long-acuminate, serrate, glabrous or sparingly pubescent on both sides,  $1\frac{1}{2}$ – $2\frac{1}{2}$  in. long: fls. axillary, solitary or in 3's on stalks 1–3 in. long, campanulate, reddish purple, about  $\frac{3}{4}$  in. long; sepals with recurved tips, as long as the stamens. Aug.–Oct. Cent. and W. China.

16. *æthusifolia*, Turcz. Slender, climbing: lvs. bipinnate, pubescent; lfts. finely cut, usually unequally 3-lobed and deeply incisely serrate with obtusish mucronulate narrow lobes,  $\frac{1}{3}$ – $\frac{3}{4}$  in. long: fls. 1–3, axillary, on slender stalks, whitish, tubular,  $\frac{3}{4}$  in. long; sepals with recurved tips: achenes pubescent with long plumose whitish tails. Aug., Sept. Mongolia, Manchuria. Var. *latisecta*, Maxim. Lfts. larger, to  $1\frac{1}{2}$  in. long with oval or oblong rounded lobes. Gt. 10:342. B.M. 6542. Gn. 6, p. 423; 31, p. 186; 45, p. 241. R.H. 1869, p. 10.—This is the form usually cult.; the type with much more finely divided foliage is very rare in cult.

#### Group ATRAGENEÆ.

17. *verticillaris*, DC. (*Atrágene americana*, Sims). Fig. 983. Trailing or sometimes climbing, 8–10 ft.: usually 4 trifoliate lvs. from each node; lfts. thin, ovate, acute, toothed or entire, somewhat cordate: fls. solitary, blue or purple, nodding at first, 2–4 in. broad when expanded; 4 thin sepals, silky along the margins and veins; staminodes spatulate, narrow, scarcely half as long as sepals. May, June. Woodlands, Va. to Hudson Bay, west to Minn. B.M. 887.—Intro.

983. Achene of *Clematis verticillaris*. (×1)

1881. Var. *columbiàna*, Gray. Sepals narrower and more pointed than in the type. Rocky Mts.

18. *alpina*, Mill. (*Atrágene alpina*, Linn.). Sts. 3–5 ft., slender, with prominent joints becoming swollen with age: lvs. once or twice ternate, with ovate or ovate-lanceolate lfts., serrate or incised; many petal-like stamens, which are devoid of anthers; sepals 4, bright blue. Spring. N. W. N. Amer., Siberia to S. and Cent. Eu. B.M. 530 (as var. *austriaca*). Gn. 46:318; 57, p. 481. R.H. 1855:321. L.B.C. 3:250. G.W. 10, p. 82.

H.W. 3, p. 16.—A very hardy climber, preferring a northern exposure. Var. *sibirica*, Kuntze (var. *alba*, Hort. *Atrágene sibirica*, Linn.). Fls. white or nearly so. B.M. 1951. L.B.C. 14:1358. R.H. 1855:321. Var. *occidentàlis*, Gray. Petal-like stamens very few, and often bearing rudimentary anthers. Rocky Mts.

#### Section PSEUDANEMONE.

19. *Stanleyi*, Hook. (*C. Stanleyana*, Hort.). Fig. 984. Erect robust herbs, 3 ft. high: lvs. biternate, lfts. sessile or petioled, variable in size, cuneate, silky:

984. *Clematis Stanleyi*. (× $\frac{1}{4}$ )

fls. 1–3 in. across, white to pink-purple; sepals becoming widely expanded; stamens yellow; styles becoming very plumose, white. July–Oct. Transvaal. Intro. 1893. B.M. 7166. Gn. 39:76. G.F. 3:513 (adapted in Fig. 984). G.C. III. 8:327. G.M. 34:320.—Suitable for greenhouse cult.; in the northern states it is apt to winterkill if left unprotected.

#### Section VITICELLA.

20. *Viticella*, Linn. Climbing 8–12 ft.: lvs. sometimes entire, but usually divided into 3 nearly entire lfts.: fls.  $1\frac{1}{2}$ –2 in. diam., growing singly on peduncles or sometimes in 3's; sepals 4, blue, purple or rosy purple, obovate, pointed, reflexed; stamens yellow: fr. with rather short glabrous tails. June–Aug. S. Eu. to Persia. R.H. 1860, p. 183; 1876:110; 1879:350 (vars.). B.M. 565. G. 22:310; 8:399. H.W. 3, p. 15. Lav. 7.—This is the type of one of the leading groups of garden clematises, and is one of the parents of the Jackmanii type of hybrids.

The following are garden varieties:

Var. *albiflora*, Kuntze. Fls. white.

Var. *rubra*, Hort. Fls. purple.—Var. *rubra grandiflora*, Jackman, has larger bright crimson fls. and 6 sepals. F.S. 20:2053 (1873). F. 1872:265.

Var. *kermesina*, Lem. (*C. kermesina*, Hort.). Fls. of bright wine-red color, purple being absent. Gn. 39:30.

Var. *ilicina-floribunda*, Hort. (*C. ilicina-floribunda*, Hort. *C. floribunda*, Hort.). Fls. pale gray-lilac, conspicuously veined. Gn. 18, p. 389 (note).—An abundant bloomer. Produced in an English garden in 1880.

*Lady Bovill*, Jackman (*C. Lady Bovill*, Hort.). Fls. cup-formed, sepals being concave and little or not at all recurved at the ends, fls. 4 in. across; sepals 4–6, grayish blue; stamens light brown. M. & J. 15. R.H. 1876:190.

Var. *marmorata*, Jackman (*C. marmorata*, Hort.). Fls. rather small, with 4 broad sepals, light grayish blue with darker veins, 3

longitudinal bars. M. & J. 1, f. 2; same plate in F.S. 20:2050-55 (2008). F. 1872:265.

Hybrids of *C. Viticella* which are closely allied to that type:

*C. eriostemon*, Decne. (× *C. integrifolia*; *C. Hendersonii*, Henderson. *C. Chandleri*, Hort.) Fig. 985. St. and habit of *C. Viticella*: lfts. and fls. much like *C. integrifolia*: climbing 8-10 ft.: 4 blue sepals, spreading, reflexed at the tips. R.H. 1852: 341. F.S. 13:1364 (as var. *venosa*). Lav. 12. Here belongs also: *C. intermedia*, Bonamy, smaller, with more pubescent branchlets and paler fls. *C. Bergeronii*, Lav., resembling more *C. integrifolia*: lvs. usually entire: fls. pink, about 2 in. across in terminal panicles. Lav. 10. *C. distorta*, Lav., with rosy-lilac twisted sepals. Lav. 11. *C. Boskoop*, Hort. (*C. Boskoop* Seedling, Hort. = *C. V.* × *C. integrifolia*). A new race in 1892: growing 3-5 ft.: fls. blue, lavender, rose or reddish rose.

*C. violacea*, DC. (× *C. Flammula*). Fls. in several to many-fld. terminal panicles, pale violet, about 1 in. across; petals sometimes 6. Here belongs also: *C. Othello*, Cripps (= *C. V.* var. *rubra* × *C. Flammula*). Fls. of medium size, of a deep velvety purple; continues blooming until Oct.—*C. rubro-marginata*, Jouin (*C. Flammula* var. *rubro-marginata*, Cripp.). Similar to *C. Flammula*; sepals white bordered reddish violet.

*C. parviflora*, DC. (× *C. campaniflora*; *C. revoluta*, Desf.). Fls. white, small, scarcely 1 in. across, sometimes larger; achenes with the tail usually pubescent at the base. A.P. De Candolle, Pl. Rar. Geneve, 12.—Of no ornamental value.

*C. venosa*, Krampen (× *C. florida*; *C. florida* var. *venosa*, Lav.). Similar to *C. florida*, but petals obovate. Lav. 6. R.H. 1860, p. 183. G. 2:251. G.Z. 6:160. F.S. 13:1364. Here also belongs *Louise Carriere*; fls. lilac with paler veins. R.H. 1880:10 and several forms described by Carriere as *C. contorta*, *C. atroviolacea* and *C. Viticella alba*. R.H. 1879:350.

For other hybrids of this species see *C. Guascoi*, Lem., under *C. patens*, *C. splendens* under *C. lanuginosa* as form of *C. Jackmanii*.

21. *campaniflora*, Brot. Climbing, 10-15 ft.: fls. reflexed and bell-shaped as in the above type or more so, usually 1 in. or less diam., purple or whitish: fr. with short pubescent tail. June, July. Native of Portugal. L.B.C. 10:987. Gn. 31, p. 187. Lav. 8. This has been called *C. Viticella* because of its close resemblance in fl., fr. and lf.; but the lvs. are often twice ternate, and the plant is much more slender in habit.

22. *florida*, Thunb. (*C. japonica*, Makino, not Thunb.). A slender plant, climbing 9-12 ft.: lvs. variable, more or less ternate or biternate; lfts. small, ovate-lanceolate: fls. 2-4 in. across, flat when expanded; the 5-6 broad, ovate sepals creamy white, barred with purple beneath; stamens purplish. May, June, Japan. B.M. 834. R.H. 1856:41. Lav. 5. J.H. III. 44:321. G.C. III. 35:51. Var. *bicolor*, Steud. (*C. Sieboldii*, D. Don). Fig. 986. Like the type, but with the purple stamens somewhat petal-like, and forming a dense, purple head in the center. F.S. 5:487.

985. *Clematis eriostemon*. (× 1/2)

986. *Clematis florida* var. *bicolor*. (× 1/2)

Lav. 5. M. & J. 16. B.R. 24:25. P.M. 4:147. Gn. 22: 142. R.H. 1856:401. S.B.F.G. II. 4:396. F. 1872, p. 200. Var. *Fortunei*, Moore (*C. Fortunei*, Hort.). Fls. large, very much doubled; sepals creamy white, becoming pink. F.S. 15:1553. G.C. 1863:676. I.H. 10, p. 86. M. & J. 13. F. 1863:169. F.M. 3:153.

*Belle of Woking*. A hybrid form: fls. very full and double; sepals purple.

*John Gould Veitch* (*C. Veitchii*, Hort.). Fls. velvet, double, resembling var. *Fortunei*, except in the color of the sepals. From Japanese gardens. F.S. 18:1875-6.

Hybrids of this species are: *C. venosa*, Krampen, see *C. Viticella*; *C. Lawsoniana*, see *C. lanuginosa*.

23. *lanuginosa*, Lindl. (including var. *pallida*, Hort.). Climbing only 5 or 6 ft.: lvs. simple or of 3 lfts., cordate-acuminate, woolly beneath: fls. erect on stout stalks shorter than the sepals, woolly in the bud, the largest of the wild species, being 6 in. across; sepals 5 or 6, broadly ovate, leathery, rather flat, overlapping, lavender or bluish gray; center of stamens pale reddish brown; styles plumose. Summer. Native near Ningpo, China. F.S. 8:811. I.H. 1:14. Lav. 1. M. & J. 4. J. F. 4:363. H.F. 1855:1. 1854:225. G.C. III. 29:23. G. I, p. 257. Gng. 5:38.—It is to this species, more than to any other, that the beauty and popularity of the garden varieties and hybrids are due. The finest hybrids, including *C. Jackmanii* and its section, and *C. Lawsoniana*, contain more or less of the blood of *C. lanuginosa*.

Forms of *C. lanuginosa* are:

Var. *candida*, Lemoine (*C. candida*, Hort.). Like the type, except that the simple lvs. and lfts. of the compound lvs. are much larger, and the fls. are larger, being 7-8 in. across, and white with a purplish shading around the margins. F.M. 5:310. V. 6:225.—Perhaps a hybrid of *C. patens*.

Var. *nivea*, Lemoine (*C. nivea*, Hort.). Sepals 6-8, narrowish, pure white; anthers pale brown.—Thought to be of same origin as the above var.

*alba magna*, Jackman. Fls. very large, pure white, with about 6 broad sepals and purplish brown anthers. G.C. II. 3:685.

*Lady Caroline Nevill*, Cripps. Fls. often 7 in. across; sepals 6, nearly white, with mauve-colored stripe down center of each. Gn. 46, p. 33.—One of the finest light-colored varieties.

*Princess of Wales*, Jackman. Fls. 6 in. across; sepals 8, satiny bluish mauve, very broad. G.C. III. 27:53. Gn. 59, p. 366.

*Marie Lefebvre*, Cripps. Resembles the last, but has 8 sepals, more pointed, and darker in shade.

*Perfection*, Froebel. Fls. very large; sepals 8, very broad, lilac-mauve. R.B. 6:193.

*Sensation*, Cripps. Fls. like the type, but with 6-7 grayish blue sepals, 6 in. across.

*Madame Emile Sorbet*, Paillet. Fls. bright blue. R.H. 1878:291.

*Madame Van Houtte*, Cripps. Late-blooming; sepals pale blue, becoming white.

*Madame Thibaut*. Fls. very abundant.—Thought to be a hybrid with *C. Viticella*.

*The Presiaent*, Noble. A rich violet-blue fl.

*Excelsior*, Cripps. Fls. double; sepals grayish purple, with a reddish bar down the center of each. F.S. 20:2055.

*violacea*, Noble. Fls. violet-blue, 7 in. across. F.M. 1876:217.

*Robert Hanbury*, Jackman. Sepals bluish lilac, flushed at the edges with red, and the bar slightly tinted with red. Gn. 16:128.

This species has given rise to numerous beautiful hybrids which in many cases are the product of so much intercrossing that it is impossible to recognize the exact parentage. By far the most important group of these hybrids may be classed under *C. Jackmanii*, which, however, by some is considered not a hybrid, but a species intro. from Japan.

*C. Jackmanii*, Moore (*C. lanuginosa* × *C. Hendersonii* and *C. lanuginosa* × *C. Viticella*. *C. hakonensis*, Franch. & Sav.). Fig. 987. Habit and lvs. of *C. lanuginosa*: fls. flat, 5-6 in. broad, usually in 3's and forming

panicles at the ends of the branches; sepals 4-6, very broad, velvety purple, with a ribbed bar down the center; broad, central tuft of pale green stamens. M. & J. 5, 6, 9, 10, 11, 12, 14. I.H. 11:414. F.S. 16:1629. Gn. 22:142; 53, p. 262; 71, p. 107. A.G. 12:125; 19:269. A.F. 10:1329; 14:995-7; 16:282. R.H. 1865:390. Gng. 4:261; 9:17; 7:230-2. C.L.A. 5:379. Gn. M. 4:226. G.M. 47:102. G.Z. 9:96. F. 1864:193. V. 6:129; 9:340. 18:70. Lav. 4. Var. *alba*, Hort. Fls. nearly pure white. G. 23:185.

987. Clematis Jackmanii.

France, Gégou (C. lanuginosa × C. Jackmanii). Lvs. smooth; buds woolly; sepals deep cobalt-blue, pointed, with wavy edges. *Reine des Bleues*, Boisselot (same cross as the last). Fls. large, blue, with broad, recurved sepals. *devoniensis*, Lem. (same cross). Fls. 8-9 in. across; sepals 8, delicate lavender-blue. Gn. 9, p. 563 (note). *splendida*, Simon-Louis (× C. Viticella). Fls. very dark purple, changing to reddish violet. R.H. 1865:71.

*Gipsy Queen*, Cripps. Deep violet. *Alexandra*, Jackman. Reddish violet. *Star of India*, Cripps. Five in. across, purple, barred with red. *tunbridgensis*, Cripps. Reddish purple, barred with light blue. Lav. 4 bis. I.H. 18:50. *magnifica*, Jackman. Rich purple, shaded with crimson, 3 bars of red in each sepal. F.M. 8:453. R.H. 1876:110. *Madame Grangé*, Hort. Sepals very concave, purple-crimson. R.H. 1877:150. Mrs. *James Bateman*, Noble. Pale lavender; a probable cross of C. J. with C. lanuginosa. M. & J. 2, f. 1. F.S. 20:2053 (1779). Mrs. *Moore*, Jackman. Eight to 9 in. across, sepals rather narrow, white. *Thomas Moore*, Jackman. As large as the last, rich violet, with white stamens. *Madame Baron Veillard*, Baron Veil. Rose-lilac. *Madame André*, carmine-violet. R.H. 1893:180. *velutina-purpurea*, Jackman. Fls. 4-6 in. across, usually 4, sometimes 5 or 6 sepals, blackish purple. *François Morel*, Morel. Fls. 4 in. across; sepals usually 4, bright violet-red. R.H. 1884:444. *Ville de Lyon*, Morel. Fls. 5 in. across; sepals usually 6, broad, deep amaranth-red. R.H. 1899:184.

Other hybrids of C. lanuginosa are the following:

C. *Durandii*, Kuntze (C. integrifolia or possibly C. Jackmanii × C. integrifolia). Upright, to 6 ft.; lvs. simple, petioled; fls. and infl. similar to C. Jackmanii; fls. blue, 4-5 in. broad, flat, with usually 4, rarely 5 or 6 recurved sepals. June-Sept. Gn. 49:98. Gng. 5:276. G. 31:257.—Here belongs probably C. *Pellieri*, Carr., though the author gives C. lanuginosa × *recta* as the parents. R.H. 1880, p. 228.

C. *Lawsoniana*, Anderson-Henry (× C. florida var. Fortunei). Fig. 989 (adapted from Floral Magazine, 1872). Fls. very large;

sepals 6-8, broad, rose-purple, marked with darker veins. Aug.-Nov. G. 33:411. Var. *Symesiana* (C. Symesiana, Anderson-Henry. × C. florida var. Fortunei). Fls. 7 in. across; sepals 6-8, pale mauve; a profuse bloomer. Var. *Henryi* (C. Henryi, Anderson-Henry). Fig. 988. Robust plant; free bloomer; fls. creamy white, becoming fully expanded when grown in the open sun or under glass. Aug.-Nov. Gn.M. 13:348. G.M. 43:318.—It resembles more the lanuginosa parent. It is not to be confused with C. Henryi, Oliv., a Chinese species allied to C. orientalis and not in cult.

C. *Glabilensis* (× C. patens; C. patens var. *Glabilensis*, Hort.). Lvs. simple or 3-parted, ovate, subcordate; fls. large deep violet-blue; sepals 6-8. G.Z. 14:80.—Here belong also:

Otto Froebel, Lemoine. Lvs. leathery, simple or 3-parted; fls. of fleshy texture, grayish white, sometimes becoming bluish; sepals 8, blunt, broad; anthers brownish. *Imperatrice Eugénie*, Carré (C. l. var. pallida × C. patens). Lvs. simple or 3-parted; fls. broad and woolly; fls. 8-9 in. across, with 8 broad, white sepals. *Jeanne d'Arc*, Dauvesse. Same cross as last and much like it, but the sepals are grayish white, with 3 blue bars down the center of each. *Gloire de St. Julien*, Carré. (× C. patens var. plena). Plant much like C. lanuginosa, but with larger fls.: sepals 6-8, white or pale gray at first; stamens yellow. *Gem*, Baker (× C. Standishii). Lvs. 3-parted or simple; fls. like C. lanuginosa in form; grayish blue.

24. *patens*, Morr. & Decne. (C. *cærulea*, Lindl. C. *azurea*, Hort., ex Turcz.). Taller and more slender, and fls. smaller and narrower than C. lanuginosa; fls. appearing on last year's branches on slender stalks longer than the sepals, spreading; sepals about 8, rather narrow, delicate lilac; stamens purple. Spring. Isle of Nippon, Japan. M. & J. 3. Lav. 2 and 3. B.R. 23:1955. P.M. 4:193. B. 3:126. H.B. 4:78. R.H. 1856:261.—Should be grown on a northern exposure to preserve the color of the fls. It is almost as prolific as C. lanuginosa in producing garden varieties and hybrids, and it is the most likely of all to produce double-fl. forms. Var. *grandiflora*, Davis (C. *cærulea* var. *grandiflora*, Hook.). Fls. larger than the type. B.M. 3983. Var. *Standishii*, Moore (C. *Standishii*, Hort.). Fls. about 5 in. across; sepals light lilac-blue, elliptic, of metallic luster; fls. 3, ovate, acuminate, small.—A fine variety from Japanese gardens flowering profusely in spring.

The following other garden varieties or crosses belong here:

Mrs. *James Baker*. Sepals nearly white, ribbed with dark carmine. *Miss Bateman*, Noble. Fls. more compact than the type, 6 in. across; sepals ovate, shortly acuminate, pure white, with cream-colored bars; anthers brown. Probably of hybrid origin; allied to var. *Standishii*. *Stella*, Jackman. Fls. not so large as the last; sepals deep mauve, with a red bar down the center of each. F.S. 22:2341. *Amalia*, Sieb. Sepals 6 or more, oblong-lanceolate, light lilac. From Japanese gardens. F.S. 10:1051. *Lord Lanesborough*, Noble. Sepals bluish lilac, each with a metallic purple bar.—A good variety to gradually force to blossom in the greenhouse by March. *Lady Lanesborough*, Noble. Sepals silvery-gray, the bar being lighter colored.—It will blossom in March in the greenhouse. *Marie*, Simon-Louis. Fls. darker than the type. Mrs. G. *Jackman*, Jackman. Sepals bluish-white with indistinct wine-red bars. Gn. 16:128. *The Queen*, Jackman. Fls. rather compact, the sepals being broader than the type. *John Murray*, Jackman. Habit and foliage bolder than the type; fls. somewhat later. Gn. 46:32. *Fair Rosamond*, Jackman. Sepals apiculate, broader than the type, and of the same color. F.S. 22:2342. Gn. 16:128. *Countess of Lovelace*, Jackman. Fls. double, blue-violet; sepals much imbricated. In the second crop of blooms the fls. are single, as is often the case in other double varieties. *Albert Victor*, Noble. Fls. much like the type, but large and more compact.—Suitable for forcing under glass. *Duchess of Edinburgh*, Jackman. Fls. double, white, strongly imbricated. *Marcel Moser*, Moser. Fls. 7 in. across; sepals 8, mauve with a reddish violet bar. J. 1897:104; 1900, p. 85. *Nelly Moser*, Moser. Fls. 5 in. across; sepals 8, mauve-pink, with a darker red bar. R.H. 1898:236. *Louisa van Houtte*, Hort. Semi-double, rosy white. *Vesta*, Endl. Sepals gray; anthers red. Gt. 39:1333. Gn. 9:408. R.B. 6:193. *Helena*, Sieb. Fls. pure white, with yellow stamens. F.S. 11:1117. I.H. 1:21. R.H. 1855:341. *Louisa*, Sieb. Fls. pure white, with purple stamens. F.S. 10:1052. *monströsa*, Planch. Fls. semi-double, pure white. F.S. 9:960. R.H. 1856:9. *Sophia*, Sieb. Sepals deep lilac-purple on the edges, with light green bars. F. S. 8:852. I.H. 1:21. B.H. 4:97. R.H. 1855:461. *violacea*, Lem. Fls. violet-blue; stamens yellow. I.H. 7:254.

Some double-flowered varieties which possibly belong here are: *Snowdrift*, with white, very double fls. Gn. 49, p. 189. M.D.G. 1898:496. *Ostrich Plume*, also white and very double with narrower wavy sepals. M.D.G. 1898:496. *Waverly*, blue, semi-double. M.D.G. 1898:497.

Hybrids of this species are the following: C. *Gudscoti*, Lem. (× C. Viticella). Branches pubescent; fls. 5, nearly glabrous; fls. solitary, violet-purple, 3 in. across, with 4-6 sepals, strongly 3-nerved, tomentose outside. J.H. 4:117. I.H. 7:226.—C. *francofurtensis*, Lav., supposed to be a hybrid of C. Jackmanii (C. *hakonenensis*) and C. patens, is hardly different. Lav. 7 bis.—C. *lanuginosa* × C. *patens*, see the preceding species.—C. *florida* × C. *patens*. Some believe that C. patens var. *Standishii* represents this cross

## Section VITALBA.

## Group CIRRHOSÆ.

25. *cirrhosa*, Linn. Climbing, to 10 ft.; glabrous: lvs. persistent, slender-petioled, simple, ovate to ovate-oblong, crenately serrate, 1-1½ in. long: fls. 1-2 on the old wood, axillary, whitish, open campanulate, nodding, 1½ in. across, with a short involucre below the sepals: achenes with long plumose tail. Spring. S. Eu., Asia Minor. B.M. 1070. L.B.C. 19:1806.—Tender, only for warmer temperate regions.

26. *baleárica*, Rich. (*C. calycina*, Ait.). Closely allied to the preceding: lvs. ternate; lfts. incisely serrate, often deeply 3-lobed, ½-1 in. long: fls. greenish yellow, spotted red inside. Spring. S. Eu. Asia Minor. R.H. 1859, p. 190; 1874, p. 289. G.C. II. 9:500. Gn. 6, p. 425; 31, p. 187; 45, p. 240. L.B.C. 8:720. B.M. 959.—Tender.

## Group MONTANÆ.

27. *gracilifolia*, Rehd. & Wilson. Climbing, to 10 ft.: lvs. deciduous, pinnate; lfts. 5-7, ovate to oblong-ovate, cuneate at the base, coarsely serrate, pubescent, about ½ in. long: fls. 1-4, axillary, fascicled, white, 1-1½ in. across, on slender stalks 1-2 in. long; sepals 4, spreading, obovate to oblong-obovate: achenes glabrous, with long plumose tail. June. W. China.—Very graceful and floriferous species; has proved hardy at the Arnold Arboretum.

28. *montana*, Buch.-Ham. (*C. odorata*, Hort., not Wall.). A vigorous climber, often reaching a height of 15-20 ft.: lvs. ternate, with oblong-acuminate cut-toothed lfts.: fls. several in each axil, following each other in succession of time, resembling white anemone blossoms, sweet-scented; sepals 4, elliptic-oblong, 1 in. long, spreading, becoming pink; stamens conspicuous, yellow: achenes glabrous with plumose tails. May. Himalaya region. B.R. 26:53. M. & J. 8. Gn. 30, p. 309; 49, p. 39; 51, p. 349; 60, p. 79; 68, p. 379; 75, p. 371. A.G. 19:391. R.H. 1856:161; 1899, p. 529. G.C. III. 18:303; 20:589. M.D.G. 1902:423. Lav. 22. J.H. III. 49:533. G. 27:237. G.M. 38:661; 46:121; 51:319. Var. *grandiflora*, Hook. (var. *anemoniflora*, Kuntze). Fls. larger, 3-4 in. across. B.M. 4061. M.D.G. 1902:422. G. 34:477. Var. *rubens*, Wilson. Foliage reddish, particularly when unfolding: fls. pink or light pink. June. R.H. 1909:35. R.B. 33:232. F.S.R. 3:252. Gn. 77, p. 84. G.M. 50:395; 54:168. J.H. III. 59:325.—Offsprings of a cross between this variety and the preceding are: Var. *lilacina*, Lemoine, with bluish lilac fls. G. 34:345. Var. *perfecta*, Lemoine, and var. *undulata*, Lemoine, with bluish white very large fls. Var. *Wilsonii*, Sprague (*C. repens*, Veitch, not Finet & Gagnep.). Lfts. ovate, usually rounded or subcordate at the base, puberulous on the veins beneath; sepals obovate-oblong, ¾-1 in. long: fls. in July and Aug., nearly 2 months later than the type. B.M. 8365. M.D.G. 1912:26. R.B. 35:108. See page 3567.

29. *Spođneri*, Rehd. & Wilson (*C. montana* var. *sericea*, Franch.). Climbing, to 20 ft.: lvs. ternate; lfts. ovate or oval, usually rounded at the base, with 1 or few teeth on each side, silky pubescent above and beneath, 1-3 in. long: fls. 1 or 2, white, 3-4 in. across on pedicels 3-6 in. long; sepals broadly obovate, densely pubescent outside: achenes pubescent, with long plumose tail. Spring. W. China.—Beautiful species; has proved fairly hardy at the Arnold Arboretum.

## Group RECTÆ.

30. *Armandii*, Franch. Climbing, to 15 ft.: lvs. ternate, evergreen, glabrous; lfts. ovate to ovate-oblong, acuminate, rounded or subcordate at the base, entire, 4-5 in. long, coriaceous: fls. white, 1-2½ in. across, with oblong-obovate sepals, in loose axillary

cymes in the axils of last year's branches, with persistent bud-scales at the base: achenes hairy, with long plumose tails. April, May. Cent. and W. China. G.C. III. 38:30. R.B. 35, p. 281. R.H. 1913, p. 65. Var. *Farquhariana*, Rehd. & Wilson. Fls. light pink, large, about 2 in. across: lfts. oblong-ovate.—This handsome species is like the following 3 species, adapted only for warmer temperate regions.

31. *Meyeniāna*, Walp. Climbing rapidly; glabrous or slightly pubescent: lvs. ternate; lfts. coriaceous, ovate to ovate-lanceolate, cordate or rounded at the base, entire, 2-3 in. long: panicle loose and many-fl'd.; fls. white, less than ½ in. across: sepals 4, obtusish; anthers as long or longer than filaments: achenes with long feathery tails. Japan, E. China and Indo-China. Summer. B.M. 7897.—Hardy only in warmer temperate regions.

32. *crassifolia*, Benth. Closely allied to the preceding species: climbing; quite glabrous: lfts. thicker, cuneate at the base, usually obtusish; sepals acuminate; anthers shorter than the filaments. Late summer. China.—Suitable for greenhouse, more tender than the preceding.

33. *Pavoliniāna*, Pampanini. Climbing, glabrous: lvs. subcoriaceous ternate; lfts. long-petioled, lanceolate or oblong-lanceolate, acuminate, 2-3 in. long: fls. slender-pedicelled, white, 1-1½ in. across in axillary racemes; sepals linear-oblong: achenes fulvous-pubescent, with a long plumose tail. May. Cent. China.

34. *recta*, Linn. (*C. erecta*, Linn.). Herbaceous, somewhat tufted, 2-3 ft. long: lvs. pinnate; lfts. stalked, ovate, acuminate, entire: fls. numerous, on a large, branching terminal panicle, white, sweet-scented,

988. *Clematis Lawsoniana* var. *Henryi*, a derivative from *C. lanuginosa*. (×¼)

1 in. across. June–Aug. S. Eu. Gn. 52, p. 510; 53, p. 547; 66, p. 152. R.H. 1899, p. 528. G.M. 45:866. G.W. 14, p. 561. Var. *plèna*, Lemoine. Fully doubled, button-like blossoms. H.F. 1860:13. R.H. 1860, pp. 512–13. Var. *mandshùrica*, Maxim. (*C. terniflora*, DC. *C. mandchùria*, Rupr.). Taller and slenderer: lfts. 3–5, ovate, subcordate at the base, rarely cuneate, obtuse, reticulate beneath: fls. pure white in axillary and terminal panicles. R.H. 1909, p. 423.

35. *paniculata*, Thunb. Figs. 990, 991. A vigorous climber: lfts. 3–5, often lobed, acuminate, 1–4 in. long, glabrous: fls. fragrant, 1–1½ in. across, in axillary and

numerous, in axillary and terminal panicles; sepals 4, linear-oblong, white; stamens white: fr. bearing white plumes. Aug.–Oct. Medit. region. Gn. 52, p. 499; 55, p. 114; 58, p. 319; 76, p. 23. Gn. M. 13:347. H.W. 3, p. 14. V. 5:321.—Must have a sunny exposure; very beautiful. Var. *rubella*, Bele (*C. rubella*, Pers., not Hort.). Differs from the type in having the fls. red outside. Var. *rotundifolia*, DC. (*C. fragrans*, Tenore). Lfts. broader, obtuse: fls. fragrant. S. Eu. R.F.G. 4:62 (4666).

There are hybrids of this species with *C. integrifolia* for which see No. 5, *C. aromatica*, and with *C. viticella*, see *C. violacea* under No. 20.

#### Group EUVITALBÆ.

##### 37. *Fargesii*, Franch.

Climbing, to 20 ft.: lvs. pinnate; lfts. 5–7, ovate, incised-serrate, sometimes 3-lobed or 3-parted, nearly glabrous or sometimes sparingly silky-pubescent, particularly beneath, 1–2 in. long: fls. 2 in. across, white, in 3-fld. axillary cymes, long-stalked; sepals 4–6, obovate, finely pubescent outside: achenes glabrous with feathery tails. July. W. China. Var. *Souliei*, Finet & Gagnep. Fls. larger, 3 in. across, solitary.—A handsome species, resembling *C. montana*.

38. *apiifolia*, DC. Climbing, to 10 ft.: branchlets pubescent: lvs. ternate, long-petioled; lfts. usually ovate, coarsely serrate and sometimes 3-lobed or occasionally the terminal ternate, glabrous above, pubescent on the veins beneath: fls. in axillary, many-fld. short cymes, white, about ½ in. across; sepals pubescent on both sides: achenes pubescent with plumose tails. Sept., Oct. Japan. Var. *obtusidentata*, Rehd. & Wilson. Lfts. broader, usually truncate or subcordate at base, less deeply serrate with shallow rounded teeth, more pubescent. Cent. China.—Resembles *C. grata* in the shape of the lfts.

39. *brevicaudata*, DC. (*C. brevicaudata*, Hort.). Climbing vigorously: lvs. pinnate to bipinnate; segms. ovate-lanceolate, acuminate, coarsely toothed, sometimes nearly entire, nearly glabrous or pubescent: fls. in axillary panicles, white, ½–¾ in. across: achenes hairy, rarely glabrous, with rather short plumose tails. Aug.–Oct. China. G.F. 5:139.—A very variable species, but little used. Var. *tenuisepala*, Maxim. Segms. with only 1–3 teeth on each side or sometimes entire: fls. about 1 in. across with glabrous sepals.

40. *grata*, Wall. High climbing: young branchlets pubescent: lvs. pinnate; lfts. usually 5, broadly ovate, usually cordate at the base, incisely serrate, sometimes 3-lobed, 1–2 in. long, pubescent on both sides or glabrous above: fls. ¾–1 in. across, creamy white, in large panicles; sepals tomentose outside: achenes densely pubescent, with long feathery tails. Sept., Oct. Himalayas. G.M. 47:642. Gn. 66, p. 365; 71, p. 506. Var. *lobulata*, Rehd. & Wilson. Lfts. with coarser and fewer

989. *Clematis lawsoniana*, one of *C. lanuginosa* derivatives. (× ½)

terminal panicles; sepals 4, dull white. Sept. Japan. G.F. 3:621 (adapted in Fig. 990); 5:91; 9:75 and 185. F.R. 2:581; 6:471. Mn. 7:113. Gng. 1:101 and 165; 4:161, 229; 6:291; 7:246. A.F. 13:1314. M.D.G. 1898:487–9. G.W. 11:127. V. 16:18. A.G. 20:847. F.E. 16:375. Gn. 57, p. 155; 61, p. 91. R.H. 1874, p. 465 and 1899, p. 527 (as *C. flammula robusta*): 1902, p. 86. Prop. by seed. By far the most common of the fall-blooming species in American gardens. Thrives best in sunny situations. Will stand severe pruning in winter.

36. *Flammula*, Linn. (*C. Pallasii*, J. F. Gmel.). A slender but vigorous climber, reaching 10–15 ft.: lvs. usually bipinnate, dark green, remaining fresh till mid-winter; lfts. small, ovate, oblong or linear: fls. small,

rounded teeth, often 3-lobed or 3-parted, densely pubescent on both sides. Cent. China. Var. *grandidentata*, Rehd. & Wilson. Lfts. occasionally only 3, incisely dentate, usually rounded at base, glabrescent above, silky pubescent beneath, chiefly on the veins, 2-3½ in. long. Cent. China.

990. *Clematis paniculata*. (×½)

41. *Vitalba*, Linn. In England called TRAVELER'S JOY. The most vigorous climber of the genus, ascending 20-30 ft.: lvs. pinnate; lfts. ovate to ovate-lanceolate, acuminate, cordate at the base, partly cut, 2-3½ in. long; fls. numerous, in axillary panicles, dull white, ¾ in. across, with a faint odor of almonds: styles of fr. long and feathery, from which it is given the name "old man's beard." July-Sept. Eu., N. Afr. Caucasus region. Gn. 31, p. 187; 45, p. 389; 53, p. 546. M. D.G. 1898:319. J.H. III. 54:441. H.W. 3, p. 13.—There is a hybrid of this species with *C. heracleæfolia*, for which see No. 12.

42. *virginiana*, Linn. Fig. 992. Climbing 12-15 ft.: lvs. ternate; lfts. glabrous, cut-toothed, bases often cordate, 2-3 in. long; fls. white, in leafy panicles, often monœcious or dioecious, about 1 in. across when expanded; plumose styles 1 in. or more in length. July-Sept. Nova Scotia to Ga., westward to Kan. G.W.-F.A. 12. V. 3:19; 9:36. Var. *Catesbyana*, Brit. (*C. Catesbyana*, Pursh). Lvs. somewhat pubescent, often biternate. Southeastern states. Intro. 1883.

43. *ligusticifolia*, Nutt. Allied to *C. virginiana*, but having 5-7 lfts., of firmer texture, rather more pubescent, variable in form and margin, but usually 3-lobed or coarsely toothed, 1-2 in. long; fls. white, ¾ in. across, in terminal and axillary panicles; styles densely silky-pubescent, with long, straight hairs. Aug. Mo. to New Mex. and Brit. Col. Intro. 1881. Var. *californica*, Wats., has no marked difference: lvs. usually smaller and perhaps more tomentose.

44. *Drummondii*, Torr. & Gray. Climbing: st. and lvs. ashy pubescent: lvs. pinnate; lfts. coarsely cleft, with the segms. more or less flaring and sometimes toothed, ½-1 in. long; fls. dioecious, white, ¾ in. across, in 3-fld. cymes or sometimes solitary; styles becoming 2-4 in. long. Sept. Dry ground, Texas to Ariz.

45. *lasiantha*, Nutt. Climbing; tomentulose: lvs. ternate; lfts. roundish, few-toothed, tomentulose on both sides or glabrous above, 1-2 in. long; fls. 1-3, axil-

lary from scaly buds on last year's branches, white, fragrant, 1½ in. across; sepals tomentose outside: achenes pubescent, with long feathery tails. Spring. Calif.

Group HEXAPETALÆ.

46. *indivisa*, Willd. Large woody climber: lvs. ternate, coriaceous; lfts. ovate-oblong to narrow-oblong, subcordate, 1-4 in. long, usually entire: fls. in axillary panicles, white, 2-4 in. across with 6-8 oblong sepals: achenes pubescent with a long plumose tail. New Zeal.—Only the following var seems to be in cult.: Var. *lobata*, Hook. Lfts. more or less lobed or even 3-parted. B.M. 4398. R.H. 1853: 241. F.S. 4:402. Gn. 12:400; 41, p. 336; 53, p. 547; 74, p. 527; 77, p. 67. H.F. 1853:144. G.C. III. 29:215; 38:135. G.M. 50: 267. G. 8:289; 32:281-3. J.H. III. 62:387. A.F. 13:879; 16:56; 30:221. Gng. 16:199; 8:356. G.F. 6:167.—Only for warm or temperate regions, often cult. as a greenhouse plant and flowering profusely in winter and early spring.

991.  
Flower of *Clematis paniculata*. (×¾)

Group ORIENTALES.

47. *orientalis*, Linn. (*C. graveolens*, Lindl.). A rapid climber, reaching 12-15 ft.: lvs. thin, glaucous and shiny, pinnate; lfts. 3-parted or -lobed, with small, ovate or oblong-ovate, entire or cut-toothed divisions ½-1½ in. long; fls. in few-fld. cymes, sometimes solitary, becoming erect or nearly so, 1½ in. across; sepals 4, yellow, tinted with green, pubescent on both sides, spreading, somewhat reflexed; styles plumose. Aug., Sept. Himalaya region to Persia. Lav. 21. B.M. 4495. Gn. 31, p. 186; 45:240; 52, p. 501. F.S. 4:374b (pl. 336); 6:548. R.H. 1855:321; 1899, p. 530. J.F. 2:128. P.F.G. 2, p. 67. Gng. 5:227. V. 3:362.

48. *glauca*, Willd. (*C. orientalis* var. *glauca*, Maxim.). Slender climber, glabrous: lvs. pinnate, very glaucous; lfts. usually oblong, obtusish, entire or sometimes 3-lobed or 3-parted, 1-2 in. long; fls. yellow, open, campanulate, nodding, 1½ in. across, in few-fld. axillary cymes; sepals quite glabrous inside and nearly so outside, not reflexed; achenes with long plumose tails. Aug.-Oct. Siberia to W. China. R.H. 1890, p. 561.—Hardier than the preceding species. Var. *akebioides*, Rehd. & Wilson. Lfts. usually 3-lobed with broad rounded lobes often coarsely crenate, about 1 in. long; fls. usually in 3's, rarely solitary. W. China. Var. *angustifolia*, Ledeb. (*C. intricata*, Bunge). Lfts. usually 3-parted with narrow generally linear-lanceolate segms. Mongolia.

992. Leaf of  
*Clematis virginiana*.  
(×¾)

49. *tangutica*, Korshinsky (*C. orientalis* var. *tangutica*, Maxim. *C. eriopoda*, Koehne, not Maxim.). Climb-

ing, to 10 ft.: young branchlets slightly villous or nearly glabrous: lvs. green, pinnate; lfts. oblong-lanceolate or lanceolate, acuminate, irregularly serrate with spreading teeth, sometimes 3-lobed or 3-parted, 1-3 in. long: fls. solitary, bright yellow, nodding, 3 in. across; sepals glabrous, except at the margin, acuminate or obtusish: achenes with very long plumose tails. June, sometimes again in Aug. Mongolia to W. China. B.M. 7710. R.H. 1902:528. G.W. 14, p. 651.—Very handsome with its large heads of feathery frs.; hardy.

50. *serratifolia*, Rehd. (*C. koreana*, Hort., not Komarov). Shrubby climber: lvs. biternate, bright green, glabrous; lfts. ovate-lanceolate to lanceolate, acuminate, inequally serrate, 1-2½ in. long: fls. 1-3, axillary, long-stalked, yellow, nodding, 2 in. across; sepals glabrous, except at the margin: achenes with long plumose tails. Aug., Sept. Korea.—Handsome and quite hardy. The true *C. koreana* belongs to the Atragene group and has petaloid staminodes.

*C. acutangula*, Hook. f. & Thoms. Allied to *C. lasiandra*. Sts. deeply grooved: lvs. bipinnate, with ovate or ovate-lanceolate crenate lfts.: fls. axillary, brownish yellow, with the sepals winged on the back. Sept., Oct. Himalayas. Not hardy N.—*C. Addisonii*, Brit. Allied to *C. Viorna*. Upright herb; glabrous: lower lvs. simple, upper pinnate: fls. purplish. May, June. Va. and N.C. G.F. 9:325.—*C. angustifolia*, Jacq. Allied to *C. recta*. Lvs. pinnate with simple or 3-parted linear lfts.: fls. solitary or in 3's with 4-8 sepals. S. Eu. R.F.G. 4:62 (4665).—*C. aristata*, R. Br. Allied to *C. indivisa*. Evergreen: lvs. ternate, with ovate to ovate-lanceolate, cordate lfts.: fls. dioecious, white, in few-fld. axillary corymbs, 2 in. across, fragrant. Austral. B.R. 3:238 and L.B.C. 7:620 (pistillate plant). G.C. III. 32:55 (staminate plant). Var. *Dennisae*, Guilf. (C. Sanderi, Wats.). Fls. with salmon-red filaments. B.M. 8367. Tender.—*C. barbellata*, Edgew. Allied to *C. montana*. Lfts. ovate-lanceolate, toothed: fls. solitary, large, dull purple: achenes glabrous. Himalaya. R.H. 1858, p. 407. B.M. 4794. F.S. 9:956.—*C. Benthamiana*, Hemsl. (*C. terniflora*, Benth. not DC.). Allied to *C. Meyeniana* and *C. chinensis*. Lfts. 5, broadly ovate, subcordate, sparingly pubescent, 1½-2 in. long: fls. in axillary and terminal panicles, white, ½ in. across. China.—Of no particular ornamental value.—*C. brachiata*, Thunb. Climbing; pubescent: lvs. bipinnate or the upper pinnate; lfts. ovate, coarsely toothed: fls. greenish white, in axillary panicles, fragrant, 1-1½ in. across; sepals spreading obtuse: filaments hairy at the base. S. Afr. B.R. 2:97, G.C. III. 30:367. Tender.—*C. brachyura*, Maxim. Similar to *C. recta*. Herbaceous, upright: lvs. pinnate with 3-5 ovate, 3-nerved lfts.: fls. axillary, solitary, white; sepals glabrous except at the margin: achenes few with short pubescent style. Korea.—*C. Buchananiana*, DC. Allied to *C. nutans*. Large climber, hairy: lvs. pinnate; lfts. broadly ovate, serrate or lobed: fls. in panicles, tubular; sepals ribbed. Himalaya. See also *C. nutans* var. *thyrsoides*.—*C. chinensis*, Retz. Allied to *C. Meyeniana*. Lfts. 5, ovate to ovate-lanceolate, nearly glabrous, ¾-1½ in. long: fls. in axillary and terminal panicles. China.—*C. chrysocoma*, Franco. Allied to *C. montana*. Upright shrub: lfts. obovate with few coarse teeth, ¾-1¼ in. long, yellowish silky-pubescent beneath: fls. axillary, 1-3, 2 in. across; sepals white with pink margin. China. B.M. 8395.—*C. connata*, DC. Allied to *C. nutans*. Large climber; glabrous: lfts. 3-7, broadly ovate, slightly pubescent or nearly glabrous, cordate at base, coarsely serrate, often 3-lobed, 2-4 in. long: fls. ¾-1 in. long, in many-fld. panicles. Himalayas. G.F. 4:235.—*C. Delavayi*, Franch. Allied to *C. recta*. Upright shrub: lvs. pinnate; lfts. 9-11, ovate, entire, silvery white beneath, ½-¾ in. long: fls. white, slender-stalked, 3-5, terminal, about 1 in. across. W. China. Very distinct, but apparently not hardy N.—*C. Geberiana*, Bong.—*C. songarica* var. *Geberiana*.—*C. Gouriána*, Roxbg. Allied to *C. grata*. Tall climber; usually glabrous: lvs. pinnate or bipinnate; lfts. ovate-oblong, glabrous above, pubescent or sometimes glabrous beneath: fls. ½-¾ in. across, white, in large panicles. Himalayas. S. Asia, Philippine Isls. Wight, Icon. 933-4.—*C. grevilliflora*, DC. Allied to *C. nutans*. Tall woody climber; densely tomentose: lfts. 3-5, broadly ovate, cordate, serrate, usually deeply 5-lobed, 3-4 in. long: fls. 1½ in. long, tubular-campanulate, tawny yellow. Himalayas. B.M. 6369.—Very distinct, but only for warmer regions.—*C. hexapétala*, Forst. (*C. hexasepala*, DC.). Allied to *C. indivisa*. Lvs. ternate; lfts. coarsely dentate or lobed: fls. dioecious, in axillary cymes, greenish white, fragrant, 1 in. across. New Zeal. B.R. 32:44.—*C. koreana*, Komarov. Allied to *C. alpina*. Lvs. ternate or biternate; lfts. ovate, cordate, coarsely toothed: fls. yellow or violet; sepals about 1 in. long; staminode, spatulate, narrow. Korea. Act. Hort. Petrop. 22:6.—*C. macropétala*, Ledeb. Allied to *C. alpina*. Lvs. ternate or biternate; lfts. coarsely serrate or nearly entire: fls. large, violet; petaloid staminodes lanceolate, little shorter than sepals. N. China. Gt. 19:651.—*C. mendocina*, Phil. Allied to *C. ligusticifolia*. Lower lfts. 3-parted or 3-lobed, segms. lanceolate: fls. monœcious, white, in panicles; sepals sparingly hairy inside: tails of achenes very long. Sept., Oct. Chile. Tender.—*C. Pierdii*, Miqu. Allied to *C. brevicaudata*. Slender climber: lvs. biternate; lfts. ovate-oblong, coarsely serrate, 1¼-2½ in. long: fls. white, ¾ in. across, solitary, or in 3-fld., rarely many-fld. cymes: achenes glabrous, with rather short plumose tails. Aug. Japan.—*C. quinquefoliolata*, Hutchinson (*C. Meyeniana*

var. *heterophylla*, Gagnep.). Allied to *C. Meyeniana*. Lfts. 5, lanceolate or oblong-lanceolate, about 3 in. long: cymes few-fld., shorter than the lvs.: tails of fr. fulvous. Cent. China. V.F. 3.—*C. Sanderi*, Wats.—*C. aristata* var. *Dennisae*.—*C. smilacifolia*, Wall. Tall woody climber: lvs. simple, ovate usually cordate, entire, 3-10 in. long, rarely ternate: fls. 1-1½ in. across, brownish tomentose outside, purple inside, in axillary panicles: achenes with long feathery tail. B.M. 4259. F.S. 2, pt. 12:3. G.C. III. 30:466.—*C. songarica*, Bunge. Allied to *C. recta*. Shrubby, upright: lvs. simple, thickish, grayish green, usually lanceolate, entire or sparingly serrate: fls. yellowish white, in terminal and axillary cymes: sepals glabrous inside. Turkestan, Mongolia. Var. *Geberiana*, Kuntze (*C. Geberiana*, Bong.). Lvs. thinner, more serrate, green.—*C. Suksdorfii*, Robins. Allied to *C. ligusticifolia*. Lfts. 5, ovate, to ovate-oblong, 1-1½ in. long: fls. in axillary racemes or panicles, white, 1 in. across; sepals reflexed: achenes few. Brit. Col. G.F. 9:255.—*C. Thunbergii*, Steud. Climbing, pubescent or glabrous: lvs. pinnate with ovate to lanceolate, often 3-lobed or 3-parted lfts.: fls. in axillary panicles; sepals spreading, lanceolate; filaments hairy at the base. S. Afr. G.C. III. 50:253.

K. C. DAVIS.

ALFRED REHDER.†

CLEMATIS, MOCK: *Agdestis clematidea*.

CLEMATOCLETHRA (*Clematis* and *clethra*, referring to the similarity of the flower to that of *Clethra* and to the climbing habit). *Dilleniaceæ*. Shrubs grown for the profusely produced fragrant flowers and the attractive black or red berries.

Deciduous climbing plants: branches with solid pith: winter-buds conspicuous, free, with several imbricate scales: lvs. petioled, usually serrate: fls. in axillary cymes or panicles, sometimes solitary, white; sepals 5, imbricate, persistent; petals 5, imbricate; stamens 10, short; ovary 5-celled, each cell with 10 ovules; style simple, cylindric: fr. berry-like, with thin flesh, subglobose, usually 5-seeded.—About 12 species in Cent. and W. China. Closely allied to *Actinidia* which is easily distinguished by its numerous stamens, many styles, many-seeded fr. and in the winter state by its winter-buds being hidden by a swelling of the tissue around their base. Several species have been recently intro., but the names of most of them have not yet been determined. They are apparently harder than the Chinese actinidias and superior from an ornamental point of view on account of their profusely produced fls. and frs. though the foliage as a rule is smaller and not quite so handsome. Prop. by seeds and probably, like actinidias, by greenwood cuttings in summer and also by hardwood cuttings and layers.

Hémsleyi, Bail.

Climbing, to 20 ft.: young branches pubescent at first, soon glabrous: lvs. slender petioled, ovate to oblong-ovate, acuminate, denticulate, glabrous above, brownish pubescent on the veins beneath, 2-4 in. long: fls. white, about ½ in. across, 4-12 in stalked axillary cymes: fr. globose, black, about ½ in. across. Cent. China. H.I. 29:2808.

*integrifolia*, Maxim. Quite glabrous: lvs. ovate to ovate-lanceolate, acuminate, finely serrulate or entire, dark green above, glaucous beneath, 1½-3 in. long:

993. *Cleome spinosa*.

fls. solitary or in 2- or 3-fl. cymes on slender stalks, white,  $\frac{1}{3}$ – $\frac{1}{2}$  in. across: fr. globose, black. W. China.

ALFRED REHDER.

**CLEOME** (meaning uncertain). *Capparidaceæ*. Odd spider-flowered plants sometimes grown in the flower-garden.

Sub-shrubs or annual herbs, simple or branched, glabrous or glandular, with simple lvs. or 3–7 lfts., and white, green, yellow or purplish fls. borne singly or in racemes; petals entire, with claws.—Seventy tropical species, in both hemispheres. The genus is distinguished from *Gynandropsis* by its short torus, which often bears an appendage, and by the 4–6, rarely 10, stamens.

The garden cleomes are chiefly interesting for their long purple spidery stamens and showy rose-colored petals. They succeed in sandy soils and sunny situations, and can be used like castor-oil plants to fill up large gaps in a border. *C. spinosa* is the best, and has lately been planted considerably in public parks amongst shrubbery. Propagated by seeds, which are produced freely in long slender pods borne on long stalks.

A. Lfts. more than 3.

*spinosa*, Jacq. (*C. pungens*, Willd. *C. gigantea*, Hort., not Linn.). GIANT SPIDER PLANT. Figs. 993, 994. Clammy, strong-scented, 3–4 ft. high: lfts. usually 5, sometimes 7, oblong-lanceolate, with a pair of short stipular spines under the petioles of most of the lvs., and in the tropics some little prickles on the petioles also: fls. rose-purple, varying to white; petals 4, obovate, clawed,  $\frac{1}{2}$  in. long; stamens 2–3 in. long, blue or purple. N. C. to La. (naturalized from Trop. Amer.) and escaped from gardens. B.M. 1640. G.C. III. 45: 115.—A tender biennial north, but annual in the tropics. The plant recently intro. as *C. gigantea* is not the true species, which is a green-fl. S. American plant as yet apparently unknown in the trade in this country. *C. spinosa* differs widely in the extent and character of its spines. The fls. vary in the development of the style; Fig. 994 shows a fully perfected style.

*speciosissima*, Deppe. Annual or half-shrubby, sometimes 5 ft. high: sts. strongly hairy without spines; lfts. 5–7, lanceolate, dentate, narrowed at the base, conspicuously hairy on both sides: fls. light purple or purplish rose. July to fall. Mex. B.R. 1312.—Said to be the showiest of cleomes. Under this name a very different plant is passing, the lfts. of which have only minute hairs but rather numerous spines.

AA. Lfts. 3.

*serrulata*, Pursh (*C. integrifolia*, Torr. & Gray). ROCKY MOUNTAIN BEE-PLANT. Glabrous, 2–3 or even 6 ft. high: lfts. 3, lanceolate to obovate-oblong, entire, or rarely with a few minute teeth: bracts much narrower than in *C. spinosa*: petals rose.

rarely white, 3-toothed; receptacle with a flat, conspicuous appendage. Along streams in saline soils of prairies.—In cult. over 30 years as a bee-plant.

*C. dendroidea*, Schult. Tree-like, 10–14 ft.: fls. blackish purple. Brazil. B.M. 3296.—*C. gigantea*, Linn. Shrubby, 3–5 ft., downy: lfts. 7, lanceolate, lance-oblong or oblanceolate, the entire lf. shorter than petiole: fls. greenish; petals linear, 2 in. or more long, cohering by their margins and opening only on one side; sepals long-linear, glandular, becoming revolute. Trop. Amer. B.M. 3137.—*C. speciosa*, HBK.=*Gynandropsis*.

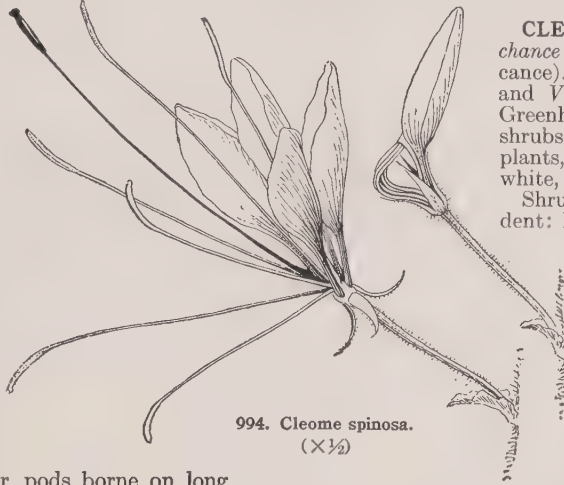

N. TAYLOR.†

**CLERODENDRON** (Greek, *chance* and *tree*: of no significance). Includes *Siphonantha* and *Volkameria*. *Verbenaceæ*. Greenhouse climbers and hardy shrubs and other ornamental plants, grown for the showy white, violet or red flowers.

Shrubs or trees, often scandent: lvs. opposite or verticillate, mostly entire or not compound: fls. in mostly terminal cymes or panicles; calyx campanulate or rarely tubular, shallowly 5-toothed or 5-lobed; corolla-tube usually slender and cylindrical, the limb 5-parted and spreading, the lobes somewhat unequal; stamens 4, affixed on the corolla-tube, long-exserted and curved; style exserted, 2-cleft at the end; ovary 4-loculed: fr. a drupe inclosed in the calyx.—About 100 species, in the tropics, mostly of the eastern hemisphere.

Clerodendrons are divided into two garden sections, —those with a shrubby habit, and the twining kinds. The culture is about the same for both kinds. They may be grown from seeds or from cuttings of the half-ripened wood. In either case, use 2-inch pots filled with a mixture of equal parts of leaf-mold or peat and good sharp sand. Place a cutting or a seed in each pot, and press moderately firm. Leave the pots in a tight case with a temperature of 70°, and keep the soil at all times fairly moist. When the pots are filled with roots, shift into a 4-inch pot, using a compost consisting of fibrous loam two parts, leaf-mold and sand one part each, and a fifth part of well-rotted manure. Pot rather firm, as this insures a stronger growth, and during the growing season keep in a night temperature of 65°.—Clerodendrons may be flowered in any size pot desired, and some of the species, notably *C. Balfourii* (or properly *C. Thomsonæ*), can be had in flower from Easter until late September. This species is probably the best and most useful, either for decorative work or exhibition purposes; when it is grown in large pots, a good rough material may be used for potting. A good stiff fibrous loam

with about one-third part of decayed manure is best. When the season's growth is completed, gradually withhold water for two months and lower the night temperature from 65° to 55°. Many of the leaves under the above treatment will drop and the wood will become firm. If plants are wanted in flower about Easter.

994. *Cleome spinosa*. ( $\times \frac{1}{2}$ )

995. *Clerodendron Thomsonæ*. ( $\times \frac{1}{2}$ )

give them a thorough soaking with water about January 1, and raise the temperature again to 65° by night, letting it rise during the day to 75° to 80°. Syringe the plants two or three times a day, which will encourage the young growths to start all over the ripened wood. When this takes place, the plant will either have to be repotted or fed liberally with liquid manure and fertilizers, repotting usually resulting in larger panicles of flowers. If feeding is resorted to, a handful of green cow-manure to a watering-pot containing two and a half or three gallons of water is sufficient; and if any of the popular fertilizers are used for a change, a small handful to the same amount of water will answer. Water twice in between with clean water. Plants for a succession may be started when the first are beginning to show the crimson at the end of the flower, and so on until the end of July or first of August. —Clerodendrons are not subject to insect pests if kept thoroughly syringed during their growing season. If this is neglected, the shrubby kinds may become affected with brown-scale or mealy-bug, which should be immediately treated with the usual hydrocyanic gas fumigation. (George F. Stewart.)

## A. Plant of twining habit.

1. *Thomsonae*, Balfour (*C. Balfourii*, Hort.). Fig. 995. Tall, twining, glabrous evergreen shrub: lvs. opposite, oblong-ovate and acuminate, strongly several-nerved, entire, petioled: fls. in axillary, and terminal forking lax cymes; calyx strongly 5-angled, narrowed at the apex, white; corolla-limb light crimson and spreading; corolla-tube 1 in. long; stamens  $\frac{3}{4}$  in. long. W. Afr. B.M. 5313. R.H. 1867:310; 1902:504. G.M. 46:173. G.W. 4, p. 439; 8, p. 173; 13, p. 340. F.E. 28:261.—A warmhouse plant of great merit, and the most popular of the tender species. Blooms profusely on the young wood. Var. *delectum*, Hort. (*C. delectum* and *C. delicatulum*, Hort.). Fl.-clusters very large; calyx pure white or green-tinged; corolla large, rose-magenta.

2. *splendens*, Don (*Siphonanthus splendens*, Hiern). A most excellent stove climber: sts. slender, woody, glabrous, slightly angled: lvs. opposite, variable, oblong-cordate, or elliptic, 4–6 in. long, dark green; petiole rather short: fls. in dense many-flowered cymes on leafy growths from the ripened wood of the previous year, bright scarlet passing into bright yellow, an inch or more in diam.; stamens 1 in. long. Trop. Afr. B.R. 28:7. R.H. 1902:504. H.U. 5, p. 325.

3. *speciosum*, Hort. A garden hybrid between *C. splendens* and *C. Thomsonae*, intermediate in habit and foliage: the fls. are produced in profusion, are dull red, and are continuously borne throughout the summer months; old calices more or less persistent, and ornamental pale red after fls. are past.—As figured in R. H. 1873, 471 and Gn. 1877, 404, this recedes very little from typical *C. splendens*, according to Baker, but the *C. speciosum hybridum* of I. H. 1869, t593 is intermediate between *C. splendens* and *C. Thomsonae*.

AA. Plant of erect or self-supporting habit.

B. Corolla-tube not much if any longer than the large calyx: fls. white or light blush.

4. *fragrans*, Vent. (*C. coronaria*, Hort.? *Volkameria fragrans*, Vent.). Pubescent, half shrubby, with angled branches, 3–5 ft.: lvs. broadly ovate, with truncate or cordate base, acuminate, coarsely toothed: fls. white or blush, in terminal, compact, hydrangea-like corymbs, usually double, delicately scented. China, Japan. B.M. 1834.—Very desirable and fragrant plant for the coolhouse. Hardy in S. Lvs. ill-scented.

5. *infortunatum*, Gaertn. (*C. viscosum*, Vent.). Height 5–7 ft., pubescent, with square branches: lvs. opposite and stalked, cordate-ovate, acuminate, entire or toothed, hairy: fls. in a loose villous terminal panicle, white, with a flesh-colored center, flaring, the tube projecting beyond the loose, hairy, large, 5-angled calyx. E. Indies. B.M. 1805.—Fls. sweet-scented. Greenhouse.

6. *trichotomum*, Thunb. (*C. serotinum*, Carr. *Volkameria japonica*, Hort., not Thunb.). Fig. 996. Slender but erect, graceful, pubescent sub-shrub, 4–10 ft. high or even higher: lvs. mostly opposite, soft and flaccid, ovate-acuminate, narrowed at the base, very closely serrate or entire, hairy: fls. white, with a reddish brown calyx, on forking, slender, reddish peduncles, the corolla-tube

996. *Clerodendron trichotomum*.  
 (×  $\frac{1}{2}$ )

sometimes twice as long as the calyx; segms. of calyx turning red and affording pleasing contrast to bright blue frs. Japan. B.M. 6561. Gn. 43:504; 51, p. 320; 75, pp. 67, 447. G. 26:492. J.H. III. 55:355. F.E. 29:653. R.H. 1867, p. 351.—A very handsome, hardy shrub or small tree. In the N. it kills to the ground, but sprouts up if the crown is protected.

7. *Fargesii*, Dode (*C. trichotomum* var. *Fargesii*, Hort.). A recent shrub, reported as being hardy in England, rapid-growing: lvs. dark green or purplish, opposite, petioled, the blade ovate and acute or acuminate, strongly veined, abruptly narrowed at the base, entire: fls. in panicles in summer, whitish, fragrant; sepals lance-ovate, becoming reflexed: fr. globular,

size of a sweet pea seed, peacock-blue, set on the purple or crimson old calyx. China. G.M. 54:817. R.H. 1911, p. 522, 523.

8. *inérme*, Gärtner. Tall shrub or becoming small tree: lvs. opposite or ternate, obovate or elliptic, entire, scentless, privet-like,  $1\frac{1}{2}$  in. or less long; fls. white, fragrant, on 3-7-fld. axillary peduncles; corolla-tube  $\frac{3}{4}$  in. long, the lobes very short; fr.  $\frac{1}{2}$  in. long, smooth, separating into 4 parts. India, where it is said to be used for hedges.—Offered in S. Calif.

BB. Corolla-tube markedly longer than the small calyx (usually 2-3 times or more longer).

c. Fls. white.

9. *tomentosum*, R. Br. Shrubby and erect (often becoming a small tree), pubescent, often purplish: lvs. opposite and petioled, ovate-elliptic to sub-lanceolate, short-acuminate, 2-4 in. long, entire or sparingly toothed, pubescent on both sides, but thickly so on the under side; fls. in opposite, forking compact clusters, the calyx not enlarged, the slim, corolla-tube

long-exserted (3-4 times length of calyx), and the clear white corolla-lobes reflexed-curved; anthers yellow, protruding. Austral. B.M. 1518.—Cult. in S. Calif.

10. *macrósiphon*, Hook. f. (*C. incisum* var. *macrósiphon*, Baker). Elegant erect shrub, finely pubescent: lvs. opposite, oblanceolate-oblong, acuminate, notched or pinnatifid; fls. in a nearly sessile terminal cyme or head, pure white; calyx green, very small; corolla-tube very narrow, 4-5 in. long, hairy, the limb 1-sided,  $\frac{1}{2}$  in. long; filaments 2 in. long, red. E. Afr. B.M. 6695.—Warmhouse plant of merit, but the handsome fls. are short-lived.

11. *Siphonánthus*, R. Br. (*Siphonánthus indica*, Willd.). TURK'S TURBAN. TUBE-FLOWER. Shrub, 2-8 ft. high, open-branched: lvs. opposite or verticillate, nearly sessile, narrowly lanceolate, entire or nearly so; fls. long-tubed and white (tube 3-4 in. long) in very large terminal racemes, the lobes  $\frac{2}{3}$  in. long, obovate-oblong; fr. a showy, red and purple berry, which persists a long time. E. Indies. Hardy in Fla.

cc. Fls. red, orange or distinctly lilac.

12. *squamatum*, Vahl (*C. Kaempferi*, Sieb.). Shrub 6-10 ft., thinly pubescent: lvs. large, opposite, round-cordate, entire or denticulate, acuminate; infl. and fls. brilliant scarlet; fls. with small red calyx and reflexed, spreading, unequal corolla-lobes; corolla-tube 1 in. or less long, very slender; drupe blue-black or greenish blue, rather fleshy. China. B.R. 649. R.B. 22:253. Gn. 42:562. Gt. 5:352.—Very showy. Cult. in warm greenhouses, and in the open in S. Calif. and S. Fla. The fls. are in an erect branchy, panicle-like cluster.

13. *fallax*, Lindl. Fig. 997. A highly ornamental species: st. erect, shrubby, branching after flowering, bluntly 4-angled; lvs. large, cordate-ovate, hairy, rich

dark green, often 1 ft. in length and supported by a stout hairy petiole; infl. erect, often 18 in. or more in length; fls. bright scarlet, numerous,  $1\frac{1}{2}$ -2 in. diam., tube narrow, lobes reflexed. Java. G.C. III. 45:324. Gn. 59, p. 179, desc. G.W. 10, p. 247.—Should be in every collection of warmhouse plants, as it may be induced to bloom practically all the year round; it should be given a fairly light position, with slight shade from strong sun.

14. *myrmecophilum*, Ridley. Shrub, sparingly branched, 3 ft., with terete sts. and white bark: lvs. opposite and alternate, 1 ft. long, linear-oblong, shining dark green, with a dozen pairs of conspicuous nerves, short-petioled; fls. yellow-red, in a large, showy terminal pubescent panicle; calyx about  $\frac{1}{2}$  in. long; corolla-tube considerably longer than calyx; corolla-lobes  $\frac{1}{2}$  in. long, obovate to oblong and obtuse; filaments red, much exserted. Singapore. B.M. 7887. G.C. III. 33:291; 35:237. R.H. 1907, p. 443. G. 26:359. G.M. 47:259. Gng. 13:376. A.F. 25:78.—The hollow sts. afford nesting-places for ants, whence the name *myrmecophilum* ("ant-loving").—Blossoms well in 6-in. pots in a warmhouse, producing panicles 8 in. long on plants 2 ft. high.

15. *foetidum*, Bunge (*C. Bungei*, Steud.). Shrub, 3-6 ft., pubescent, spiny, of a dwarf spreading habit, sparsely branched: lvs. opposite, broad-ovate and acuminate, stalked, coarsely toothed, often 1 ft. long, dark green above and red-hairy beneath; fls. rosy-red,  $\frac{3}{4}$  in. across, tube 3-4 times as long as calyx, in a dense capitate corymb 4-8 in. across. China. B.M. 4880. F.S. 9:863. G. 27:452; 30:361.—Cool greenhouse; hardy in middle and southern states. August. Killed to the ground in the latitude of Philadelphia, but sprouts up and blooms. Fls. not fetid, but name given because of the odor of the bruised lvs. Spreads by suckers from the root, and soon forms a mass of beautiful free flowering growths.

L. H. B.

CLÉTHRA (ancient Greek name of the Alder, transferred to this genus on account of the resemblance of the leaves). *Clethraceæ*. WHITE ALDER. Shrubs or small trees grown for their handsome spikes of white fragrant flowers appearing in summer.

Leaves alternate, usually serrate, deciduous or persistent: fls. white, in terminal often paniced racemes; petals 5, erect; stamens 10; caps. splitting into 3 valves, many-seeded.—

About 25 species in Amer., E. Asia, Madeira. Only a few hardy deciduous species are generally cult.; valuable for their showy spikes of white fragrant fls., appearing late in summer. They grow best in a moist, peaty or sandy soil. Prop. by seeds, sown in spring in pans in sandy and peaty soil, and by greenwood cuttings under glass, growing best if taken from forced plants in early spring and placed in slight bottom heat; also, in-

998. *Clethra tomentosa*. ( $\times \frac{1}{2}$ )

997. *Clerodendron fallax*. ( $\times \frac{1}{2}$ )

creased by layers and by division of large plants. Handsome when forced under glass.

A. *Lvs. deciduous: stamens exserted.*

B. *Racemes usually solitary; stamens pubescent.*

**acuminata**, Michx. Tall shrub or small tree, to 15 ft.: lvs. petioled, oval or oblong, acuminate, rounded or narrowed at the base, sharply serrate, pubescent beneath at least on the veins, 3-7 in. long: racemes usually solitary, nodding; sepals acute; style glabrous. July-Sept. Alleghany Mts., Va. to Ga. L.B.C. 15:1427.

BB. *Racemes usually paniced.*

c. *The lvs. with 7-10 pairs of veins, 1½-4 in. long: sepals obtusish; stamens glabrous.*

**tomentosa**, Lam. (*C. alnifolia* var. *tomentosa*, Michx.). Fig. 998. Shrub, 2-8 ft.: lvs. short-petioled, obovate, acute or short-acuminate, cuneate, serrate usually above the middle, pubescent above, tomentose beneath, 2-4 in. long: racemes few or solitary; style pubescent. Aug., Sept. N. C. to Fla. and Ala. B.M. 3743. G.F. 4:65 (adapted in Fig. 998). R.H. 1912, p. 519.

**alnifolia**, Linn. SWEET PEPPERBUSH. Shrub, 3-10 ft.: lvs. short-petioled, cuneate, obovate or oblong, sharply serrate, mostly glabrous or nearly so, 2-4 in. long: fls. fragrant, in erect, usually paniced racemes. July-Sept. Maine to Fla. M.D.G. 1890:65; 1903:473, 474. G. 26:63. J.H. III. 31:375. Em. 426. Var. **paniculata**, Arb. Kew. (*C. paniculata*, Ait.). Lvs. cuneate-lanceolate, less toothed, green and glabrous on both sides: racemes paniced. Var. **rosea**, Rehd. With pinkish fls.

cc. *The lvs. with 10-15 pairs of veins, 3-6 in. long.*

**barbinervis**, Sieb. & Zucc. (*C. canescens*, Authors, not Reinw.). Shrub or tree, to 30 ft.: branches glabrous: lvs. petioled, cuneate, obovate or oblong-obovate, acuminate, sharply dentate-serrate, pubescent beneath at least on the veins, 3-6 in. long: racemes paniced; fls. fragrant; pedicels about as long as the fls.; sepals obtuse; filaments glabrous. July-Sept. E. Asia. Gt. 19:654.

**Fargesii**, Franch. Shrub, to 12 ft.: young branchlets tomentose or nearly glabrous: petioles ½-1 in. long: lvs. oblong-ovate or elliptic-oblong, acuminate, broadly cuneate or rounded at base, sharply serrate, slightly pubescent beneath or nearly glabrous, 3-6 in. long: fls. white, in paniced racemes 5-7 in. long; sepals pointed; filaments hairy, style glabrous. Cent. China.—One of the most ornamental species on account of its very long racemes.

AA. *Lvs. evergreen: stamens included.*

**arborea**, Ait. Shrub or small tree, to 20 ft.: lvs. cuneate, narrow-elliptic, acuminate, serrate, almost glabrous, shining above, 3-4 in. long: racemes paniced; fls. fragrant. Aug.-Oct. Madeira. B.M. 1057. G.C. III. 52:100. J.H. III. 64:245. G.M. 49:97; 52:127. Gt. 52, p. 209. Gn. 76, p. 428.—It stands only a few degrees of frost.

*C. monostachya*, Rehd. & Wilson. Allied to *C. Fargesii*. Lvs. cuneate, elliptic-oblong to oblong-lanceolate, glabrous or nearly so: racemes usually solitary; style appressed pilose. Cent. China.—*C. quercifolia*, Schlecht. Shrub: lvs. obovate-oblong, tomentose beneath: racemes paniced. Mex. B.R. 28:23.—*C. tinifolia*, Swartz. Shrub: lvs. oblong, entire, tomentose beneath: racemes paniced. Jamaica.—The last two are evergreen and hardly only in subtropical regions.

ALFRED REHDER.

**CLEYÈRA** (after Andrew Cleyer, Dutch physician of the seventeenth century). *Ternstramedaceæ*. Greenhouse evergreen shrubs distinguished by the petals free or scarcely coalesced, the pilose anthers, numerous ovules, and scarcely bracted fls.: sepals 5, with 2 bractlets; petals 5; stigmas 2-3; berries 2-3-celled.—About 9 species

**ochnácea**, DC. (*C. japonica*, Sieb. & Zucc.). Height about 6 ft.: lvs. oval-oblong, acute at both ends, veined above, entire. Himalayas.—A tender shrub rarely cult. in northern greenhouses. In the S. it is cult. outdoors. It has glossy foliage, numerous creamy white, fragrant fls., borne in June, and red berries, which last all winter.—*C. japonica* was distinguished by DeCandolle by its oblong-lanceolate lvs., which are veinless, and minutely serrate at the apex. Var. **tricolor**, Hort., has dark green lvs., with grayish markings, and a margin of white and rose, the variegation being more brilliant in younger lvs.

WILHELM MILLER.

**CLIANTHUS** (Greek, *glory-flower*). *Leguminosæ*. GLORY PEA. GLORY VINE. PARROT'S BILL. Tender half-trailing shrubs, with large, showy flowers of unique appearance. Swainsona is an allied genus, but its general appearance is very different and it has acuminate, not obtuse petals. interesting plants, with pinnate lvs. of many lfts., and fls. in racemes; scarcely papilionaceous: pod stalked, many-seeded.—Two or 3 species.

*Clianthus Dampieri* is somewhat difficult to grow on its own roots. In Germany, a method has been found whereby it is as easy to succeed with this species as with the better-known *C. puniceus*. The method consists of using small seedling plants of *Colutea arborescens* as stocks; these are cut over near the soil and seedlings of *C. Dampieri*, while in the cotyledon stage, are separated from the root, the base cut wedge-shape and inserted in a cut made in the *colutea* stock. While the union is taking place, the pots should be placed under a bell-jar. *C. puniceus* is an old-fashioned greenhouse plant, grown sometimes to cover rafters or trellis work, but more frequently trained around sticks placed about the edge of the pot. The flowers, not very unlike those of the common *Erythrina*, are freely produced in hanging clusters. Cuttings rooted in early spring may be grown into good-sized plants during the summer. Water should be given sparingly during the dull months. Pruning, repotting and tying the shoots should be done just before the growth begins. A sharp lookout should be kept for the red spider, frequent syringings being the only remedy for this pest. Propagated by seeds and cuttings. (G. W. Oliver.)

999. *Clianthus Dampieri*. (× ½)

**Dampieri**, A. Cunn. GLORY PEA. Fig. 999. Height 2-4 ft.: plant glaucous and hoary, with long whitish silky hairs: sts. slightly tinged with red: petioles longer than in *C. puniceus*; lfts. 15-21, nearly opposite, sessile, usually acute; stipules larger than in *C. puniceus*: fls. 4-6 in a raceme, large, drooping, about 3 in. long, rich crimson or scarlet, with a handsome velvety, purple-black area on the raised center. Austral. B. M. 5051. R.H. 1868:230. Gt. 48, p. 272. Gn. 20:86. Var. **germanicus**, Hort., is also sold, and is probably var. **marginatus**, Hort., which has one petal white, margined scarlet. See Gn. 37:298 and p. 299 for an account of grafting this species on stocks of *C. puniceus*. Var. **tricolor**, Hort. Keel white except the tip, which is bright scarlet. Gn. W. 20:409 (desc.).

**puniceus**, Banks & Soland. PARROT'S BILL. RED KOWHAI. Height 3-6 ft., much branched: plant glabrous: lfts. 16-28, each with a very short petiole, alternate (at least toward the end of the lf.), blunt or

XXVIII. Stowell Evergreen sweet corn.

slightly notched: fls. 8 or more in a raceme, crimson, fading with age, at least 3 in. long. New Zeal. B.M. 3584.—Cult. in eastern greenhouses, and a favorite Californian outdoor shrub. Blooms all winter in Golden Gate Park, San Francisco. A white-fl. form has been grown in Calif., but is not so popular as the type. It is commonly cult. in New Zeal. Var. *magnificus*, Hort. Clusters of bright scarlet fls.

WILHELM MILLER.  
N. TAYLOR.†

**CLIDÈMIA** (old Greek name). *Melastomaceæ*. About 100 Trop. American species of horticulturally rather unimportant plants in a family famous for its foliage plants. Lvs. broad, entire, 5–7-nerved, opposite, petioled: fls. in panicles or axillary clusters, white, pink, or purple; petals 5 or 6; stamens 10 or 12; branching shrubs, mostly hairy. *C. vittata*, Lind. & André, has large, oval, pointed lvs. with 5 strong nerves, and a narrow band of white down each side of the midrib. I.H. 22:219. R.H. 1876, p. 233.

CLIFF BRAKE: *Pellaea*.

**CLIFTÒNIA** (after Dr. Francis Clifton, an English physician, d. 1736). *Cyrtillacæ*. BUCKWHEAT TREE. Glabrous evergreen shrub or small tree, rarely cult. for its early appearing racemes of white or pinkish fragrant fls.: lvs. alternate, short-petioled, without stipules, entire: fls. in terminal racemes; sepals and petals 5–8; stamens 10, shorter than the petals, the filaments flattened below; ovary superior, 3–4-celled, with a 3–4-lobed nearly sessile stigma: fr. indehiscent, ovoid, with 3–4 wings and as many seeds. The only species is *C. monophylla*, Sarg. (*C. ligustrina*, Spreng. *C. nitida*, Gaertn. *Mylocaryum ligustrinum*, Sims). Occasionally 50 ft. tall: lvs. oblong-lanceolate, obtuse, cuneate at the base, dark green above,  $1\frac{1}{2}$ –2 in. long: racemes 1–2½ in. long; fls. white or pinkish, fragrant, about ½ in. across: fr. ¼ in. long. Feb., March; fr. in Aug., Sept. Ga. to Fla. and La.; swamps. S.S. 2:52. B.M. 1625.—Little known in cult. and now not in the trade, but well worth cult. for its early, delicate and fragrant fls.; also the buckwheat-like frs. are attractive. Hardy as far north as Philadelphia. Thrives best in humid sandy and peaty soil. Prop. by seeds and probably like *Cyrtilla* by cuttings of half-ripened wood under glass with slight bottom heat.

ALFRED REHDER.

**CLIMBERS** are distinguished from twiners by having some means of attachment, as tendrils or other special devices, while twiners rise by twisting their stems round their support. In a wider sense, the word is often used synonymously with “vines,” including all plants that use other plants or other objects for support, by whatever mechanism or method. By “trailers,” nurserymen commonly mean low-growing vines, and by “climbers,” tall-growing vines. See *Vines*.

**CLIMBING FERN:** *Lygodium*. Climbing Fumitory: *Adlumia fungosa*. Climbing Hempweed: *Mikania scandens*. Climbing Lily: *Gloriosa superba*.

**CLINOSTÍGMA** (Greek, *inclined stigma*). *Palmaeæ*, tribe *Arécæ*. Low spineless palms with the habit and somewhat the appearance of small kentias; feather-leaved.

Trunks not over 8 ft., usually conspicuously ringed: lvs. usually 3–4 ft. long, rarely more, and pinnate; lfts. scythe-shaped, or lanceolate, 2-parted or obliquely truncate at the apex, not revolute at the base; rachis scaly, convex beneath, grooved above: fls. monœcious in the same spadix, sessile along its branches, the male usually 2 together, the female solitary; spadix long and usually much branched; in the male there are 3 imbricate outer segms. and 3 valvate inner segms. to the perianth, with 6 stamens surrounding an abortive ovary: fr. obliquely globular.—Species 3, one from

Austral., one from Samoa, and another from Fiji. Only the following is known in cult., and it is a rare palm. Its graceful lvs. and convenient dwarf habit should commend it to the trade. For cult. see *Kentia*.

**Mooreànum**, F. Muell. (*Kentia Mooreàna*, F. Muell.). Dwarf palm, 3–4 ft. high: lvs. 3–4 ft. long; segms. numerous, about 1 ft. long, longitudinally plicate when young: spadix at first closely sessile, very much branched when older. New S. Wales, confined to Lord Howe's Isl.—This graceful and recent palm resembles *Howea Forsteriana* somewhat in habit of growth, but its arching lvs. spread wider, and its sts. are dark purplish, and its pinnæ tough and leathery. The palm is free and clean in growth.

N. TAYLOR.

**CLINTÒNIA** (after DeWitt Clinton, the famous Governor of New York and promoter of the Erie Canal). *Liliacæ*. A small group of low-growing, herbaceous plants of North America and Asia, with a few tufted, broad shining leaves, and usually umbels of flowers.

Perianth-segms. equal or nearly so; stamens 6, inserted at the base of the perianth-segms.: ovary 2–3-celled with 2 to several ovules in each cavity: fls. on scapes: root-stocks slender: fr. a globose or oval berry. For *C. pulchella* and other species of the abandoned genus *Clintonia* of Hort., see *Downingia* a very different genus belonging to Campanulaceæ.

Clintonias grow in cool, moist woods, and fanciers can secure them from some dealers in native plants. It is difficult to tell the species apart by the leaves.

A. *Scape bearing an umbel of fls.*

B. *Fls. greenish yellow.*

**boreàlis**, Raf. Height 1–2 ft.: fls. 3–6, nodding, green, margined yellow. Labrador to Winnipeg and south to N. C. B.M. 1403 (as *Smilacina borealis*).—This is one of the choicer plants of cool, moist woods, known to plant lovers chiefly by its handsome umbels of blue berries found in autumn, which are borne above the large, dark green, shining lvs. The commonest species, but not easily grown below elevations of 1,000 ft.

BB. *Fls. white, with green spots.*

**umbellulàta**, Torr. Fls. 10–20 or more, smaller than in *C. borealis*, erect or nearly so, white, with green or purplish spots. Alleghany Mts. from N. Y. to Ga. B.M. 1155 (as *Smilacina borealis*).—This species has the smallest fls. of the group, and is the only one that has but a single pair of ovules in each cell of the ovary.

BBB. *Fls. deep rose.*

**Andrewsiàna**, Torr. One to 1½ ft. high, bearing 4 sessile, oblong, acute lvs., and 20 or more nearly erect fls. which are in dense umbels. Calif., to S. Ore., in deep, cool woods, in clayey soil rich in mold. B.M. 7092.—The showiest of the group. Cult. to some extent.

AA. *Scape bearing 1 white fl.*

**uniflòra**, Kunth. The only species in which the scape is shorter than the lvs.: fls. nearly erect; rarely there are 2 fls.: lvs. narrow, obovate-lanceolate, hairy. Calif. to Alaska.

WILHELM MILLER.  
N. TAYLOR.†

**CLITÒRIA** (derivation *recondite*). *Leguminosæ* BUTTERFLY-PEA. Glasshouse vines with pea-like flowers; and also hardy perennials.

A widespread and variable genus of 30 species allied to *Centrosema*, and characterized by the calyx-tube being cylindrical and longer than the lobes: standard narrowed at the base, not appendaged on the back; stamens in one group, the anthers all alike; style often bearded. The most important garden plant is *C. Ternatea*, a warmhouse annual twiner, reaching 15 ft., and requiring no special cult. It has very showy blue fls.

A. *Lfts. 5.*

**Ternatèa**, Linn. (*C. cærùlea*, Hort. *Ternatèa vulgàris*, HBK.). Lfts. 5, oblong, obtuse, short-petioled: fls. 1 in. or more long, rich blue, with beautiful markings, especially on the standard. B.M. 1542. Gn. 38:132. P.M. 7:147 and 13:79.—Name from Ternate, one of the Molucca Isls. and not from ternate, meaning 3-leafleted.

1000. *Clivia miniata*.

Hardy in Cent. Fla., where it is usually a biennial. *C. álba*, Hort., is a white form. More or less double forms have been known for over a century.

AA. *Lfts. 3.*

**mariàna**, Linn. Hardy perennial, smooth, erect, or slightly twining 1–3 ft. high: lfts. 3, obovate or ovate-lanceolate: fls. light blue, 2 in. long, on short peduncles: pod straight, few-seeded. Summer. Dry banks, N. Y. to Fla. and west to Mo. Also India and Burma.—Rarely sold by dealers in native plants.

**arboréscens**, Ait. St. shrubby, the rusty colored branches twining: lvs. trifoliate, the lfts. elliptical or oval: fls. racemose, showy, purple, the standard more than 2 in. long. Trop. Amer. B.M. 3165.—An excellent warmhouse climber, grown chiefly in botanic gardens.

WILHELM MILLER.  
N. TAYLOR.†

**CLÌVIA** (after a Duchess of Northumberland and member of the Clive family). Syn., *Imantophyllum*. *Amaryllidaceæ*. Tender bulbous plants with handsome evergreen foliage and showy, bright red or red and yellow flowers in large umbels.

Bulb imperfect, mostly of old lf.-bases: perianth funnelliform, curved or straight, the segms. much longer than the tube; ovules 5–6 in each cell: fr. a berry, differing in this from the capsular fr. of Nerine.—Three species from S. Afr. J. G. Baker, *Amaryllidæ*, p. 61.

Clivias make excellent house plants, but, like amaryllis, are too costly to be very popular. They have the advantage over amaryllis of having attractive foliage all the year round, and are more certain to bloom well. They have thick, fleshy roots, like an agapanthus. All the species are well worth growing, because of their handsome umbels of flowers, produced during the

spring and early summer months. *Clivia miniata* is the species most commonly grown. There are several distinct forms of this, with larger and deeper colored flowers. Established plants may be grown in the same pots for several years, if the plants are fed during the growing period with weak liquid manure. In potting, the soil given should be of a lasting nature, not easily soured, nor likely to become sodden. In arranging the drainage, place one large piece, concave side down, over the hole, and around this arrange several smaller pieces. Over these place one or two handfuls of pieces small enough to go through a No. 2 sieve. The best time to pot is after the flowers have been produced. The plants should then be kept for some time in a humid atmosphere to encourage growth, receiving an abundance of water after they are well started. After growth has been completed, they will winter safely in an ordinary greenhouse temperature (not under 40°), if kept rather dry at the root. For propagation, choose old plants which have become crowded in their pots, so that the entire plant can be pulled to pieces. After trimming the roots, put the growths in small pots and keep in heat, to encourage root action. Clivias are well suited for planting permanently in the front part of greenhouse borders. The soil for this purpose should be rich and well firmed about the roots. Withhold water as much as possible during the resting period, or the plants will produce leaves at the expense of the flowers. (G. W. Oliver.)

A. *Fls. erect; perianth broadly funnel-shaped.*

**miniàta**, Regel (*Imantophyllum miniatum*, Hook.). Fig. 1000. Lvs. 16–20, in a tuft, sword-shaped, tapering to a point, 1½ ft. long, 1½–2 in. broad: fls. 12–20, in an umbel; perianth erect, bright scarlet, with a yellow throat; tube broadly funnel-shaped, longer than *C. nobilis*; segms. about 2 in. long, the inner ones broader than the outer; stamens shorter than the segms.; style not exserted: berries ovoid, bright red, 1 in. long. Natal. B.M. 4783. R.H. 1859, pp. 126–7; 1869:250, and 1894, p. 572. F.S. 9:949; 23:2373. I.H. 26:343; 36:80; 37:102; 40:177.—*I. cyrtanthiflorum*, Van Houtte (F.S. 18:1877), is a hybrid between this species and the next. It has a curved perianth, with the inner segms. of the limb twice as broad as the outer; stamens longer than the corolla. R.H. 8:259 (desc.). Var. **àurea**, Hort. Fls. yellow with a deeper shade at base of the segms. Var. **striàta**, Hort. Lvs. freely variegated.

AA. *Fls. pendulous; perianth narrowly funnel-shaped.*

**nóbilis**, Lindl. (*Imantophyllum Aitoni*, Hook.). Lvs. about 12, strap-shaped, very obtuse, with a roughish edge: fls. 40–60, in an umbel; perianth curved and drooping; tube narrowly funnel-shaped, shorter than in *C. miniata*; segms. tipped with green, about 1 in. long; stamens as long as the segms.; style exserted. Cape Colony. B.M. 2856. L.B.C. 20:1906. Intro. to cult. 1828.—*I. cyrtanthiflorum*, Van Houtte (F.S. 18:1877), said to be a hybrid between this and the above, shows little if any influence of *C. miniata*. It has the narrow-tubed, pendulous fls. and the greenish tinge of *C. nobilis*. R.H. 1894, p. 573.

*C. Gårdenis*, Hook. Very much as in *C. nobilis* but with the corolla-lobes obviously spreading: stamens as long as the perianth-segms.; anthers oblong, yellow. B.M. 4895.—A desirable plant.

WILHELM MILLER.  
N. TAYLOR.†

CLOTBUR, a weed: *Xanthium*.

1001.  
*Trifolium pratense*.  
Root-system.

**CLOVE PINK:** The carnation, *Dianthus Caryophyllus*.

**CLOVER.** Species of *Trifolium* (Leguminosæ), particularly those that are useful in agriculture. The word is also applied to species of related genera, as *Medicago*. The sweet clover is *Melilotus*. Bush and Japan clover are *Lepedezas*. Prairie clover is a *Petalostemon*.

About 300 species of *Trifolium* have been described. These are widely dispersed in temperate climates. The flowers are papilionaceous but small, and are disposed in dense heads or spikes. The leaves are digitately or palmately 3-foliolate. The common European red clover is *T. pratense*, Linn., now thoroughly naturalized in North America, but supposed not to be native here. It is valuable both for stock feed (as pasturage and hay), and also as a green manure. As a manure crop, to be plowed under, it is particularly useful because of its deep root-system and its power (in common with other leguminous plants) of fixing the nitrogen of the air by means of its roots. Fig. 1001 illustrates the root system. Fig. 1002 shows the root of a fifteen-months-old plant that grew in hard clay soil. It is 22 inches long, and some of the root was left in the ground. The mammoth red clover (*T. medium*, Linn.) is perhaps an offshoot of *T. pratense*. It is usually a larger plant, with zigzag stem, entire and spotted leaflets, and longer-stalked head. White clover, or shamrock, is *T. repens*, Linn., introduced from Europe, and supposed to be native to North America as well. Alsike clover, *T. hybridum*, Linn., is of

Old World nativity. The crimson or scarlet clover (*T. incarnatum*, Linn.), Fig. 1003, an annual from southern Europe, is now much grown as a catch- or cover-crop in orchards. See *Cover-crops*. It is also highly ornamental, and is worthy the attention of the florist. For agricultural discussion of the clovers, see Vol. II, *Cyclo. Amer. Agric.* L. H. B.

**CLOVES** are the dried flower-buds (Fig. 1004) of a handsome tree of the myrtle family *Jambosa Caryophyllus* or *Eugenia caryophyllata*, better known as *Caryophyllus aromaticus*, a native of the Spice Islands, but now cultivated in the West Indies and elsewhere. See *Eugenia*. *Caryophyllus*, the ancient name of the clove, means "nut-leaf." The carnation, or "clove pink," was named *Dianthus Caryophyllus* because of its clove-like odor, and it has become the type of the great order Caryophyllaceæ, which, however, is far removed botanically from the Myrtaceæ. The word "gilliflower" is a corruption of *caryophyllus*, and, until Shakespeare's time and after, was applied to the carnation, but now-a-days it usually refers to certain cruciferous plants of the genera *Cheiranthus* and *Matthiola*.

The clove bark of pharmacy is secured from *Dicypellium caryophyllatum*, of Brazil, one of the Lauraceæ. The word clove is used among gardeners for a small secondary bulb employed for propagating, specially for the little bulb that forms in a scale-axil of a larger bulb.

**CLUB-MOSS:** *Lycopodium*.

**CLÛYTIA** (after Cluyt, Dutch botanist of 16th century). *Euphorbiaceæ*. Evergreen greenhouse shrubs from S. Afr., rarely cult., chiefly in botanical gardens. Habit often ericoid; lvs. alternate, small, entire; fls. clustered in the axils, staminate with petals; calyx imbricate; stamens about 5; ovules 3. Prop. by cuttings. *C. pulchella*, Linn., is a small shrub; lvs. ovate and somewhat acute, petioled, glabrous, entire; fls. axillary, small, white. B.M. 1945.

J. B. S. NORTON.

**CLYTOSTOMA** (Greek *klytos*, splendid or beauteous and *stoma* mouth; alluding to the beautiful flowers). *Bignoniaceæ*. Ornamental vines, grown for their beautiful flowers.

Evergreen shrubs, climbing by leaf-tendrils: lvs. opposite, with 1 pair of short-stalked entire lfts., the rachis elongated into a slender simple tendril, sometimes wanting: fls. in 2's, axillary, or terminal or in panicles; calyx campanulate with 5 small or subulate teeth; corolla funnelform-campanulate with imbricate rounded lobes; stamens 4, with spreading anther-cells; disk short; ovary conical, warty, 2-celled, with

1002. The penetrating root of the red clover.

1003. Crimson clover.—*Trifolium incarnatum*. ( $\times \frac{1}{2}$ )

1004. Clove.

1. Spray of leaves and flowers; 2. The expanded flower; 3. An unopened bud, or clove.

the ovules in 2 rows: caps. compressed, prickly, septoid, with numerous nearly orbicular winged seeds.—About 8 species in S. Amer., usually described under *Bignonia* in horticultural writings. Closely related to *Bignonia*, from which it differs chiefly in its simple

1005. *Cnicus benedictus*.

slender tendrils, the short disk, the small or subulate calyx-teeth and the prickly pod. Suited for cult. in subtropical or tropical regions only, or as a stove plant in the N. For cult. and prop., see *Bignonia*.

*callistegioides*, Bur. & Schum. (*Bignonia callistegioides*, Cham. *B. speciosa*, Graham. *B. picta*, Lindl. *B. Lindleyi*, DC.). Large climber: lfts. elliptic-oblong, acuminate, undulate, glabrous, lustrous, reticulate below, about 3 in. long; fls. on 2-fld. terminal peduncles; calyx campanulate, with subulate teeth; corolla pale purple, streaked, about 3 in. long, the tube yellowish streaked purplish, limb 2-3 in. broad, with the lobes spreading, broadly oval, obtuse and wavy; disk crenate. Spring and early summer. S. Brazil, Argentina. B.M. 3888. B.R. 28:45. H.U. 3:227. P.M. 10:125. F.S. 9:907.—Will stand a little frost, when grown in the open in the S.

*purpureum*, Rehd. (*Bignonia purpurea*, Lodd.). Large climber: lfts. sometimes 3, ovate-oblong or obovate-oblong, short-acuminate, bright green above, paler below, entire, occasionally toothed, about 3 in. long; fls. on axillary 2-fld. peduncles or sometimes in clusters; calyx tubular-campanulate, with short triangular teeth; corolla mauve-colored with white eye, with a rather slender tube 1 in. long, lobes spreading, orbicular-obovate. Uruguay. B.M. 5800. G.C. III. 24:399.

ALFRED REHDER.

**CNICUS** (Latin name of Safflower, early applied to thistles). *Compositæ*. BLESSED THISTLE. A monotypic genus allied to *Centaurea*, and distinguished from it botanically by its heads being quite sessile and surrounded just below by bristly leaves. Its habit in the garden is very different from the bachelor's button, being thistle-like, and more interesting than ornamental. A hardy annual low-growing herb, rough, branching and pilose. Once thought to counteract poison. Culture easy. Fit for wild gardens and rockeries.

*benedictus*, (Linn. *Carduus benedictus*, Authors. *Centaurea benedicta*, Linn. *Carbènia benedicta*, Adans.).

Fig. 1005. Height 2 ft.: lvs. alternate, sinuate-pinnatifid, oblong, the lobes and teeth spiny; heads terminal, yellow, 1 in. wide, the fls. exclusively tubular. Medit. regions and Caucasus. Sometimes cult.; also seen in waste places of S. Atlantic states and Calif. as a weed adventive from Eu.

*C. raphilèpis*, Hemsl., S. Mex., has recently been cult. abroad. It is described as a handsome plant with deeply cut spiny-toothed lvs. about 2 ft. long, gray-tomentose beneath: st. colored, much branched: fl.-heads 3-3½ in. long, the involucre bracts scarlet and spine-tipped; fls. scarcely exserted, the filaments carmine. Under the above definition of *Cnicus*, this plant must fall in another genus. It has been placed in *Carduus* by E. L. Greene, as *C. raphilèpis*.

N. TAYLOR.†

**COBÆA** (after Father Cobo, Spanish Jesuit of the seventeenth century, naturalist, and resident of America for many years). Syn. *Rosenbergia*. Sometimes incorrectly spelled *Cobæa*. *Polemoniaceæ*. Attractive climbers, one or two species commonly grown in the open and under glass for the large bell-shaped flowers.

Shrubby plants climbing by lf.-tendrils, but known in cult. as herbs: lvs. alternate, pinnate; calyx large, 5-parted; corolla bell-shaped, the limb 5-lobed: caps. 3-valved, angled: fls. solitary on long peduncles, bracted at the base.—A genus of about 10 Trop. American climbers (monographed by Brand in Engler's *Pflanzenreich*, hft. 27, 1907), of which *C. scandens*, a tender perennial plant, is amongst the dozen most popular vines commonly treated as annuals. This is the only genus of climbers in the order. Prop. by seeds which should be placed in moist earth, edge down. It is a rapid grower.

*scandens*, Cav. (*Rosenbergia scandens*, House). Figs. 1006-1008. Height 10-20 ft.: lfts. in 2 or 3 pairs, the lowest close to the st., and more or less eared: fls. bell-shaped, 1-1½ in. across, light violet or greenish purple, with protruding style and stamens: tendrils

1006. *Cobæa scandens*. (×½)

branched. Mex. B.M. 851. F.S. 14:1467.—There is a white-fl'd. form (*C. alba*, Hort.), and one with variegated lvs., var. *variegata*, Hort.—The terminal lft. is represented by a tendril (Fig. 1007). Sometimes there are indications of tendrils on other lfts. (Fig. 1008), making the plant an interesting one for students of morphology.

*stipulàris*, Benth. (*Rosenbergia stipulàris*, House). Resembles the preceding species but the sepals ovate, tapering to a broadly acuminate apex (the sepals of *C. scandens* being broadly ovate or suborbicular). Mex.

1007. Normal leaf of *Cobæa scandens*.

*macrostoma*, Pav. (Sometimes erroneously written *macrostema* and *macrostemma*.) Sts. climbing 6–10 ft.: lvs. alternate, of 3 pairs of obovate lfts.: fls. solitary, on a 2-lvd. long peduncle, the petals yellow-green; stamens at least  $1\frac{1}{2}$  in. longer than the corolla. Guatemala. B.M. 3780.

*C. minor*. Marten & Galleotti. A small vine of which little is known, but cult. in Amer. in botanic gardens and fanciers' collections. It has small fls., borne on stalks shorter than the lvs. Mex.—*C. Pringlei*, House (*Rosenbergia Pringlei*, House). A glabrous, high-twining vine: lfts. 6, the basal pair oblong-lanceolate, hastately clasping; peduncles 4–5 in. long; calyx-lobes green, herbaceous, scarcely 1 in. long and half as broad; corolla pure white, 2 in. long; stamens exserted less than  $\frac{1}{2}$  in. Mex.

WILHELM MILLER.  
N. TAYLOR.†

COBNUT: *Corylus*.

COBÚRGIA: *Stenomesson*.

COCA. The leaves of *Erythroxylon Coca*, used in medicine. Sold chiefly as a fluid extract. Cocaine is the famous local anesthetic. See *Erythroxylon*.

COCCÍNIA (Latin, *scarlet*; referring to the ornamental gourds). *Cucurbitaceæ*. Tender perennial vines, usually with tuberous roots, grown for ornament mostly indoors.

Leaves angled or lobed, sometimes glandular: fls. white or yellowish, large, staminate and pistillate on different plants or sometimes on different branches of the same plant; calyx short, often campanulate: fr. a small, scarlet gourd, sometimes marbled, with an insipid pulp.—Twenty species from the tropics of Asia and Afr. A. Cogniaux in DC., Mon. Phan. 3:528. *C. cordifolia* is treated as a tender annual, requiring an early start and no special cult. The genus is sometimes referred to *Cephalandra*.

A. *Tendrils simple*: male fls. solitary: lvs. small.

*cordifolia*, Cogn. (*C. indica*, Wight & Arn.). Height about 10 ft., perfectly smooth: lvs. small, 1–2 in. long, glossy, ivy-like, short-petioled, obtusely 5-angled: fl. white, bell-shaped, the staminate solitary: fr. roundish at both ends, about 2 in. long, 1 in. thick. India.

AA. *Tendrils bifid*: male fls. in racemes: lvs. large.

*palmata*, Cogn. (*Cephalandra palmata*, Lond.). Attaining 30 ft.: lvs. large, 3–4 in. long and wide, long-

petioled, palmately 5-lobed: fls. yellowish: fr. ovate, acute. Natal.—Intro. by P. Henderson & Co., 1890. A rare greenhouse plant.

*C. Dinteri*, André, with palmate lvs. and handsome scarlet frs., may be in cult. S. Afr. R.H. 1900:268.

WILHELM MILLER.  
N. TAYLOR.†

COCCÓLOBA (Greek, *lobed berry*, referring to the ends of the pear-shaped fruit). Sometimes spelled *Coccolobis*. Including *Campderia*. *Polygonaceæ*. Tropical shrubs, trees or rarely tall woody climbers, grown for their fruits and usually large glossy leathery leaves.

Leaves alternate, always entire: fls. small, in axillary or terminal spike-like racemes, usually some shade of green or yellow-green; sepals 5, herbaceous; petals 0; stamens 8, exceeding the perianth: fr. berry-like, with a small stone, often edible.—About 125 species in the American tropics and reaching to Fla. *C. platyclada* is now referred to *Muehlenbeckia*, which see.

*Coccoloba uvifera*, the sea-grape or shore-grape of the West Indies, bears an edible fruit, and has particularly beautiful foliage. It is the most important of the genus and is offered by dealers in tropical plants. It will not stand the frost and its cultivation out-of-doors is limited to the frostless region of California and Florida. It can be easily grown in any greenhouse North. All species are easily propagated by seeds, which are very plentiful with most of the species. Some species may be increased by cuttings of ripe wood, which root easily in sand under the usual conditions, in a frame or propagating-house. Layering may also be employed to increase the stock. The various species grow naturally in both clayey and sandy soils, preferring moist rich earth, and a high temperature. *C. uvifera* frequents the seashore, and is found growing in sand and broken shells apparently lacking altogether in plant-food. Rich sandy soil of a light character seems to be best for all the species so far known in cultivation. Plants are readily transplanted from the open ground, but pot-grown plants are to be preferred. (E. N. Reasoner.)

*uvifera*, Linn. SEA-GRAPE. SHORE-GRAPE. UVADEL MAR. Fig. 1009. Tree, reaching 20 ft. or more, with many flexuous branches: lvs. large, often 5 in. long by 7 in. wide, broadly heart-shaped, wavy margined,

1008. Monstrous or abnormal leaf of *Cobæa*.

glossy, leathery, glabrous, the midrib red at the base; petioles short, with sheathing stipules at the base: racemes 6 in. long, erect in fl., nodding in fr.; fls.  $1\frac{1}{2}$  in. across, white, fragrant; petals 5; stamens 8; styles 3: berries 9 or more in a raceme, small, about  $\frac{3}{4}$  in. long, pear-shaped, reddish purple, dotted green, sweetish acid: nut roundish, with a short, sharp point on top, and vertical wrinkles. Sandy seashores of Trop. Amer. especially S. Fla. and W. Indies. B.M. 3130.—The wood is used in cabinet-work, and, when boiled, gives a red color.

**floridana**, Meissn. (*C. laurifolia*, Jacq.). **PIGEON PLUM.** Tree, 25–30 ft.: lvs.  $1\frac{1}{2}$ –3 in. long, 1–2 in. wide, ovate or elliptical, glabrous, narrowed at both ends, obtuse, margin slightly recurved: berries small,  $\frac{1}{2}$  in. long, pear-shaped, edible, but not marketable. S. Fla., the Bahamas, and northern coast of S. Amer.

1009. *Coccoloba uvifera*. ( $\times \frac{1}{2}$ )

**pubescens**, Linn. (*C. grandifolia*, Jacq.). A high, sparingly branched tree: lvs. cordate-orbicular, 3–6 in. long, rusty-pubescent beneath, chiefly on the prominent veins: fls. racemose: fr. berry-like, about  $\frac{3}{4}$  in. diam. Trop. Amer. April. B.M. 3166.

*C. caracasana*, Meissn., or a closely related species, has recently been intro. to the trade by Franceschi, of Santa Barbara, Calif. It is described as having "larger frs. than other known species, like a good-sized plum." Venezuela.

WILHELM MILLER.  
N. TAYLOR.†

**COCCOTHRINAX** (a berry and *Thrinax*, in reference to the berry-like fruit). **Palmaceæ.** Small or medium-sized palms, with fan-leaves.

Trees (or rarely stemless) with slender sts., clothed above with the persistent petiole-sheaths; lvs. terminal, pale beneath, thin and brittle, divided into narrow, acute, 2-parted obliquely folded lobes; petioles compressed, slightly rounded and ridged on the 2 surfaces, thin and smooth on the margins: spadix interfoliar, paniculate, shorter than the petioles: fls. perfect, minute, solitary; perianth cup-like, obscurely 6-lobed, deciduous; stamens 9, exserted; ovary superior, ovoid, 1-celled: fr. berry-like, subglobose, 1-seeded, in ripening becoming thick and juicy, shining black or purple-black; albumen channeled.—A genus of a few species, made from *Thrinax*; Fla. and S.

**Gárberi**, Sarg. (*Thrinax Gárberi*, Chapm. *T. argentea* var. *Gárberi*, Chapm.). **SILVER-PALM.** Stemless: lvs. only 10–12 in. across, fan-shaped, silvery beneath. An attractive dwarf palm, early showing its characteristic form, native on shore of Biscayne Bay, Fla.; perhaps a depauperate form of *C. jucunda*, Sarg. (*Thrinax argentea*, Chapm., not Roem. & Sch.), which has lvs. 20–32 in. across; it bears the fls. on rigid spreading short pedicels, the perianth is white, anthers light yellow, and ovary orange: fr.  $\frac{3}{4}$  in. or less diam., becoming succulent and bright violet and later almost black

and shining, ripening 6 months after the flowering: petiole slender, flexible, rounded on upper side and obscurely ribbed on lower side, extending as a thin undulate rachis that ends in a short obtuse point.

L. H. B.

**CÓCCULUS** (diminutive of *kokkos*, berry; the fruit being berry-like). Syn., *Cébatha*, *Epibatèrium*. **Menispermaceæ.** Shrubs grown for their handsome foliage and the ornamental red or black fruits.

Twining or erect: lvs. alternate, petioled, entire or lobed, with entire margin, deciduous or persistent, palminerved: fls. inconspicuous, dioecious, in axillary panicles or racemes, sometimes terminal; sepals, petals and stamens 6: carpels 3–6, distinct, developing into berry-like, 1-seeded drupes; seed reniform.—About 12 species in N. Amer., E. and S. Asia, Afr. and Hawaii, chiefly in tropical and subtropical regions. Only a few species are cult., thriving in almost any somewhat moist soil; the evergreen kinds are sometimes grown in pots, in a sandy compost of peat and loam. Prop. by seeds or by cuttings of half-ripened wood in summer, under glass, with bottom heat.

"*Cocculus indicus*" is the trade name of the berries used by the Chinese in catching fish. The berries contain an acrid poison, which intoxicates or stuns the fish until they can be caught. The berries are imported from the East Indies to adulterate porter, and "*Cocculus indicus*" is a trade name with druggists, not a botanical one, just as "*Cassia lignea*" is a trade name of a kind of cinnamon bark, derived, not from a cassia, but from a species of *Cinnamomum*. The name "*Cocculus indicus*" was given by Bauhin, but binomial nomenclature began later, with Linnæus, in 1753. The plant which produces the berries is *Anamirta Cocculus*.

**carolinus**, DC. (*Cébatha carolina*, Brit. *Epibatèrium carolinum*, Brit.). **CAROLINA MOONSEED.** A rapid-growing, twining shrub, attaining 12 ft., with pubescent branches: lvs. long-petioled, usually ovate, sometimes cordate, obtuse, entire or 3-, rarely 5-lobed, pubescent, glabrous above at length: petals emarginate: fr. red,  $\frac{1}{4}$  in. diam. Along streams from Va. and Ill. to Fla. and Texas.—Decorative in fall, with its bright red fr. Not hardy north of N. Y.

**trilobus**, DC. (*C. orbiculatus*, Schneid. *Cébatha orbiculata*, Kuntze. *C. Thünbergii*, DC.). Slender climber with pubescent branches: lvs. broadly ovate to oblong-ovate, truncate or subcordate at the base, obtuse, often emarginate, usually entire, pubescent on both sides: petals bifid at the apex: fr. bluish black, about  $\frac{1}{4}$  in. thick, in short-stalked axillary clusters. Japan. B.M. 8489. I.T. 6:231.—Quite hardy at the Arnold Arboretum; keeps its lvs. green until very late in autumn.

*C. diversifolius*, Miq., not DC.=*Sinomenium acutum*.—*C. heterophyllum*, Hensl. & Wilson=*Sinomenium acutum*.—*C. japonicus*, DC.=*Stephania hernandifolia*.—*C. laurifolius*, DC. Erect shrub, to 15 ft., glabrous: lvs. evergreen, oblong, acute at both ends. Himalayas. Decorative, with its bright green, shining foliage. Only hardy in subtropical regions.

ALFRED REHDER.

**COCHLEÀRIA** (Greek, *cochlear*, a spoon; referring to the leaves). **Cruciferae.** More or less fleshy seaside small herbs, including scurvy-grass and related things; scarcely cultivated.

Annual or perennial: lvs. simple: fls. small, white, yellowish or purplish, in racemes: fr. an inflated silicle, with very convex valves, the seeds several in each cell and usually 2-rowed.—About 15 species in Eu. and N. Amer. Formerly the horse-radish was referred here, but it is now placed by some in *Radicula*, by others in *Roripa*, and by still others in *Nasturtium*.

1010. *Cochlearia danica*.

**officinális**, Linn. SCURVY-GRASS. Hardy biennial, 2–12 in. high, but cult. as an annual; root-lvs. petioled, cordate; st.-lvs. oblong, more or less toothed and sometimes with a short-winged petiole: fls. early spring; calyx-lobes erect. Arctic regions.—Prop. by seed, which is small, oval, slightly angular, rough-skinned, reddish brown. The germinating power lasts 4 years. The green parts of the plant are strongly acrid, and have a tarry flavor. The seed is sown in a cool, shady position, where the plants are to stand. The lvs. are rarely eaten as salad, but the plant is mostly grown for its anti-scorbutic properties. Not to be confounded with water-cress.

**dánica**, Linn. Fig. 1010. Annual, scarcely 6–8 in. high: lvs. rounded, kidney-shaped, scarcely 1 in. long in large specimens, usually much smaller. North temperate and arctic regions. L.B.C. 15:1482.—It is covered in early summer with a profusion of small white fls. A valuable plant for ornament northward.

N. TAYLOR.†

**COCHLIÒDA** (Greek for *spiral*, in reference to the structure of the lip). *Orchidaceæ*. A small group of orchids found at high elevations in South America, little grown, requiring treatment given *Odontoglossum*.

Pseudobulbous: fls. bright rose-color or scarlet, in long racemes; sepals equal or the side ones more or less joined; petals all much alike; lip clawed, the blade spreading and the side lobes rounded and perhaps reflexed, the middle lobe narrow.—Some of the species are retained by various authors in *Odontoglossum* and *Mesopidinium*.

**Noetziàna**, Rolfe. Pseudobulbs ovate-oblong, compressed, about 2 in. long, monodiphyllous: lvs. linear: peduncles arcuate; fls. numerous, in graceful racemes, orange-scarlet, about 1 in. across; sepals oblong; petals rather ovate; labellum 3-lobed, disk yellow, otherwise similar in color to the petals. Andes. B.M. 7474. Gt. 43:1403. G.C. III. 16:71. O.R. 12:309.

**rõsea**, Hort. Plants similar to *C. Noetziàna*: fls. rose-color. Peru. B.M. 6084. I.H. 18:66.

**vulcànica**, Benth. & Hook. Peduncles more or less erect: fls. larger than in the preceding, bright rose-color; labellum 3-lobed, provided with 4 ridges. Peru. B.M. 6001.

*C. brasiliensis*, Rolfe. Pseudobulbs tufted, oblong: lvs. oblong-lanceolate; scapes erect or arching, with 6–13 greenish fls. Brazil.—*C. Flóryn*, Rolfe. Natural hybrid between *C. Noetziàna* and *C. rosea*. Fls. cinnamon-red with yellow crest; sepals lanceolate; petals elliptic oblong.

OAKES AMES.

**COCHLIOGLÓSSA**. *Orchidaceæ*. A garden hybrid between *Cochlioda Noetziàna* and *Odontoglossum sceptrum* or *O. prænites*, known as *Cochlioglossa moortbeekiensis*. Fls. star-shaped, the petals and sepals yellow with pale brown spots; lip has the characters of that of *Odontoglossum sceptrum*, but a little longer and less attractive. Shows no marks of *Cochlioda Noetziàna*.

**COCHLIOSTÈMA** (Greek, *spiral stamens*). *Comelinaceæ*. Curious and gorgeous plants cultivated under glass.

Cochliostemas are epiphytes, with the habit of *Billbergia* and great axillary panicles of large fls. of peculiar structure and beauty. They are stemless herbs from Ecuador, with large, oblong-lanceolate lvs., sheathing at the base, and fls. which individually last only a short time, although a succession is produced for several weeks; sepals 3, oblong, obtuse, concave; petals 3, nearly equal, wider than the sepals, margined with long hairs; staminodes 3, villous, 2 erect, linear, the third short, plumose; staminal column hooded, with incurved margins, inclosing 3 spirally twisted anthers; style slender, curved.—Gardeners recognize 2 species, although they are considered by some botanists as forms of one. Recorded as the most beautiful cult. plants of the family.

These are handsome stove-flowering perennial plants, closely related to the *commelinas*, and are of comparatively easy culture, thriving well in ordinary stove temperature in a mixture of two parts loam and one part fibrous peat, with a little well-decayed cow- or sheep-manure added when potting mature plants. They like a copious supply of water at the roots during the summer months, and at no season must they be allowed to become dry. Propagation is effected by division of the plants in early spring, or by seeds, to obtain which the flowers must be artificially fertilized.—They seed freely when fertilized at the proper time. Only a few of the stronger or larger flowers should be allowed to bear seed. Sometimes a simple shaking of the flower-stalk will accomplish the necessary work of fertilizing, but it is safer to employ the regular method to insure thorough impregnation. The seeds ripen within six weeks' time, and they can be sown soon thereafter, in shallow pans of light, peaty soil, and placed in a warm, close atmosphere until germinated. As soon as the seedlings are large enough, they should be potted singly into thumb-pots, and shifted on as often as they require it, when they will flower in six to twelve months. The chief reason why cochliostemas are grown in America so little is, probably, that it is necessary to keep a much more humid atmosphere in stove-houses than in England, and this is very much against all stove-flowering plants, causing the season of blossoming to be very short. (Edward J. Canning.)

A. *Lvs. red beneath: panicle hairy; fls. very fragrant.*

**odoratissimum**, Lem. Lvs. lighter green above than in *C. Jacobianum*, and deep purplish red beneath, narrower, and with a similar margin: fls. very numerous: sepals more leaf-like, hairy, green, with a reddish tip. I.H. 6:217. R.H. 1869, p. 170.

AA. *Lvs. green beneath: panicle not hairy; fls. less fragrant.*

**Jacobiànum**, C. Koch and Lind. Height 1–3 ft.: lvs. in a rosette, spreading or recurved, dilated and sheathing at the base, margined brown or purplish, 3–4 ft. long, 6 in. broad at the base, 4 in. broad at the middle: peduncles stout, white, tinged purple, 1 ft. long: bracts large, opposite and whorled, 3–4 in. long, acuminate, concave: panicle-branches 4–6 in. long; fls. 2–2½ in. across; sepals purplish; petals violet-blue. Autumn. B.M. 5705. R.H. 1868:71. G.C. 1868:323, desc. F.S. 18:1837–9.

WILHELM MILLER.

**COCHLOSPÉRMUM**: *Mazimilianea*.

**COCKLE**. In North America, a name for *Lychnis Githago*, or corn-cockle, a familiar handsome-flowered weed of wheat-fields. The name is also applied to the darnel, *Lolium temulentum*.

**COCKLE-BUR**: *Xanthium*, a weed.

**COCKSCOMB**: *Celosia*.

**COCKSFOOT GRASS**: Barnyard Grass, *Panicum Crus-Galli*.

**COCOA**: Products of *Theobroma Cacao*.

**COCOA PLUM**: *Chrysobalanus Icaco*.

**COCO-GRASS**: *Cyperus rotundus*.

**COCONUT**. Plate XXVII. Figs. 1011, 1012, 1014, 1015. The coconut, *Cocos nucifera*, is the most important of cultivated palms. Its nearest relatives, whether or not regarded as in the same genus, are natives of tropical America. For this and for other reasons which have been presented by Cook, it must be believed that the coconut is a native of America, and that it was carried westward across the Pacific in prehistoric times. While the nut will float and retain its power of germination for a considerable time, its propagation from island to island in known cases has practically always been the deliberate work of men, and it is probable that men were

also responsible for its crossing the Pacific. It was a cultivated plant in Polynesia and Malaya, and in many places the chief crop, at the time of the discovery of this part of the world by Europeans. But it reached Ceylon recently enough so that its introduction is a matter of fairly reliable legend. It is now grown in all tropical countries except the interior of continents. Its cultivation extends somewhat beyond the tropics, both north and south, but its growth at these extremes, in Florida, India and Madagascar, is not thrifty enough to give it any industrial importance. Within the last two decades, the rise in the price of oils and the discovery of new uses for coconut-oil have caused a tremendous increase in the area devoted to the plantation and cultivation of coconuts.

*Climatic conditions favorable for the coconut.*

The coconut makes on the climate the characteristic demands of a typically tropical plant. It thrives where the mean annual temperature is 72° F. or higher, and where there are no great differences in temperature between seasons. Except where supply of ground water

1011. End of a mature coconut. The nut sprouts usually from the largest eye.

makes it independent of local rainfall, the coconut demands an annual rainfall of at least one meter (about 40 in.); and this precipitation should be well distributed through the year. In most of the best coconut countries, the rainfall is considerably more than one meter. The coconut can endure exceedingly drying conditions for short periods, and is accordingly adapted to the intense light of the seashore, to resisting strong winds, and to enduring salt water about its roots for short periods of time. Moreover, it will live through prolonged droughts. But long dry seasons cut down the crops; and the damage done by droughts lasts for as much as two or three years after the return of rain. A dry season of five or six months every other year will keep the crop at all times down to not more than 40 per cent of what it would be if the supply of water were constant. If there is an ample supply of soil-water, dryness of the atmosphere is favorable to the best production. Seacoasts usually have higher land back of them, and the ground-water from the higher country circulates through the soil toward the sea. Near the shore it comes near enough to the surface to be reached by the roots of the coconut. For this reason, coconuts thrive on the seashore under climatic conditions that prevent good development in the interior. This is the principal ground for the idea that coconuts thrive only near the sea. Around the bases of volcanoes in the interior, similar soil conditions are met with, and such localities are admirably adapted to this crop.

*Propagation and cultivation.*

The coconut is produced only by seed. Nuts for this purpose should of course be selected from conspicuously good trees. They are usually planted in seed-beds, although, on a small scale, there are various other local methods of handling them during germination. The best treatment is to take them from the seed-bed when the plumule is not more than 6 inches high, which will usually be after about six months. To avoid the expense of keeping the groves clean while the trees are small, it is common practice to leave the nuts for a longer time in the seed-beds, but the transplanting of older seedlings, even with the greatest practicable care, sets them back for several months. In the Jaffna district of northern Ceylon, the nuts are transplanted from the first seed-beds to others in which they have more room, and are not put in their permanent places until they are three or four years old.

In the first years after the coconuts are transplanted, it is good policy to raise catch-crops between the trees. But these crops should be so chosen that they will not compete with the coconut for light or water; and from the profit they pay, a return should be made to the soil of fertilizers at least sufficient to replace what they have removed. By the time the grove is four years old, the coconuts will shade the ground and it will no longer be possible to raise catch-crops on a large scale. Then, but not before this time, it is good practice to use the grove for pasture. The returns from live-stock should be at least sufficient to pay for keeping the plantation in good condition and cattle will themselves do a large part of the work in keeping down the other vegetation. Pasturing of other live-stock in coconut groves is in general not to be recommended. It is not customary anywhere in the tropics to give to coconut plantations such cultivation as is given to orchards in temperate countries. It has even been believed that any but the most shallow cultivation would be detrimental by destroying the roots near the surface, and that machine-cultivation was likely to be too expensive to be profitable, in view of the time that it would have to be kept up before the coconut begins to pay returns. Limited experience in the Philippines indicates that real cultivation produces very much the same results with coconuts as it does with other crops. Coconuts respond, as do other crops, to the application of manures containing potash, nitrogen, and phosphorus. So far as the very limited evidence shows, the demand for these three fertilizing elements is in the order given. With ordinarily good treatment, coconuts come into bearing in seven or eight years. Single trees of standard varieties will bear fruit in five years, while others will require ten. If the coconut is treated as a wild crop, which is by no means uncommon, and little or no attention is given it after the first three years, it will be ten or fifteen years, as a rule, before a full crop is produced and even then the crop will be an inferior one.

*Pests.*

With the increase in the industry in the tropical world, and with the increase in commerce, there have been created conditions favorable to the development and spread of pests. Twenty years ago, serious coconut pests were practically unknown, and only eight years ago, Prudhomme, in an excellent general treatment of the coconut industry, listed as serious pests only two or three insects and no other organisms. There are now known as serious pests various species of Rhynchophorus, known as palm weevils; *Oryctes*, called the rhinoceros beetle; a scale, *Aspidiotus destructor*, closely related to the San José scale; at least two fungi, and the organisms causing bud-rot. The latter have been determined in the West Indies to be *Bacillus Coli*, and in India to be a fungus, *Pythium palmivorum*. Besides these, there are a large number of minor or local pests, including weevils and other beetles, the

larvæ of moths and butterflies, insects of other groups, and fungi. Damage is also done in places by crustaceans, and by rats and other higher animals. Forests made up of one kind of tree practically do not exist in nature in the tropics; and when such forests are made, as has been done with the coconut, the prevention of devastation by pests will be accomplished only by greater care than is ordinarily demanded to protect the crops of temperate lands.

#### Varieties.

A very large number of varieties of coconuts is known in different parts of the tropics, but a careful comparative study of their merits has never been made on a large scale and with nuts from many different sources. The best experiment began less than a decade ago in Madagascar. In several localities in the Philippines, there are strains of very large nuts, of which, as a plantation average extending over years, 3,300 produce a ton of copra. In favorable seasons the production has been at the rate of a ton from 2,800 nuts. There are reports of similar large nuts from other countries, but no data as to their yield on a plantation scale. In the parts of the Philippines having the greatest coconut industry, it requires 5,600 to 6,000 nuts to produce a ton of copra, and the same figures apply to Ceylon and various other coconut countries. In still other places the nuts are so small that 7,000 are required to the ton. There are varieties characterized by shape and by color, but these characteristics seem not to be related to the yield either of copra or oil. The nuts of the Laccadive and Maldive Islands are reputed to produce a particularly good fiber. Throughout the eastern tropics, coconuts are locally used to produce liquor. For this purpose, early maturing varieties that are likely also to produce very small nuts, but numerous clusters, are selected. There are varieties in Ceylon and the Philippines which bear at the age of four years, while the varieties in extensive cultivation and used for the production of copra can none of them be relied upon to produce a crop in less than seven years and not in less than ten years unless properly treated. A Philippine variety known as Makapunô has the interior of the nuts completely filled with a soft, sweet tissue, used as a table delicacy. Such nuts sell locally for about 10 cents, while the ordinary nut is worth 2 or 3 cents.

#### Uses and products of the coconut.

The local uses of the coconut are almost unlimited. Besides being of practical utility in a very large number of ways to the people of the Malay-Polynesian region, it has, as a result of its practical importance, acquired a prominent place in the rites and superstitions of the people of this part of the world. Thus Murray tells of a tribe of Papuans, among whom it is not proper for a man to eat a person whom he has killed, this privilege being reserved for his associates; but a man may eat the heart of his own victim if he sits on one coconut and balances himself with his feet on two others while he prepares and devours it.

The products of great industrial importance are toddy and its derivatives, coir, and copra and its products.

*Toddy* is an usual English name of the fresh beverage obtained from the unopen flower-clusters. In the Philippines it is known as "tubâ." The mode of securing it differs somewhat in the three countries in which it is secured on an industrial scale, the Philippines, Java and Ceylon. In all of them, the spathe is bent down gradually and the tip is then cut off. A thin slice is afterward cut off with a sharp knife, usually twice a day. After a few days of this treatment, the irritation results in a flow of sap from the cut surface. This sap falls into a jar or bamboo tube from which it is collected, as a rule twice a day, and a very thin slice is removed from the end at each time of collection.

This continues until the whole inflorescence has been removed by the series of slices. The amount of toddy collected depends on the vigor of the tree, on the weather, and on the skill of the workman. Under fairly favorable conditions, a good workman will secure a quart or more a day from one inflorescence. The technique of this business seems to be better developed in the Philippines than elsewhere, with the result that more toddy is secured in a given time from the tree. The toddy is used as a fresh beverage or as a source of alcohol, or less frequently of sugar, or still more rarely of vinegar; it is also a common source of yeast in the East Indies. The toddy, as it falls from the cut branch, contains about 16 per cent of sucrose. This inverts very rapidly if permitted to do so, and the invert sugar is in turn rapidly fermented to alcohol. In parts of the Philippines, the production of strong liquor in this way is a business of some importance. If sugar is to be produced, care is taken to keep the vessels clean and approximately sterile, and the inversion is often prevented by the use of tanbark from one of the mangroves, usually *Bruguiera*. If alcohol is the product desired, the same bamboo tubes are used over and over without cleaning. In the Philippines it is common practice to connect the trees used for this purpose with bridges of bamboo on which the collectors pass rapidly from tree to tree. In other countries each tree is climbed by itself.

(Nat. size at this stage.)

(Nat. size.)

1012. Stages in the growth of a coconut.

*Coir* is produced for local use in many parts of the world, but as an article of commerce comes chiefly from Ceylon. This fiber was the old staple cordage material of the Polynesian region. As a fiber material, it is conspicuous for its elasticity, being able to stretch 20 or 25 per cent without exceeding the limit of elasticity. It is also remarkable for lightness, for resistance to decay, and for the short length of the individual cells. It is accordingly a valuable fiber for use in ropes subject to abrupt strains, for calking boats, and for a stuffing fiber. Its stiffness and durability make it especially serviceable for the manufacture of mats, and this is its chief commercial use.

*Copra*.—The principal coconut product exported from most producing regions is copra, which is the dried meat or hard endosperm of the fruit. To produce the best copra, nuts should be thoroughly and uniformly ripe, and this condition is best guaranteed by permitting them to ripen on the trees until they fall, and then to collect and use them at frequent intervals. However, it is far more common practice to harvest them before they fall, going through the groves at regular intervals. This is most commonly done every three months. The nuts are cut down in various ways. The simplest method is the use of a long pole made of detachable joints of bamboo and bearing at the top a sharp and recurved knife. A nut-gatherer then goes from tree to tree and cuts down the nuts that are ready, without leaving the ground. This method is the local one used in certain parts of the Philippines.

Elsewhere in the Philippines and in many other places, the practice is to climb each tree, using notches cut at convenient heights for this purpose. If these notches are cut with sufficient care, it probably can be done without real damage to the tree, but in practice such care is not usually taken, and the notches are very often centers from which decay of the trunk begins. In other places the nut-gatherers climb the trees without notches. To do this easily, they usually bind their ankles together with a thong, or pass a rope around the hips and around the tree, or use both of these devices. The old story of the harvesting of coconuts by the use of monkeys is not altogether a myth. In the Sunda islands and in Sarawak, monkeys are sometimes trained for this purpose; and from Sarawak, these trained monkeys are occasionally exported to the Straits settlements. In some of the islands of the south seas, the entire nuts, husk and all, are split into halves with an axe, and in Ceylon a machine for this purpose has come into limited use. Elsewhere, the first step in the preparation of copra is the removal of the husks. This is usually done with the aid of a piece of iron, three cornered and moderately sharp, mounted on an erect stick and standing at about the height of the knee. This implement is in universal use in the Philippines, and elsewhere in the East, and has of late years come into use in the tropics of the New World. A machine to remove the husks has also been invented, but the most that is claimed for it is that a workman can husk a thousand nuts a day, and this is only the standard day's work for a nut-husker in the Philippines by the old method. After the removal of the husk, the nut is split into two halves by a sharp blow with a heavy knife. The water is allowed to run out on the ground.—Methods of drying copra fall under three heads: sun-drying, grill-drying, and kiln-drying. Centrifugal dryers have also been tried and are said to give good results. Sun-drying is the oldest method, and is a good one where the climate is such that the drying can be trusted to go on without interruption. Under favorable conditions it produces the finest grade of copra, Cochin sun-dried being the standard of excellence. Most Philippine copra is grill-dried. A hole is dug in the ground on which is placed a grating usually made of bamboo, and the whole protected by a roof. Coconut husks and shells are used for fuel. The heat and smoke rise directly from the fire to the coconuts. Sun-drying takes usually five to nine days; if more than this is required, the method is unsafe. Smoke-drying is finished as a rule in a single day or in parts of two days. Smoke-dried copra is unsuited for the manufacture of food products and accordingly sells at a lower price than the best copra. It is a good way of making poor copra; for if any copra is imperfectly dried or is even in part the product of unripe nuts, it ferments with a considerable loss of oil, and this fermentation is decidedly checked by smoking. Kilns for drying coconuts are of various patterns in different countries, and if properly handled always produce a high grade of copra. There is one kiln in the Philippines which handles more than three tons of copra at a charge, and dries it in six or eight hours. By all methods, it is customary to make two stages of the drying, one immediately after the nuts are opened, and the other after the meat has shrunk enough to be easily removed from the shells. The ultimate use of copra is the manufacture of oil, an industry which has been developed to the greatest extent in France. In all coconut countries there is a local business in manufacturing oil. This is done by various primitive methods, some of which produce a food or toilet product of the highest possible quality. In the manufacture of such oil, the utmost care is taken and the product is of purely local use. Oil for wider distribution is manufactured with less care, by methods characteristic of the different countries. To prepare oil for world com-

merce, such establishments as have long been used in European countries, and to a less extent in the United States, have more recently been founded in the producing lands. The oil has a variety of uses. It was formerly consumed almost entirely in the manufacture of soap and candles. Principally during the last decade, methods of refining and separation have been developed, by which excellent butter-substitutes are made. As the butter produced in this way is palatable and most digestible, and is cheaper than real butter, these products have found a ready sale, with the result that there has been a great increase in the demand for good grades of copra and a consequent improvement in the general quality produced in most countries, and an increase in the price of all grades. It seems probable that the market will for some time continue to increase more rapidly than the supply.

*Other products.*—A well-known product is desiccated coconut. Among producing countries, Ceylon is the only one which has taken up the manufacture of this article. It is prepared directly from the fresh meat of ripe nuts. Very large numbers of coconuts are also put upon the market of temperate countries as "coconuts," usually after the removal of the husk. The United States is the chief market for these nuts and the export of them is accordingly a conspicuous feature of the business in lands situated where delivery in the United States is economically possible, that is in the West Indies and to a much less extent in the islands of the Pacific. An exportation of this kind is also assuming large proportions with Australia as a market. For all kinds of coconut produce, Ceylon long held first place and the business of producing coconuts, copra and oil, as well as coir, and desiccated coconut, has reached a better development in Ceylon than anywhere else. However, during the last few years, the Philippines have far outstripped Ceylon in the production of copra. The export from the Philippines in the year ending June 30, 1912, was more than 160,000 tons. In this year, copra was for the first time the foremost export of the islands, taking from abacá the place which it has held almost without interruption for the last fifty years.

E. B. COPELAND.

**CÔCOS** (Portuguese, *monkey*, from the nut, which suggests a monkey's face). *Palmaceæ*. This genus includes the coconut tree, *C. nucifera*, and a few pinnate palms cultivated for ornament in the North under glass, and in southern Florida and southern California as avenue and ornamental trees. See page 3567.

Low or tall palms, with slender or robust ringed spineless trunks, often clothed with the bases of the lvs.: lvs. terminal, pinnatisect; segms. ensiform or lanceolate, equidistant or in groups, 1- to many-nerved, entire at the apex, or with 1 lateral tooth, or more or less deeply lobed, the margins smooth, recurved at the base; rachis 3-sided, acute above, convex on the back; petiole concave above, smooth or spiny on the margins; sheath short, open, fibrous: spadices erect, at length drooping, the branches erect or drooping; spathes 2, the lower one the shorter, split at the apex, the upper one fusiform or clavate, woody, furrowed on the back; bracts variable; fls. white or yellow: fr. large or medium, ovoid or ellipsoidal, terete or obtusely 3-angled, often fibrous-coated as in the coconut.—Species 56 in Trop. and Subtrop. S. Amer., 1 in the tropics around the world. The genus is allied to Maximiliana and Attalea, and distinguished by its male fls. having lanceolate petals, 6 included stamens, and a 1-seeded fr. G.C. II. 23: 439.

The coconut is the example most commonly cited of dispersal of seeds by water. Its buoyant, impervious husk is said to enable it to cross an ocean without losing its germinating power. Its structure is interesting and at first puzzling. Although it is a dry, indehiscent, one-seeded fruit, it seems very unlike an achene, as

for example, in the Compositæ. Structurally, it is more like a drupe, for the fibrous husk is formed from the outer part of the pericarp, and the hard shell inclosing the meat from the inner. In other words the husk is exocarp and the shell endocarp. The milk of the coconut is unsolidified endosperm. In the cereal grains it is the endosperm which affords most of the material used for human food. Only a part of the liquid matter of the coconut solidifies, and the milk is left in the center. The eyes of the coconut (Fig. 1011) mark the positions of the micropyles, and germination takes place only through the larger one. Palm pistils are three-carpelled and each carpel in Cocos has one ovule. The marks of the three carpels are seen in Fig. 1011, but only one ovule develops into a seed. Fig. 1012 tells the story of the growth of a coconut. In *a*, the young nut is enveloped by three petals and three sepals. At *b*, the pericarp has far outgrown the sepals and petals. Sometimes the floral envelopes remain when the nut is picked. Coconuts, like many other fruits, often grow to a considerable size without pollination, and then perish.

Of the species cultivated for ornament, *C. Weddelliana* is by far the most important. It is sold in great quantities from 3- and 4-inch pots when the plants are 12 to 15 inches high. They are favorite house-plants, as their culture is easy, and they grow slowly and retain their beauty a long while. They are much used in fern-dishes. As a house-plant, *C. Weddelliana* is probably the most popular species of all the smaller palms. It is especially suitable for table-decoration. In distinguishing tropical from subtropical regions, the coconut is an excellent guide. It flourishes best where frost is never known, although there are magnificent specimens at Miami and Palm Beach, Florida, both places having rare but sharp frosts. The oil extracted from the nuts is an important article of commerce. The fiber refuse is much used by florists and gardeners. Being open, spongy, very retentive of moisture, clean and easily handled, it is a favorite material in which to root bedding-plants and to start very small seeds; but it is not used for permanent potting. See U. S. Dept. Agric., Bull. of Div. of Ent. (new series) 38:20-3, for a report of diseased coconuts. For culture of Cocos under glass, see *Palms*.

*Cocos in Florida*.—The species of the *C. australis* group (as known in the trade) are dry-land palms, the best and most beautiful palms adapted to poor sandy soils in Florida. In moist and rich ground they are subject to diseases, particularly to blight. On dry land, they thrive with great vigor, and although slow growers, they are strikingly beautiful specimens when only a few years old. They look best in groups of five or even a dozen planted together (about 12 to 15 feet apart). After they have formed trunks 5 to 10 feet high they are very impressive, particularly when the background consists of tall bamboos or dark evergreens such as *Magnolia grandiflora* or live-oaks. All the species of this group have leaves more or less glaucous, silvery white or bluish green. The leaflets are often very hard to the touch—very rigid. The petiole at its base is provided with short blunt spines. The roots are brown and quite numerous, but the root-system is very shallow, the trunks do not rest deep in the ground as is the case with the *Sabal* and *Phoenix* species, and for this reason they are easily blown over or they acquire a leaning disposition. In planting these palms, they should be set in a saucer-like cavity, which can be filled up gradually. Both young and old plants are easily transplanted in November and December, but it is always advisable to plant only young specimens. Few palms require so little care and fertilizer as these Cocos species. A good application of stable manure as a mulch when the rainy season begins helps them along wonderfully, or they may be fertilized with a combination consisting of equal parts of ammonia, phosphoric acid and potash. The flowers are always inclosed

in a club-like spathe varying in size from a large walking-stick to a baseball club. These spathes burst open with a crack and reveal the much-branched flower-spike, varying in color from a creamy white, yellowish, lavender-crimson to a deep violet. The fruits also vary in size and color. Some of them are not larger than a large pea, others as large as a plum, some are yellowish and others orange and red in color. (H. Nehrling.)

*Cocos in California*.—After passing through a severe test during the first week in January of the year 1913, the several species of Cocos palms are in a condition in which one may safely judge of their comparative hardiness. In the Cocos palms found in local gardens are two very distinct groups. These two groups may each contain but one species having several varie-

1013. *Cocos Weddelliana*.

ties, or they may consist of several species as they are known "in the trade," and it is upon the latter basis they are here dealt with. (1) The dwarf group is commonly and widely represented by the one known as *C. australis* and the other and less-known kinds are catalogued as *C. Alphonssi*, *C. Bonnetii*, *C. campestris*, *C. Gaertneri*, and *C. Yatai*. Occasionally two others, *C. odorata* and *C. pulposa*, are listed. All those named are quite hardy and may safely be planted from Los Angeles to San Francisco without fear of losing them through freezing, though in places some may get "scorched" while young. With age all become quite hardy. (2) To a taller and more striking group, belong those of which *C. plumosa* is the best known and, unfortunately, most widely planted type. These are *C. botryophora*, *C. coronata*, *C. Datil*, *C. flexuosa*, *C. plumosa*, and *C. Romanzoffiana*. Of these six four have proved quite tender and three quite hardy, the latter lot resistant to at least a half-dozen degrees more of cold than the former. The tender ones are: *C. botryophora*, *C. coronata*, *C. plumosa*, and *C. Romanzoffiana*. Those proving hardy over all of southern California in 1913 were *C. Datil* and *C. flexuosa*, the latter the

only one at all common. To these may be added the true *C. australis*, not known here in the trade at all, a tall-growing species, and not the dwarf one commonly sold under this name. J. Harrison Wright, of Riverside, has grown this novel species and assures the writer of its hardiness in his garden where *C. plumosa* succumbs in comparatively mild winters. These notes are based upon a close study of these species and varieties as observed during the past few winters in the gardens of Los Angeles and Pasadena in Southern California. (Ernest Braunton.)

## A. Filaments present on the rachis.

1. *eriospatha*, Mart. St. 9–15 ft. high, 10–14 in. thick, capitately thickened with the persistent bases of the petioles: lvs. ample, glaucous, finely pectinate; margins of the rachis with excurrent filaments; segms. about 1 in. apart, the lower elongated, linear, 20–24 in. long, very long-acuminate, the upper narrowly linear, short, attenuate, 1 ft. long, 2 lines wide, all rigid, faintly nervose-striate: spadix thick, branched but very compact. S. Brazil.—“The hardest of the genus and one of the hardest palms in S. Calif. Fronds bluish: fr. pulp tastes like apricots.”—F. Franceschi, Santa Barbara. Some of the *C. australis* of the trade may belong here.

## AA. Filaments absent.

## B. Rachis abruptly contracted above the insertion of the lowest lfts.

2. *flexuosa*, Mart. St. 9–12 ft. high, 2–3½ in. diam., arcuate-ascending, naked just above the base, thence densely clothed with dead petiole bases: lvs. lax, 3–6 ft. long; petiole flat above, arcuate, at first tomentose, later smooth; rachis abruptly narrowed above the insertion of the lowest lf.-segm., thence linear-filiform at the apex, excurrent; segms. 70–90 on each side, rigid in opposite groups, the middle 10–14 in. long, ½ in. wide, the upper 4 in. long, ¼ in. wide; spadix long-peduncled and rather loose. Brazil.—Cult. in northern greenhouses. Similar in habit to *S. plumosa*, but with more finely cut lvs., and in S. Eu. considered to stand more frost. Probably the *C. flexuosa* planted in this country is not the true species *C. flexuosa* of Martius, but of Hort., a hardy form of *C. Romanzoffiana*, Cham., which latter according to the late Barbosa-Rodriguez is a polymorphic species including, besides this *flexuosa* type, all our garden forms known as *C. plumosa*, Hook., *C. coronata*, Hort., not Mart., *C. botryophora*, Hort., *C. Datil*, Griseb. & Drude, and *C. australis*, Mart. The foregoing description has been drawn from Martius and not from cult. specimens. The true *C. flexuosa* of Martius is a slender-stemmed palm from tropical Brazil.

The true *C. australis* of Martius is native in Paraguay; it is like *C. plumosa* in appearance but hardier.

## BB. Rachis not abruptly contracted.

## c. Lfts. flaccid.

## D. Arrangement of lfts. equidistant.

3. *Weddelliana*, Wendl. (*Glazioua Martiana*, Glaz., to which genus Martius considers the species to belong). Fig. 1013. St. 4–7 ft. high, 1¼ in. diam., densely covered with persistent sheaths: lvs. equally pectinate-pinnatisect, 3–3¼ ft. long; petiole 8–20 in.; sheath coriaceous-fibrous, glabrous or tomentose, with slender brown hairs, at length evanescent; blade 2–3 ft.; segms. about 50 on each side, widely spreading, the middle 5 in. long, 2 lines wide, subequidistant, glaucous beneath; rachis filiform at the apex, brown-scaly: spadix equaling the lvs., stiff and erect. Trop. Brazil. R.H. 1879, p. 434. I.H. 22:220. A.G. 16:345.—The most important of small ornamental palms for the N.

1014. Coconut germinating.

## DD. Arrangement of lfts. in groups of 2–4.

4. *plumosa*, Hook. St. 30–36 ft. high, 10–12 in. thick, ringed at intervals of a foot, clothed near the apex with remnants of the dead petioles: lvs. erect-spreading, 12–15 ft. long, recurving; petiole a third to half as long as the blade; segms. linear-acuminate, sparse, solitary or mostly in groups of 2–4, 1½ ft. long, deflexed near the apex: spadix usually 3 ft. long and much branched, the branchlets pendular. Cent. Brazil. B.M. 5180.—The chief avenue palm of the genus. A quick grower, ultimately 50 ft. high in S. Fla. and Calif. The slender smooth boles and heads of graceful recurving lvs. make this a very attractive tree.

## cc. Lfts. rigid.

## D. Form of lfts. sword-shaped.

5. *butyracea*, Linn. Sts. very tall, naked: lvs. pinnate; lfts. simple: spathe cylindrical-oblong, 4–6 ft.; spadix as long as the spathe, 4–6 ft.; branches of the spadix about 1 ft., thickly clustered and somewhat pendulous. Venezuela.—Rare and perhaps confused with *Scheelea butyracea*. Little known, although long ago described.

6. *Romanzoffiana*, Cham. Sts. 30–40 ft. high, somewhat fusiform above: lvs. about half as long as the caudex, the withered ones deflexed, pendent, the upper spreading, often arching; segms. conduplicate at the base, ensiform: spadix about 6 ft. long, at first inclosed in a stout pendulous spathe which appears among the lowest lvs. S. Brazil near the sea; according to recent characterizations, it comprises a wide variety of forms, as explained under No. 2.

1015. Coconuts.

DD. *Form of lfts. linear: apex obtuse: petiole glaucous.*

7. *austrâlis*, Mart. PINO PALM. Height about 30 ft.: st. erect, columnar, equal, strongly annular above: lvs. 9-12 ft. long, the sheath fibrous and glabrous; petiole naked; segms. linear, glaucous, rather rigid: fr. as large as a pigeon's egg, outer pulp sweet, edible, seed oily. Paraguay. G.C. III. 18:739. A.F. 5:515; 7:805. R.H. 1876, p. 155.—A good grower. Cult. under glass and outdoors in Fla. and Calif.

8. *nucifera*, Linn. COCO PALM. COCONUT TREE. Figs. 1014 (adapted from Cook), 1015. Caudex 40-100 ft. high, flexuous, thickened at the base: lvs. 12-18 ft. long; lfts. linear-lanceolate, 2-3 ft., coriaceous, flaccid; petiole 3-5 ft., stout. Seashores within the tropics and at Miami and Palm Beach, Fla. Indigenous to Cocos or Keeling Isls. of the Indian Ocean, but recently thought to be native of Trop. Amer. See O. F. Cook, Contr. U. S. Nat. Herb., 7:257-93 (1901); 14:271-342 (1910). R.H. 1895, p. 457. Mn. 2:171. G.F. 7:15.—Produces the coconuts of commerce. Var. *aûrea*, Hort., is a form remarkable for its orange-yellow sheaths, petioles and midribs." It is known in cult. only in England.

DDD. *Form of lfts. narrowly lanceolate.*

E. *Lvs. long, 6-15 ft. in mature specimens.*

F. *Petiole spinose-serrate: segms. of lf. less numerous.*

9. *Yatây*, Mart. St. 12-15 ft. high, over 1 ft. diam., naked below, covered with dead sheaths above: lvs. recurved, spreading 6-9 ft.; sheath 1 ft. long, fibrous at the mouth; petiole 1½ ft. long, spinose-serrate, the spines increasing in length towards the lower end of petiole; segms. 50-60 on a side, crowded below, then equidistant, linear-lanceolate, the uppermost long-setaceous filiform, the middle ones 2½ ft. long, 2-5 in. wide, the upper 20 in. long, ¼ in. wide, all rigid, glaucous beneath: spadix about 4½ ft. long with at least 150 branches. Brazil, Argentina.

FF. *Petiole not spinose-serrate: segms. of lf. very numerous.*

10. *Dâtîl*, Drude & Griseb. St. 30 ft. high, 8-12 in. diam.: lvs. 12-15 ft. long; sheath about 16 in. long; petiole 1½ ft. long, 1½ in. wide, ½ in. thick; segms. linear-acuminate, glaucous, densely crowded in groups of 3 or 4, 150-160 on each side, the lowest 2 ft., middle 2½ ft. and apical 1 ft., the uppermost filiform, all narrow, stiff and rigid, the dried lvs. glaucous green or whitish: spadix 3-3½ ft. long with at least 300 spirally twisted branches. Argentina; isls. and river banks.—The frs. are edible, resembling those of the date palm. Hardier in S. Calif. than *C. plumosa*, *C. flexuosa*, and *C. Romanzoffiana*.

11. *coronâta*, Hort., not Mart. Trunk at length 18-30 ft. high, 8 in. diam., erect, deeply ringed: lvs. erect-spreading, 6-9 ft. long, short-petioled, arranged in a close, 5-ranked spiral, the long-persistent bases of the petioles forming a spiral-twisted column below the crown; lf.-segms. in groups of 2 or 3, folded together from the base (conduplicate), linear-lanceolate, coriaceous, densely crowded, about 100 on each side; midrib 4-sided below, 3-sided above: spadix about 2½-3 ft. with not more than 60 branches. Brazil.

EE. *Lvs. shorter, 3-4½ ft. in mature specimens.*

F. *Apex of lfts. obtuse.*

12. *campêstris*, Mart. St. 8-10 ft. high, thickened, scaly: lvs. spreading-recurved, rigid, 3-4½ ft. long; rachis elevated, triangular above, convex below; segms. narrowly lanceolate, 30-40 on each side, obtuse at the apex and shortly cordate-acuminate: spadix about 2½ ft. long, with 10-14 branches. Brazil.—Hardier than *C. nucifera*, but scarcely known in cult. in N. Amer. Perhaps hardly as far north as N. C.

FF. *Apex of lfts. acuminate.*

13. *insignis*, Mart. (*Glaziôva insignis*, Hort.). St. 3-6 ft. high, 1½ in. diam.: lvs. 4½-6 ft. long; sheath densely brown-lanate; petiole shorter than or equaling the sheath, a fourth or fifth as long as the rachis; segms. equidistant, 50 on each side, narrowly lanceolate, obliquely acuminate and caudate, silvery glaucous beneath: spadix about 3 ft. long, with about 50 branches. Brazil.

The following are trade names of rare or botanically little-known plants not sufficiently described: *C. Alphônsei*.—*C. Arechavaletana*, Barb., is described as somewhat like *C. Romanzoffiana* but taller and making larger crowns. It is a native of Uruguay.—*C. Blumen-dvi*=*C. eriospatha*.—*C. Bonnetii*.—*C. Gärtneri*=(?).—*C. Geriva*, Hort. G.C. III. 27:293 figures *C. Geriva*, a remarkable *Cocos* (?) with 4 branches. Nothing further is known of this plant. It may be *C. Geriba*, Rodr.=*C. botryophora*, Mart.—*C. Maximiliana*, Hort.=(?).—*C. odorata*, Rodr. St. short: lfts. in 3's or 5's, linear-lanceolate; petioles spiny: fr. yellowish green or pink, pulp scented. Brazil. R.H. 1893, p. 345.—*C. pulposa*, is supposed to be very like *C. eriospatha*. This species is scarcely known in this country.—*C. Yurumajnas*=(?).

N. TAYLOR.†

**CODIÆUM** (probably from Greek for *head*, the colored leaves being used for crowning-wreaths, or from the Malayan name). *Euphorbiaceæ*. CROTON. VARIEGATED LAUREL. Tropical shrubs or trees grown for the variegated and interesting foliage, as greenhouse plants or for summer bedding outdoors.

Leaves alternate, simple, somewhat thick and leathery, pinnately veined, glabrous: juice somewhat milky: fls. monœcious, in slender axillary racemes; staminate fls. with petals, calyx imbricate, stamens 20-30, erect in the bud; pistillate fls. apetalous, ovary 3-celled, 3-ovuled.—Six species of Malaya and Pacific Isls., not closely related to any other commonly cult. *Euphorbiaceæ*. Differs from the true crotons in the erect stamens, glabrous foliage and more or less milky juice.

The almost endless variety of codieums (or crotons of gardens) are probably all from one botanical species, greatly varied by selection and crossing. Although a great many of these bear Latin binomials they intergrade so that it is often difficult to separate them or to make a reliable classification; however, they may be grouped conveniently as below. Totally different leaf forms and color variations often appear on the same plant. The latest botanical treatment is by Pax in *Das Pflanzenreich*, hft. 47, and is followed in this article.

The crotons are prized chiefly for the varied and brilliant markings of the leaves. The young leaves are usually green and yellow, changing later to red, although in some the markings remain yellow or with red only in the petiole. They are usually kept not over 2 to 3 feet high, but if given opportunity will grow into considerable trees in the greenhouse. They are good subjects for massing in the open and develop most brilliant colors in our bright hot summers; however, they will not stand frost.

Codieums (or crotons, as they are popularly known in America) are beautiful plants with many forms of handsome and odd foliage of the most brilliant coloring. The colors range from almost pure white to light and deep yellow, orange, pink, red and crimson, in the most charming combinations. In some cases one color predominates, as in *Carrièrei* (yellow), *Czar Alexander III.* (crimson), *Hawkeri* (light yellow). These varieties of distinct coloring make beautiful specimen plants for jardinières; and their beauty is enhanced when used in jardinières of appropriate color. As exhibition plants they are very effective, and may be grown to specimens 5 or 6 feet high, or even larger. In smaller sizes, codieums are much used as table plants, for which purpose well-colored tops are rooted and grown on until they are from 12 to 15 inches high. The narrow-leaved varieties are most used for this purpose. Codieums are very attractive in vases and window-boxes and for mantel and table decorations. They are also

very valuable as bedding plants. Planted in clumps or masses, the effect of the combination of rich colors is charming. They should be planted in any good, rich, not too heavy soil, and regularly syringed to keep down red spider. They color best when fully exposed to the sun, and should not be planted out until about the 10th of June in the neighborhood of New York and Philadelphia. If something is needed to make the beds look attractive early in the season, it is a good plan to plant pansies in April, to remain until it is time to plant the codieums. Some of the tender varieties, such as Reedii, albicans, and a few others, are inclined to burn in the extremely hot weather, but nearly all the sorts do well bedded out. Among the very best for this purpose are Queen Victoria, Dayspring, Baron Rothschild, Andreanum, Lady Zetland, Carrièrei, Barryi, Hawkeri, fasciatum, anietumense.—The house culture of codieums is very simple. It is neces-

1016. *Codiæum variegatum* Baronne de Rothschild.  
(An example of form *platyphyllum*.)

sary that a night temperature be maintained of 70° to 75°, and that the air be kept moist by frequent syringings. Cuttings of half-ripened wood may be easily rooted at any time from October until June, a bottom heat of 80° being just what they need. When very fine specimens are desired, root strong and shapely tops by making an incision in the stem and tying moss around the wounded part; it will be rooted ready to pot in about three weeks. By this method all the foliage may be retained, and a perfect plant will result. The more light the plant receives, the better will be the color; but with some kinds of glass it is necessary to shade lightly to prevent burning of the leaves. They may be grown finely in a house glazed with ground glass, which admits the light and does not require shading. It is well to syringe two or three times a week with tobacco water, to kill mealy bug and red spider. Little's Antipest, or any emulsion of coal-oil, is a good insecticide for codieums. New varieties from seed, the result of crossing existing sorts, are continually being raised. Seed ripens freely under glass in North America, and there is no doubt that the list of about eighty choice varieties now in cultivation will be largely added to in the near future. (Robert Craig.)

*variegatum*, Blume, var. *pictum*, Muell. Arg. (*C. medium*, Baill. *C. variegatum* var. *genuinum*,

Muell. Arg., in part. *C. pictum*, Hook. *Crôton variegatus*, Linn. *Crôton pictus*, Lodd. *Phyllaurea Codiæum*, Lour.). Lvs. ovate to linear, marked with various colors, entire or lobed.—Cult. throughout the Old World tropics as well as in Eu. and Amer. The wild form with green lvs. is var. *molluccanum*, Muell. Arg. (*C. molluccanum*, Decne.). B.M. 3051. L.B.C. 9:870.

A. *Foliage plane or recurved, entire, not appendiculate.*  
B. *Lvs. 2-3, rarely 4 times as long as broad, usually broadest above the middle. Form platyphyllum, Pax.*

c. *The lvs. with practically no red coloration.*

Hort. vars.: *aureo-maculatum*, *aureo-marmoratum*, Baron Frank Seilliere, Barryi, Bergmanii, Bruce Findlay, Carrièrei, Delight, Exquisite, fasciatum, fucatum, Golden Queen, grande, Hawkeri, Henryanum, Hookeri, invictum, Jamesii, lacteum, magnolifolium, maximum, medium variegatum, Orvilla, ovalifolium, Princess Waldeck, superbien, tournfordensis, Truffautii.

cc. *The lvs., at least when older, red colored.*

Hort. vars.: *Andreanum*, *acubæfolium*, *Austinianum*, Baronne James de Rothschild (Fig. 1016), B. Compte, Beauty, Dayspring, Dormannianum, Hilleaum, Le Tzar, Magnificent, Marquis de Guadiaro, Me. Lucien Linden, Mortii, Mrs. Icton, Nestor, Newmannii, Pennincki, pictum, Pilgrimii, Prince Henry, recurvifolium, Reidii, Regina, roseo-pictum, Stewartii, Williamsii.

ccc. *The lvs. broad, color not specified.*

Hort. vars.: *Compte de Germiny*, d'Haenei, Dr. Friedenthal, Henderonii, Kreutzanum, Makoyanum, marmoratum, Prince Royal, Sanderi, Seemannii, Sinai, Stroemer, verum, Watsonii.

BB. *Lvs. lanceolate to narrowly lanceolate, 5 or more times as long as wide. Form ambiguum, Pax.*

c. *The lvs. with practically no red coloration.*

Hort. vars.: *albo-lineatum*, *angustissimum*, *anietumense*, *bellulum*, *Burtonii*, *concinnum*, *Countess*, *Crown Prince*, *Davisii*, *Duvallii*, *eburneum*, *elongatum*, *eminens*, *Goednoughtii*, *irregulare*, *latimaculatum*, *maculatum*, *Monarch*, *Mooreanum*, *Mrs. Swan*, *volutum*, *Weismanii*, *Wilsonii*.

cc. *The lvs., at least when older, red-colored.*

Hort. vars.: *albicans*, *amabile*, *Broomfieldii*, *Challengerii*, *Chantrieri*, *chrysophyllum*, *Cooperi*, *Drouetii*, *Duvivieri*, *Flamingo*, *Hanburyanum*, *imperiale*, *inimitabile*, *insigne*, *Jubilee*, *Lady Zetland*, *lancifolium*, *Macfarlanei*, *magnificum*, *Massangeanum*, *multicolor*, *musaicum*, *Neவில்*, *princeps*, *Queen Victoria*, *recurvatum*, *Sunshine*, *triumphans*, *triumphans* *Harwoodianum*, *Vervæti*, *Victory*, *Veitchii*, *Youngii*.

ccc. *The lvs. medium width, lanceolate, color not specified.*

Hort. vars.: *Boucheanum*, *Eckhautei*, *Eclipse*, *Excelenz*, *Flambeau*, *Gaerdtii*, *Grusonii*, *Imperator*, *Leopoldii*, *Margarete Daniel*, *marginatum*, *neriifolium*, *Oberstleutnant Brode*, *Ohlendorffii*, *Pres. Chereau*, *Said Pascha*, *Spindlerianum*, *splendidum*, *undulatum*.

BBB. *Lvs. linear, 1 cm. (2/3 in.) or less broad. Form teniosum, Muell. Arg.*

c. *The lvs. with practically no red coloration.*

Hort. vars.: *aigburthiense*, *aureo-punctatum*, *Dodgsonæ* (in part), *elegantissimum*, *Elvira*, *gloriosum*, *Hermion*, *Johannis*, *Phillipsii*, *superbum*, *Van Oosterzeei*.

cc. *The lvs. with red color, at least when old.*

Hort. vars.: *Bragæanum*, *elegans*, *majesticum*, *Mrs. Dorman*, *nobile*, *Princess of Wales*, *Rodeckianum*, *ruberrimum*, *septræ*.

ccc. *The lvs. narrow linear, color not specified.*

Hort. vars.: *Donai*, *Fascination*, *Grayii*, *Klissingii*, *lineare*, *pendulinum*.

AA. *Foliage lobed, or with margin crisped or spirally twisted, or with a hair-like or lf.-like apical appendage.*

B. *Lvs. entire, with margin crisped, or the whole lf. spirally twisted, without appendage. Form crispum, Muell. Arg.*

Hort. vars.: *caudatum tortile*, *Chelsonii*, *Cronstadii*, *Elysian*, *Eyrei*, *Katharina*, *Madam Seilliere*, *Rex*, *spirale* (in part) (Fig. 1019), *Warrenii*.

BB. *Lvs. more or less 3-lobed, at least constricted in the middle (panduriform). Form lobatum, Pax.*

c. *The lvs. panduriform or indistinctly lobed.*

Hort. vars.: *Bismarckii*, *irregulare*, *lyratum*, *monti-fontainense*, *multicolor*, *Princess Matilda*, *Russelii*, *Thomsonii*.

cc. *The lvs. distinctly 3-lobed.*

Hort. vars.: *Craigii*, *Disraeli*, *Evansianum*, *Fred Sander*, *Goldie*, *hastiferum*, *illustre*, *Lord Derby*, *maculatum Katonii*, *trilobum*.

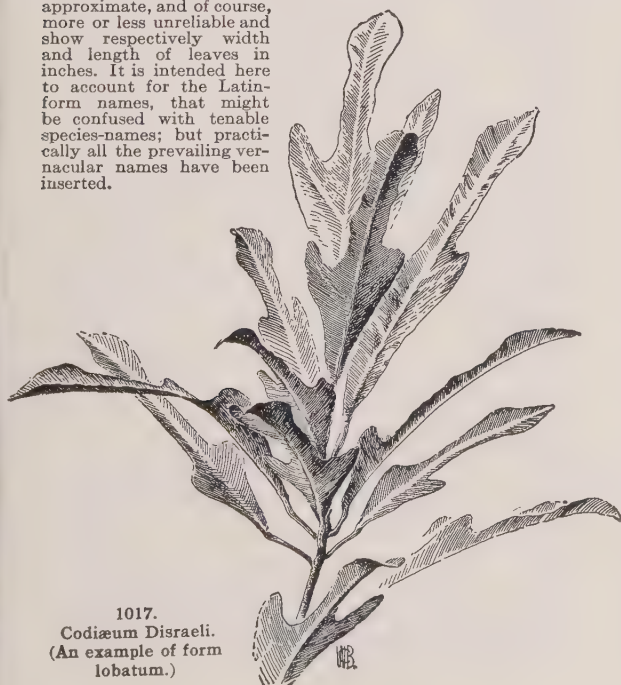

BBB. *Lvs. entire or nearly so, the midrib projecting, usually below the apex, as a horn-like appendage. Form cornutum, André.*

Hort. vars.: *appendiculatum*, *chrysophyllum* (in part), *cornutum*, *excurrens*, *Mrs. McLeod*, *paradoxum*, *Prince of Wales*, *spirale* (Fig. 1019).

BBBB. *Lvs. constricted to the midrib, or with the apically projecting midrib, bearing a second or even third plane, or cucullate, lamina. Form appendiculatum, Celak.*

Hort. vars.: *Dodgsonæ*, *interruptum* (Fig. 1018), *elegans*, *irregulare*, *Laingii*, *Mrs. McLeod* (in part), *multiforme*, *mutabile*, *picturatum*, *Rodeckianum* (in part), *Sintizianum*.

The following varieties are in the American trade or frequently cultivated in this country. A great many variations in spelling of names occur, chiefly due to different terminations to agree with either *Croton* or *Codiaeum*. Such slightly different forms of names have been omitted. The brief descriptive phrases do not include the more important characters given in the above classification. When yellow and red are both mentioned, the foliage is generally at first yellow-marked and later the yellow changing to red with ground-color green or dark red-green. The measurements are approximate, and of course, more or less unreliable and show respectively width and length of leaves in inches. It is intended here to account for the Latin-form names, that might be confused with tenable species-names; but practically all the prevailing vernacular names have been inserted.

1017.  
*Codiaum Disraeli*.  
(An example of form  
lobatum.)

*Aigberth Gem* (= following?).  
*Aigburthiense*. Yellow midrib and spots,  $\frac{1}{2} \times 11$ . A.F. 16:255 Gng. 9:19.  
*Albicans*. White variegated, crimson beneath,  $3 \times 18$ .  
*Albo-lineatum*. Yellow center changing to white,  $1 \times 12$ . A.F. 16:255. Gng. 9:19.  
*Amabile* ("often called *variabile*"). Lvs. often distorted and curved to one side, variegated with yellow and two distinct shades of green and red,  $1 \frac{1}{2} \times 11$ .  
*Andreanum*. Yellow to red veins,  $2 \frac{1}{2} \times 9$ . I.H. 22:201. A.F. 23:241. Gng. 13:81. R.H. 1876, p. 234.

1018. *Codiaum interruptum*.  
(An example of form *appendiculatum*.)

*Angustissimum* (*Angustifolium*). Yellow margin and ribs,  $\frac{1}{4} \times 15$ . G.C. 1871:612.  
*Anietumense*. Yellow midrib and cross veins,  $1 \times 11$ .  
*Aucubafolium*. Yellow, red-blotched,  $2 \frac{1}{2} \times 8$ . I.H. 19, p. 327.  
*Aureo-maculatum*. Yellow-spotted,  $1 \frac{1}{2} \times 3 \frac{1}{2}$ .  
*Aureum*. Yellow-marked.  
*Baron Adolph Seilliere*. Lvs. large, veins pale yellow, soon white.  
*Baronne James de Rothschild* (Baron Rothschild, etc., Baron A. de Rothschild (?)). Fig. 1016. Yellow, red veins, etc.,  $2 \frac{1}{2} \times 7$ . A.F. 23:242. R.H. 1879:450; 1898:180. F.E. 18:379. I.H. 26:365.  
*Barryi*. Yellow, changing to white, midrib, veins and dots,  $2 \times 7$ .  
*B. Comple*. Large, yellow, red blotches,  $2 \frac{1}{2} \times 7$ .  
*Beauty*. Yellow to pink center, margin and mottling, ovate,  $2 \times 6$ .  
*Bergmanii*. Cream-yellow with green blotches. I.H. 27:389.  
*Broomfieldii*. Various yellow marks, midrib red-tinted,  $2 \times 10$ .  
*Burtonii*. Yellow mottled, lanceolate,  $3 \times 15$ .  
*Cartierei*. Margin, midrib, dots and some veins yellow, oblong,  $1 \frac{1}{2} \times 11$ . I.H. 27, p. 90, desc.  
*Caudatum tortile*. Yellow variegated with some red, long, narrow, spiral lvs. R.B. 35:240. Gn. 11, p. 83. Gt. 33:9.  
*Challenger* (*Challengerii?*, *Imperator?*). Midribs creamy white changing to red.  
*Chelsonii*. Yellow, red midrib and mottling,  $\frac{3}{8} \times 10$ . A.F. 16:255. Gng. 9:19.  
*Chrysophyllum* (perhaps two vars. under this name). Irregular, large, yellow, red blotch,  $2 \times 12$ .  
*Compte de Germiny*. Lvs. broad.  
*Cooperi*. Yellow, red center and spots,  $\frac{3}{4} \times 10$ . Gn. 10, p. 139.  
*Cornutum*. Yellow midrib and dots, often wavy, spiral or even lobed,  $\frac{3}{4} \times 4$ . I.H. 19, p. 188.  
*Countess* (*Countess Superba?*). Yellow spotted, tapering,  $\frac{2}{3} \times 14$ .  
*Cronstadii*. Yellow variegated, tapering, spiral,  $\frac{2}{3}$  in. wide. A.F. 16:255; 23:275. Gt. 31:309.  
*Crown Prince*. Yellow veins,  $2 \times 16$ .  
*Czar Alexander III*. See *Le Tzar*.  
*Davisii*. White midrib and variegation,  $\frac{3}{4} \times 12$ .  
*Dayspring*. Yellow, red-mottled, margin green, ovate,  $1 \frac{1}{2} \times 8$ .  
*Delight*. Yellow changing to white, with green margin, lanceolate,  $2 \times 8$ .  
*Disraeli*. Fig. 1017. Variously lobed, yellow, red veins and spots,  $3 \times 12$ . Gn. 10, p. 141. F.M. 1876:207.  
*Dodgsonæ*. Yellow midrib, margin and spots, often spiral, excurrent midrib often foliaceous,  $\frac{2}{3} \times 12$ .  
*Dormannianum*. Lvs. small, bronze-red and yellow.  
*Earl of Derby*. See *Lord Derby*.  
*Earls court*.  
*Edmontonense*. Lvs. narrow, brilliantly colored.  
*Elegans* (*Parvifolium*, see *Interruptum*). Yellow, red midrib and margin,  $\frac{1}{2} \times 6$ .  
*Elegantissimum*. Yellow center and dots, petiole red, rarely with apical seta,  $\frac{1}{2} \times 14$ . I.H. 29:469.  
*Elvira*. Yellow center and variegation, sometimes with apical seta and twisted,  $\frac{1}{2} \times 10$ .  
*Elysian*. Yellow midrib and dots,  $\frac{2}{3} \times 14$ , twisted.  
*Evansianum*. Yellow, red-veined and mottled, 3-lobed. Gn. W. 4:409.  
*Excelsior*.  
*Excurrens*. Greenish yellow variegated, oblong, midrib projecting.

*Eutrype*.  
*Fasciatum*. Yellow veins, broad ovate. A.F. 23:241.  
*Flambeau*. Medium width, lanceolate.  
*Flamingo*. Irregular yellow central stripe,  $1\frac{1}{2} \times 8$ .  
*Gloriosum* (Prince of Wales). Lvs. long-narrow, variously yellow-marked, sometimes spiral and appendaged. Gng. 9:19. Gn. 14, p. 543. A.F. 16, p. 255.  
*Golden Ring*.  
*Goldiei*. Yellow veins, 3-lobed,  $3 \times 10$ .  
*Grande*. Yellow veins and spots.  
*Grayii*. Resembling Majesticum.  
*Hanburyanum*. Yellow, rose marks and blotches,  $2\frac{1}{2} \times 15$ . Gng. 7:324.  
*Harwoodianum* (Triumphans Harwoodianum). Yellow, crimson midrib.  
*Hawkerii*. Light yellow, green margins and tips, broad-lanceolate, 6 in. long. J.H. III. 61:129. G.Z. 23, p. 265.  
*Henryanum*. Yellow-mottled, ovate,  $3 \times 9$ .  
*Hermion*. Yellow midrib and spots,  $\frac{1}{2} \times 10$ .  
*Hillebrandum*. Purplish green, crimson marks, oblong or spatulate,  $3 \times 9$ . I.H. 19, p. 326.  
*Hookerianum* (Hookeri). Irregular yellow center and blotches, broad lance-ovate. G.C. 1871:1067. Gn. 3, p. 45. I.H. 19, p. 40. G. 7:137. F. 1871, p. 199.  
*Illustris*. Yellow markings, 3-lobed, midrib excurrent. G.Z. 28:2.  
*Imperator*. See Challenger.  
*Inimitabilis*. Yellow, red midrib and veins all dark red,  $1 \times 6$ .

1019. *Codium spirale*. (An example of forms crispum and cornutum.)

*Insigne*. Yellow midrib and veins, margin red, narrow-oblong.  
*Interruptum*. Fig. 1018. Yellow, red midrib,  $\frac{3}{4} \times 12$ . Sometimes distorted or spiral, midrib excurrent. I.H. 19, p. 170. F. 1872, p. 209. A.F. 16:1510. Journ. Bot. 19:220.  
*Invicta*. Lemon-color, broad lf.  
*Irregularis*. Lf. form irregular, often contracted below middle, midrib and spots yellow. I.H. 19, p. 135.  
*Jamesii*. Irregular yellow blotch changing to white,  $3 \times 10$ .  
*Johannis* (Taeniosum). Center and margin yellow: lvs. long, narrow. F. 1872, p. 161. Gng. 9:19. I.H. 19, p. 169. F.S. 19, p. 12. Gt. 34:24. A.F. 13:1070.  
*Katonii* (Maculatum Katonii). Lvs. partly trilobed, yellow-spotted. F. 1879, p. 27.  
*Lady Zealand*. Yellow, red margin, midrib and veins,  $\frac{3}{4} \times 11$ .  
*Lainqui*. Lf. base yellow, remainder green to dark red, spiral, midrib excurrent or appendaged.  
*Le Tsar*. Lf. broad, veins and most of lf. yellow, red. I.H. 35:70.  
*Lord Derby* (Earl of Derby?). Trilobed, base and center yellow, red,  $\frac{1}{2} \times 8$ .  
*MacFarlanei*. Yellow, red-blotched,  $1 \times 12$ .  
*Majesticum*. Yellow, red margin, midrib and mottling, linear, 15 in. long. G.Z. 18, p. 97. G. 2:163. F. 1876, p. 53. F.M. 1874:103.  
*Makoyanum*. Broad lvs. chocolate and carmine marking.  
*Marquis de Castellane*.  
*Maximum*. Border and veins yellow or yellow with green blotches, 12 in. long. I.H. 14, p. 534; 19, p. 168. B.H. 19:65.  
*Memphis*.  
*Montfontainense* (Montfortiense?). Somewhat 3-lobed, veins yellow, red,  $1\frac{1}{2} \times 6$ .  
*Mortii*. Midrib and veins yellow, light red,  $3 \times 10$ .  
*Mrs. Chas. Heine*.  
*Mrs. Craige Lippincott*. Lvs. lance-ovate, veins colored. A.F. 23:274. Gng. 13:98.  
*Mrs. Dorman*. Midrib scarlet, margins green, linear,  $\frac{1}{2} \times 12$ . A.F. 16:255. Gng. 9:19.  
*Mrs. H. F. Watson*. Lvs. large, variously marked with yellow and red.  
*Mrs. Icelon*. Very dark red with rose mottling,  $2 \times 4\frac{1}{2}$ .  
*Mrs. McLeod*. Constricted in middle, midrib yellow, red, projecting,  $\frac{1}{2} \times 10$ .  
*Mrs. Swan*. Central yellow stripe and blotch, petioles red,  $1 \times 12$ .  
*Multicolor*. Like Irregularis but with red coloration developed. I.H. 19, p. 120. F. 1872, p. 89.  
*Musaicum*. Yellow, red-veined and mottled, or with green blotches on colored ground,  $1\frac{1}{2} \times 8$ . R.H. 1882:240.  
*Nestor*. Serrated central yellow, red blotch and spots,  $2\frac{1}{2} \times 12$ .  
*Nevillii*. Green-red mottling or yellow.  
*Newmannii*. Lvs. short, broad, dark crimson.  
*Nobile*. Lvs. linear, yellow, red variegated. A.F. 16:255. Gng. 9:19. F. 1878, p. 133.  
*Orville*. Green mottling on yellow,  $1 \times 4\frac{1}{2}$ .  
*Onalifolium*. Yellow variegated. Gt. 24, p. 221. F. 1875:8.  
*Pictum*. Lvs. broad oblong-acuminate, less than 10 inches long, blotches of green and blackish on red. B.M. 3051.  
*Picturatum*. Similar to Interruptum. Gt. 25:375.  
*Pilgrimii*. Yellow-blotched, overspread with pink,  $3 \times 9$ .  
*Princes* (mutabile). Yellow, red midrib and margins, lvs. narrow, variable in form, sometimes appendaged. F. 1879, p. 69. Gn. 13:621, desc.  
*Princess Matilda*. Lvs. subtrilobed, yellow, red blotch, base nearly white, petioles red.  
*Princess of Wales*. Yellow midrib and mottling, changing to white, with pink reverse, linear,  $\frac{1}{2} \times 12$ . Gng. 13:84. A.F. 23:275.  
*Punctatum*.  
*Queen Victoria*. Yellow, red veins and mottling,  $1\frac{1}{2} \times 10$ . A.F. 23:241.  
*Recurvifolium*. Lvs. acuminate, recurved at the tip, yellow, red veins and blotches.  
*Reginae*. Lvs. short and broad, yellow, crimson and brown colored. F. 1879, p. 59.  
*Reidii*. Yellow, red variegation and veins, rose tints,  $4 \times 8$ . A.F. 23:242.  
*Rodeckianum*. Variously mottled and marked with yellow and red,  $\frac{3}{4} \times 12$ , sometimes twisted and appendaged.  
*Roseo-pictum*. Yellow, red, with green blotches between veins. I.H. 26:364; 43, p. 159.  
*Ruberrimum*. Crimson marked with creamy white, linear.  
*Rubro-lineatum*. Yellow, with crimson tints, oblong-lanceolate, "1 in. to  $1\frac{1}{4}$  in. long."  
*Rubro-striatum*.  
*Sceptre*. Lvs. linear, yellow spots, red midrib.  
*Sinclairianum*. Yellow spots changing to white, projecting midrib appendaged,  $\frac{1}{2} \times 10$ . Gt. 30:278. G.Z. 26:145. J.H. III. 48:435.  
*Sollerii*.  
*Spirale*. Fig. 1019. Midrib yellow, red or green, lvs. spiral, midrib excurrent,  $\frac{3}{4} \times 10$ . V. 9, p. 203. F. 1874, p. 211. F.M. 1874:126. A.F. 23:242. Gt. 24:26.  
*Splendens*. "Lvs. broad, yellow and dull red on green."  
*Stewartii*. Yellow veins and margin, midrib and petiole red.  
*Sunshine* (Sunbeam?). Yellow, red veins and mottling,  $2 \times 9$ .  
*Superbissimum*.  
*Superbum*. Lvs. linear, drooping, green and yellow mottled. A.F. 16:255; 23 p. 275; 21:674. Gng. 12:471; 9:19.  
*Thomsonii*. Irregular central yellow area or all yellow, subtrilobed,  $2 \times 6$ .  
*Tortilis*. See Caudatum tortile.  
*Tricolor*. Lvs. oblong spatulate, margin sinuous, center yellow, lower surface reddish.  
*Triumphans*. Lvs. oblong, green and red.  
*Undulatum*. Lvs. long and broad, undulate, veins red to purple. I.H. 19, p. 265. F. 1870, p. 207. G. 9:106. Gn. 3, p. 118.  
*Veitchii*. Yellow, red midrib and wide veins, some mottling,  $1\frac{1}{2} \times 10$ . Gn. 17, p. 565. F. 1870, p. 206. I.H. 19, p. 134. R.H. 1867, p. 190. V. 9, p. 203.  
*Victory*. Yellow, red midrib and blotches,  $2\frac{1}{2} \times 12$ .  
*Volutum*. Yellow midrib and veins,  $1 \times 6$ , with long tip rolled backward. Gt. 24:61. V. 9, p. 202. F. 1874, p. 138. G.Z. 20, p. 33. F.M. 1875:154.  
*Warrenii*. Yellow, red variegated,  $1 \times 20$  spiral. P.F.G. 1882:111. G. 11:123; 13:705. A.F. 16:255. G.W. 12:62. Gn.W. 6:457. Gn. 36, p. 337.  
*Weismanii*. Yellow midrib and veins, petiole red, margin undulate,  $1 \times 10$ . I.H. 20, p. 80. F.S. 19, p. 14. F. 1873:55. Gt. 22, p. 149.  
*Williamii*. Yellow, red and pink variegated, ovate-oblong,  $3 \times 12$ .  
*Wilsonii*. Green overspread with yellow, linear lanceolate,  $1 \times 18$ .  
*Youngii*. Irregular yellow, red blotches,  $1 \times 15$ . Gn. 4, p. 129.  
 Others not in American trade: *appendiculatum*. Horned, green. G.Z. 21:241. F. 1879, p. 67. R.H. 1877, p. 88. F.W. 1877, p. 136.—*aureo-lineatum*. Yellow margins and veins.—*Baron Frank Seilliere*. Yellow to white veins on reddish green. I.H. 27, p. 72, desc. Gn. 21, p. 289.—*bellulum*. Yellow, green margins. I.H. 22:210.—*Bræganum*. Yellow and green, red midrib, linear, 18 in. long.—*Chantrieri*. Linear, yellow red spots. I.H. 27, p. 73, desc.—*contortum*.

Lvs. ovate, tips recurved, veins and margins yellow.—*Craigii*. 3-lobed. Gng. 13:97. A.F. 23:238.—*Cræsus*. Oblanceolate, yellow-blotched.—*Drouetii*. Linear, border and veins yellow, red. I.H. 27, p. 73, desc.—*Duvallii*. Lvs. lance-linear, veins light yellow. I.H. 27, p. 73, desc.—*Duvivieri*. Short-oblong, chiefly red.—*eburneum*. Central irregular, white band.—*elongatum*. Narrow lanceolate, yellow veins, margins, and spots. I.H. 24:299.—*eminens*. Lanceolate, midrib and pair of veins white.—*Exquisite*. Broad-ovate, margins and variegation yellow.—*Eyreii*. Recurved and spiral, yellow variegated, petiole red.—*Fascination*. Long-linear. A.F. 23:243. Gng. 13:119.—*formosum*. Yellow, red-spotted.—*fucatum*. Obovate, yellow blotched, petiole red.—*Goedenoughii*. Yellow variegated.—*Golden Queen*. Yellow midrib and few veins and dots, petiole red,  $2\frac{1}{2} \times 9$ .—*hastiferum*. Two acute lobes at broad base, yellow veins and blotches. I.H. 22:216. *heroicum*. Yellow, red.—*imperiale*. Oblong, yellow, red margins and veins, horned. F. 1876, p. 209.—*interruptum elegans*. I.H. 27, p. 90, desc. R.H. 1880:170.—*Jubilee*. Center, veins and margins, yellow, red,  $2 \times 13$ .—*Junius*. Long, narrow, yellow and red-colored.—*Katharina*. Spiral, red variegated,  $2 \times 10$ .—*lacteam*. Oblanceolate, margin sinuous, midrib and veins yellow. F.S. 19, p. 8.—*lanceifolium*. Lanceolate, yellow- and red-marked,  $1\frac{1}{2} \times 15$ .—*latimaculatum*. Lanceolate, yellow-marked, petiole red. I.H. 27, p. 73, desc.—*limbatum*. Yellow margins and spots.—*Lord Belhaven*. Lanceolate, Gng. 7:323. F.E. 18:379.—*lyratum*. Slightly 3-lobed, yellow veins. I.H. 24:293.—*maculatum*. Lanceolate, 12 in. long, yellow-spotted.—*magnificum*. Yellow, red irregular central mark. I.H. 29:447.—*Magnificent*. Central part yellow, red,  $2\frac{1}{2} \times 7$ .—*Marquis de Guadiaro*. Irregular yellow, red center. I.H. 37:96.—*Massangeanum*. Lanceolate, 10 in. long, yellow, and, with green blotches. I.H. 26:347. S.H. 1:124.—*medium variegatum*. Obovate, margins and veins yellow.—*Me. Lucien Linden*. Yellow, red-variegated. I.H. 38:140.—*Monarch*. Lanceolate,  $2\frac{1}{2} \times 12$ , yellow spots.—*Mooreanum*. Oblanceolate, yellow edge and veins. G.Z. 22:25.—*ornatum*. Yellow, red center, veins and blotches.—*patulum*. Horned, yellow variegated. F. 1879, p. 68.—*Penninecki*. Obovate, red with green marks. R.B. 33:304.—*Philipsii*. Lance-linear, base and center yellow,  $\frac{3}{4} \times 9$ .—*Prince Henry*. Tip recurved, variously red- and yellow-marked.—*Princess Waldeck*. Obovate, 4 in. long, yellow center.—*recurvatum*. Tip recurved, yellow along the red midrib.—*Rez*. Spiral, yellow, red mottled,  $\frac{3}{8} \times 10$ .—*Russellii*. Constricted in the middle, yellow, red spots and veins. J.H. III. 27, p. 493.—*Sanderi*. Obovate, large, irregular blotches. G. 22:197.—*splendidum*. Lvs. broad, lanceolate, yellow, red.—*superbiens*. Oblong, yellow, red-variegated. Gng. 13:84.—*Torquetum*.—*Torriganum*. Yellow, red veins, ribs and margins.—*townfordense*. Obovate, wide yellow center and base. Gn. 65, p. 42.—*trilobum*. Lobed, yellow blotched. R.H. 1877, p. 89. F. 1877, p. 56. G.Z. 21:97.—*Truffautii*. Yellow to white veins, lvs. broad.—*Van Oosterzeel*. Lance-linear, yellow-spotted. I.H. 30:502.—*Vervetii*. Yellow, red midrib and spots, lanceolate. I.H. 23:253.—*vittatum*. Irregular yellow center, petiole red.—*Wigmannii*. Yellow blotches,  $\frac{1}{2} \times 9$ .

J. B. S. NORTON.

**CODLIN.** Used in England to mean a small, green, half-wild, inferior apple. It is used in distinction to grafted or dessert fruit. It is about equivalent to the American popular use of the word "crab." The word is also used in England as the name of a particular variety or group of varieties, as Keswick Codlin. The word codlin is known in America only in connection with the apple-worm insect, the codlin-moth. Sometimes written *Codling*.

**CODONANTHE** (Greek for bellflower). *Gesneriaceæ*. A dozen or more trailing or scandent herbs or subshrubs of Brazil, Guiana, Cent. Amer., and W. Indies, 1 or 2 of which may be found in choice collections of stove plants. Plants with long branches, opposite entire and fleshy or thick mostly small lvs., and whitish fls. borne singly in the axils: corolla with a declined or curved tube, the throat broad or open, and the limb with 5 rounded nearly equal lobes, exceeding the 5 narrow lobes of the calyx; stamens attached in corolla-tube, not exerted: fr. berry-like. *C. gracilis*, Hanst., with creamy white spotted orange fls. and lvs. often blotched red beneath, is the species most likely to be seen. Cult. of Gesneria and similar things. L. H. B.

**CODONOPSIS** (Greek, bell-like, alluding to the shape of the flowers). *Campanulaceæ*. Twinning or decumbent perennials, more or less hardy in the open, with showy blue, whitish or greenish flowers.

Herbs, with tuberous rhizomes: lvs. alternate or irregularly opposite, petiolate, mostly crenate: fls. axillary or terminal, stalked; calyx-tube hemispherical, the limb 5-parted and the lobes leafy; corolla-tube broadly tubular or bell-shaped, 5-parted (rarely 4- or 6-parted); stamens free, the filaments dilated at base; stigma 3-5-lobed: fr. a dry or somewhat fleshy 3-5-

valved caps.—Eighteen or 20 species in Cent. and E. Asia. A few of the species may occur in choice border-collections; they need protection N.

**ovata**, Benth. Six to 12 in., decumbent and branches becoming erect: lvs. ovate, small ( $\frac{3}{4}$  in. or less long), both alternate and opposite, acute or obtuse, hairy, short-petioled: fls. pale blue, speckled inside,  $1\frac{1}{4}$  in. or less long, broadly bell-shaped, on long terminal peduncles. Himalayas.—Offered in England; half-hardy to hardy.

*C. clematidea*, Schr. Two to 3 ft., from mts. of Asia; one of the hardest: lvs. ovate-acuminate, petioled: fls. white tinged blue. Much like *C. ovata*.—*C. convolvulacea*, Kurz. Sts. thin and wiry: fls. bright blue, 1 in. across, numerous. Upper Burma.—*C. lanceolata*, Benth. & Hook. (Campanumæa lanceolata, Sieb. & Zucc.). Twinning, 2-3 ft.: fls. hanging, greenish white and purple-veined, 1-2 in. long and 1 in. wide, in a short simple raceme: lvs. alternate, oblong-lanceolate, nearly or quite entire. Burma, China. F.S. 9:927.—*C. Tängshen*, Oliver. Climbing, with long thickened rhizome, the sts. slender and 2 ft. or more long: lvs. ovate or broad-lanceolate, toothed: fls. solitary, stalked, bell-shaped,  $1\frac{1}{2}$  in. long, greenish, spotted and striped purple inside. China. B.M. 8090. Root used in China as a tonic.—*C. vinciflora*, Fedde. Allied to *C. convolvulacea*: twining, slender: lvs. mostly opposite, ovate or oblong-acuminate, sinuate-dentate: fls. solitary, very long-peduncled, rather small, rotate, and deeply parted, lilac. W. China.—*C. viridiflora*, Maxim. Small climber, free-flowering: fls. bell-shaped, whitish green, gray and violet. E. Asia. L. H. B.

**CÆLIA** (Greek, *koilos*, hollow: referring to the pollen masses). *Orchidaceæ*. Epiphytic orchids of minor importance; culture of Epidendrum.

1020. Cœlia Baueriana.

The cœlias are divided into 2 strongly marked groups with widely different kinds of infl. *C. macrostachya* is a type of the first section, with long racemes of numerous small, horizontal fls., which are much exceeded by the long spreading bracts, and the base of the column short. *C. bella* is typical of the second section, with the fls. few, larger, erect, in groups of about 3, longer than their bracts, and the base of the column produced to twice its own length, which gives the fls. a tubular appearance.—A half-dozen species in Cent. and S. Amer.

A. Fls. small, in a long raceme.

**macrostachya**, Lindl. Pseudobulbs  $2\frac{1}{2}$  in. long, almost round, with brown scales at the base: lvs. about 3, from the top of the pseudobulb, 1 ft. or more long, lanceolate, arching, broader than in *C. bella*, and not channeled: sepals red; petals white. Mex. R.H. 1878:210. B.M. 4712. J.F. 4:423.

**Baueriana**, Lindl. Fig. 1020. Pseudobulbs 1-2 in. long, 2-3-lvd.: lvs. 10-18 in. long, linear, acute: racemes of numerous small white fragrant fls.; ovary 3-winged; sepals ovate-lanceolate, the petals ovate-oblong; lip with the claw yellow, the blade triangular. W. Indies and Mex. B.R. 28:36.

AA. Fls. white, tipped purple, few, large.

**bella**, Reichb. f. Pseudobulbs smaller and more constricted at the top: lvs. 6-10 in. long, narrower, chan-

neled above, arching: fls. 2 in. long, erect, 3 or 4 in number, with the mid-lobe of the lip orange-colored. Guatemala. B.M. 6628.

*C. densiflora*, Rolfe. Characterized by a dense-fl. raceme, wingless ovary and oblong mentum. Cent. Amer.

GEORGE V. NASH.†

1021. Details of *Cælogyne speciosa*.

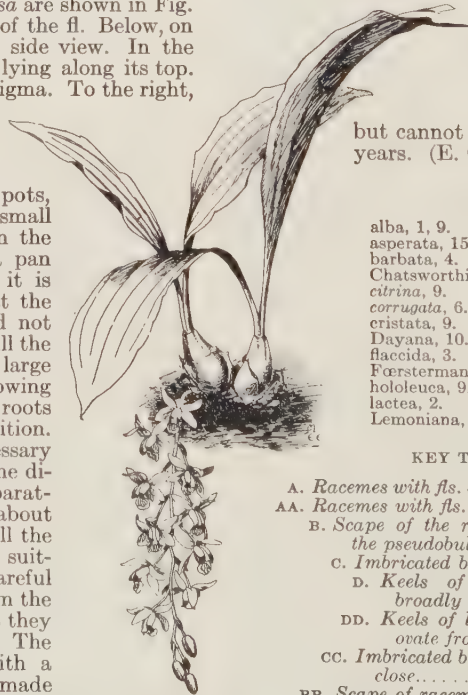

**CÆLÓGYNE** (*hollow pistil*). *Orchidaceæ*. Popular epiphytic warmhouse orchids of the eastern hemisphere.

Pseudobulbs tufted or at intervals on the st.: fls. in racemes, opening simultaneously or in succession; sepals and petals similar, spreading or reflexed; lip 3-lobed, the lateral lobes erect, inclosing the slender column, the middle lobe flat or recurved, keeled; column slightly curved, winged above; pollinia 4.—Species about 115, distributed from N. India to Ceylon, middle China, and in the islands of the Indian Ocean. The botanical details of *Cælogyne speciosa* are shown in Fig. 1021. At the top is a general view of the fl. Below, on the left, is the column, front and side view. In the center is the lip, with the column lying along its top. Below the lip, on the left, is the stigma. To the right, on the bottom row, are the pollinia, front and back view; and at the right center are separate pollen masses.

Cælogynes may be grown in pots, baskets or pans, using pots for small plants, and larger receptacles when the plants require them; but when a pan larger than 12-inch is necessary, it is best to use perforated ones so that the material may be well aerated and not become unsuitable for the roots. All the species are of rambling habit and large specimens may soon be had by growing on, provided the material at the roots is kept in a sweet healthy condition. When, however, it becomes necessary to divide a plant, this is best done directly after flowering, carefully separating the running shoots, cutting off about three of the last-made bulbs with all the roots attached, planting these in suitable-sized receptacles, being very careful to point the growing end away from the edge, or toward the center, so that they will not so readily outgrow again. The material to use is osmundine with a little sphagnum moss if it can be made to grow, packing all very firm about the roots so that too much water will not

be held about the roots. Place in the shady part of a warm house until root-action begins; but, during the hot summer months, the varieties of *C. cristata* may with great benefit be placed in a frame in a shady place outdoors, there to remain until danger of frost in October. Treated in this way, the plants will bloom much better. They should all be placed on inverted pots when outside to exclude vermin. When brought indoors the bulbs will be finishing up for bloom, and as they are terrestrial plants, weak manure-water should be given at every watering. A glance at the roots and their structure will show how they differ from the epiphytal orchids such as the cattleyas. Cælogynes, being evergreen, should never be quite dry at the roots, or shriveling will result; this always is the case after flowering or repotting; but, when growth commences, they soon plump up again. It is often desired to grow these plants in baskets. Space can then be made for them overhead in the cool-houses in winter, bringing a few at a time into warmth, thus having succession of bloom for three months for cutting, house or conservatory decoration, where they last a long time. There are more than 100 kinds of cælogynes, many of which are but of botanical interest. *C. pandurata*, *C. Dayana* and *C. Sanderiana* are warm-house plants and should be kept at a minimum temperature of 60° in winter. *C. nervosa*, *C. flaccida*, *C. nitida*, and *C. Massangeana* are coolhouse plants, often grown in collections; but *C. cristata* and its forms are the most valued, especially the variety *maxima* once so scarce, but now plentiful; this makes large bulbs and longer spikes of bloom. The Chatsworth variety, by some considered the same as *maxima*, *hololeuca* or *alba* as it is most often known in gardens, is a pure white form, perhaps the whitest of all orchids. This is inclined to ramble, owing to the length of rhizome between each bulb or growth, and needs attention in repotting frequently; it is also the latest to flower. *C. Lemoniana* has a pretty lemon-yellow blotch on the lip instead of the usual orange and is very pretty by

contrast with the other forms. When it is desired to increase the stock of plants, the back bulbs taken off at potting time may be planted similar to the other pieces and will grow on, but cannot be expected to bloom for two years. (E. O. Orpet.)

1022. *Cælogyne Massangeana*. (× ¼)

KEY TO THE SPECIES.

- A. Racemes with fls. opening in succession. 1. *speciosa*  
 AA. Racemes with fls. opening all at once.  
 B. Scape of the raceme naked between the pseudobulb and lowest fl.-bract.  
 C. Imbricated bracts below fls. none.  
 D. Keels of lip extending into broadly ovate front lobe..... 2. *lactea*  
 DD. Keels of lip not extending into ovate front lobe..... 3. *flaccida*  
 CC. Imbricated bracts below fls. several, close..... 4. *barbata*  
 BB. Scape of raceme with 1 or few scales between pseudobulb and lowest fl.-bract.

- c. Lip with a large eye-like spot.... 5. *nitida*  
 CC. Lip with no eye-like spot.  
 D. Keels of lip lacerated or fimbriated.  
 E. The scape arising from large lvs.  
 F. Fl.-bracts persistent..... 6. *nervosa*  
 FF. Fl.-bracts deciduous..... 7. *Sanderiana*  
 EE. The scape without large lvs.  
 F. Sepals about as long as broad; keels of the lip only slightly cut..... 8. *Förstermannii*  
 FF. Sepals about twice as long as broad; keels of lip strongly cut..... 9. *cristata*  
 DD. Keels of lip warty.  
 E. Peduncle, rachis and ovaries tomentose.  
 F. The scape arising from large lvs..... 10. *Dayana*  
 FF. The scape without large lvs.  
 G. The keels in middle lobe of lip papillose..... 11. *tomentosa*  
 GG. The keels in middle lip cut into tooth-like segms..... 12. *Massangeana*  
 EE. Peduncle, rachis and ovaries glabrous.  
 F. Pseudobulbs elliptic to ovate-oblong, compressed.  
 G. Middle lobe of lip separated from lateral lobes by a distinct claw..... 13. *pandurata*  
 GG. Middle lobe of lip sessile..... 14. *Mayeriana*  
 FF. Pseudobulbs fusiform, 4-sided.  
 G. Raceme many-fld., nodding..... 15. *asperata*  
 GG. Raceme few-fld., erect..... 16. *Parishii*

1. *speciosa*, Lindl. (*C. salmonicolor*, Reichb.). Pseudobulbs ovoid, distinctly angled, 2-3 in. long, 1-lvd.: lvs. up to a foot long; racemes with 1, 2 or 3 fls.; sepals oblong, translucent, pale yellow-brown; petals pale yellow-brown, linear, reflexed; lateral lobes of lip erect, reticulated, with dull copper-brown on a bluish-salmon ground, mid-lobe roundish, partly broad-margined with white; disk with 2 fringed ridges and umber-brown markings. Java. B.M. 4889. Gn. 49, p. 62. B.R. 33:23. C.O. 3. Var. *alba*, Hort. A light-colored form.

2. *lacteæ*, Reichb. f. Pseudobulbs ovate, somewhat 4-sided, sulcate, 2-lvd., 3 in. long; lvs. up to 10 in. long, 2 in. broad; fls. 6-12; sepals and petals spreading, cream-white, the sepals oblong-ovate, acuminate, the petals much narrower, linear-lanceolate; lip about as long as petals, the lateral lobes semi-ovate, truncate, the middle lobe about equaling one-half the whole length of the lip, triangular at the apex, acute, reflexed; keels 3, undulate, extending to the center of middle lobe. Burma.

3. *flaccida*, Lindl. Pseudobulbs ovate, angulate, 2-3 in. long; lvs. lanceolate, about 8-10 in. long; raceme 7-12-fld., cream-white, the sepals oblong, the petals linear-oblong; fls.  $1\frac{1}{2}$  in. across; sepals and petals pendulous; lip with 3 ridges, the lateral lobes white, streaked red-brown inside, the middle lobe reflexed, acute, a bright yellow blotch on the disk. Nepal. B.M. 3318. B.R. 27:31. C.L.A. 6:166.

4. *barbata*, Griff. Pseudobulbs about 2 in. long, ovate; lvs. broadly lanceolate, 10-12 in. long; raceme 6-10-fld.; sepals and petals white, the sepals ovate-oblong, the petals linear; mid-lobe of lip brownish inside, curiously fringed with brown; crests 3. Khasia hills.

5. *nitida*, Hook. f. (*C. ocellata*, Lindl.). Pseudobulbs pyriform or nearly so; lvs. up to 1 ft. long, narrowly lanceolate; racemes erect, 5-8-fld.; fls. 2 in. across, white, the sepals oblong, the petals linear-oblong; lip with bright orange-yellow spots on each of the lateral

lobes and 2 smaller spots at the base of the mid-lobe; disk with 3 keels, the front lobe of lip with 5. Himalayas, at an elevation of 7,000 ft. B.M. 3767. C.L.A. 1:55. Var. *máxima*, Reichb. Racemes longer; fls. larger. J.H. III. 52:25.

6. *nervosa*, A. Rich. (*C. corrugata*, Wight). Pseudobulbs ovate-pointed,  $2\frac{1}{2}$ -3 in. long; lvs. 6-12 in. long; racemes 3-6-fld.; fls. white, 2-2 $\frac{1}{2}$  in. across; sepals and petals nearly equal, oblong and acute; lip with the lateral lobes striped red inside, the middle lobe ovate, acuminate; disk yellow, with 3 white fringed keels. India. B.M. 5601.

7. *Sanderiana*, Reichb. f. Pseudobulbs ovate and wrinkled or costate, 2-3 in. long; lvs. a foot long; fls. about 6 in a pendulous raceme, 2-3 in. across, white; sepals lanceolate-acuminate; petals narrower; lip with the side lobes striped with brown inside and with a yellow blotch, the middle lobe oblong, acute, reflexed, undulate; disk bright yellow, with 6 fringed keels. India. J.H. III. 44:75.

8. *Förstermannii*, Reichb. f. Pseudobulbs cylindric or fusiform; lvs. up to  $1\frac{1}{2}$  ft. long; racemes many-fld.; fls. 2 in. across, white; sepals and petals lanceolate; lip with 3 denticulate keels, the middle lobe elliptic, acute; disk marked with yellowish brown. India.

1023. *Cœlogyne cristata*.  
( $\times \frac{1}{4}$ )

9. *cristata*, Lindl. Fig. 1023. Pseudobulbs  $1\frac{1}{2}$ -2 in. long, ovoid-oblong, scattered on a scaly rhizome; lvs. 8-12 in. long; racemes 5-9-fld., drooping; fls. white; sepals and petals lanceolate-oblong, undulate, acute, with 5 orange fringed keels, the lateral lobes slightly incurved, the mid-lobe transversely oval, denticulate. Nepal. J.H. III. 31:349. P.G. 1:55. A.G. 14:331; 15:513. A.F. 4:497; 6:87; 9:1111; 13:1133; 16:1445. C.L.A. 6:163. F.E. 9:331. B.R. 27:57. G.C. III. 47:40. O.R. 18:169. Gng. 2:393; 4:225. Var. *hololeuca*, Hort. (var. *alba*), has white fls., labellum without yellow. C.O. 1a. Var. *Lemoniana*, Hort. (var. *citrina*, Hort.), has citron-yellow fringes. J.H. III. 57:537. Var. *Chatsworthii*, Hort., has large pseudobulbs and large fls. of good substance. Var. *máxima*, Hort., has very large fls.—*C. cristata* is one of the best and most popular of orchids. It is one of the easiest to grow. Can be grown with cattleyas.

10. *Dayana*, Reichb. f. Pseudobulbs cylindric-fusiform, 5-10 in. long; lvs. up to  $2\frac{1}{2}$  ft. long, oblong-lanceolate; racemes many-fld., pendulous; fls. 2-2 $\frac{1}{2}$  in. across; sepals and petals pale yellow, margins reflexed, the petals much narrower than sepals; lip with 6 erect ridges fringed with brown, the lateral lobes brown, streaked with white inside, the middle lobe nearly quadrate, reflexed, apiculate. Borneo. G.C. III. 15:695. A.F. 35:380.

11. *tomentosa*, Lindl. Pseudobulbs elongated, ovoid, 2-3 in. long; lvs. up to a foot long, 3-5-nerved; racemes pendulous, tomentose; fls. 15-20, 2-2 $\frac{1}{2}$  in. across; sepals

and petals pale orange-red, sepals lanceolate, petals linear-lanceolate; lip with lateral lobes oblong, rounded, streaked with red on inside, the middle lobe reniform or transverse-elliptic, sessile; keels 3, crenulate, lateral ones converging in the middle lobe and sometimes bearing 2 branches. Perak, Borneo, Sumatra.

12. *Massangeana*, Reichb. f. Fig. 1022. Pseudobulbs pyriform, 3-5 in. long; lvs. elliptical, large, tapering toward the base, up to 20 in. long; racemes many-fl., pendulous, pubescent; fls. 2-3 in. across; sepals and petals pale yellow, the sepals oblong-lanceolate, the petals linear-oblong; lip with lateral lobes brownish within, lined or streaked with yellow, mid-lobe with a verrucose brown and yellow disk from which extend 3 denticulate keels. Assam. B.M. 6979. C.O. 4.

13. *pandurata*, Lindl. Pseudobulbs 3-4 in. long, oval-oblong, compressed; lvs. 15-20 in. long, cuneate-oblong; racemes many-fl., pendulous; fls. up to 4 in. across; sepals and petals green, linear-oblong, acute; lip fiddle-shaped, with black veins and stains on yellowish green ground, the mid-lobe crisped, black-warty; disk 2-keeled. Borneo. B.M. 5084. F.S. 20:2139. J.H. III. 30:377. A.F. 6:633. C.O. 6. Gt. 49:1480.

14. *Mayeriana*, Reichb. f. Pseudobulbs ovate-oblong, about 2 in. long, compressed, 2-lvd.: lvs. 8-10 in. long, cuneate-obovate; raceme 8-10-fl., erect or nodding; fls. about 2½ in. across, green, veined black-brown; sepals oblong, acuminate, the petals shorter and narrower, the margins reflexed; lip nearly as long as sepals, the lateral lobes concealing only the base of the column, the middle lobe sessile, oblong-elliptic, crisped; keels 3, papillose. Singapore.

15. *asperata*, Lindl. (*C. Loddii*, Paxt.). Large species (18-24 in. high); pseudobulbs ovate-oblong, 5-6 in. long or more; lvs. up to 2½ ft. long, lanceolate, acute; raceme 7-10-fl., pendulous; fls. 3 in. across, cream-colored; sepals and petals lanceolate, lip with the lateral lobes white, streaked red-brown inside, the middle lobe nearly orbicular, the crisped margin pale yellow streaked red-brown; disk with 2 or 3 orange-red warty ridges. Borneo. P.M. 16:227. G.C. III. 46:34.

16. *Parishii*, Hook. f. Like No. 13, but racemes not drooping, pseudobulb 4-angled, 4-6 in. long; lvs. up to a foot long, lanceolate, acuminate; racemes 4-7-fl., erect; fls. about 2 in. across, pale yellow-green; sepals lanceolate, acuminate; petals linear-lanceolate; lip fiddle-shaped, black-spotted, the middle lobe apiculate, undulate; disk with 5 raised lines. Moulmein. B.M. 5323.

*C. albo-lutea*, Rolfe. Fls. showy, very fragrant, pure white, with lobes yellow. Mts. of N. India.—*C. Brymeriana*, Hort. A garden hybrid between *C. Dayana* and *C. asperata*.—*C. burfordiensis*, Hort. (*C. pandurata* × *C. asperata*). Fls. pale green, the spiny crest black, the ridges green and yellow. G.C. III. 49:331.—*C. chrysotrópis*, Schltr. Scape much shorter than the lvs., few-fl. Sumatra.—*C. Colmanii*, Hort. A garden hybrid between *C. speciosa* major and *C. cristata* alba.—*C. Cumingii*, Lindl. Fls. white, the disk citron-yellow; sepals and petals lanceolate. Singapore. B.R. 27:29. B.M. 4645.—*C. fragrans*, Hort. A trade name.—*C. fuliginosa*, Lindl. Fls. appearing in succession, 2 in. across, light brownish white, the lip fringed. N. India. B.M. 4440. J.F. 1:7.—*C. Garderiana*, Lindl.—*Neogyne*.—*C. Lawrenceana*, Rolfe. Fl. single; sepals and petals yellow, 2-2½ in. long, the sepals lanceolate-oblong, the petals linear; lateral lobes of lip brown, the middle lobe white, the disk marbled with brown. Annam. B.M. 8164. G.C. III. 47:335.—*C. Mooreana*, Sander. Racemes 4-8-fl.; fls. white; disk golden yellow, covered with clavate processes. Annam. B.M. 8297.—*C. ochracea*, Lindl. Fls. about 2 in. across, fragrant, white, the lip blotched and streaked orange-yellow. N. India. B.R. 32:69. B.M. 4661. J.F. 4:342.—*C. perakensis*, Rolfe. Racemes many-fl.; sepals light buff, lanceolate-oblong, about ½ in. long; petals light green, linear, a little shorter than sepals; lip light yellow, with a deep yellow blotch on disk. Perak. B.M. 8203.—*C. præcox*, Lindl., var. *alba*. A nearly white form.—*C. Sanderæ*, Kränzl. Fls. white; sepals oblong-lanceolate; petals narrower, linear; lip yellow, marked with golden, the keels red-brown. Burma. G.C. III. 13:361.—*C. Veitchii*, Rolfe. Racemes many-fl., pendulous; fls. nearly globose, white, the sepals and petals much incurved; lip longer than sepals, the lateral lobes obtuse, the middle lobe ovate, revolute; disk obscurely 3-keeled. New Guinea. B.M. 7764.—*C. venusta*, Rolfe. Racemes many-fl., pendulous; fls. pale yellow, the lip white, marked with yellow. S. W. China. B.M. 8262.—*C. viridescens*, Rolfe. Resembling *C. Parishii*. Fls. pale green with dark dots on the lip. Annam. GEORGE V. NASH.

**COFFÈA** (from the Arabian name for the drink, itself conjecturally derived from Caffa, a district in southern Abyssinia). *Rubiaceæ*. Woody plants, producing the coffee of commerce; as a horticultural subject, sometimes cultivated for the ornamental appearance; and also in collections of economic plants.

Shrubs or small trees, natives of Trop. Asia and Afr.: lvs. mostly opposite, rarely in whorls of 3, elliptical, acute, usually coriaceous and glossy; fls. clustered in the axils, cream or cream-white and fragrant; calyx-limb 5-, rarely 4-, parted, the corolla salver-shaped, the corolla-tube cylindrical, the throat sometimes villous; stamens inserted in or below the throat of the corolla: fr. a berry; seeds 2, horny, which are the well-known coffee of commerce.—From 25-40 species, in Trop. Afr. and Asia, the species not yet clearly defined, nor well understood horticulturally.

Coffee-production is based mostly on *C. arabica* and *C. liberica*, both widely cultivated throughout the tropics, and in greenhouses northward. The coffee industry, one of the most important industries in the tropics, reaches the enormous figure of \$200,000,000 or sometimes a little more than this. See the treatment in Vol. II Cyclo. Amer. Agri.

*The coffee plant and its product.* (T. B. McClelland.)

The main source of coffee is *Coffea arabica*, an ever-green shrub, growing 10 to 15 feet high. The younger plants have one main trunk or stem, but from this others frequently develop later, which are similar in form and habit to the first. The lateral branches are opposite, horizontal and in pairs, very rarely in whorls of three. The pairs of branches are in whorls on the main stem. The leaves, which are opposite and borne in pairs, are 4 to 7 centimeters (about 1½ to 3 inches) broad by 10 to 20 centimeters (4 to 8 inches) long, the length being usually slightly more than two and a half times the breadth. They are elliptical, acuminate at tip and attenuate at base. There are eight to eleven pairs of main lateral veins. In the axils where the veins join the midrib are small pores, open below and slightly swollen above. The tip of the leaf is frequently curled and is rather abruptly contracted. The margin is entire and wavy. The leaves, which are perennial, are a dark glossy green, and though thin are firm in texture.

There are usually two or three large blossomings and several small ones extending over a period of several months. The pure white and delicately fragrant star-like flowers are borne on very short pedicels in one to four axillary clusters of one to four flowers each. These flower-clusters are subtended by two to four common calyculi. The tube of the corolla is 8 to 10 millimeters (about ½ to ⅔ inch) long. Its segments are about 7 millimeters (nearly ⅓ inch) broad by 15 to 18 millimeters (⅔ to ¾ inch) long. The style is 17 to 22 millimeters (⅔ to nearly 1 inch) long. The stigma is two-branched, each branch being 5 millimeters (about ½ inch) long. The linear anthers, corresponding in number to the petals, are 9 millimeters long and are supported on filaments 5 to 7 millimeters long. The size varies somewhat with favorable or unfavorable conditions. The short annular calyx with its denticulate limb is so small as almost to escape notice.

Under *Coffea arabica* are included a number of varieties quite distinct in growth and product from the other varieties of the same species, such as Maragogipe, Mocha, Pointed Bourbon (sometimes classified as *C. laurina*) and others.

Maragogipe coffee, as its name indicates, is of Brazilian origin, having been discovered in 1870 near the town from which its name is derived. On account of the large size of the bean it has commanded a fancy price on the market, but this variety is considered to be a small yielder. The flowers, fruits, and leaves are all larger than the ordinary Arabian coffee and the

leaves curl noticeably. Its flavor is not considered superior to that of the ordinary Arabian coffee.

Mocha coffee, with its shorter internodes and smaller flowers, fruits, and leaves is a distinct variety. The "beans" are much less oval and are more rounded and hold a high reputation for quality.

Normally two coffee "beans", or seeds are produced in each red cherry-like drupe. Some drupes, however, contain three beans and others only one. When only one is formed it is called "peaberry," and is oval in shape instead of being flat on one side and convex on the other as is the bean when two are produced. The peaberries are sorted out by machinery and are sold at a fancy price on account of being a little different in appearance from the other coffee, but any claim to superiority of flavor is without foundation. There is one variety of coffee that produces a number of beans in each drupe, and the corolla-segments may range up to ten. As the number of beans increases, the size and the attractiveness of appearance decrease, so that this is a very undesirable variation.

The fruits require six and one-half to seven months to mature. The ripening of the coffee, in relation to the blossoming, extends over several months. Where the West Indian or wet process for curing the coffee is followed, the ripe cherries are picked every fortnight. While fresh they are passed through a machine which pulps and separates the coffee in its parchment from the pulp. The former is then fermented and washed to remove a slimy covering. After thorough drying in the sun or in heated driers, the parchment coffee may be stored or it may have the thin brittle parchment or horn-skin and the silver-skin removed by special machinery. If desired it may be further polished and artificially colored. After being sized and having the better grades cleaned of inferior beans, it is ready for roasting. In some places where the dry or old preparation is followed the coffee is allowed to ripen and much of it to fall from the trees and lie on the ground until all can be collected in one picking. It is then dried in the sun without preliminary preparation.

1024.  
*Coffea arabica*.  
( $\times \frac{1}{4}$ )

Although coffee has been used as a beverage for hundreds of years by a few persons, as a world beverage it is comparatively modern. In 1825 the estimated production did not exceed 218,255,400 pounds. In 1906-1907 the production was estimated as 3,164,041,920 pounds, or an increase of 1,350 per cent in eighty-one years.

Brazil produces about three-fourths of the world's coffee crop. Then follow in order of importance Venezuela, Colombia, Guatemala, Mexico, Haiti, Salvador, Dutch East Indies, Porto Rico, British India, Costa Rica, Nicaragua, and other countries.

In Bulletin No. 79, Bureau of Statistics, United States Department of Agriculture, may be found a very extensive bibliography of coffee. In the Netherlands the per capita consumption is more than 15 pounds; in the United States under  $11\frac{1}{2}$  pounds; in Japan .003 pound.

A. Corolla 5-parted, sometimes 4-parted.

B. Segms. of corolla narrow: lvs. oblong, 4-5 in. long,  $1\frac{1}{2}$  in. wide.

**arábica**, Linn. COMMON OR ARABIAN COFFEE. Fig. 1024. Lvs. 3-6 in. long, rather thin, oblong, nearly 3 times as long as broad, more or less abruptly contracted near the apex to a point about  $\frac{1}{2}$  in. long; segms. of corolla over twice as long as wide: fr. a 2-seeded, deep crimson berry, but the "berries" or beans of commerce are the seeds. The commercial varieties of coffee are based largely on the size, shape, color and flavor of the seeds, and hence the fr. is very variable, but the typical fr. may be considered to be oval and  $\frac{1}{2}$  in. long. Indigenous in Abyssinia, Mozambique and Angola; supposed to have been intro. in early Mohammedan times from Abyssinia to Arabia, whence it became known to Europeans in the 16th century. This species furnished until recently the entire commercial product. B.M. 1303. Gng. 6:55.—A variegated form, var. **variegata**, Hort., is more showy than the type. It is offered by dealers in tropical plants. As coffee grows wild in Afr. it is a small tree 10-15 ft. high, with the trunk 9-12 in. thick at the base. Often cult. under glass in the N. for its economic interest, and in S. Calif. it is a good outdoor ornamental shrub, esteemed for its shining lvs., fragrant white fls., and red berries.

BB. Segms. of corolla wide: lvs. ovate.

**bengalensis**, Roxbg. BENGAL COFFEE. Lvs. ovate, barely twice as long as broad, acute, but not having a long, abrupt point: fls. in 2's or 3's; segms. of corolla barely twice as long as wide. E. Indies, Malaya. B.M. 4917.—This has much showier fls. than *C. arabica*. A small shrub with glabrous, dichotomous branches. Mts. of N. E. India, whence it was brought to Calcutta and much cult. for a time. It is now neglected, the berries being of inferior quality and the plants not productive enough.

AA. Corolla 6-, 7-, or 8-parted.

B. Fls. in dense clusters or glomes: lvs. short-pointed.

**libérica**, Hiern. LIBERIAN COFFEE. Lvs. longer than in *C. arabica*, and wider above the middle, with a proportionately shorter and less abruptly contracted point: fls. 15 or more in a dense cluster; corolla-segms. usually 7. Trop. Afr. Trans. Linn. Soc. II. 1:171 (1876). G.C. II. 6:105. R.H. 1890, pp. 104-5.—Said to be more robust and productive than *C. arabica*, with berries larger and of finer flavor. It is a more tropical plant than the common coffee, and can be grown at lower levels.

**Zanguebariæ**, Lour. (*C. zanzibarensis*, Hort.). A glabrous, erect, closely branched shrub or small tree, to 6 ft., the branches ash: lvs. ovate or obovate, obtuse or shortly pointed, 2-4 in. long,  $\frac{3}{4}$ - $1\frac{1}{2}$  in. wide, the lateral veins about 6 pairs: fls. white, axillary, in dense clusters; corolla-lobes 6-7: berry red, turning black.

BB. Fls. solitary or in 3's: lvs. long-pointed,  $2\frac{1}{2}$ -5 in. long.

**stenophylla**, Don. Lvs. 4-6 in. long,  $1-1\frac{1}{2}$  in. broad, narrower than in *C. arabica*, with a relatively longer and more tapering point: corolla-segms. usually 9. W. Afr. B.M. 7475.—This is said to yield berries of finer flavor than the Liberian coffee, and quite as freely, but the bush is longer in coming into bearing. This is a promising rival to the *C. arabica* of commerce. Seeds have been distributed by British botanical gardens, but are not known to be for sale at present in Amer.

*C. madagascariensis*, Hort., and *C. robusta*, Hort., are names of uncertain status.

WILHELM MILLER.  
N. TAYLOR.†

COFFEE: *Coffea*.

**COFFEE BERRY.** A name of *Glycine hispida*, which should be abandoned in favor of soybean. Various leguminous seeds are used as coffee substitutes and are so named; cf. *Cassia*, *Canavalia* and others.

**COFFEE PEA.** A western name for chick pea, *Cicer arietinum*, which is used as a substitute for coffee.

**COFFEE-TREE:** *Gymnocladus*.

**COHOSH:** *Actæa*. The blue cohosh is *Caulophyllum*.

**COHUNE:** *Attalea Cohune*; it is a source of oil.

**COIR:** Fiber of coconut, which see.

**CÔIX** (an old Greek name). *Gramineæ*. Tall, broad-leaved, branched grasses with bead-like inflorescence, one of them grown in gardens.

Plant loose-growing: at the end of each peduncle is an indurated, globular, or oval, hollow bead, developed from a lf.-sheath; from an orifice at the tip projects the staminate spike: pistillate fls. inclosed in the bead, the styles projecting.—Species about 3, E. Indies, the following widely distributed in all tropical countries.

**Lácryma-Jôbi**, Linn. **JOB'S TEARS**. Fig. 1025. Annual, 2-4 ft.: the beads or "tears," pearly white to lead-color, containing the seed, are about  $\frac{1}{2}$  in. long. Dept. Agric., Div. Agrost., 20:14.—Cult. for ornament and as a curiosity. The hard bony frs. are used as beads and made into necklaces, to which are attributed marvelous properties. Var. *aurea zebrina*, has yellow-striped blades. A. S. HITCHCOCK.

**CÔLA** (native name). *Sterculiææ*. **COLA**. Also called Kola, Korra, Gorra. One species is much grown in the tropics for the stimulating cola nut.

The genus consists entirely of plants with unisexual or polygamous fls. in axillary or terminal clusters: calyx 4-5-cleft; petals none: fr. of 4-5 leathery or woody oblong carpels.—Probably about 40 species, of Trop. Afr. trees chiefly interesting for the cola nuts, which are said to sustain the natives in great feats of endurance. The tree grows on the east coast of Afr., but is very abundant on the west coast, and is now cult. in the W. Indies. Within the tropics the trade in this nut is said to be immense. It has become famous in the U. S. through many preparations for medicinal purposes and summer drinks. The seeds are about the size and appearance of a horse-chestnut, and have a bitter taste. Although repeatedly intro. to Kew, England, the plant never flowered there until 1868.

Colas require a rich, well-drained soil. Those introduced into the West Indies and other parts of America, especially *C. acuminata*, thrive best on a sandy loam. The trees are grown from seeds, which are large and fleshy, keeping well for some weeks after ripening. As the tree is difficult to transplant, the seeds may be planted singly in small pots, and the young trees kept growing thus until wanted for permanent planting. Propagation may also be effected by cuttings of ripe wood, which should be placed in bottom heat, and treated in the usual way. (E. N. Reasoner.)

*acuminata*, Schott & Endl. About 40 ft. high in Afr., resembling an apple tree: lvs. alternate; petiole 1-3 in. long; blade 4-6 in. long, 1-2 in. broad, leathery, with prominent ribs below; older lvs. entire, obovate, acute; younger lvs. often once or twice cut near the base about half way to the midrib: fls. yellow, 15 or more in axillary and terminal panicles, about  $\frac{1}{2}$  in. across, with a slender green tube and a showy yellow 6- or 5-cut limb, which is a part of the calyx: fr. 5-6 in. long. B.M. 5699.

N. TAYLOR.†

**CÔLAX** (Greek, *parasite*). *Orchidææ*. Epiphytic orchids, much like *Lycaste*.

Pseudobulbous: fls. in an upright raceme, arising from the base of the new shoot; sepals and petals similar, the lateral sepal forming a distinct foot with the base of the column; lip 3-lobed, clawed, with a transverse hairy process; pollinia 4.—A Brazilian genus of 2 species.

*jugôsus*, Lindl. (*Maxillaria jugôsa*, Lindl. *Lycaste jugôsa*, Benth.). Pseudobulbs ovoid, 2-3 in. long, 2-lvd.: lvs. 5-9 in. long, lanceolate: raceme 2-3-fl.; fls. 2-3 in. across; sepals white, obtuse, oval-oblong; petals white, obovate-oblong, spotted and barred with violet-purple; lip white, shorter than petals, the side lobes streaked violet-purple, the middle lobe semi-circular, with numerous pubescent keels, streaked and blotched violet-purple. B.M. 5661. I.H. 19:96.

*C. tripteris*, Rolfe. Ovary 3-winged; disk of lip bearing a broad fleshy callus. Brazil.

GEORGE V. NASH.

**CÔLCHICUM** (from Colchis, a country in Asia Minor, where the genus is most plentiful). *Liliææ*. **MEADOW SAFFRON**. **AUTUMN CROCUS**. Autumn flowering, rarely spring-flowering, bulbous plants with crocus-like blossoms.

Leaves either all radical, or radical and cauline, sometimes ciliate, appearing in early spring and usually dying down by June: fls. various colored, very beautiful; perianth tubular, varying from purple to white (there is 1 yellow-fl. sort), the limb 6-parted; stamens 6, inserted on the perianth; ovary 3-celled, many-ovuled: caps. ovate-oblong in most of the species, the seeds globose.—A difficult genus, very much confused botanically, but horticulturally well known and popular. They are narcotic poisons. J. G. Baker, Jour. Linn. Soc. 17. 1880. G. B. Mallett, in Flora and Sylva, 1:108, 1903, has an excellent horticultural account of the genus.

Colchicums are most charming and interesting plants of easy culture. The bloom comes in August and September, at a season when the herbaceous beds begin to lose their freshness, and, although individual flowers are fugacious, others follow in quick succession, thus prolonging the time of flowering. Opening, as they do, without foliage, some help is required from the greenery of other plants; for this purpose any low-growing, not too dense kind, may be used, such as the dwarf artemisias, sedums, or *Phlox subulata*. Colchicums are most effective in masses, which can be established by thick planting, or as the result of many years' growth. They can be grown in rockwork, in beds, or in grass which is not too thick nor too often mown; they will thrive in partial shade, but succeed best in an open sunny border. They should be planted in August or early September, in deep well-enriched soil, a light sandy loam, with the tip of the long bulbs 2 to 3 inches below the surface; some protection should be given in winter. They remain in good condition for many years, and should not be disturbed unless they show signs of deterioration, fewer flowers and poor foliage. Then

1025.  
Coix Lacryma-Jobi.  
( $\times \frac{1}{2}$ )

they should be lifted and separated, just after the leaves die, end of June or early July. This is the usual method of propagation, but they can also be increased from seeds, sown just after ripening, June to July; the seedlings may not appear until the following spring. Seedlings bloom when three to five years old. The bulbs are obtainable from the Dutch growers at moderate prices, and they must be imported early; otherwise they are apt to bloom in the cases. *C. autumnale*, with rosy purple flowers, is a well-known and the most commonly cultivated species. There are numerous varieties, of which the best are the white, the double white and the double purple. Belonging to this same group and not differing much except in size and shading of the flower, are *C. byzantinum*, *C. montanum*, and *C. umbrosum*. *C. speciosum*, a native of the Caucasus, is the finest in every way of the genus. The flowers are much larger and of better shape, and the color, a rosy pink, is much more delicate; the habit of growth is robust, and the plant is most easily handled. *C. Parkinsonii* is distinct from the above varieties inasmuch as the flowers are tessellated, purple and white, giving a curious checker-board appearance which is unique; the leaves are much smaller and are wavy. *C. agrippinum*, *C. Bivonæ*, *C. cilicicum* and *C. Sibthorpii*, are other species having checkered flowers more or less similar to *C. Parkinsonii*. *C. Bulbocodium*=*Bulbocodium vernalis*. Monograph by J. G. Baker in Jour. Linn. Soc., vol. 17 (1880). (B. M. Watson.)

## INDEX.

*byzantinum*, 11.  
*chionense*, 5.

*cilicicum*, 11.  
*crociflorum*, 2.  
*Decaisnei*, 14.  
*fasciculare*, 16.  
*luteum*, 4.  
*maximum*, 10.  
*montanum*, 1, 18.  
*Parkinsonii*, 6.

*Sibthorpii*, 9.  
*speciosum*, 10.  
*Stevenii*, 3.  
*superbum*, 8.  
*tessellatum*, 6, 7.  
*Troodii*, 15.  
*umbrosum*, 17.  
*variegatum*, 5.

## A. Blooming in spring: lvs. appearing with the fls.

## B. Color rosy lilac: size of anthers small.

## C. Anthers oblong, purple.

1. *montanum*, Linn. (*C. Bertolonii*, Stev.). An important and variable species, with many synonyms and variations. Baker makes 7 forms. Corm ovoid,  $\frac{1}{2}$ -1 in. thick, the tunics brown, membranaceous, the inner ones produced to a point 2-4 in. above the neck: lvs. 2-3, rarely 4-6, linear or lanceolate, about 2-3 in. long at the time of flowering, finally 6-9 in. long: fls. 1-4, in spring and autumn. Oct.-June. Medit. region, from Spain to Persia. B.M. 6443.—It appears in early spring with the snowdrops and crocuses.

2. *crociflorum*, Regel, not Sims nor Schott & Kotschy. Corm ovate-oblong: lvs. all radical, sheathing at the base, a few sometimes on the st., flat and linear, margins minutely and usually distantly toothed: corolla white, with violet-purple stripes, especially within, the tube about 2 in. long, the limb scarcely  $1\frac{1}{3}$  in. long; style exceeding the stamens. Feb., March. Cent. Asia.

## CC. Anthers linear, yellow.

3. *Stevenii*, Kunth. Corm narrower than in No. 1, about  $\frac{1}{2}$ - $\frac{3}{4}$  in. thick: lvs. at length 4-5 in. long: fls. Oct.-Jan. Syria, Arabia, Persia.—Less popular than No. 1.

## BB. Color yellow: size of anthers large.

4. *luteum*, Baker. This is the only yellow-fl. form in the genus, all the others ranging from purple to white. Although it belongs to the Medit. group, with lvs. and fls. produced at the same time and in spring, it is a native of W. India at an elevation of 7,000-8,000 ft. Corm tunics dark brown, sometimes almost black: lvs. 3 or 4, wider and less tapering than in No. 1, at the time of flowering 3-4 in. long, finally 6-7 in. long. B.M. 6153.—Very desirable.

## AA. Blooming in autumn: lvs. appearing after the fls.

## B. Perianth tessellated or checkered.

## C. Tessellation distinct.

## D. Lvs. spreading or prostrate.

5. *variegatum*, Linn. Lvs. 2-3, lanceolate, about 6 in. long, 12-15 lines wide, lying flat on the ground; margins wavy: fls. 2-3 from each spathe, 4 in. across, rose-color with a white tube. Isls. of the Levant and Asia Minor. B.M. 1028. Variable. The plant known as *C. chionense* is apparently a form of it. Corm size of walnut.

6. *Parkinsonii*, Hook. f. (B.M. 6090) (*C. tessellatum*, Authors), is the best of all the tessellated forms, the tessellation being more sharply defined and more delicate

than the type. It is a smaller plant, and has shorter and more strongly undulated lvs., which lie closer to the ground. Of this plant Parkinson said in his "Paradiseus Terrestris," 1629: "This most beautiful saffron flower riseth up with his flowers in the Autumne, as the others before specified doe, although not of so large a size, yet farre more pleasant and delightfull in the thicke, deep blew, or purple

1026. *Colchicum autumnale*. ( $\times \frac{1}{2}$ )

coloured beautiful spots therein, which make it excell all others whatsoever: the leaves rise up in the Spring, being smaller then the former, for the most part 3 in number, and of a paler or fresher green color, lying close upon the ground, broad at the bottome, a little pointed at the end, and twining or folding themselves in and out at the edges, as if they were indented. I have not seen any seede it hath borne: the root is like unto the others of this kinde, but small and long, and not so great: it flowereth later for the most part then any of the other, even not untill November, and is very hard to be preserved with us, in that for the most part the roote waxeth lesse and lesse every yeare, our cold Country being so contrary unto his naturall, that it will scarce shew his flower; yet when it flowereth any thing early, that it may have any comfort of a warm Sunne, it is the glory of all these kindes."

## DD. Lvs. ascending.

## E. Margin of lvs. wavy.

7. *agrippinum*, Baker (*C. tessellatum*, Hort.). Corms a trifle thicker than in No. 5: lvs. 3-4, 6-9 in. long, 12-15 lines wide, margin wavy: fls. 2-4 from each spathe. F.S. 11:1153.—This is a marked form of *C. variegatum*, of garden origin, which has similar fls., but a more robust habit and more nearly erect lvs.

## EE. Margin of lvs. flat, not wavy.

8. *Bivonæ*, Guss. Lvs. 6-9, nearly 1 ft. long, 9-15 lines wide, rather hooded at the apex, margin flat, not wavy: fls. 1-6 from each spathe, rose-purple faintly checkered with a darker color, 4-6 in. long. Medit. region. Var. *superbum*, Hort., an excellent form, is advertised in English catalogues. F.S.R. 1:108.

cc. *Tessellation less distinct.*

9. *Sibthorpii*, Baker. Easily distinguished from Nos. 5, 7, and 8 by the much broader segms. of the perianth, and by the lvs., which are nearly erect, obtuse, and not at all wavy: lvs. 5-6, dull green, finally 1 ft. or more long,  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. wide, narrowed gradually to the base: spathe striped with green, and tinged with lilac at the tip: fls. 1-5 from each spathe; perianth-tube often 6 in. long. Mts. of Greece. B.M. 7181. F.S.R. 1:108. —A large, cup-shaped fl., showing no open spaces between the broad, overlapping segms. Very handsome.

bb. *Perianth not tessellated.*

c. *Size of fls. large, 3 in. or more across.*

d. *Lvs. broad, 3-4 in. wide.*

e. *Number of fls. 1-4.*

10. *speciosum*, Stev. Corm 2 in. thick, the largest of the genus: st. 1 ft. high: lvs. 4-5, 12-15 in. long, 3-4 in. wide, narrowed from the middle to the base, shining green: fls. 1-4 from each spathe, violet, with a white eye, but varying almost to pure pink, often 6 in. across. Caucasus. B.M. 6078. F.S. 23:2385. F.M. 1876:235. Gn. 11:80.—Commonly considered the finest species of the genus; blooms Sept. and Oct. Var. *maximum*, Hort. Plant  $7\frac{1}{2}$  in. high.

ee. *Number of fls. 12-20.*

11. *byzantinum*, Ker-Gawl. Closely allied to the above, but with wider lvs., smaller and paler fls., and broad, short anthers: st. 6 in. high: lvs. 5-6, oblong, dark green, striate, 9-12 in. long, 3-4 in. wide: fls. smaller than in No. 10, usually 3-4 in. across, lilac-purple, and often 12-20 from each spathe. Transylvania and Constantinople. B.M. 1122.—Corm large, depressed. *C. cilicicum*, Hort., has rosy fls., somewhat tessellated. G.C. III. 23:35.

dd. *Lvs. narrow, 1-2 in. wide.*

12. *Bornmülleri*, Freyn. Lvs. elliptic-lanceolate, 3-4 in. long, 1-2 in. broad: fls. 8 in. long and 5 in. across, the limb pale rose or lilac-rose at first, subsequently deeper purple, the corolla-tube white. Asia Minor. Early spring.—One of the rarest and finest of the group, suitable for the rock-garden.

13. *autumnale*, Linn. Fig. 1026; 442, p. 433. St. 3-4 in. high: lvs. 3-4, rarely 5-6, 9-12 in. long,  $1\frac{1}{2}$ -2 in. wide: fls. 1-4, rarely 5-6, from each spathe, purple, with a white variety, about 4 in. across; perianth veined. Eu. and N. Afr. B.M. 2673 (as *C. crociflorum*). —Possibly the commonest in the American trade. It has beautiful double forms in purple and pure white. F.S. 19:1936.

14. *Decaisnei*, Boiss. Corm ovate, membranaceous: lower lvs. broadly lanceolate, the upper ones narrower and acutish, entire, 1- $1\frac{1}{2}$  in. broad: fls. pale-rose, or flesh-colored, the tube elongate-elliptic, the stamens a little shorter than the perianth; anthers yellow, linear; style only slightly exceeding the stamens. N. Afr. and the eastern Medit. region. Nov.-Jan.—Planted in masses with *C. crociflorum* for rock-gardens, it is very effective.

cc. *Size of fls. small, about 2 in. across.*

d. *Number of fls. from each spathe more than 1 or 2.*

e. *Perianth-segms. acute.*

15. *Troëdii*, Kotschy. Corm medium-sized: lvs. 3-4, 6-12 in. long, 9-12 lines wide, dark green above: fls. 4-5 or even 12, lilac-purple, about 2 in. across; perianth segms. lanceolate-acute. Cyprus. B.M. 6901 shows a pure white variety.

16. *fasciculare*, Boiss. Corm oblong: lvs. 5-7, broadly lanceolate, channeled, the apex acutish, frequently ciliate, about 1 in. wide: fls. many, in clusters,

the corolla  $2\frac{1}{2}$  in. long, white, 6-10-nerved; stamens equalling the corolla, but slightly exceeded by the style branches. Feb. Syria.

ee. *Perianth-segms. obtuse.*

17. *umbròsum*, Stev. Corm small: lvs. 4-5, 6-9 in. long, 9-12 lines wide: fls. 1-5 from each spathe, lilac, about 2 in. across; perianth-segms. oblanceolate, obtuse, with 8-12 veins. Caucasus.

dd. *Number of fls. from each spathe 1 or 2.*

18. *alpinum*, DC. (*C. montanum*, All. not Linn.). Lvs. 2, rarely 3, nearly erect or spreading, 4-8 in. long, 3-6 lines wide, obtuse, channeled, shining green, narrowed from the middle to the base: fls. 1 or 2 from each spathe, about 2 in. across, lilac; segms. oblanceolate, obtuse, 3-4 lines wide, with 10-15 veins. Mts. of France and Switzerland.

*C. gigantum*, Hort. A plant with magnificent pink fls.—Is not certainly referable to any species. The name appears in several catalogues, but is unknown in botanical literature. See F.S.R. 1:108.—*C. hydrophilum*, Hort. An early spring-flowering species; bulb size of a walnut: lvs. and fls. appearing together, the fls. bright clear rose and taller than the lvs., the latter growing after the fls. are gone and attaining a length of 6 in.; fls. in clusters of 3-15; stamens half as long as the segms. Taurus Mts. G.C. III. 29:102.—*C. siehdanum*, Hort. A late autumn-flowering species with rich reddish purple fls. Asia Minor.—*C. veratrifolium*, Hort. Similar to some of the forms of *C. speciosum*, but earlier in flowering.

WILHELM MILLER.

N. TAYLOR.†

**COLDFRAME.** An unheated covered frame (see *Frame*) used (1) for the starting of plants in spring in advance of settled weather but not so early as in a hotbed; (2) for receiving plants from a hotbed or greenhouse, holding them as an intermediate station until they may go in the field; (3) carrying hardy plants over winter, as spinach, lettuce; (4) providing a general store-place for hardy or semi-hardy stuff from greenhouse and garden; (5) affording a propagating-bed in spring and summer for seeds or cuttings. Usually the coldframe is topped with glass, as is the hotbed, but prepared paper or cloth is sometimes used. Coldframes are usually of temporary construction. L. H. B.

**COLD-STORAGE, REFRIGERATION, RETARDING.** Dealers in bulbs, cut-flowers, nursery stock, fruits and vegetables employ cold-storage to retard the growth of bulbs and plants, or to preserve cut-flowers and produce, by using specially constructed sheds, refrigerators, ice-boxes, or the public cold-storage warehouses. The nursery stock thus stored can be packed and shipped from the cold to warmer parts of the country in good season for planting, when it would be impossible to dig and ship such stock without the storage system. Sheds for the storage of nursery stock have earthen floors, are ventilated and lighted from the ridge-and-furrow roof and heated to exclude frost, the maximum temperature being 35° to 40°. Large trees are stood upright, the smaller stock usually laid lengthwise in compartments. The roots are covered with sphagnum, or a mixture of sphagnum and excelsior or cedar shingletow: the shingletow or excelsior alone will not make good covering for this purpose. See *Nursery*.

The roots and bulbs commonly placed in cold-storage are those used by florists for forcing, such as lily bulbs, lily-of-the-valley pips, and the like. By placing these in cold-storage, growers can secure a continuous succession of bloom throughout the year. Lily bulbs are stored in the original cases packed in soil, the cases being cleated to provide circulation of air, and held at 34°. The *multiflorum* and *formosum* varieties of *Lilium longiflorum* can be held in storage three to four months, and the *giganteum* type of this lily ten to eleven months, *L. auratum* four months, *L. speciosum* and varieties eight months. The sizes (circumference) of storage lily bulbs and number of bulbs to the case are as follows:

*L. longiflorum* and its varieties *multiflorum*, *formosum* and *giganteum*, 6- to 8-inch, 400; 7- to 9-inch, 300; 9- to 11-inch, 200; in *L. longiflorum giganteum* there is an 8- to 10-inch size which runs 225 to the case; *L. auratum* 8- to 9-inch, 160; 9- to 11-inch, 100; 11- to 13-inch, 75; *L. speciosum*, 8- to 9-inch, 200; 9- to 11-inch, 100; 11- to 13-inch, 75. Lily-of-the-valley pips are packed in a mixture of sphagnum and sand, one-fourth of the latter being used to three-fourths of the moss and held at 28°. These are packed 500, 1,000 and 2,000 to the case and

can be kept in storage eleven months. Canna roots, dahlias and gladioli should be held at 35° to 40°.

Cut-flowers, such as roses, carnations, orchids, violets, and lilies, used by florists, are preserved for varying periods in ice-boxes or refrigerators, the usual temperature being 35° to 40°. Peonies cut when the buds show color, leaves removed

from the lower part of the stem, wrapped in paper, and the lower bare portions of the stems placed in water, will keep several weeks at a temperature of 32° to 33°. *Lilium candidum* in bud can be treated the same way.

Fruits and vegetables are stored at 33° to 35°. Warehousemen say that cold-storage merchandise keeps best and is easiest to handle in packages containing about a bushel. See *Storage*. MICHAEL BARKER.

**COLE.** A generic name, little known in North America, for plants of the cabbage tribe; cole-oil is secured from species of *Brassica*.

**COLEA** (Sir G. Lowry Cole, Governor of Mauritius). *Bignoniaceæ*. Glabrous evergreen trees or shrubs of Madagascar, Mauritius and the Seychelles, members of which may occur in collections of warmhouse (or stove) plants. Lvs. opposite or verticillate, pinnate, with many entire lfts.; fls. medium-sized, yellow, white or rose-color in lax or dense cymes or fascicles; corolla funnelform, somewhat bilabiate, with 5 rounded spreading lobes; perfect stamens 4, didynamous.—Probably 15 species, but little known in cult. They thrive in a fibrous earth and prop. by means of mature shoots in sand over bottom-heat.

**COLEUS** (Greek for *sheath*, referring to the monadelphous stamens). *Labiataæ*. Common window-garden and greenhouse showy-leaved herbs, and a few less known species grown for the handsome flowers.

Herbs or small shrubs, annual or perennial, upright: lvs. opposite, dentate or serrate, petioled or sessile: st. 4-angled: fls. mostly blue or lilac, in terminal spike-like racemes, small and middle-sized and usually bluish, the 5-toothed calyx deflexed in fr.; corolla bilabiate, the lower lobes longer and concave, and inclosing the essential organs; stamens 4, didynamous and declinate, the filaments united into a tube, the anther-cells confluent; ovary 4-parted, subtended by a gland-like disk, the style 2-lobed.—Probably 150 species, in the tropics of the eastern hemisphere, being especially abundant in Afr., E. India and adjacent isls. Some species produce tubers that are eaten in the same way as potatoes.

The common coleuses are of the most easy culture. They root readily from short cuttings, cut either to a joint or in the middle of an internode (Fig. 1027). Few conservatory plants are more ready to root than this. They may be rooted at any time of the year when new

wood is to be secured. Formerly coleuses were much used for bedding, but the introduction of better plants for this purpose has lessened their popularity. They require a long season; they are likely to burn in the hot summers of the interior country; they have a weedy habit. However, they withstand shearing and therefore are useful for carpet-bedding. The leading variety for this purpose is still the old Golden Bedder, whose golden yellow foliage is used as filling for fancy designs.—Coleus plants make excellent specimens for the window-garden and conservatory. Best results are secured when new plants are started from cuttings each spring. They also grow readily from seeds, many interesting leaf-forms and colors arising. The old plants become leggy, lose their leaves, and lack brightness of color. They are very subject to mealy-bug. They are also liable to root-gall (the work of a nematode worm), as shown in Fig. 1028. When plants are thus affected, take cuttings and burn the old plants, and either bake or freeze the earth in which they grew.

A. Common garden coleus, with red, purple, yellow, green and variegated foliage.

**Blumei**, Benth. (*C. Verschaffeltii*, Lem. *C. scutellarioides* var. *Blumei*, Miq.). This species, founded on cult. plants in Java, is probably to be regarded, as now understood, as an assemblage or combination of species. The horticultural forms are perhaps derived in part (as suggested by Briquet and by Koorders) from *C. laciniatus*, *C. bicolor*, and others; and perhaps they are to be considered also in connection with *C. atropurpureus*, Benth., of Malaysia, and its relatives. The entire garden material needs to be worked over in

comparison with authentic native oriental specimens. Portraits of *C. Blumei* of botanical interest are: B.M. 4754. I.H. 27:3-7; 35:46; 39:164. F.S. 22:228778. A soft perennial herb or sub-shrub, growing 2-3 ft. high, little branched: lvs. ovate, narrowed or broad at base and long-acuminate, sharply and nearly regularly toothed, variously colored with yellow, dull red and purplish. An extreme form of this is var. *Verschaffeltii*, Lem., Fig. 1030, which is more robust and branchy, the lvs. more brilliantly colored, acute but not acuminate, truncate or even cordate at base, and irregularly cut-dentate, with rounded teeth, giving the margin a crispy effect (I.H. 8:293). In some forms, the lvs. are lacinate.

1027. Coleus cutting.

1028. A coleus attacked by root-galls.

1029. A good young coleus plant.

AA. *Other species of Coleus, now and then in cult. (Still other species may be expected to appear in the trade.)*

**thyrsoides**, Baker. Tender shrub, 2-3 ft. high: sts. pubescent; lvs. cordate-acuminate, coarsely crenate, lower ones 7 in. long; fls. bright blue, in racemes which contain as many as 18 forking cymes with about 10 fls. in each. Cent. Afr. B.M. 7672.—Considered to have much merit for cult., either under glass, or in the open far S. Winter.

**shirënsis**, Baker. Perennial herb, densely pubescent, 3 ft., much like the above in habit: sts. angular, pale green turning to brown: lvs. glandular, pungently aromatic, broadly ovate, acuminate, membranous, 2-3 in. long, deeply crenate, pubescent beneath but scantily so above: fls. dark blue (also described as light blue), in large erect terminal panicles. Cent. Afr. B.M. 8024.—Winter.

**Mahônii**, Baker. Shrub, to 2 ft., pubescent, the branchlets slender: lvs. petioled, ovate, acute, 2-3 in. long, crenate, membranous, pale and finely pubescent beneath and green and nearly glabrous above: fls. small, purple with golden anthers, in a large graceful panicle. Cent. Afr.—Winter.

**Pénzigii**, Damm. Soft perennial herb, white-hairy: lvs. ovate, membranous, narrowed abruptly at base, crenate; petiole winged: fls. bright lilac (also described as ashy blue) in a long and lax racemose panicle, the whorls being about 8-fld. Nile Land. L. H. B.

**COLIC-ROOT:** *Aletris farinosa*.

**COLLABIUM** (*neck and lip*, referring to a peculiarity of the fl.). *Orchidaceæ*. Two terrestrial orchids, of Java and Borneo, rarely cult., requiring the treatment given *Catasetum*. Lf. single, plicate: fls. or clusters racemose, on a tall scape; lateral petals attached to the foot or base of the incurved column; lip at its base encircling the column (whence the generic name); pollinia 2. *C. nebulosum*, Blume. Sts. fleshy, about 2 in. long; lf. broadly ovate, acuminate, the petiole rounded: scape about 2 ft., erect; fls. numerous in scattered clusters or whorls, spurred, about ½ in. long, the lip 3-lobed, white and a little fringed, the sepals and

1030. *Coleus Blumei* var. *Verschaffeltii*.

petals greenish with reddish margins. Java. *C. simplex*, Reichb. Lf. oblong, acute, wavy, green with darker blotches: fls. racemose at the apex of the scape; lip white; sepals and petals greenish yellow with purple and brown blotches. Borneo.

**COLLARDS**. A kind of kale. Probably several somewhat different plants pass as collards, the characteristic being that they produce tufts or rosettes of leaves that are removed and used as greens. Usually referred to *Brassica oleracea* var. *acephala*. See *Brassica*.

In the South, a form of the plant known as Georgia collards is much grown for domestic use and the southern market. The plant grows 2 to 4 feet high and forms no head, but the central leaves often form a kind of loose rosette.

These tender leaves are eaten as a pot-herb, as all other kales are. Fig. 1031, shows a Georgia collard, with a heavy crown. The seeds of collard may be started in a frame under glass, or in a seed-bed in the open. As far south as the orange-belt, they are usually started in February and March, in order that the plants may mature before the dry, hot weather. Farther north they are started in July or August and the plants are ready for use before cold weather. Trans-

1031. Collards.

plant to rows 3½ to 4 feet apart, and 3 feet apart in the row. Till as for cabbage.

Young cabbage plants are sometimes eaten as "greens" under the name of collards; and cabbage seeds are sown for this specific purpose. In the North, where heading cabbages can be raised, collards of whatever kind are not greatly prized.

L. H. B.

**COLLETIA** (Philibert Collet, 1643-1718, French botanist). *Rhamnaceæ*. Odd spiny shrubs grown under glass, and in the open in California and other warm regions.

Leaves small and simple (or wanting), opposite: branches short, often flattened, arranged in opposite pairs, thickened, spiny (sometimes called lvs.): fls. small, perfect, yellowish or white, nodding on 1-fld. pedicels, single or fascicled in the axils or beneath the flattened divaricate spines; calyx bell-shaped or tubular, 4-5-parted; petals 4-6 or 0, inserted on the calyx; stamens 4-6; disk joined to calyx-tube, inconspicuous or the margin rolled-in; ovary 3-lobed and 3-celled, standing in the disk, the stigma 3-lobed: fr. a coriaceous dry drupe-like caps.—About a dozen species in S. Amer., mostly in the tropical parts. The colletias are said to start readily from cuttings of half-ripened wood, as well as from seeds. They are to be grown as single or detached specimens, because of their oddity.

**cruciata**, Gill. & Hook. (*C. horrida*, Hort.). Very curious shrub, 3-4 ft., with elliptic flattened very broad-spiny decurrent branches: lvs. few, elliptic, entire: fls. small, white, a few together at the base of the spines, borne profusely in spring. S. Brazil, Uruguay. B.M. 5033.

**spinosa**, Lam. Shrub, to 10 ft., with strong awl-shaped very sharp spines: lvs. elliptic, small, sessile, serrate, mostly vanishing at blooming time: fls. larger, urn-shaped, borne singly or nearly so beneath the spines. S. Brazil, Uruguay.

**ulicina**, Gill. & Hook. Smaller, 3-4 ft.: spines as in *C. spinosa*, but more numerous, thicker, and hairy: fls. cylindrical, in clusters near tops of the branches. Andes of Chile.

**Ephédra**, Vent. Small stiff bush: branches erect, spiny: lvs. wanting: fls. (in very early spring) sessile at

the nodes, spicate-glomerate; calyx top-shaped, the lobes spreading. Peru, Chile. L.B.C. 19:1830.—Reported as cult. in Calif.

L. H. B.

**COLLIGUÀYA** (Chilean name). *Euphorbiaceæ*. Small trees of the Chilean region, scarcely in cult., although the fragrant wood of some species is used. Seeds of this and related genera which have springing movements, due to contained insect larvæ, are sometimes known as "jumping beans." Juice milky; fls. monocious, apetalous; calyx imbricate or none in staminate fls.; stamens 1-5; ovary 2-4-celled, cells 1-ovuled. The following may be expected in botanical collections, although probably not in the trade: *C. odorifera*, Molina. Lvs. serrate, ovate to oblong. *C. brasiliensis*, Klotzsch. Lvs. serrulate, linear-lanceolate. *C. integririma*, Gill. & Hook. Lvs. linear, entire.

J. B. S. NORTON.

**COLLÍNSIA** (after Zaccheus Collins, American philanthropist and promoter of science, Philadelphia, 1764-1831). *Scrophulariaceæ*. Hardy flower-garden annuals mostly from California and western North America.

Leaves simple, verticillate in 3's, or opposite; fls. in the axils, solitary or in whorls, racemose in some species; calyx bell-shaped; corolla deeply bi-labiate; stamens 4, the fifth rudimentary and glandular.—About 25 species. They are not far removed botanically from *Pentstemon* and *Chelone*. From the former, the genus differs in having the fifth sterile stamen reduced to a mere gland.

The collinsias are free-flowering and of the easiest culture. They may be sown outdoors in the fall in well-drained soil, and will bloom earlier than if sown in spring. Their flowers borne in midsummer range in color from white through lilac and rose to violet, with clear, bright blue also, at least on one lip of the flower. There is no yellow.

A. Fl.-stalks very short, giving the clusters a dense appearance.

B. Corolla strongly declined; throat as wide as long.

*bicolor*, Benth. Fig. 1032.

Height 1-2 ft.: hairy, glabrous, or sticky; sts. weak and bending; lvs. more or less toothed, and oblong or lanceolate, sessile, finely toothed, opposite or in 3's; fls. typically purple and white, with 5 or 6 well-marked color varieties. Var. *álba*, Hort. (Fig. 1033), has pure white fls., or the lower lip greenish or yellowish. Var. *multicolor*, Voss (*C. multicolor*, Lindl. & Paxt.), has variegated fls., the same fl. being white, lilac, rose or violet on either lip or both. Var. *multicolor marmorata*, has the lower lip white, suffused lilac, and upper lip light lilac, spotted and striped carmine. Calif., below 2,000 ft. B.M. 3488. P.M. 3:195. B.R. 1734.—This is the most widely distributed and variable species, and the one on which the genus was founded.

1032. *Collinsia bicolor*.

Calif., mostly in moist ground.

BB. Corolla less strongly declined; throat much longer than broad.

*bartsiaefolia*, Benth. Height  $1\frac{1}{2}$  ft., the st. usually stiff and simple; sticky and somewhat glandular, rarely

hairy; lvs. from ovate-oblong to linear; fl.-whorls 2-5, purplish or whitish; seeds not wrinkled. Calif.

AA. Fl.-stalks  $\frac{1}{2}$  in. long or more, giving the clusters a looser look.

*vérna*, Nutt. Height about 6 in.: lvs. ovate or oblong or the lowest rounded and slender-stalked, and the upper ovate-lanceolate and partly clasping; whorls about 6-fld.; fl.-stalks longer than the fls.; throat of the corolla as long as the calyx-lobes; lower lip bright blue; upper lip white or purplish; seeds thick, not flattened, oblong, arched. Moist woods, W. N. Y. and Pa. to Wis. and Ky. B.M. 4927.

*grandiflora*, Douglas. Height 4-12 in.: lvs. thickish, the lowest, roundish and stalked; whorls 3-9-fld.; fl.-stalks about as long as the fls.; lower lip deep blue or violet; upper lip white or purple; throat of the corolla sac-like, as broad as long, or as long as the upper lip; seeds roundish, smooth. Shady hills of Calif. B.R. 1107.

WILHELM MILLER.

N. TAYLOR.†

1033. *Collinsia bicolor* var. *alba*. ( $\times\frac{1}{2}$ )

**COLLINSÒNIA** (after Peter

Collinson, English botanist, correspondent of Linnaeus and John Bartram). *Labiatae*. HORSE-BALM. HORSE-WEED. STONE-ROOT. Native perennial herbs.

Plants of small importance horticulturally, with large, odorous, ovate, serrate, mostly long-stalked lvs., thick roots, and simple or panicked, naked, terminal racemes of yellow or whitish fls.—Three species in E. N. Amer., one of which is sometimes offered by dealers in native plants, but is not especially ornamental. They are of simple cult.

*canadensis*, Linn. CITRONELLA. Height 2-4 ft.: lvs. 4-9 in. long, broadly ovate to oblong; racemes panicked; calyx in fl. 1 line, in fr. 4 or 5 lines long; corolla light yellow, lemon-scented,  $\frac{1}{2}$  in. long. Rich woods, Canada to Wis., Kans., and south to Fla.

L. H. B.

**COLLÒMIA** (Greek for *glue*, alluding to the mucilaginous character of the wetted seeds). *Polemoniaceæ*. In Asa Gray's late treatment, *Collomia* is included with *Gilia*, although at first kept distinct by him (Proc. Amer. Acad. Arts. & Sci. XVII, 223), and this disposition is followed here, particularly since none of the species seems to be known in the trade as *Collomia*. Engler & Prantl keep the genus distinct, however, ascribing to it eighteen species from western North America and Chile. Such as are cultivated will be found in this Cyclopedia under *Gilia*. The *Collomias* are annual, biennial and perennial.

**COLOCÀSIA** (old Greek substantive name). *Araceæ*. Perennial herbs with cordate-peltate leaves, which are often handsomely colored in cultivation; grown under glass, and one of the forms much used for planting out when large-leaved tropical effects are desired; also grown for the edible tubers.

Plants tuberous or with an erect caudex: lf.-blades peltate, ovate or sagittate-cordate, basal lobes rounded; blade of spathe 2-5 times longer than tube; spadix shorter than spathe, terminating in a club-shaped or subulate appendage destitute of stamens. Differs from *Alocasia* and *Caladium* in floral characters—Species 5. Tropics.

*Colocasias* include the plants known as *Caladium esculentum*, which are much grown for subtropical bedding. *C. odorata* (which is an *Alocasia*) has very large,

The generic character of flower-colors is comprehended in the hues just named, although such names are of little consequence so long as identification is without question. Unfortunately scientists and artists have not yet established a standard nomenclature of color, and as a consequence the name of a

505, violet at 430, ultramarine at 455, and blue at 480. These numbers indicate the wave-lengths of the respective hues, with the micron (one-millionth part of an inch) as the unit. This identification of color, however satisfactory from a scientific point of view, is both intangible and impracticable in every other respect. The flower-petal or the artist's pigment matched with the spectrum is the only proper medium through which to convey an adequate knowledge of a given hue to the layman, and it must be remembered that everyone is hypothetically the layman who is not directly associated with the particular science or art under consideration. The colors of certain flower-petals as matched with the spectrum lines are as follows:

Yellow (580).—*Oenothera biennis*, *Brassica nigra*, *Ranunculus acris*, *Helianthus decapetalus*, a single dandelion ray.

Gold-yellow (590).—*Rudbeckia hirta*, golden calendula.

Gold-yellow (585).—*Kerria japonica*.

Gold-orange (600).—Golden eschscholtzia.

Gold-orange (615).—*Crocus susianus*.

Orange (635).—*Tropæolum majus* (deepest orange hue), the common type.

Scarlet (645).—Mme. Crozy canna, scarlet geranium and *tropæolum*, berry of *Cornus canadensis*.

Red (680).—Red azalea, red carnation, tube of *Rhododendron nudiflorum*.

Red (690).—Red gladiolus.

Crimson.—Crimson peony, American Beauty rose (dilute).

Magenta.—Magenta cineraria, *Polygala sanguinea*.

Purple.—Purple cineraria, *Mimulus ringens*.

Violet (425).—*Viola cuculata* and *Campanula rotundifolia* (light).

Violet (430).—*Verbena erinoides*.

Ultramarine violet (440).—*Centaurea Cyanus*, the bluest phase (light).

Ultramarine blue (455).—*Scilla sibirica* (light).

Ultramarine blue (435).—*Gentiana Andrewsii*, (bluest tip of petal).

Blue (475).—*Myosotis palustris*, bluest phase (pale).

particular hue is largely determined by a consensus of public opinion, which, very naturally, is not always correct.

#### Classification of colors.

It is essential, therefore, to accept both popular and scientific estimates of color if the subject is to be considered in its relation to flowers. The scientific determination of simple colors is expressed by certain arbitrary numbered lines in the spectrum. Thus, yellow is at line 580, gold-yellow at 605, orange at 630, scarlet at 655, red at 680, green at 530, peacock-blue at

Such a list is manifestly imperfect; to state the case accurately, few flowers are "on the line;" three of the colors have no numbered lines, and many of the plant species or varieties are not and can not be explicitly cited. For example, the red carnation must be a red and not a scarlet-red variety, and its coloring should match that of the *Rhododendron nudiflorum* tube; the same rule applies to the red gladiolus. It is equally the case that many flowers show only a modification or a dilution of the hue they are chosen to represent; the blue of the forget-me-not at best is extremely dilute.

A list of artists' pigments is more to the point. It has the great advantage of nomenclatorial fixity and it does not include hues subject to change. The representative colors are:

Lemon, zinc, ultramarine, pale cadmium, and light malori yellow.

Medium cadmium and malori gold-yellows.

Cadmium orange and deep malori orange-yellow.

Orange mineral.

Scarlet-vermilion.

Carmine or alizarin lake (no single pigment is exactly normal red), these incline to scarlet.

Crimson lake.

Magenta: a mixture of crimson and mauve lakes in nearly equal parts.

Mauve lake: a true purple.

Violet ultramarine.

Guimet's French ultramarine.

Cobalt blue.

Emerald-green.

#### The color harmonies.

If the simple colors, yellow, orange, red, purple, blue, and green, are arranged in a circle (Fig. 1037), those lying opposite each other harmonize by reason of absolute contrast. Blue and orange, for example, are complementary colors and theoretically they balance each other. It by no means follows, however, that a mass of orange nasturtiums and blue forget-me-nots must therefore look well together; the very massing of such hues would make that impossible in spite of the fact that the misty grayish character of a clump of blue forget-me-nots is the reverse of aggressive. But the orange of the nasturtium is obtrusive to the last degree, and its environment should be as colorless as possible—even to the point of dull gray or white.

If these six simple colors in the circle are again separated by intermediate hues (Fig. 1035), so about three of the latter lie between the six original colors, the result will be a circle of twenty-four divisions, having the effect of a rainbow. This will perfectly illustrate the principle of color harmony and color discord. Besides the opposing colors which harmonize by contrast, there are neighboring colors which harmonize by analogy.

For example, any four or five colors lying side by side in the circle are bound together harmoniously by reason of their near relationship. Therefore, all these four or five colors may be combined—and nature does combine them—with esthetic results. But skip over four of the colors and attempt a combination of the first and sixth, and the result will prove to be a discord, the bond of relationship is broken, and the eye is disturbed by the aggressiveness of two colors between which there is evidently no bond of sympathy. It

1037. Harmony by contrast.

would be safe to say, therefore, that the circle demonstrates the fact that its colors situated at right angles with each other are discordant, and those lying nearly parallel with each other are harmonious.

This is the theoretical side of color harmony. The practical side is scarcely different; it simply modifies the theory. Brilliant blue and orange, which are theoretically harmonious, are scarcely as agreeable in each other's company as the rule would imply. The trouble, however, lies with the brilliancy. The golden calendula and the deep purple aster in association are violent and aggressive. Remove the one and the other and substitute pale-tinted flowers of these hues and the result will be harmonious.

Flower families are very likely to sustain harmonies of analogy. Hyacinths, sweet peas, and nasturtiums

with each other. It will be found quickly that white is a peacemaker, and green is an invaluable mediator. With these colors at command, the chances of discord are reduced to a minimum. Everything also depends upon simplicity in color-combinations. It is questionable whether a combination of more than two colors can be ever esthetically a success. The adjustment of many colors needs the hand of an expert.

#### *The restriction of color in flowers.*

The very strict limitation of range in flower-colors demands careful study if it would be thoroughly understood. Augustin Pyramus de Candolle divided flower-colors into two classes, which he named xanthic (red, scarlet, orange, gold-orange, yellow, and green-yellow), and cyanic (green-blue, blue, ultramarine-violet, violet, purple, and red). Further, he explained, flowers of the yellow (xanthic) series could pass into red or white but never into blue, and those of the blue (cyanic) series could pass into red or white but never into yellow. The theory is correct but it requires both modification and revision. Gold-orange must evidently displace yellow, and ultramarine-violet displace blue as series names; furthermore, the passage into red should not exceed scarlet-red in the xanthic series, or crimson-red in the cyanic series. Pure red logically should be the zero point between the two divisions, and not be included in either unless connected by analogous hues.

Gold-orange and ultramarine-violet are respectively the type-colors of the two series because each occupies a median position with equal influence on either hand. Red, occupying the median position between the two series, should and does exercise an equal influence on both; a casual glance at the chromatic scale demonstrates the fact. Neither the xanthic nor the cyanic series can exclusively claim the respective yellow and blue in absolute purity, for the cogent reason that among flowers yellow is associated with both these divisions, and a true blue scarcely appears at all. Further, if pure red is the zero point between the two series, then the consistent red of the xanthic order is scarlet-red, and that of the cyanic order is crimson-red; a pure red or pure yellow flower, therefore, consistently belongs to either order according to its xanthic or cyanic congeners.

The best proofs of the above statements are to be found among the flowers themselves. Asters belong to the cyanic group, but there is no blue aster. Tropæolums belong to the xanthic group, but there is no pure yellow nasturtium; there are, however, ultramarine-violet asters and gold-yellow nasturtiums. There is a pure yellow, a golden orange, but no white marigold (*Tagetes*); the species is xanthic. The family *Cruciferae* is cyanic; it includes pure yellow, deeper yellow, and magenta flowers. The genus *Hyacinthus* is cyanic; it includes no blue flower, but many which are purple, violet, cyanic red, and modified yellow. *Viola tricolor* is cyanic; it includes a strong yellow along with intense purple and violet-ultramarine flowers. The genus *Zinnia* is xanthic; it includes no true yellow flower but many which range through all reds into cyanic crimson. The genus *Rosa* is cyanic; its flowers range from pure red to magenta-crimson, develop a strong, modified yellow, fuse yellow with crimson, but never approach the xanthic gold-orange. The genus *Chrysanthemum* is xanthic; its flowers include all yellows, skip pure orange and scarlet, and range from scarlet-red to cyanic red-crimson.

Species belonging to the cyanic group invariably produce white flowers which have an albino origin. Species of the xanthic order produce white flowers which are not albinos but which invariably displace flowers of some strong, pure xanthic hue. For example, geraniums are white, red, scarlet, and pink, but never gold-orange or golden yellow. Carnations are white, red, and cardinal-red, but never scarlet, or orange. Chrysanthem-

1038. The circle of 360° in colors.

represent groups with very nearly related hues or tints. There is a predominating influence of crimson-pink among sweet peas, of lilac among hyacinths, and of orange among nasturtiums, yet the influence at times (in a particular variety) is wholly wanting and is replaced by an analogous tint or hue. It would be a rather nice bit of color adjustment which would result in a harmony superior to that of a careless grouping together of flowers gathered at random from any one of these three genera.

But the theory that analogous colors harmonize is correct only when not carried to excess. Attempts to force deep-hued flowers into harmony often lead to contrary results. A range of color from crimson to ultramarine depends for its harmony upon the careful grading of intermediate hues. Such colors, in full force, might do violence to each other. It is tempting the hardness of a diamond to pound it with a hammer. It is taxing crimson too heavily to expect it to show its beauty in the presence of strong violet! The effort should rather be to merge the individualities of the crimson and the purple flowers into a group and effect a play of color between the two.

The theory that colors at right angles on the wheel are discordant is also subject to some modification. Relatively the right-angled colors must be crude and strong to affect the eye objectionably. Yellow and red in the rose is an agreeable color-combination. Yellow and red dahlias crowded together are certainly harsh and unneighborly.

A country bouquet of asters, marigolds, fuchsias and dahlias is bad, because the country garden is not a part of it. Atmosphere, space, and a stretch of green foliage make a world of difference.

It is wisest to try the effect of one color upon another before allowing two or three strong hues to wage war

XXIX. Cranberry-picking in a New Jersey bog.

mums are yellow, white, and pink, but never orange or scarlet. Dahlias are scarlet, red, crimson-red, and even pure yellow, but never pure gold-orange, or orange.

It is perfectly evident from the foregoing examples that the range in a given genus, or species, is limited to what may be termed the swing of a pendulum upon the chromatic scale (Fig. 1038). The swing may extend over a quarter of the dial, rarely it does more. If it happens that two colors are developed, like violet and yellow, it will still be found that there is but one pendulum-swing and not two. Violet will be associated with contiguous hues, but yellow will be developed quite alone.

This, it is reasonable to believe, is direct evidence of a dual or treble origin of color in a flower group. Yellow cannot be evolved from violet, or vice versa. Necessarily, if white appears in a xanthic group, it must have evolved alone and independent of any color-range in that group. Undoubtedly the range of contiguous colors itself has evolved from a median hue which has spread out, fanlike, in graded variations within strict limits. Naturally, such statements conflict with the old theory that all flowers were originally yellow, but they are not inimical to the idea that the earlier ones might have been yellow, and later ones magenta, violent ultramarine, scarlet, and gold-orange. It is important to keep in mind the fact that a steamboat is not evolved from a locomotive.

It is further evident that yellow belongs quite as little to the xanthic as it does to the cyanic series, or, to put it more strongly, it belongs to neither. Its origin, independent of any "range," was undoubtedly the elimination of blue from chlorophyll. Hence, it is not surprising to find it in some modified form associated with both series, and in the cyanic series isolated. The flora of the northeastern United States is essentially cyanic. Twenty-one per cent is yellow, 21 per cent magenta and 22 per cent white; the remainder is 8 per cent xanthic and 28 per cent cyanic—the last mostly pink and light violet. The record is significant and points directly either to an arrested color development, or to a depauperate color condition in an inclement region; the former seems the more likely. An aggregation of cyanic-flowered plants are found in the north temperate zone, and of xanthic-flowered plants in the torrid zone.

#### Color activity.

Color results from a play of light upon a surface which rejects or absorbs certain rays. It is a significant fact that the red end of the spectrum comprehends those hues which are produced by the caloric rays of the sun, and the violet end those hues which are produced by the actinic rays. It is not surprising therefore that the coloring of vegetation is intense, and that xanthic flowers predominate under the equator. A separation of cyanic and xanthic flowers follows almost identically the thermal lines which band the great continents of the northern hemisphere, cyanic color prevailing north, and xanthic color south of the line marking 80° F. In a word, xanthic flowers belong to a very warm, and cyanic flowers to a temperate or cold climate. That they should become mixed in a narrow zone between the extremes is only natural; the rule, therefore, is in no way compromised thereby. That yellow, too, should appear in both cyanic and xanthic groups is not at all surprising. In the spectrum it holds a median position between the red and the violet ends; it is neither a hot nor a cold color, and has consequently evolved from its primitive condition as a constituent of the green in chlorophyll under any and all temperatures. That is the only way to account for its isolation when connected with cyanic groups.

It would appear, then, that magenta, violet, and ultramarines, together with gold-orange, orange, and red, are primitive colors quite as well as yellow and

white. In what order they appeared upon the earth in the petals of flowers, it would be difficult to determine, but it is reasonable to think they appeared as original colors, in weak, perhaps, but absolute purity. Otherwise, the remarkable limitation of color-range must be accounted for by a less logical theory. Upset this limitation, and attempts to produce a blue rose, yellow aster, white nasturtium, or green carnation, should prove successful. Recognize the limitation, and the futility of such attempts becomes at once apparent, and the possibility of improving existing "strains" of color is illimitable. At some time or other in the distant past the law of limitations fixed the range of flower-colors; no new law of elasticity has since developed to remove the boundaries and thus aid the floriculturist in his ambition to produce what would prove to be a mere novelty. See *Standards of Color*.

F. SCHUYLER MATHEWS.

**COLTSFOOT:** *Tussilago Farfara*. Sweet coltsfoot is *Petasites*, formerly called *Nardosmia*.

**COLUMBINE:** *Aquilegia*.

**COLQUHOUNIA** (after Sir Robert Colquhoun). *Labiata*. Tender plants with dense whorls of gaping fls. an inch long or more, colored scarlet and yellow.

Erect or twining shrubs, woolly in all parts when young: lvs. large, crenate: whorls few-fl'd., axillary or crowded into a terminal spike or raceme; corolla-tube incurved, the throat inflated.—Two Asian species. Prop. by cuttings of growing tips, in sandy soil, under glass in summer.

**coccinea**, Wall. Tall climber, with very long branches, 8–10 ft.: lvs. stalked, ovate-acuminate, 3–5 in. long, crenate, dark green above, roughish, typically with scarcely any wooliness except when young: corolla twice as long as the calyx. B.M. 4514.—*C. tomentosa*, Houll., is probably identical. The dense wooliness is perhaps temporary. R.H. 1873:130 shows a handsome terminal spike in addition to axillary clusters, containing about 20 fls.—Apparently not advertised, but probably as worthy as the next.

**vestita**, Wall. Very similar to *C. coccinea*, except that it is a low-growing, erect plant, and more densely and permanently woolly on the st., calyx and under side of lvs., which are elliptic or elliptic-ovate and cordate.—Cult. outdoors at Santa Barbara, Calif., where it may be used for the wild garden as it is perfectly hardy. Not of much horticultural value.

N. TAYLOR.†

1039. *Columnea gloriosa*. (× ½)

**COLUMNEA** (after Columna or Colonna, Italian writer on plants, sixteenth century). *Gesneraceae*. Tropical American shrubs and climbers, sometimes grown under glass in choice collections.

Flowers widely gaping, showy, often 2 in. long: lvs. opposite, nearly equal or widely unlike: fls. solitary or numerous, axillary, stalked or not, without bracts or with bracts in an involucre; corollas scarlet, carmine or yellowish.—A group of 100

species of which half a dozen mostly red- or orange-fl., are cult. abroad and may be known to a few fanciers at home, but are not advertised by the dealers. They are warmhouse evergreens requiring the treatment of *Trichosporum* (*Æschynanthus*).

**Schiedeana**, Schlecht. The best known species. It has handsome scarlet fls. 2 in. long, sometimes variegated with yellow. It is an herbaceous climber from Mex. B.M. 4045. P.M. 9:31.

**gloriösa**, Sprague. Fig. 1039. An epiphytic perennial herb: lvs. ovate or ovate-oblong: fls. axillary, solitary, scarlet and yellow. Costa Rica. B. M. 8378.

*C. glabra*, Oerst, var. *major*. Fls. scarlet; stamens white. Costa Rica.—*C. magnifica*, Klotzsch & Hanst. Corolla bright scarlet; tube inflated about the middle. Costa Rica. G.C. III. 43:66.—*C. Oerstediana*, Klotzsch. Epiphytic undershrub or herb: fls. scarlet. Costa Rica. B.M. 8344. N. TAYLOR.†

**COLÛTEA** (*Koloutea*, ancient Greek name). *Leguminosæ*. **BLADDER SENNA**. Shrubs grown chiefly for their attractive yellow or brownish red flowers and the ornamental bladder-like pods.

Deciduous, with alternate, odd-pinnate lvs.: lfts. many, rather small; stipules small: fls. papilionaceous, in axillary, few-fl., long-peduncled racemes, yellow to brownish red; calyx campanulate, 5-toothed; standard suborbicular with 2 swellings above the claw; 9 stamens connate, 1 free: pod inflated, bladder-like, many-seeded.—About 15 species in the Medit. region to Abyssinia and Himalayas. Ornamental free-flowering plants of rapid growth, with pale green or glaucous foliage and yellow or brownish red fls. during summer, followed by large, usually reddish-colored and decorative pods. They grow in almost any soil, but prefer a tolerably dry and sunny position; not quite hardy N., the hardest being *C. arborescens*.—Prop. by seeds sown in spring or by cuttings of mature wood inserted in fall in sandy soil; rarer species and varieties are sometimes grafted on *C. arborescens* in spring under glass.

A. Fls. yellow: pod closed at the apex.

**arborescens**, Linn. Fig. 1040. Shrub, to 15 ft.: lfts. 9-13, elliptic, dull green, mucronulate, usually slightly pubescent beneath,  $\frac{1}{2}$ -1 in. long: fls. 3-8, about  $\frac{3}{4}$  in. long; wings nearly as long as the keel, flat. June-Sept. S. Eu., N. Afr., N. B.M. 81.—Lvs. have cathartic properties. Var. *crispâ*, Kirchn. Dwarf, with crisped lvs. Var. *bullata*, Rehd. (*C. bullata*, Hort.). Dwarf and compact: lfts. 5-7, obovate or nearly orbicular and somewhat bullate.

**cilicica**, Boiss. (*C. longialata*, Koehne. *C. melanocalyx*, Hort., not Boiss.). Shrub: lfts. bluish green, usually 11, oval or broadly ovate, rounded or truncate and mucronulate at the apex,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long: fls. bright yellow, 3-6, about  $\frac{3}{4}$  in. long; wings longer than the keel. June-Aug. Asia Minor. G.C. III. 16:155.

AA. Fls. orange-yellow or brownish red; wings shorter than the keel.

**média**, Willd. Shrub, to 10 ft.: lfts. 7-13, obovate, grayish green or glaucous,  $\frac{1}{3}$ - $\frac{2}{3}$  in. long, nearly gla-

brous: fls. 3-6, orange or reddish yellow, the standard with brownish markings: pod closed at the apex. June-Sept.—Probably hybrid of garden origin between *C. arborescens* and the following, often cult. under the names of the following species.

**orientalis**, Mill. (*C. cruenta*, Ait.). Shrub, to 6 ft.: lfts. 7-11, obovate, glaucous, thickish,  $\frac{1}{3}$ - $\frac{1}{2}$  in. long, nearly glabrous: fls. 3-5, reddish yellow or brownish red: pod open at the apex. June-Sept. S. E. Eu., Orient.—Often cult. under the name of *C. halepica* or *C. istria*.

*C. brevialata*, Lange. Shrub, to 4 ft.: lfts. usually 11, oval,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long: fls. 2-6, yellow; wings much shorter than keel. S. France.—*C. gracilis*, Freyn & Sitenis. Lfts. usually 11, obovate,  $\frac{1}{4}$ - $\frac{1}{2}$  in. long: fls. 2-5, yellow, with the wings almost as long as the keel. Turkestan.—*C. istria*, Mill. (*C. halepica*, Lam. C. Pocockii, Ait.). To 4 ft.: lfts. glaucous, small and numerous: fls. yellow, nearly 1 in. long; wing longer than the keel.—*C. nepalensis*, Hook. Similar to *C. arborescens*: racemes drooping. B.M. 2622. B.R. 1727. Tender.

ALFRED REHDER.

**COLVILLEA** (after Sir Charles Colville, governor of Mauritius). *Leguminosæ*. Showy-flowered tropical tree, a worthy rival of the royal poinciana, which is closely allied, but easily distinguished, especially by its round and full, not flat, legume.

Colvillea has drooping racemes,  $1\frac{1}{2}$  ft. long, densely crowded with perhaps 200 fls. of curious shape and of a splendid scarlet; the fls. open at the st. end of the pendent dense raceme, and display masses of long showy yellow stamens; the unopened fls. are about the size and shape of a filbert, and these are gradually smaller towards the end of the raceme.—Only 1 species, characterized by its large, oblique, colored calyx, having 4 segms., the standard being the smallest instead of the largest part; wings very long, narrow, erect, obovate: pod 2-valved.—Supposed to be a native of E. Afr., but discovered in 1824 by Bojer on the west coast of Madagascar, where a single tree was cult. by the natives. It flowered there in April or May. Its cult. is similar to that of *cesalpinia*. Prop. in the S. only by seeds. Not common in cult. outside of botanic gardens and fanciers' collections.

**racemosa**, Bojer. Tree, 40-50 ft. high, with the general aspect of *Poinciana regia* but with a thicker trunk and ampler foliage; branches very long and spreading: lvs. about 3 ft. long, alternate, remote, twice pinnate, with 20-30 pairs of pinnae which are opposite, 4 in. long, and have 20-28 pairs of lfts., each  $\frac{1}{2}$  in. long: keel very small, almost covered by the wings; free stamens 10, 3 inserted below the standard, 2 under the wings, 1 under the keel, and 4 under the ovary. B.M. 3325-6.

WILHELM MILLER.

**COMÁNDRA** (name alludes to the hairs in the fl.). *Santalacææ*. Perhaps a half-dozen leafy herbs or subshrubs, one in Eu., and the others in N. Amer., more or less parasitically attached to the roots of other plants, one or two of which may be of interest to horticulturists. Lvs. alternate, almost sessile: fls. whitish or greenish, small, perfect, in terminal cymes or umbellate panicles; calyx 4-5-cleft, lined or constricted

1040. *Colutea arborescens*. ( $\times \frac{1}{2}$ )

above the ovary, and the tube sometimes conspicuously continued to a neck or top on the fr.; petals wanting; stamens of same number as calyx-lobes, the anthers connected by hairs to the calyx-lobes: fr. nut-like or drupe-like. *C. umbellata*, Nutt. (Fig. 1041), 6-18 in.

high, in dry mostly open ground in the eastern states, is an attractive plant when allowed to spread naturally in patches in waste places: rootstock not showing above ground (*C. Richardiana*, Fern., has a superficial rootstock): lvs. thin, oblong, pale beneath: fls. whivish.

L. H. B.

**COMARÉLLA:** *Potentilla*.

**COMAROSTAPHYLIS:** *Arctostaphylos*.

**COMARUM** (an old Greek name). *Rosaceæ*. One species allied to *Potentilla*, and often referred to that genus but differing in the lateral style unknown in *Potentilla*. *C. palustre*, Linn. (*Potentilla palustris*, Scop.), the marsh cinquefoil, is a decumbent herb growing in swales in the northern states (also in the Old World), with pinnate, 5-7-foliolate lvs. (lfts. dentate), and solitary or cymose purple fls.  $\frac{1}{2}$  in. across: petals shorter than the calyx-lobes, acute; stamens numerous. An odd and interesting but not showy plant, sometimes planted in bogs. Mn. 3:97.—The fr. somewhat resembles a strawberry, but is spongy instead of juicy. In some parts of Scotland, it is said to be called cowberry and is rubbed on the inside of milk-pails to thicken the milk. *C. Salesovii*, Bunge (*Potentilla Salesoviana* Steph.), of the Himalayan region and Thibet, 11,000-14,000 ft. altitude, is a suffruticose silky-hairy plant worthy of cult., but little known in gardens: lvs. pinnate; lfts. 7-9, oblong, obtuse, crenate-serrate: fls. white, in an ample paniculate cyme. Probably better placed in *Potentilla*. B.M. 7258.

N. TAYLOR.†

**COMBRÈTUM** (old Latin name). *Combretææ*. Tropical shrubs and trees, many of which are climbers by means of the persistent leaf-stalks.

Leaves mostly opposite, in some species verticillate in 3's or 4's, entire: fls. in spikes or racemes, polygamous; calyx bell-shaped; petals usually 4; stamens usually 8: fr. winged and indehiscent, 1-seeded.—A genus of 250 species from Asia, Afr. and Amer., particularly S. Afr. The combretums are warmhouse plants, little known in this country. Prop. by cuttings of firm wood. One climbing species is in the American trade: *C. coccineum*, Lam. (*C. purpureum*, Vahl. *Poivreia coccinea*, DC.), from Madagascar. Lvs

oblong-lanceolate, acuminate, evergreen: fls. small, brilliant red, the long-exserted stamens forming the chief feature of beauty; the handsome loose spikes often in panicles; parts of the fl. in 10's. B.M. 2102. L.B.C. 6:563.—Handsome. *C. butyrosom* yields a butter-like substance, used by the Afirs as food. *C. sundaicum* in recent years has attained some prominence as a reputed anti-opium remedy.

N. TAYLOR.†

**COMFREY:** *Symphytum*.

**COMMELINA** (bears the name of early Dutch botanists). Also written *Commelyna*. *Commelinææ*. DAY-FLOWER. Perennial or annual herbs, of which a very few are cultivated in the open or under glass for their interesting flowers.

Upright, spreading or procumbent, usually more or less succulent, often rooting at the joints: lvs. alternate, sessile or short-petioled, clasping the st., a lf. subtending the sessile fl.-cluster and forming a clasping folded spathe: fls. opening for a day, mostly blue (varying to white and rose), irregular; outer perianth parts (calyx) 3, colored, 2 of them somewhat united; inner parts (petals) 3, one of them small and 2 broad and with long claws; stamens usually 6, but only 3 of them fertile; filaments not hairy: fr. a 2-3-celled caps. on a recurved pedicel.—Nearly or quite 100 species, in warm regions around the globe, a few of them reaching cool-temperate climates. The cult. species are perennials. The hothouse species appear not to be offered in this country or to be much cult. Allied to *Tradescantia* and *Zebrina*.

Commelinas are mostly of easy culture, thriving well in any light rich soil. The evergreen stove and greenhouse species are readily propagated in March or April by cuttings inserted in an ordinary propagating-bed and kept close for a few days, while the tuberous-rooted half-hardy herbaceous species may be propagated either by division of the tubers or by seeds sown in a frame early in April and afterwards transplanting the seedlings in the herbaceous border. In the fall, they should be lifted and the tubers stored away in the same manner as dahlias. Of the tuberous-rooted species, *C. caelestis* is perhaps the best, its bright blue flowers being very effective, especially when planted in masses. (Edward J. Canning.)

A. Plant hardy in the open.

**nudiflora**, Linn. (*C. Sellowii*, Walp. *C. Sellowiana*, Schlecht.). Creeping, rooting at the joints, glabrous or practically so: lvs. lanceolate to ovate-lanceolate, acute or acuminate, the lf.-sheaths often ciliate: spathe-lf. acute or acuminate, broad at base, petioled: fls. few in each cluster,  $\frac{1}{2}$  in. or less across, blue: caps. 3-celled and 5-seeded. N. J. southward and widely dispersed in other parts of the world.—Sometimes offered as an outdoor plant. A rose-colored form is reported.

**communis**, Linn. Much like the last and often confused with it: more erect and less rooting at joints: fls. larger: caps. 2-celled and 4-seeded. N. Y. southward, and widely distributed; perhaps an intro. from Asia.

1042.  
*Commelina*  
*caelestis*.  
( $\times \frac{1}{2}$ )

1041. *Comandra umbellata*. ( $\times \frac{1}{2}$ )

AA. *Plant tender or only half-hardy.*

**tuberosa**, Linn. Diffuse and branching, from a tuberous root: lvs. narrow-lanceolate, 2-3 in. long: spathe-lf. cordate-ovate to lanceolate, conduplicate, more or less hairy; sheaths pubescent: fls. rich blue. Mts. of Mex.—The plant sold under this name is recommended as a free-flowering border plant in England, the tubers to be lifted in autumn and stored in dry sand for the winter.

**cœlestis**, Willd. Fig. 1042. Erect, root more or less tuberous, 10-18 in. high, branching, with clasping, long, broad-lanceolate pointed lvs. and blue fls. (2-10 together) on elongating axillary pubescent peduncles: spathe-lf. ovate, folded; sheaths ciliate. Mts. of Mex.—Runs into several forms. Var. **alba**, Hort., has white fls. Var. **variegata**, Hort., has fls. blue and white. *C. cœlestis* is a half-hardy plant, in the N. requiring protection of a greenhouse, although it may be planted out. Prop. by seed, cuttings and tubers.

L. H. B.

**COMPARÉTTIA** (Andreas Comparetti, 1746-1811, Italian botanist). *Orchidaceæ*. A small group of graceful epiphytes.

Pseudobulbs, 1-3-lyd.: racemes simple or branched; fls. small, lateral sepals united in a single piece, lengthened at the base into a conspicuous horn; lateral petals converging; labellum large, produced into a double spur, which is hidden in the horn made by the sepals; column free, semi-terete, erect; pollinia 2.—Four species, Mex. to Brazil. Grown on blocks or in baskets in a light intermediate or warmhouse.

**coccinea**, Lindl. Pseudobulbs small, bearing lanceolate, coriaceous lvs., purple beneath: racemes several-fld.; fls. 1 in. across; petals and sepals light yellow, margined orange-red, labellum large, broader than long, crimson. Brazil. B.R. 24:68. I.H. 13:472.

**falcata**, Poepp. et Endl. (*C. rosea*, Lindl.). Similar in habit to *C. coccinea*: fls. 1 in. across, deep crimson; labellum broad; racemes pendent. Peru. B.M. 4980. A.F. 6:609. Lind. 4:163. F.S. 2:109.

**macropiëtron**, Reichb. f. Fls. 10 or more, 2 in. across, dorsal sepal whitish, often spotted with purple; midlobe of labellum cleft, suborbicular, magenta-rose, dotted at the angled base; spurs conspicuous. Colombia. B.M. 6679. Var. **punctatissima**, Hort., has the fls. copiously rose-spotted. C.O. 1. GEORGE V. NASH.†

COMPASS PLANT: *Silphium*.

**COMPOST**. Mixed and rotted vegetable matter, particularly manure and litter, used as a fertilizer and amendment.

The mixture of bulky fertilizing materials known as compost, while of little importance to the general farmer, plays an important part in garden practices. Many of the garden crops must be made in a very short time, or are of delicate feeding habits. Their food, therefore, must be easily assimilable. It is good practice to pile all coarse manures, sods, weeds, or any rubbish available for the purpose, in big flat heaps (Fig. 1043), to ferment and rot before being applied to the garden soil. If desired, chemical manures, especially superphosphate (dissolved bone or South Carolina rock) and potash (muriate or kainit), may be added to make the compost the richer. By spading or forking the heaps over a few times at reasonable intervals, a homogeneous mass is easily obtained, which can be applied in greatest liberality without fear, or more sparingly, in accordance with the needs of the particular crop. Of equal, if not still greater importance, is the compost heap which gives soil for greenhouse benches, flats, hotbeds and coldframes. This compost is principally made of sods shaved off a rich pasture or meadow and piled in alternate layers with stable manure, more of the latter being used for forcing succulent crops, and

less in growing plants which should be short and stocky, like cabbage or tomato plants. Garden litter may be added to the pile, as leaves and trimmings. All compost heaps, during dry weather, need frequent and thorough moistening with water, or, better, with liquid manure. Turn several times during the year, to ensure thorough rotting of the materials. T. GREINER.

**COMPTÈRIS**. The only published reference to this generic name and species is in G.C. III. 29: May 21, 1901, suppl. 2, where its introduction to cultivation by L. Linden is noted. The name *Compteris* may be a corruption, or the plant may have been a young form of some known form. The description below is quoted from *The Gardeners' Chronicle*.

**C. Brazzaiana**, Hort. Intro. in Eu. about 1900, as a remarkably distinct large fern with long bipinnate fronds narrow at base and broad across the middle and tapering to a narrow point; barren pinnae oval or oblong and simple; fertile pinnae distinctly lobed.

R. C. BENEDICT.

**COMPTÔNIA** (Henry Compton, Bishop of London, patron of horticulture, died 1713). *Myricaceæ*. A small native shrub, useful for covering banks and to grow on sterile sandy and stony soil.

1043. A compost heap.

The genus is allied to *Myrica*, and by some not regarded as sufficiently different in botanical characters to justify separate generic rank: branching brown-twigged bush, dioecious or monoecious, with globular fertile catkins, the 1-celled ovary surrounded by 8 linear persistent scales or bractlets: lvs. long-oblong, pinnatifid: fr. a bur-like axillary head of few small nuts. The only species is *C. asplenifolia*, Gærtn. (*C. peregrina*, Coulter. *Myrica asplenifolia*, Linn.) SWEET FERN. In dry, sterile soil in the E. and N. U. S.; also in the trade. It is an attractive undershrub (1-3 ft.) with fern-like, scented foliage and brownish heads of imperfect fls.: roots long and cord-like: staminate catkins 1 in. or less long, slender, in clusters at the ends of the branchlets.

L. H. B.

**CONÁNDRON** (cone-shaped anther). *Gesneriaceæ*. Almost stemless herb with radical glabrous rugose lvs. Differs from *Streptocarpus*, its nearest horticultural relative, in having a straight, not twisted pod. For cult. see *Streptocarpus*. It should be grown in shade and is hardy only south of N. C.

**C. ramondoides**, Sieb. & Zucc., of Japanese mountains, is the only species. It is an interesting little tuberous-rooted herb, with oblong, rugose, irregularly toothed root-lvs. and scapes bearing 6-12 white or purple, dodecatheon-like fls.: cymes nodding or drooping pubescent; corolla 1 in. diam.: seeds very minute

B.M. 6484.—This is one of several groups of rare and widely scattered herbs, of which *Ramondia*, *Haberlea*, *Wulfenia*, *Didymocarpus*, *Shortia* and *Schizocodon* are examples. Conandron is adapted to growing in shady rockeries. Scapes less than 1 ft. high. Little known in cult., but is in the trade.

N. TAYLOR.†

**CONE-FLOWER:** *Rudbeckia*. **Purple Cone-Flower:** *Echinacea*.

**CONGÈA** (from an East Indian vernacular name). *Verbenacæ*. A few species of climbing shrubs in Burma and the Malayan peninsula: lvs. opposite and entire: fls. in peduncled capitate cymes which are combined in large terminal panicles, the bracts at the base of the cyme-peduncles large and often showy; calyx funnel-form, 5-toothed; corolla-tube slender, seldom much exceeding the calyx, usually hairy in the throat, 2-lipped, the upper lip of 2 narrow upright lobes and the lower of 3 shorter broader lobes; stamens 4, exserted; ovary incompletely 2-celled: fr. a small roundish nearly dry drupe. *C. tomentosa*, Roxbg., is grown in India and is said to be suitable for growing in a stove or warm conservatory in Britain: a strong climber, conspicuous for the pink and changing tints of the large elliptic persistent bracts in the loose woody terminal panicles: lvs. 3 in. long, ovate-acute, soft-hairy beneath: corolla white; calyx hairy. Burma. G.C. III. 54:399.—Evergreen: infl. retained for several weeks. Allied to *Petræa volubilis*.

**CONIFERS:** *Arboriculture*.

**CONIOGRÁMME** (Greek, *dust-line*). Formerly *Dictyogramma*. *Polypodiææ*. A few Japanese and Pacific island ferns, with naked sori, which follow the course of the free or reticulated veins. The species are sometimes referred to *Gymnogramma*. Strong-growing indoor-ferns, useful for specimen plants.

**japónica**, Diels. Lvs. simply pinnate or bipinnate at the base, 1½–2 ft. high, the pinnæ 6–12 in. long and an inch wide; sori extending from the midrib to the edge. Japan and Formosa.—Also known as *Gymnogramma japonica*. An interesting fern of rather strong growth, and very distinct in appearance. Grows best in a moderate temperature—for example, 55–60°—and requires an open and well-drained soil of peaty character.

R. C. BENEDICT.†

**CONIUM** (Greek name). *Umbelliferæ*. Two weedy biennial plants, widely distributed. *C. maculatum*, Linn., is the poison hemlock, “by which,” as Gray writes, “criminals and philosophers were put to death at Athens.” It is a rank, much-branched European herb which has run wild in E. N. Amer., and which has been offered in the trade as a border plant. It is biennial, rank-smelling, and poisonous, and is scarcely worth cult. although the finely cut dark foliage is highly ornamental. It grows from 2–4 ft. high, and has large umbels of small white fls. See *Poisonous Plants*.

In North America the word hemlock is used for the hemlock spruce, *Tsuga*.

**CONOCÉPHALUS** (Greek, *cone head*). One of the liverworts (*Marchantiacæ*), with broad flat forking evergreen thallus, growing on moist banks, like a moss. *C. cónicus*, Dumort., is sometimes offered by collectors as a cover for rockeries, but can scarcely be said to be a cultivated plant.

**CONOCLINIUM:** *Eupatorium*.

**CONOPHÁLLUS** (name refers to the cone-shaped inflorescence). *Aracææ*. A name proposed by Schott for certain aroids, but now made a section of *Amorphophallus*. *C. Kónjac*, Koch., is *Amorphophallus Rivieri* var. *Konjac*, Engler. The great tuber is much grown in Japan for the making of flour (see Georgeson, A.G.13:79). *Amorphophallus Rivieri* is figured on p.

276, Vol. I.; also in R.H. 1871, p. 573; and in B.M. 6195 (as *Proteinophallus Rivieri*). Konjak is offered by importers of Japanese plants.

**CONSERVATORY.** Primarily a glasshouse in which plants that have been brought to perfection—usually in other greenhouses—are to be placed for display or to be kept in condition.

The conservatory should be as near the residence as possible; if not an architectural unit of the house, it may be connected by a corridor or pergola. The size of a conservatory depends of course upon the requirements or taste of the family; some are as small as 6 by 10 feet, while others are as large as 35 by 75. The aspect or side of the dwelling best suited to a conservatory is on the east, and preferably against a gable, so that sliding snow from the roof of the dwelling will not give trouble. If this is not convenient, the glass roof of the conservatory must be protected with snow-guards. A lean-to house is subject to great fluctuations if placed against the south side.

Since much attention has been given to the building of conservatories within the past few years, they can now be made attractive in architectural design, and at the same time supply the best possible conditions for the well-being of the plants. A curvilinear roof is usually more attractive and is better for the plants than a flat roof, but abundant ventilation must be provided. The roof glass should be ground or frosted, as plants remain in flower much longer under a subdued light than when exposed to direct sunlight. Even ground glass is not sufficient in summer, some shading being required; roller shades are hard to adjust and not altogether practicable: whitewash applied to the glass outside is unsightly and damages the painted wooden strips in which the glass is laid. The following has been found to be an excellent shading mixture: Sixteen ounces white lead, thirty-eight ounces turpentine, two ounces linseed oil; apply to the glass outside with an ordinary paint-brush. The advantages of this mixture are that it is not unsightly, is easily applied, and wears off as winter comes on.

The heating of a conservatory is an important matter, since even night temperatures must be maintained as in other greenhouses. This can easily be arranged if the dwelling is heated by hot water, which is the best for any conservatory; but with steam or hot air it is more difficult; if possible when these methods of heating the dwelling are used, a separate small hot-water system should be installed for the conservatory. The temperature at which conservatories are to be kept depends upon the plants grown in them. Palms, ferns, orchids and ornamental-leaved plants generally require a night temperature of about 60°. Flowering plants, such as chrysanthemums, azaleas, primulas and bulbs, do better in a temperature of 45° to 50° at night with a rise of 15° to 20° for both classes of plants by day before opening the ventilators, and these, in winter especially, must be opened with caution, admitting the outside air very sparingly.

The floor of a conservatory may be of tiles and the interior may be arranged with rugs and easy chairs in the center with the plants arranged on tables around the outside or over the heating-pipes. The catalogues of the principal greenhouse builders show some very artistic arrangements, both inside and outside.

A conservatory is often a part of a commercial greenhouse establishment, being in effect the display house or room into which interesting and perfected plants are brought for inspection; and in large cities conservatories are often attached to florists' stores, not only as a display house but because plants will keep in much better health and condition for a much longer time than in the ordinary conditions of the florist's store; but commonly the word is used as above to designate an adjunct to a home.

EDWARD J. CANNING.

**CONVALLARIA** (old name *Lilium convallium*, derived from *convallis*, a valley). *Liliaceæ*. **LILY-OF-THE-VALLEY**. A dainty herb, much prized for its erect racemes of white delicately-scented flowers; perennial.

Leaves radical, from a horizontal rootstock, producing upright parts or pips (Fig. 1044): fls. white (sometimes pink-tinged), small and short-bell-shaped, with short blunt recurved lobes, nodding, in a short, radical, raceme (Fig. 1045), the stamens 6 included, style 1 (Fig. 1046): fr. a globular small few-seeded red berry. —Commonly considered to be only one species, native in Asia, Eu., and in the higher mts., Va. to S. C.; of several similar races or types.

Lily-of-the-valley is much prized for its delicate, sweet-scented flowers. The rhizome and roots are sold in drug-stores: they are poisonous in large doses; in small doses used as a heart tonic. The plant is popularly supposed to be the one referred to in the Sermon

on the Mount, but this is not to be determined. It is essentially a shade-loving plant. The species is *C. majalis*, Linn. Lvs. oblong or oval, thick and persisting till autumn, forming a dense sod, plane, with more or less bloom: racemes 5–10 in. high: berry  $\frac{1}{4}$  in. diam. R.H. 1886: 84. Gn. 47, p. 179; 52:182 and p. 319 (the latter in fruit). A.F. 13:402. Gng. 5:56–7. F.R. 2:4. G.C. III. 23:149 (var. *grandiflora*). Lowe, 42 (var. *variegata*).

The plant is hardy, and is easily grown in partially shaded places and moderately rich ground. Old beds are liable to run out. The roots and runners become crowded, and few good flower-stems are produced. It is best to replant the beds every few years with vigorous fresh clumps, which have been grown for the purpose in some out-of-the-way place. Five or six strong pips, with their side growths, planted close together, will form a good clump in two years if not allowed to spread too much. The mats of clean foliage make attractive carpets under trees and in other shady places. If the bed is made rich and top-dressed every fall, it may give good results for four or five years; and plants in such beds thrive in full sunshine. One form has prettily striped foliage, very ornamental in the early part of the season. Lilies-of-the-valley bloom early in spring. They run wild in many old yards, in cemeteries, and along shady road-sides. There are double-flowered forms; also one (var. *prolificans*) with racemes 2 feet long. (J. B. Keller.)

For culture as a florist's flower, see *Lily-of-the-valley*.

Recent studies of this genus by E. L. Greene, have distinguished 3 other species: *C. japonica*, Greene, representing the Japanese form of the plant: rootstock very short and stout: lvs. 2 only, sub-equal, elliptic, cuspidately acute, bright green with no trace of bloom on either surface; peduncle short, about equaling the bases of the lvs.: raceme few-fl'd., the bracts small, ovate-lanceolate; perianth widely opening, broadly bell-shaped or almost saucer-shaped; stamens large, very short, the very obtuse anthers longer than the filaments. —*C. globosa*, Greene. Herbage light green, without trace of bloom: lvs. with a more fibrous and less fleshy anatomy than those of *C. majalis*, and of shorter duration, disappearing by the end of summer: perianth urn-shaped (not bell-shaped); stamens inserted about the middle of the perianth, extending horizontally (rather than vertically, as in *C. majalis*). Probably N. C., but described from plants growing in a wild garden in Washington, D. C.; later-blooming than *C. majalis*. —*C. majuscula*, Greene. Differs from *C. majalis* in its very large light green lvs., which have no trace of bloom and an excessively fibrous

anatomy which makes the growing lf. to look plicate; more than twice larger than *C. majalis*, later-blooming: perianth broadly bell-shaped; filaments very short, nearly hypogynous, erect; anthers large, oblong, obtuse, cordate at base. S.E. Pa., and southward. L. H. B.

**CONVOLVULUS** (Latin, *convolvere*, to entwine). *Convolvulaceæ*. Includes *Calystegia*. **BINDWEED**. Annual and perennial herbs, grown mostly in the open; some are twiners.

Sometimes suffrutescent, twining, trailing, erect or ascending, with filiform, creeping rootstocks: lvs. petiolate, entire, toothed or lobed, generally cordate or sagittate: fls. axillary, solitary or loosely cymose, mostly opening only in early morning; corolla campanulate or funneliform, the limb plaited, 5-angled, 5-lobed or entire. —A genus of about 175 species, widely distributed in temperate and tropical regions. *Convolvulus* and *Calystegia* are no longer kept separate. As *Convolvulus Sepium* is the type of both genera, they are therefore synonymous. When the fls. of *C. occidentalis* are borne singly, the calyx bracts are broad and *Calystegia*-like; when borne in clusters the bracts are greatly reduced.

The species thrive in a variety of soils without especial care. The greenhouse species do best in a soil with considerable fiber. The hardy perennials are usually propagated by dividing the roots, otherwise by cuttings or seeds, the tender species preferably by cuttings. *C. tricolor* is the most important of the hardy annuals. It may also be started in the greenhouse, and makes an excellent plant for the hanging-basket. All are vigorous growers, and may become troublesome weeds in some places if not kept within bounds. *C. japonicus* and *C. Sepium* should be used with caution. This is the chief reason why the hardy perennials are not often found in well-kept gardens, except along wire fences or lattice screens, where the turf is laid up close so as to allow only a narrow border for the roots. The double-flowered form of *C. japonicus* is seen to best advantage in half-wild places, or on rocky banks, where shrubs make but a stunted growth. Here it will grow luxuriantly, forming graceful festoons from branch to branch, and covering the ground with a pretty mantle of green. (J. B. Keller.)

*C. purpureus*, the common morning-glory, and many related species are to be found under *Ipomœa*.

1044. Lily-of-the-valley pip.

1045. Raceme of Lily-of-the-valley. (Natural size)

1046. Section of flower of lily-of-the-valley, laid open to show the parts. (×2)

A. Calyx with 2 membranaceous bracts at the base: peduncles usually 1-fld. (*Calystegia*.)

B. St. prostrate, 8 in. to 2 ft. high: peduncle usually shorter than the lvs.

1. *californicus*, Choisy (*C. villosus*, Gray. *Calystegia villosa*, Kellogg). Plant densely white-villose throughout: st. prostrate, scarcely twining: lvs. slender-

1047.  
*Convolvulus japonicus*.  
( $\times \frac{1}{2}$ )

petioled, reniform-hastate to sagittate, the upper acuminate, 1 in. or less long, the basal lobes often coarsely toothed: bracts oval or ovate, completely inclosing the calyx: fls. cream-yellow, 1 in. long. Calif.—Perennial.

2. *malacophyllus*, Greene. Similar to the preceding but foliage velvety or plushy pubescent. Calif.—Perennial. Other closely related Californian species are *C. saxicola*, Eastw., *C. deltoideus*, Greene, *C. Berryi*, Eastw. and *C. atriplicifolius*, House.

BB. St. twining or trailing, 3–10 ft. high: peduncle exceeding the lvs.

3. *japonicus*, Thunb. (*Calystegia pubescens*, Lindl.). CALIFORNIA ROSE. Fig. 1047. Hardy perennial herbaceous twiner: growth very vigorous, often 20 ft.: whole plant more or less densely and minutely pubescent: lvs. hastate, lanceolate, obtuse or broadly acute, with angular or rounded lobes at the base, variable, occasionally without lobes, rarely sharp lanceolate: fls. bright pink, 1–2 in. broad, produced freely during the summer months and remaining expanded for several days. Japan and E. Asia. The double form is now naturalized from S. E. N. Y. to D. C. and Mo. P.M. 13:243. F.S. 2:172. B.R. 32:42.—The double form is completely sterile, with narrow wavy petals, irregularly arranged, the outer somewhat lacerate. A valuable decorative plant for covering stumps and walls. In rich soil the roots spread rapidly, and will smother out all other plants unless confined in tubs. The *Calystegia pubescens* of Lindley has been wrongly referred to *Ipomæa hederacea*, but the two plants are very different, the former being perennial and the latter annual. See Journ. Hort. Soc. 1:70 (1846). The plant is commonly confounded with *C. Sepium*.

4. *occidentalis*, Gray. Hardy perennial, herbaceous or with suffrutescent base: st. twining, several feet high, glabrous or minutely pubescent: lvs. from angulate-cordate, with a deep and narrow sinus, to lanceolate-hastate, the posterior lobes often 1–2-toothed: peduncle 1-fld. or proliferously 2–3-fld., bracts ovate or lanceolate, usually completely inclosing the calyx, variable; corolla white or pinkish, 1–2 in. long; stigmas linear. Dry hills, Calif.—Listed as early as 1881.

An admirable plant for rockeries. Several related species are native also to Calif.: *C. cyclostegius*, House, *C. Binghamiæ*, Greene, *C. polymorphus*, Greene, *C. Greenei*, House, *C. aridus*, Greene, *C. purpuratus*, Greene, *C. illecebratus*, House, *C. gracilentus*, Greene, and *C. longipes*, Wats.

5. *Sepium*, Linn. (*Calystegia Sepium*, R. Br.). RUTLAND BEAUTY. Fig. 1048. Perennial trailer, 3–10 ft. long, glabrous or minutely pubescent: lvs. round-cordate to deltoid-hastate, the basal lobes divaricate, entire or angulate: fls. white, rose or pink, with white stripes. F.S. 8:826. B.M. 732. A.G. 12:638. Gn. 50:514.—A very variable species. Cosmopolitan in temperate regions. An insidious weed in moist soil. The native forms have been called *C. interior*, House, Rocky Mt. region; and *C. americanus*, Greene, in the eastern states, but are difficult to distinguish. Var. *repens*, Gray (*C. repens*, Linn.). Pubescent: sts. trailing or sprawling: the basal lobes of the lvs. obtuse or rounded. Coastal region from Que. to Fla.

AA. Calyx without bracts: peduncle 1–6-fld. (*Euconvolvulus*.)

B. St. prostrate, trailing, glabrous or minutely pubescent.

6. *mauritanicus*, Boiss. Strong perennial roots: st. herbaceous, slender, prostrate, rarely branched, minutely villose: lvs. alternate, round-ovate, obtuse, short-petioled: fls. blue to violet-purple, with a lighter throat, 1–2 in. across, very handsome. Afr. B.M. 5243. F.S. 21:2183. Gn. 39:52.—A free bloomer through the summer. On dry banks each plant forms a dense tuft which throws up many graceful shoots. Not hardy north of Philadelphia.

7. *Scammônia*, Linn. Hardy perennial trailer, deciduous: st. angular, glabrous: lvs. cordate-sagittate, gray-green, the lobes entire or dentate: sepals glabrous, ovate, obtuse; corolla white, creamy or light pink. Asia Minor.—The large tap-roots supply the resinous cathartic drug scammony.

BB. St. erect or ascending, silky.

8. *Cneorum*, Linn. St. shrubby, half-hardy, 1–4 ft. high: lvs. persistent, lanceolate or spatulate, silky gray: infl. a loose panicle, 1–6-fld.; fls. white or tinged with pink, borne freely during the summer. S. Eu.—Valuable as a pot-plant for greenhouse or window decoration, or trained to a warm wall. Confused with *C. oleæfolius*.

9. *oleæfolius*, Desr. Tender perennial: lvs. linear-lanceolate, acute, slightly villose: fls. bright pink, borne freely in loose, umbellate panicles in the summer. Greece. B.M. 289 (as *C. linearis*).—Many plants now passing as *C. oleæfolius* are *C. Cneorum*. The latter may be distinguished by its broader, blunter, silvery-villose lvs., lighter-colored blossoms and taller growth.

10. *tricolor*, Linn. (*C. minor*, Hort.). Fig. 1049. Hardy annual: st. trailing, ascending 6–12 in., angulate, densely covered with long brown-

1048. *Convolvulus Sepium*. ( $\times \frac{1}{2}$ )

ish hairs: lvs. linear-oblong or subspatulate, obtuse or rounded at the apex, usually pubescent but sometimes glabrous, the margin ciliate towards the base: peduncle 3-fld., exceeding the lvs.; sepals ovate, lanceolate, villous, acute; limb of the corolla azure-blue, throat yellow, margined with white. S. Eu. B.M. 27.—One of the best annuals for the home border. Each plant covers a ground space of 2 ft., and blooms continuously throughout the summer. Fls. remain open all day during pleasant weather. There are many variously striped and spotted forms of this popular annual, none of which surpasses the type in beauty. A variety with pure white fls. is attractive. Other well-marked horticultural forms are: Var. *vittatus*, prettily striped with blue and white. F.S. 3:298. R.H. 1848:121. Var. *compactus*, dwarf, and valuable for pot culture. Gt. 47, p. 635. A 5-petaled form is also recorded. F.S. 8, p. 116, desc.

11. *aureus superbus*, Hort. A tender perennial, but may be treated as an annual, since it flowers the first season from seed: st. trailing or twining, 4-5 ft. long: fls. golden.—Valuable as a greenhouse climber and for hanging-baskets. Not sufficiently described for identification.

*C. althæoides*, Linn. (*C. italicus*, Roem. & Schult.). St. prostrate, twining or climbing, if it finds support: upper lvs. pedatifid.; lower ovate-cordate, crenate, silvery: fls. pink. May-Aug. Medit. region. B.M. 359. F.S. 10:1021 (as var. *argyreus*). R.H. 1864:111.—*C. ambigens*, House, native from Mont. to New Mex. and S. Calif., is a close relative to *C. arvensis*.—*C. arvensis*, Linn. Slender perennial trailer, 1-3 ft. long, glabrous or nearly so: lvs. ovate-sagittate or hastate, variable: fls. white or pink. Eu. and E. Asia. Naturalized in old fields through the Atlantic states and Calif. A troublesome weed in cult. grounds.—*C. canariensis*, Linn. Greenhouse evergreen: lvs. oblong-cordate, acute, villous: fls. violet-purple; peduncle 1-6-fld. Canary Isls. B.M. 1228.—*C. dahuricus*, Herb. (*Calystegia dahuricus*, Fisch.). Hardy deciduous twiner, 3-6 ft.: lvs. oblong-cordate, shortly acute: fls. pink or rose-violet. June, July. N. Eu. B.M. 2609. F.S. 10:1075.—*C. erubescens*, Sims (*C. acaulis*, Choisy). Tender biennial: lvs. oblong, hastate, the basal lobes toothed: fls. small, 5-lobed, rose-pink. Austral. B.M. 1067.—*C. macrostegius*, Greene. The plants in the trade under this name may be referred to *C. occidentalis*.—*C. major*, Hort., not Gilib. = *Ipomoea purpurea*.—*C. ocellatus*, Hook. Stove evergreen: limb of corolla white, 5-angled; throat reddish purple: lvs. sessile, linear, acute, 1-veined, villous. S. Afr. B.M. 4065.—*C. scoparius*, Linn.—*C. Soldanella*, Linn. Sts. prostrate: lvs. reniform: fls. pink or rose-colored. Sandy shores, Wash. to Calif.; also in Eu. and Asia.

S. W. FLETCHER.  
H. D. HOUSE.†

COÖKIA: *Claucaena*.

COONTIE: *Zamia integrifolia*.

COOPÈRIA (after Joseph Cooper, English gardener). *Amaryllidaceæ*. Tender bulbous plants with the habit of *Zephyranthes* but night-blooming.

Flowers fragrant, solitary, 2 in. or more across, waxy-white, tinged red outside, and more or less green within; the perianth subtended by a bract-like spathe, somewhat as in *Iris*; anthers erect in distinction to versatile in *Zephyranthes*: lvs. appearing with the fls. in summer, long, narrow, flat and twisted.—Only 2 or 3 species from Texas to New Mex. and Mex., usually growing in dry places. The bulbs should be taken up in autumn and stored during the winter in dry soil. Cult. easy and like *zephyranthes*.

A. Neck of bulb short: perianth-tube  $3\frac{1}{2}$  in. long or more.

*Drummondii*, Herb. EVENING STAR. Bulb roundish, 1 in. thick, with a short neck: lvs. narrowly linear, erect, 1 ft. long: peduncle slender, fragile, hollow,  $\frac{1}{2}$ -1 ft. long; spathe  $1\frac{1}{2}$ -2 in. long, 2-valved at the tip; perianth tube 3-5 in. long; limb  $\frac{3}{4}$ -1 in. long, white, tinged with red outside; segms. oblong, cuspidate. Prairies, of wide range. Var. *chlorosolen*, Baker, has a perianth-tube stouter and tinged with green: limb

1049. *Convolvulus tricolor*. ( $\times \frac{1}{2}$ )

longer and less wheel-shaped: lvs. a little broader. B.M. 3482.

AA. Neck of bulb long: perianth-tube less than  $2\frac{1}{2}$  in. long.

*pedunculata*, Herb. GIANT PRAIRIE LILY. More robust than *C. Drummondii*: bulb with a longer neck, 2-3 in. long: lvs. about 6, 1 ft. long,  $\frac{1}{4}$  in. broad: peduncle about 1 ft. long; spathe 1-2-valved at the tip; perianth-tube shorter,  $1\frac{1}{2}$  in. long; limb nearly as long as the tube, tinged red outside. B.M. 3727. R.H. 1853:401.—The best species. Fls. larger, of purer color, and remaining open a day or two longer.

N. TAYLOR.†

COPAÍFERA (from *copaiba*, Brazilian name of the balsam derived from some of these trees). Syn. *Copaiba*. *Leguminosæ*. Sixteen or more spineless trees of Trop. Amer., and Afr., with abruptly pinnate lvs., small mostly white, not papilionaceous fls. in panicles, interesting because several of them produce an oleo-resin known as *copaiba*. They are not in cult., except now and then in collections of economic plants.

COPERNÍCIA (from *Copernicus*). *Palmææ*, tribe *Coryphææ*. Tall fan-palms with their trunks frequently thickened above the base.

Leaves flabellate, the petiole often with small spines; the small young lvs. usually undivided, the older much cut palmately: spadix very much branched, the fls. single upon it or in small clusters; calyx tubular, more or less deeply 3-toothed: fr. globose or ovoid, 1-seeded.—Species about 8, all confined to Trop. Amer. *C. cerifera* is a valuable economic plant, the wood being among the hardest known, and the lvs. being the source of a valuable wax. For cult., see *Corypha*. G.C. II. 24:362. Beccari, *Le Palme Americane*, tribe *Coryphææ*, 1907.

*cerifera*, Mart. CARNAUBA PALM. St. 30-35 ft., with a small swelling near the base: lvs. 3-4 ft. wide, nearly round; rachis none; petiole convex below, concave above, the margins with rather thick spines: spadix erect or spreading, 5-6 ft. long and thrice branched; fls. in clusters on the spathe. Trop. S. Amer.—Not well known in the trade; see *Livistona*.

*C. australis*, Becc., a recently described species, said to be more hardy than *C. cerifera*, has been cult. at Riverside, Calif. Taller, 60-80 ft.; infl. densely woolly tomentose.

N. TAYLOR.

COPRA: material from the coconut, which see (p. 811).

COPRÓSMIA (Greek name referring to the fetid odor of the plants). *Rubiaceæ*. Shrubs or small trees, often trailing, of New Zealand, Australia and Polynesia, sometimes planted for the pretty fruit or variegated leaves.

Leaves opposite, mostly small, stalked or almost sessile: fls. small, solitary or fascicled, white or greenish, dioecious; corolla-limb 4-5-lobed, the lobes revolute; stamens 4-5: fr. an ovoid or globose usually 2-celled drupe.—About 60 species mostly in New Zeal., extending to Borneo, Hawaii and Juan Fernandez.

Coprosmas are greenhouse plants in the North, but they are rarely cultivated. Propagated by hardened cuttings. The soil which is found among *kalmia* roots, mixed with good loam and sand, if necessary, will suit these plants. Cuttings should be rooted in moderate heat in spring, before growth begins. If placed under a handlight or propagating-frame, care must be taken to prevent damping, to which the cuttings are liable. (G. W. Oliver.)

**Baëri**, Endl. (*C. Baueriana*, Hook. f.) Shrub or small tree, in exposed and rocky places in its native habitat sometimes not more than 1-3 ft. high and with branches nearly prostrate, in better conditions often a round-topped tree 20-25 ft. high: lvs. thick, shining green, 1-3 in. long, wide-ovate or oblong, obtuse or notched at the apex, the margins usually revolute: male fls. in dense heads on short axillary peduncles; females 3-6, the heads with shorter peduncles; calyx very small; corolla of female fls. tubular, 4-lobed. New Zeal.—In cult. there are two forms, both with variegated lvs.; one has lvs. broadly blotched creamy yellow, at times the green disappearing altogether (var. *variegata* or *picturata*); the other (*C. Stöckii*, Hort.) has lvs. blotched yellow-green on a deeper ground. *C. Baueri* is a favorite in S. Calif., and probably the only one grown there; thrives near the sea.

**acerōsa**, A. Cunn. Low and spreading, much branched, with minute lvs., small white fls., and pretty sky-blue drupes or berries. New Zeal.—Once catalogued in Calif.

**Pétriei**, Cheesem. Prostrate and creeping, forming mats, the branches to 1½ ft. long: lvs. ¼ in. or less long, linear-oblong or -obovate, rigid and thickish: fls. solitary, on the ends of short erect branchlets, the males 4-toothed and without calyx, the females smaller, irregularly toothed and calyculate: drupe ½-¾ in. diam., mostly purplish. New Zeal.—Mentioned abroad for cultivation.

L. H. B.

**CÓPTIS** (Greek, *to cut*, from the cut leaves). *Ranunculaceæ*. Hardy perennial herbs of the cooler parts of the northern hemisphere, sometimes planted in bogs and moist places.

Low, stemless plants, with slender rootstocks: lvs. radical, compound or divided, lasting over winter: fls. white or yellow, scapose; sepals 5-7, petal-like; petals 5-6, small, linear, hood-like; stamens numerous: carpels stalked, few, becoming an umbel of follicles.—Eight species, only one of which is used in American gardens.

The bitter roots yield the tonic medicine known as "gold thread;" also a yellow dye. The plants should have peaty soil, with a little sand, and prefer shade, in damp situations. They are rather hardy. The roots withstand severe winters, being native of the cooler parts of the northern hemisphere. If the plants are given some protection in winter, as in a cold pit or by a dressing of litter, the leaves remain green and fresh. The plants are valuable in hardy borders because of the leaves and also the flowers.

The plants are very easily propagated in either early spring or late fall, the former being preferred. Seeds may be sown when ripe, before they become old, and will grow readily in moist but well-drained soil. They should be only slightly covered with soil but the surface should be kept moist by a close covering with leaves or paper, and partial shade is preferred. The seedlings may be transplanted at any time after the leaves are large, by keeping plenty of soil about the roots.

**trifolia**, Salisb. No st.: rootstock yellow: lvs. compound, long-petioled; lfts. broadly obovate, cuneate, obtuse, the teeth mucronate: fl.-st. slender; sepals white, with yellow base; petals small, club-shaped: follicles 3-7, spreading, equaled by their stalk; seeds black. May-July. Adirondacks and westward. L.B.C. 2:173.—Neat and pretty, with shining lvs.

K. C. DAVIS.

**CORAL BERRY**: *Symphoricarpos vulgaris*.

**CORAL DROPS**: *Bessera elegans*.

**CORALLORHIZA** (Greek for *coral-root*). *Orchidaceæ*. **CORAL-ROOT**. Low orchids, growing in woods and parasitic on roots, destitute of green foliage, the plant usually brownish or yellowish and inconspicuous.

Flowers small, somewhat 2-lipped, usually obscurely spurred at the base; sepals and petals nearly alike; lip small, slightly adherent to the base of the column; pollinia 4.—Species few, in N. Amer., Eu. and Asia. The coral-roots have little merit as garden plants, although very interesting to the student. They may be grown in rich, shady borders. Two species have been offered by dealers in native plants. *C. multiflora*, Nutt. (Fig. 1050), is purplish, 1½ ft. or less high, 10-30-fld., lip deeply 3-lobed; grows in dry woods in northern states; *C. Mertensiana*, Bong., scape many-fld., 8-15 in. high, the lip entire and broadly oblong; occurs in Brit. Col. and north to Alaska. *C. odontorrhiza*, Nutt., provides what is known as *crawley-root*, said to be used for its diaphoretic and febrifuge properties: it is a slender plant, in woods S., but extending north as far as Canada, light brown or purplish, 6-7 in. tall: lip nearly or quite entire, white spotted with crimson.

L. H. B.

**CORAL-PLANT**: *Jatropha*.

**CORAL-ROOT**: *Corallorhiza*.

**CORAL-TREE**: *Erythrina*.

**CÓRCHORUS** (name refers to some reputed virtue, as an eye remedy, of one of the species). *Tiliaceæ*. Shrubs or herbs of the tropics, two of which supply jute.

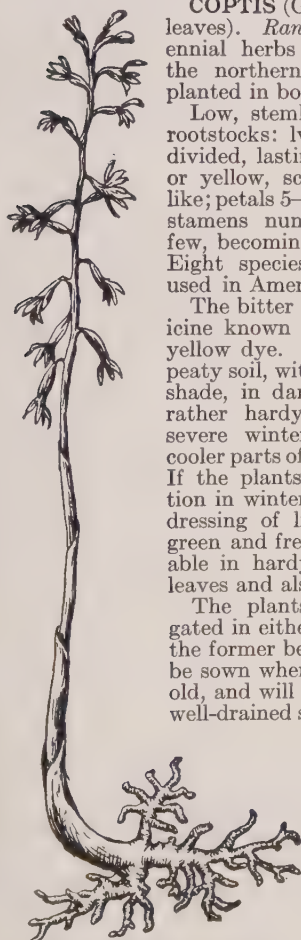

The jute plants are *C. capsularis* Linn. and *C. olitorius*, Linn. The latter differs from the *C. capsularis* in having an elongated, not semi-globose, pod. B.M. 2810. They are annual plants, natives of Asia but cult. throughout the tropics, growing 10-12 ft. high, with a straight st. as thick as the little finger and branched only at the top. Fls. small, yellow, with 4-5 glandless petals and a slender caps., or sometimes the caps. is globose. The young shoots of both are used as pot herbs. *C. olitorius* is much grown for this purpose in Egypt, and is known as Jews' mallow. Jute is made from the fibrous bark of these and other species of Corchorus. It is released from the sts. by retting in stagnant pools. See Cyclo. Amer. Agric., Vol. II, pp. 282, 507.

*C. Baldacii*, Fedde, has very recently been mentioned in foreign horticultural literature. It is described as a perennial, woody at the base: lvs. linear-elliptic, pilose above and white-tomentose beneath: fls. solitary, axillary and minute. Italian Somaliland.

The corchorus of trade lists is likely to be *Kerria*.

**CÓRDIA** (an early German botanist, Valerius Cordus, born 1515). *Boraginaceæ*. Warm-climate trees, shrubs or almost herbaceous, sometimes planted.

Leaves mostly alternate, reticled, entire or dentate: fls. in dense heads or clusters or scirpioid cymes, perfect or polygamous, the corolla usually white or orange; calyx tubular or campanulate, toothed or lobed; corolla tubular, funnellform or salverform, lobed, the parts and the stamens 4 or more; style 4-lobed: fr. a drupe which is 4-lobuled and usually 4-seeded.—Species about 230 in tropical and subtropical regions, mostly

1050. *Corallorhiza multiflora*.  
(× ½)

in the western hemisphere. Some of them are vines; some are herbaceous above the base. Species confused.

The cordias are greenhouse plants with showy flowers of easy culture. Grown in the open in the extreme South. Propagated by cuttings of firm wood and by seeds.

1051. *Cordia Greggii* var. *Palmeri*. ( $\times \frac{3}{8}$ )

**Sebestëna**, Linn. (*C. speciosa*, Willd.). **GEIGER TREE**. Tall evergreen shrub or small tree, hairy, with rough, ovate, entire or undulate stalked lvs.: fls. 1-2 in. long, orange or scarlet, stalked, in large open terminal clusters, the crumpled corolla-lobes and stamens 5-12; drupe inclosed in the hazel-like husk formed by the persistent calyx. Keys of Fla. and south. B.M. 794.

**Gréggii**, Torr. Much-branched shrub, to 8 ft.: lvs. less than 1 in. long, pale, obovate, obtuse, dentate, rugose, long-cuneate at the base: fls. more than 1 in. across, white, in few-fl. contracted capitate clusters but becoming looser as flowering proceeds; corolla-lobes obtuse; stamens 5 or 6, scarcely half the length of the corolla. Mex. Var. **Palmeri**, Wats. (Fig. 1051, adapted from G.F. 2:233) has more broadly funnel-form corolla, the limb  $1\frac{1}{4}$  in. broad: lvs. somewhat larger, ovate-oblong and abruptly cuneate at the base, acute or obtuse at the apex. Mex.—Deserving of planting in the southwest country, if hardy.

Other cordias are likely to come into cult. in the southern country. Some of them yield drugs, many of them produce useful timber, and some have edible frs. There are numbers of species in Porto Rico and others of the W. Indies.—*C. Francisci*, Tenore. Tall: lvs. dark green: fls. white. S. Amer.—*C. Myxa*, Linn., from Trop. Asia and Austral., is one of the best woods for kindling fire by friction, and is useful in many other ways.

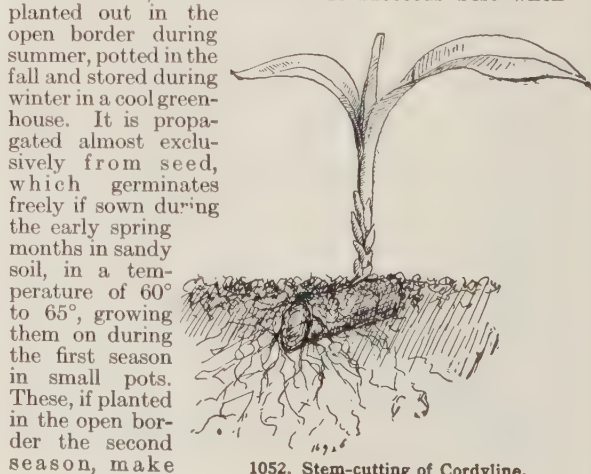

L. H. B.

**CORDYLÏNE** (*club-like*, referring to the fleshy roots). *Liliacæ*. **DRACENA**. **DRACENA PALM**. Greenhouse plants closely related to *Dracæna*; planted in the open in California and similar climates.

Stems tall, often woody and palm-like, bearing large crowded lvs., to the striking variegation of which the group owes its value: fls. panicked; stamens 6; pedicels articulated; perianth 6-parted; ovary 3-celled: fr. a berry.—Cult. for the ornamental foliage. The horticultural

forms and names have become very numerous. The various species are in the trade under *Dracæna*, which see for a key to the species of both genera combined. From *Dracæna*, *Cordylina* differs in the ovary containing several ovules in each cell, and the solitary pedicels being provided with a 3-bracted involucre. In the following paragraphs, the initial *D.* indicates that the plant in question is known in the trade as a *Dracæna*, and *C.* that it is known as a *Cordylina* (see *Dracæna*). For a monograph, see Baker, Journ. Linn. Soc. 14:538 (1875).

Of cordylines or dracenas, propagation is usually effected by cutting the ripened stems or trunks, from which all leaves have been removed, into pieces from 2 to 4 inches long. These are laid either in very light soil or in sand in the propagating-bed, where they receive a bottom heat of about 80°, being barely covered with sand or moss (Fig. 1052). The eyes soon start into growth, and, as soon as they have developed about six leaves, these shoots are cut off with a small heel and again placed in the propagating-bed until rooted, after which they are potted off into small pots in light soil, kept close until they become established. They are then shifted on into larger pots as soon as well rooted. They delight in a mixture of three parts good turfy loam and one part well-decayed cow-manure, with a liberal sprinkling of sharp sand. A warm, moist atmosphere suits them best while growing, but towards fall the finished plants must be gradually exposed to full sunshine and a dry atmosphere, which develops their high colors. The kinds enumerated below are such as are mainly grown in large quantities for decorative purposes, and are sold principally during the winter months, especially during the holiday season, when plants with bright-colored foliage are always in strong demand: *C. amabilis*.—A strong-growing form with broad green foliage, which is prettily variegated with white and deep rose. One of the hardiest varieties, either for decorations in winter or for outdoor work, vases, and the like in summer. *D. fragrans*.—An African species with broad, massive, deep green foliage which makes noble decorative plants, being frequently grown into specimens from 6 to 8 feet high. Its foliage is of heavy texture, making it a useful plant for the dry atmosphere of a living-room. Two handsomely variegated forms of the above are *D. Lindenii* and *D. Massangeana*, both very desirable varieties. *C. terminalis*.—This is the most popular species, and is grown in immense quantities. The foliage on well-matured plants is of an intense rich crimson marked with lighter shadings. *C. australis* (commonly called *C. indivisa*).—Used principally as an outdoor decorative plant in summer, being extensively used for furnishing vases, window-boxes, and the like. It succeeds best when

1052. Stem-cutting of *Cordylina*.

fine plants for 6- or 7-inch pots. There are a number of varieties of *C. australis*, among them several handsomely variegated bronze-colored forms, which, however, are but little distributed yet. Among the principal varieties and species besides the above which are grown in a commercial way are: *Baptistii*, *Shepherdii*, *stricta grandis*, *Youngii*, *Goldieana*, *Lord Wolseley*, *Desmetiana*, *Sanderiana*, *Godseffiana*, and *Mandæana*. (J. D. Eisele.)

A. *Foliage of sessile, thick, sword-shaped lvs.*B. *Lvs. glaucous beneath, broad.*

1. *indivisa*, Kunth. Arborescent, 10-20 ft. high: lvs. dark green, densely crowded, 2-6 ft. long, 4-6 in. broad at the middle,  $1\frac{1}{2}$ -2 in. at the base, rigid, very coriaceous; midrib stout, colored red and white, veins on each side of it 40-50; panicle nodding; bracteoles lanceolate, 3-4 lines long, membranous; perianth 3-4 lines long, white; tube very short, campanulate; segms. equal, sharply recurved; berries  $\frac{1}{4}$  in. diam., blue; ovules 5-6 in each cell. New Zeal. Gn. 49, p. 86. Lowe, 52.—Coolhouse; valuable for vases. Rare in cult. See *C. australis*, No. 4.

BB. *Lvs. green on both sides, narrower.*

2. *stricta*, Endl. (*D. congesta*, Hort.). Slender, 6-12 ft. high: lvs. less crowded than in the next, acuminate, 1-2 ft. long, 9-15 lines wide, base 3-6 lines wide, scarcely costate; veins scarcely oblique, margins obscurely dentate; panicle terminal and lateral, erect or cernuous; pedicels  $\frac{1}{2}$ -1 line long; lower bracteoles lanceolate; perianth lilac, 3-4 lines long, campanulate, interior segms. longer than the outer; ovules 6-10 in each cell. Austral. B.M. 2575. G.C. III. 17:207.—Coolhouse, vases, and the like. Var. *grândis*, Hort. Large, highly colored. Var. *discolor*, Hort. Like var. *grândis*, but with foliage dark bronzy purple.

3. *austrâlis*, Hook. (*D. indivisa*, Hort. *D. calocoma*, Wend.) Fig. 1053; 359, Vol. I. Arborescent, 15-40 ft. high: lvs. densely rosulate,  $1\frac{1}{2}$ -3 ft. long,  $1\frac{1}{2}$ -2½ in. wide; base 6-12 lines wide, acuminate, green; midrib firm, indistinct, nerves on each side of it 12-20, scarcely oblique; panicle drooping or erect, terminal, ample; pedicels very short; bracteoles deltoid,  $\frac{1}{2}$  line long; perianth white, 3-4 lines long; tube short, campanulate, segms. nearly equal, recurved; berry white or bluish-white; mature seeds often solitary. New Zeal. B.M. 5636. G.C. III. 23:153. Gn. 47, p. 312; 48, p. 197. I.H. 35:40 (as var. *Doucetiana*); 37:114 (as var. *Dalseriana*); 40:190 (as *C. lineata* var. *purpurascens*). S.H. 1, p. 487.—Coolhouse, vases. Var. *aurea-striata*, Hort. Variegated with a number of longitudinal yellow stripes. Var. *atropurpurea*, Hort. Base of lf. and under side of midrib purple. Var. *lineata*, Hort. Lvs. broader, the sheathing base stained with purple. Var. *Veitchii*, Hort. (*D. Veitchii*, Hort.). Base of lf. and under side of midrib bright crimson. *C. Hookeri*, Hort., was a garden form of this species.—Much of the *C. indivisa* of the American trade has been, in the past, *C. australis*. Known as "cabbage tree" to residents of New Zealand.

AA. *Foliage of petioled lvs.*B. *Lvs. oblanceolate; petioles broad.*

4. *rubra*, Hugel. Slender, 10-15 ft. high: lvs. contiguous, ascending, 12-15 in. long, 18-21 lines wide above the middle, thick, dull green both sides, distinctly costate; veins oblique; petiole broad, deeply grooved, 4-6 in. long; panicle lateral, nodding; pedicels very short; bracteoles small, deltoid; perianth lilac,  $4\frac{1}{2}$ -5 lines long, inner segms. longer than the outer; ovules 6-8. Country unknown.—Cool-house, vases. *D. Bruantii*, Hort., was a garden form of this species. R.H. 1897, pp. 514, 515. G.C. III. 22:285. G.W. 12, p. 230.

BB. *Lvs. lanceolate; petioles narrow, nearly terete.*

5. *Haageana*, Koch (*C. Murchisoniæ*, F. Muell.). Slender and small: lvs. contiguous, ascending, oblong-falcate, 4-8 in. long, 2-2½ in. wide at the middle, acute, base rounded or deltoid, thick, dull green

1053. *Cordyline australis*—*C. indivisa* of the trade.

throughout, distinctly costate; veins slender, oblique; petiole 3-4 in. long, deeply channelled; panicle lateral; pedicels  $1\frac{1}{2}$ -2 lines long; perianth 4-4½ lines long, tinged with lilac; ovules 6-8 in each cell. Austral.

6. *terminalis*, Kunth. Low and slender, 3-8 ft. high: lvs. contiguous, ascending, green or rarely colored, 12-30 in. long, 2-5 in. wide, elliptical or elliptic-lanceolate, acute, thickish, distinctly costate; veins frequently unequal, strongly oblique; petiole 4-6 in. long, deeply channelled; pedicels very short or none; bracteoles deltoid, membranous; perianth 5-6 lines long, white, lilac, or reddish, segms. short; ovules 6-10 in each cell; berry large, red. E. Indies. A.G. 16:361. B.R. 1749. Var. *cannæfolia*, Baker (*D. and C. cannæfolia*, Hort.). Lvs. oblanceolate, 12-15 in. by 2-2½ in.; perianth 2 lines long; segms. twice the length of tube. Var. *ferrea*, Baker (*D. and C. ferrea*, Hort.). Lvs. narrow, oblanceolate, 2-2½ in. broad, dull purple or variegated; petiole short: fls. much as in the typical form, but redder and often smaller. B.M. 2053.—*C. Guilfoylei* is a form with lvs. tapering both ways, recurved, striped with red, pink or white; white on lower part of lf. and margin of petiole. I.H. 19, p. 249. Var. *Ti*, Baker (*D. braziliensis*, Schult. *C. Eschscholziæna*, Mart.). Robust: lvs. large, mostly oblong, 4-6 in. wide; panicle large, lower branches compound; perianth 6 lines long, lilac; segms. as long as the tube.—*D. imperialis*, Hort., is a form with lvs. arching or erect, thick, deep metallic green, rayed all over with bright crimson or pink, handsome. *D. reginæ*, Hort.

belongs here. The varieties of this species in cult. are almost innumerable. Names that have been used for those in the American trade, usually considered as horticultural species, though many of these names are now no longer used, are as follows: *C. amabilis*. Lvs. broad, shining deep green, in age becoming spotted and suffused with rose and white. *C. amboyensis*. Lvs. oblong-lanceolate, recurved, deep bronze-green, edged with rose-carmine below; petioles tinged with purple. *C. anerliensis*. Lvs. very broad, deep bronze-red, with some white. *C. Baptistii*. Fig. 1054. Lvs. broad, recurved, deep green, with some pink and yellow stripes; sts. also variegated. I.H. 26:334. *C. Baùsei*. Lvs. broad, dark green, with some white. *C. bella*. Lvs. small, purplish, marked with red. *C. Cántrellii*. Lvs. dark metallic crimson, young ones bright carmine. *C. Coöperi*. Lvs. deep wine-red, gracefully recurved; common in cult. *C. Fräseri*. Lvs. somewhat erect, broad, oblong, abruptly acute, blackish purple with bloom, margin below with a deep rosy lake stripe extending down the petiole. *C. Gládstonei*. Lvs. broad, brilliant crimson. *C. híbrida*. Lvs. broad, variegated, deep green margined with rose, in age deep rose, creamy white in young lvs. *C. jardinière* (*C. terminalis alba* × *C. Guilfoylei*). Lvs. very small and compact, narrow, green broadly margined with white. *C. metálica*. Lvs. erect-arching, oblong, when young uniform rich coppery purple, in age dark purple-bronze; petioles same. F.M. 1872:24. *C. nigro-rubra*. Lvs. narrow, linear-lanceolate, dark brown with rosy crimson centers, young often entirely rose. *C. norwoodiënsis*. Lvs. striped with yellow, green and crimson, last color principally confined to the margin; petioles brilliant. *C. Robinsoniana*. Lvs. long lanceolate-acuminate, arched, light green, striped with bronze-green and brownish crimson. I.H. 26:342. *C. Schúldii*. Lvs. broad, variegated. F.E. 7:961. *C. Scóttii*. Lvs. broad, arching, deep green, crimson edged; said to be a hybrid. *C. Yóungii*. Lvs. broad, spreading, when young bright green streaked with deep red and tinged with rose, in age bright bronze. *C. Yóungii* var. *rösea*, Hort. Green, tinged with pink, white or carmine. *C. Yóungii* var. *álba*, Hort. Variegated with white instead of red. Crosses with *C. Scottii* are known as *C. stricta*, *C. albo-lineata*, Mrs. George Pullman, Mrs. Terry; with *C. norwoodiënsis*, as Little Gem.

*C. angústa*, Hort. (*C. terminalis* var.). Lvs. narrow, arching, dull dark green above, purplish beneath. A slender form.—*C. angustifolia*, Kunth= *C. stricta*.—*C. aurantiaca*, Hort.= (?).—*C. Balmoréna*, Hort. Lvs. bronzy with white and pinkish stripes.—*C. Bánskii*, Hook. Lvs. very long, linear-lanceolate, 3-5 ft. long, 2-3 in. wide, petioled, green, glaucous beneath; veins conspicuous. G.C. III. 13:613.—*C. Berhéleyi*, Hort.= (?).—*C. Cassanova*, Hort.= (?).—*C. Chélsónii*, Hort. (form of *C. terminalis*). Lvs. large, glossy dark green, almost black, becoming suffused and edged with crimson. I.H. 19, p. 90.—*C. compácta*, Hort. (*C. terminalis* form). Lvs. recurved, broad, dull green, with bronze and rose stripes in age.—*C. Dénissonii*, Hort. (*C. terminalis* form). Dwarf: lvs. broad, bronzy purple.—*C. Elizabethæ*, Hort.= (?).—*C. excélsa*, Hort. (*C. terminalis* form). Lvs. broad, arching, bronzy, margined with crimson.—*C. Frederica*, Hort.= (?).—*C. frutescens*, (?).—*C. gloriösa* Hort. (*C. terminalis* form). Lvs. very large and broad, green, with a peculiar bronze-orange hue.—*C. helychioides*, F. Muell.= *C. terminalis*.—*C. heliconiæfolia*, Otto & Diet.= *C. terminalis*.—*C. Hénderonii*, Hort.= (?).—*C. magnífica*, Hort. (*C. terminalis* form). Lvs. large and broad, bronzy pink, becoming darker.—*C. Mánners-Süttoniæ*, F. Muell.= *C. terminalis*.—*C. Mays*, Hort. Lvs. green, margined with red; young lvs. wholly red.—*C. porphyrophýlla*, Hort. (*C. terminalis* form). Lvs. deep bronzy purple, glaucous beneath.—*C. Réx*, Hort. (*C. terminalis* form). Lvs. medium width, bronzy green, flushed purple and streaked with carmine.—*C. rosacea*, Hort. (*C. terminalis* form). Lvs. recurved, broad, dark bronzy green margined with pink.—*C. Rümphii*=D. Hookeriana.—*C. Salmónæa*= (?).—*C. sepáriæ*, Seem.= *C. terminalis*.—*C. Sièberi*, Kunth= *C. terminalis*.—*C. splendens*, Hort. (*C. terminalis* form). Lvs. dense, short, ovate-acute, bronzy green, shaded with rose-carmine.—*C. zeelándica*, Hort.= *C. rubra*.

K. M. WIEGAND.

**CORÈMA** (Greek, a broom, in allusion to its bushy habit). *Empetrææ*. BROOM CROWBERRY. Two species of low heath-like shrubs from E. N. Amer. and S. W. Eu. and the Atlantic Isls., of which the American spe-

cies is rarely cult. in botanical collections. Closely allied to *Empetrum* and differing chiefly in the apetalous fls. arranged in terminal heads, and in their upright bushy habit. Cult. and prop. like *Empetrum*. *C. Cónradii*, Torr., is a much-branched shrub, to 2 ft. high, with crowded linear lvs. about 1/2 in. long; fls. inconspicuous, in terminal heads, the staminate with long exserted purple stamens; fr. a small berry-like drupe, usually with

3 nutlets. H.I. 6:531. Hardy N.—*C. álbum*, D. Don, has obtuse lvs. with revolute edges and resinous dots: fls. pink; fr. white to purple. S. W. Eu., Azores. ALFRED REHDER.

1054. *Cordyline terminalis* var. *Baptistii*.

**COREÓPSIS** (Greek, signifying *bug-like*, from the fruit). Including *Calliopsis*. *Compósitæ*. TICKSEED. Annual or perennial herbs, flowering in summer or autumn, nearly all natives of eastern North America, some of them popular as flower-garden subjects.

Leaves opposite or rarely alternate: heads pedunculate and radiate; the broad involucre with bracts of 2 distinct series, the outer narrower or shorter and more herbaceous, the inner broad triangular-ovate or oblong, thin, yellowish green or purplish, and striate; receptacle chaffy; rays very showy, yellow, particled or rarely rose, neutral; disk-fls. yellow, dark or brown; pappus of 2 weak bristles or scales, or a low crown or none: achenes often winged.—The genus differs from *Bidens* only in the reduced or obsolete, not stiff-awned pappus, and lf.-segms. not serrate. Many of the species are in the trade under the name *Calliopsis*. Other genera with this peculiar involucre are *Hidalgoa*, *Dahlia*, *Thelesperma*, *Cosmos*, and *Leptosyne*. All the kinds are of easiest cult. The perennials are hardy border plants. The annuals are raised in any garden soil, and bloom freely with little care. They are all showy plants, of 50-70 species.

A. *Rays cuneate, lobed.*

B. *Disk yellow; rays rose-purple.*

1. *rosea*, Nutt. Perennial: diffusely branched from slender, creeping rootstocks, 1-2 ft. high, smooth: lvs. all narrowly linear, entire or with a few linear teeth or lobes: heads small, about 1 in. broad or less, short-peduncled; rays narrowly wedge-shaped, lobed at the apex: achene narrowly oblong, wingless; pappus an obscure border. Mass. to Ga.

BB. *Disk and involucre dark purple; rays yellow or parti-colored, wedge-shaped and lobed.*

c. *Outer involuclral bracts very short, lanceolate or triangular.*

D. *Lvs. entire: achenes with lacerate wings and setiform pappus.*

2. *angustifolia*, Ait. (*C. dichotoma*, Michx. *C. linifolia*, Nutt.). Perennial: strict and tall, 1-3 ft. high, glabrous, sparsely branched at the summit: lvs. entire, thickish; basal oblanceolate to narrowly spatulate, long-petioled; lower cauline elliptical on long petioles; upper narrowly spatulate or linear, sessile or reduced to bracts: heads 1-1½ in. broad; rays entirely yellow. S. U. S.

DD. *Lvs. divided: achenes and pappus not as above.*

3. *cardaminefolia*, Torr. & Gray. Annual: low and diffusely much branched from the base, 6-24 in. high, glabrous: numerous basal and lower cauline lvs. petioled, pinnatifid, divisions several pairs, short, oval, elliptical, rarely linear, often again divided; upper cauline nearly sessile with narrower and fewer divisions: heads as in No. 5, but smaller, and often entirely dark: achenes broader, winged; pappus minute or none. S. U. S. Gn. 29, p. 498; 37, p. 203.

4. *Atkinsoniana*, Douglas. Perennial or annual: st. tall, 2-4 ft. high: lvs. pinnatifid, the divisions linear: heads as in the next: achenes with narrow wing or scarious margin; pappus composed of 2 short, subulate teeth. Autumn-flowering. S. W. U. S. B.R. 1376.

1055. *Coreopsis tinctoria*—*Calliopsis elegans* of gardens. ( $\times \frac{1}{2}$ )

5. *tinctoria*, Nutt. (*C. bicolor*, Reichb. *C. elegans*, Hort. *Calliopsis marmorata*, Hort.). Fig. 1055. Annual: st. tall, strict, 1-3 ft. high, branched, glabrous: basal lvs. few or wanting; cauline petioled, the upper sessile, pinnatifid, divisions from narrowly elliptical to often again divided and narrowly linear: heads ¾-1½, rarely 2, in. broad; rays with dark purple base: achenes oblong, wingless; pappus none. Cent. U. S. B.M. 2512 B.R. 846. Mn. 1, p. 85.—A common garden annual; showy and good. Var. *nana*, Hort. Dwarf, low and compact. Gn. 29, p. 499. Tom Thumb varieties. Var. *atropurpurea*, Hook. (*C. nigra*, Hort.). Rays almost entirely dark. B.M. 3511.

cc. *Outer involuclral bracts narrowly linear, about equaling the inner.*

6. *Drummondii*, Torr. & Gray (*C. diversifolia*, Hook. *C. picta*, Hort.). GOLDEN WAVE. Annual: st. branched above, 10-24 in. high: lvs. petioled below, sessile above, pinnatifid, divisions few, short, broadly elliptical, those of the upper lvs. linear: heads 1-2 in. broad, large; rays usually dark at the base: achene oval, wingless, margin cartilaginous incurved; pappus none. Texas. B.M. 3474. S.B.F.G. II. 4:315. Gn. 26, p. 461; 29, p. 498; 37, p. 203; 43, p. 397. G.M. 54:13. G. 16:58.

BBB. *Disk yellow or brown; rays entirely yellow (except No. 7); peduncles long.*

c. *Style-branches acute or obtusish, not acuminate: dark lines at base of rays.*

7. *coronata*, Hook. Annual: low and often weak, 12-24 in. high, much branched from the base, sparsely hirsute: lvs. thick; the basal usually numerous, petioled, pinnatifid or entire, divisions elliptic, rather obtuse, lateral divisions smaller; the cauline lvs. few, spatulate, often entire: heads 1½-2 in. broad; rays with a few dark lines above the orange base; outer involucre a third to a half shorter than the inner: achene orbicular, broadly winged, often echinate, with a thickened callus at base and apex on inner face; pappus very minute. Texas. B.M. 3460. S.H. 1:270. Gn. 26, p. 461; 29, p. 499.

cc. *Style-branches cuspidate-acuminate: rays entirely yellow.*

8. *pubescens*, Ell. (*C. auriculata*, Schkuhr & Hort., not Linn.). Perennial: tall, 1-4 ft. high, branched above, pubescent or nearly glabrous, leafy throughout: lvs. thickish, oval to lanceolate, very acute, petioled or nearly sessile, entire or with small, acute, lateral lobes; basal few: heads 1½-2½ in. broad; outer involucre nearly as long as the inner: achenes and pappus similar to those of the next species. S. U. S. Gn. 37, p. 202.

9. *lanceolata*, Linn. Fig. 1056. Perennial: low, 1-2 ft. high, sparingly branched, glabrous or nearly so, leafy toward base: lvs. few, large, oblong-spatulate to linear, petioled, barely acute, upper entire, lower usually pinnatifid, divisions very distant: heads 1½-

1056. *Coreopsis lanceolata*. ( $\times \frac{1}{2}$ )

2½ in. broad; peduncles very long; outer involucre equaling the inner or one-half shorter: achenes orbicular, papillose, broadly winged; pappus of minute scales or obsolete. E. U. S. Gn. 25, p. 165; 33, p. 7; 37, p. 203. G.W. 10, p. 22. V. 18:102.—Used extensively for cut-fls.

Var. *glabélla*, Michx. (var. *angustifolia*, Torr. & Gray). Low: sts. scapiform: lvs. narrow and crowded at base of st., 2–4 lines wide.

Var. *villósa*, Michx. (*C. oblongifolia*, Nutt.). Lvs. spatulate-obovate to oblong, villous, as is also the st., with jointed hairs.

1057. *Coriaria japonica*. (×½)

10. *grandiflora*, Nutt. (*C. longipes*, Hook. *C. Boykiniana*, Nutt.). Perennial; simple or branched, glabrous, 1–2 ft. high, leafy throughout: basal lvs. few, lower lvs. spatulate or lanceolate, entire, upper divided into several linear entire divisions: heads 1–2½ in. broad: achene orbicular, papillose, broadly winged; pappus of 2 small scales. S. U. S. B.M. 3586. Gn. 47:7; 62, p. 338. Mn. 5:201. G. 29:461. J.H. III 57: 479. Gn. W. 23:349; 26:113.

AA. Rays elliptical, entire or toothed at apex.

B. Color of rays pale yellow: lvs. petioled.

11. *tripteris*, Linn. Perennial; very large and stout, 4–8 ft. high, branched above, glabrous: lvs. petioled, 8 in. or less long, trifoliate, or rarely irregularly 5–7-foliate, divisions lanceolate: heads medium, rays pale, disk-fls. yellow or dark purple: achene oblong, narrowly winged; pappus a fimbriate border. Cent. U. S.

BB. Color of rays deep yellow: lvs. sessile.

C. Lvs. 3-cleft to below middle; base entire, 3-ribbed.

12. *palmaßa*, Nutt. (*C. præcox*, Fresen.). Perennial; tall and stout, 1½–3 ft. high, sparingly branched at the summit: lvs. thick, cuneate, 2½ in. long, divisions broadly linear, often irregularly again divided: heads 1½–2½ in. broad: achenes oblong, narrowly winged; pappus minute or obsolete. Cent. U. S. R.H. 1845:265.

CC. Lvs. divided to the base.

D. The lvs. 3-divided, divisions entire, ½–1 in. broad.

13. *major*, Walt. (*C. senifolia*, Michx.). Perennial; tall and stout, 2–3 ft. high, pubescent, much branched

above: basal lvs. wanting, lower cauline small, upper 2–3 in. long, palmately 3-divided, divisions equal, lanceolate, acute: heads 1¼–2 in. broad; rays deep yellow; disk-fls. yellow: achenes obovate-elliptical, winged, summit 2-toothed. S. E. U. S.

Var. *Öemleri*, Brit. Smooth: lf-divisions more attenuate at the base. B.M. 3484 (as *C. senifolia*).

Var. *linearis*, Small. Smooth: lf-divisions narrow, 2–4 lines wide.

DD. The lvs. dissected, divisions ⅓–3 lines wide.

14. *delphinifolia*, Lam. Perennial; glabrous, branched above, 1–3 ft. high: lvs. sessile, 2–3 in. long, basal wanting, ternately divided, divisions dissected into linear-filiform segms., which are 1–3 lines wide: head 1–2½ in. broad; disk dark: achene oblong-obovate, narrowly winged; pappus-teeth short. S. E. U. S.

15. *verticillata*, Linn. (*C. tenuifolia*, Ehrh.). Perennial; sparingly branched, 1–3 ft. high: basal lvs. wanting; cauline, sessile, similar to the last but segms. only ⅓–½ lines wide: heads 1–2 in. broad; disk yellow: achenes oblong-obovate, narrowly winged; pappus nearly obsolete. E. U. S.

*C. aristosa*, Michx., *C. aurea*, Ait., and *C. trichosperma*, Michx., are now placed under *Cidens* (which see).—*C. atropurpurea*, Hort. = *Thelesperma* sp.—*C. auriculata*, Linn. (*C. diversifolia*, DC.). Perennial: low, stoloniferous, hirsute: lvs. petioled, short, oval, mostly entire: heads large, very long-peduncled: probably not in the trade. S. U. S.—*C. billa*, Hutchins. Undershrub about 3 ft. high. British E. Afr.—A very handsome species.—*C. Granti*, Oliv. A compact bushy plant about 2 ft. high. Fls. in the winter. Trop. Afr. B.M. 8110. G.C. III. 39:162. Gn. 69, p. 161.—*C. Léavenworthii*, Torr. & Gray. Annual: lf-divisions linear-spatulate: rays cuneate, lobed, yellow: awns 2, slender: achene winged. Fla.—*C. nudata*, Nutt. Perennial, rush-like: lvs. mostly basal, long, filiform: rays rose-colored: wing of achene pectinate. S. U. S.—*C. radiata*, Hort. Plant very dwarf: fl.-heads with ray-florets rolled up. Of garden origin.

K. M. WIEGAND.

**CORIANDER** is the seed-like fruit of *Coriandrum sativum*, Linn., an umbelliferous annual of southern Europe. The plant grows 1 to 3 feet high, glabrous, strong-smelling, with leaves divided into almost thread-like divisions, and small white flowers. The plant is easily grown in garden soil. It occasionally becomes spontaneous about old yards. The seeds (fruits) are used as seasoning and flavoring in pastries, confections and liquors, although they are less known in this country than caraway. The plant is sometimes grown in American gardens with sweet herbs and other things.

**CORIANDRUM:** *Coriander*.

**CORIARIA** (*corium*, skin, leather; a shrub used for tanning leather was described as *frutex coriarius*, by Pliny). *Coriariaceæ*. Shrubs or perennial herbs grown chiefly for their ornamental fruits.

Leaves deciduous, entire, 3–9-nerved, opposite and distichous: fls. polygamous-monœcious in slender racemes, small; petals and sepals 5; stamens 10: fr. berry-like, consisting of 5 1-seeded nutlets inclosed by the enlarged and colored petals.—About 8 species in Himalayas and E. Asia, Medit. region, N. Zeal. and S. Amer. Ornamental shrubs or herbs, with slender arching branches imitating pinnate lvs., and with very showy yellow, red or black fr. The lvs. of some species are used for tanning leather; the frs. are poisonous in some species, edible in others. *C. japonica* has proved hardy with slight protection in Mass., and *C. terminalis* seems to be of the same hardiness; the other species are more tender. They grow in almost any good garden soil, and prefer sunny position. Prop. readily by seeds and greenwood cuttings in summer under glass; also by suckers and layers.

*japonica*, Gray. Fig. 1057. Shrub, 2–3, sometimes to 10 ft.: branches quadrangular: lvs. nearly sessile, ovate or ovate-lanceolate, 3-nerved, smooth, 2–4 in. long: fls. in axillary racemes from the branches of last year: fr. becoming bright red in summer, changing to violet-

black when ripe. Japan. B.M. 7509. G.F. 10:343 (adapted in Fig. 1057). S.I.F. 2:58. R.H. 1913, p. 79.

*terminalis*, Hemsl. Herbaceous or suffruticose, 2-3 ft.: branches quadrangular; lvs. nearly sessile, broad-ovate to ovate-lanceolate, 5-9-nerved, scabrous on the veins beneath, 1-3 in.: fls. in terminal racemes on shoots of the current year: fr. black. Sikkim, W. China. Var. *xanthocarpa*, Rehd. & Wilson. Fr. yellow. Sikkim. B.M. 8525. R.H. 1907:160. G.C. III. 34:282. J.H. III. 49:443. F.S.R. 3:106. M.D. 1897:1.—A very ornamental plant, keeping its yellow fr. from July until late in fall; being herbaceous, it is easier to protect from frost than the former. Originally intro. into cult. as *C. nepalensis*.

*C. himalayensis*, Hort. Said to have persistent lvs. and edible frs. Possibly not different from *C. nepalensis*.—*C. myrtifolia*, Linn. Shrub, 4-10 ft.: lvs. 3-nerved, glabrous; fls. greenish, from the old wood: fr. black, poisonous. Medit. region. Yields a black dye.—*C. nepalensis*, Wall. Shrub, 8-10 ft.: lvs. 3-5-nerved, glabrous; fls. brownish: fr. black. Himalayas.—*C. sarmentosa*, Forst. Suffruticose, procumbent: racemes axillary, on young branches. B.M. 2470.—The wineberry shrub of the natives. The berries yield a pleasant drink, but the seeds are poisonous. Source of the New Zeal. toot-poison, which is very destructive to human and animal life.—*C. sinica*, Maxim. Allied to *C. japonica*. Shrub to 18 ft.: lvs. oval or broadly elliptic, abruptly short-pointed,  $1\frac{1}{2}$ -3 in. long: fr. black. Cent. China.

ALFRED REHDER.

**CÔRIS** (ancient name, transferred). *Primulacææ*. Two low thyme-like herbs of S. Eu., sometimes planted in rock-gardens, but apparently not in the trade. Lvs. small, alternate, linear, spreading or recurved, the margin revolute: fls. lilac or rose-purple, in terminal densely-fld. racemes. *C. monspeliensis*, Linn., of the Medit. region, is 6 in. high, much branching and spreading, the sts. thickly covered with the little narrow lvs.

**CORK-TREE:** *Quercus*.

**CÓRMUS:** *Sorbus*.

**CORN, MAIZE (SWEET and POP).** A tender annual cultivated for its grain, which is used both for human and live-stock food, and for the herbage which is used as forage. As a horticultural crop, it is grown primarily for the unripe grain or for pop-corn.

The word maize, Spanish *maiz*, is derived from the name Mahiz, which Columbus adopted for this cereal from the Haytians. Maize has not yet been found truly wild. Its close relationship to a native Mexican grass called teosinte, *Euchlaena mexicana*, is indicated by the known fertile hybrids between this species and maize as pointed out by Harshberger. Teosinte and the only other species which show close botanical relationship to maize are indigenous to Mexico. In fact the evidence all shows that maize is of American origin, although its original form has not yet been discovered, nor has its evolution from other types been completely traced. DeCandolle concludes that maize is not a native of the Old World but is of American origin, and that it was introduced into the Old World shortly after the discovery of the New, and then was rapidly disseminated.

Very early in the exploration and settlement of the New World, the whites learned from the natives the use of maize as food. Several of the Indian names for preparations of food from this cereal were adopted or adapted by the settlers and passed into the English language,—as for example hominy, samp, and succotash. In the English-speaking colonies, maize was grown as a field crop under the name Indian corn, but later the tendency was to drop the word Indian so that this cereal is now known in American agriculture and commerce by the simple word corn. The word corn has thus come to have a specific meaning on this continent which does not attach to it in the British Isles.

Corn now holds first rank among the agricultural products of the United States, both in the area

devoted to its cultivation and in the value of the annual crop. The types known in garden culture in this country are the sweet corns and the pop-corns; the other types, which are more strictly agricultural, may be designated as field corns. Sweet corn and pop-corn are also grown as field crops in comparatively limited areas, the sweet corn either as a truck crop or for canning, and the pop-corn to supply the demand for this product in our domestic markets. Only the types of sweet corn and pop-corn will receive attention in this article.

#### Botanical classification.

*Zea* almost uniformly has been considered by botanists as a monotypic genus, its one species being *Zea Mays*. But *Z. Mays* is an extremely variable species, including groups which are separated by definite characteristics. As a working classification, that proposed by Sturtevant is the best which has yet appeared. He describes seven "agricultural species." These are *Zea tunicata*, the pod corns; *Z. everta*, the pop-corns (Fig. 1058); *Z. indurata*, the flint corns; *Z. indentata*, the dent corns; *Z. amylacea*, the soft corns; *Z. saccharata*, the sweet or sugar corns (Figs. 1058, 1059, 1060); *Z. amylaea-saccharata*, the starchy sweet corns. *Z. canina*, Wats., is a hybrid form, as shown by Harshberger. *Z. Mays*, Linn., belongs to the natural order of grasses or Gramineæ. Culms 1 or more, solid, erect,  $1\frac{1}{2}$ -15 ft. tall, or more, terminated by a panicle of staminate fls. (the tassel): internodes grooved on one side; branches ear-bearing or obsolete: lvs. long, broad, channeled, tapering to the pendulous tips, with short hyaline ligules and open embracing sheaths: fls. monocious, awnless, usually proterandrous; staminate fls. in clusters of 2-4, often overlapping; 1 fl. usually pedicelled, the other sessile or all sessile; glumes herbaceous; palea membranaceous; anthers 3, linear. The ear contains the pistillate fls. on a hard, thickened, cylindrical spike or spadix (cob), which is inclosed in many spathaceous bracts (husks); spikelets closely sessile, in longitudinal rows, paired in alveoli with hard, corneous margin; fls. 2 on a spikelet, the lower abortive; glumes membranaceous; style single, filiform, very long (silk); ovary usually sessile: ear variable in length and size, often distichous; grain variable in shape and size. The color ranges from white through light and dark shades of yellow, red and purple to nearly black.

1058. Kernels of corn on the cob—sweet corn behind, pop-corn in front. ( $\times\frac{1}{2}$ )

**Sweet corn** (*Zea saccharata*, Sturt.). Figs. 1058-1060. This is a well-defined species-group, characterized by horny, more or less crinkled, wrinkled or shriveled kernels, having a semi-transparent or translucent appearance. Sturtevant, in 1899, lists sixty-one distinct varieties. He gives the first variety of sweet corn recorded in American cultivation as being introduced into the region about Plymouth, Massachusetts, from the Indians of the Susquehanna in 1779. Schenck, in 1854, knew two varieties. It appears, therefore, that the distribution of sweet corn into cultivation made little progress prior to the last half of the nineteenth century, green field corn having largely occupied its place prior to that period.

Sweet corn is preëminently a garden vegetable, although the large kinds are sometimes grown for silage or stover. As a garden vegetable, it is used when it has reached the "roasting ear" stage, the kernel then being well filled and plump but soft, and "in the milk." The kernel is the only part used for human food. When sweet corn is used as a fresh vegetable, it is often cooked and served on the cob. Dried sweet corn, though never an important article of commerce, was formerly much used, especially by the rural population. It is gradually being generally abandoned for canned corn, for other cereal preparations or for other vegetables, but recently desiccated corn has been put upon the market and is finding sale in certain districts, particularly in the South and in mining and lumber camps. It is practically unknown outside North America.

In the last quarter of the last century, canned sweet corn came to be an important article of domestic commerce in the United States and Canada. The total pack for the United States and Canada for the year 1898 was 4,398,563 cases, each containing two dozen two-pound tins. The following statement shows the number of cases packed for the United States for the five-year period from 1907 to 1911:

1907.....	6,653,744
1908.....	6,779,000
1909.....	5,787,000
1910.....	10,063,000
1911.....	14,301,000

Comparatively little of this corn was sent abroad, most of it being consumed in the States, Canada, and Alaska. In 1911 Iowa took first rank in the output of canned corn with a pack of 2,774,000 cases, which was nearly 20 per cent of the total output of the United States for that year. Illinois, New York, Maryland, Maine, Ohio, and Indiana followed in the order named. These seven states packed about 88 per cent of the total output of this country in 1911. These figures are the best obtainable and give a general idea of the progress and distribution of the corn-canning industry. Maine produces as good canned corn as is put on the market and grows the crop largely in localities having too short a season to mature the seed.

Sweet corn is commonly grown for canneries under contract, the canning company supplying the seed and guaranteeing it to be good and true to name, while the farmer agrees to grow a certain specified acreage and deliver the whole crop to the cannery at a stipulated price. In Iowa the price now paid the grower is about \$7 per ton of good ears. A yield of three to four tons to the acre is considered good. The ears are snapped from the stalks with the husks on and hauled in deep wagon-boxes to the canneries. The stalks, when preserved either as ensilage or as stover, make excellent fodder. The overripe and inferior ears, being unmarketable, are left on the stalks and thereby materially increase their value as a stock food. The stover keeps best in loose shocks, as it is liable to mold when closely packed in large stacks or bays.

As a field crop, sweet corn is grown most extensively

on medium heavy loams that are well supplied with humus or organic matter. It luxuriates in rich warm soils. The crop rotation should be planned so as to use the coarse manures with the corn, which is a gross feeder. On the more fertile lands of the central corn-belt, nitrogenous manures may not always be used to advantage with corn, but in the eastern and southern states, where the soil has lost more of its original fertility, stable manure may often be used profitably with this crop at the rate of 8 or 10 cords to the acre, or possibly more.

In the northern part of the corn-belt in the central and western states, that is to say north of the Ohio and Missouri rivers, deep fall plowing of corn land is generally favored, but in experiments at the Illinois and Indiana experiment stations, the depth of plowing has had little influence on the crop. In sections of the eastern states, shallow plowing late in spring is favored, especially if the land be in sod. In warmer, drier regions, as in parts of Nebraska and Kansas, listing has been much practised on stubble ground. The listing plow, having a double mold-board, throws the soil into alternate furrows and ridges, the furrows being 8 or 9

1059. Early Marbledhead sweet corn.

inches deeper than the tops of the ridges. The corn is planted in the bottom of the furrow, either by means of a one-horse corn-drill or by a corn-drill attachment to the lister plow, consisting of a subsoil plow through the hollow leg of which the corn is dropped.

Great care should be used to secure seed-corn having high vitality as a precaution against the rotting or weak germination of the seed in the soil, should the season be cold and wet after planting. Select the seed-ears early before any hard frosts have come. At this time the large, early, and well-matured ears can be distinguished from the rest of the crop, as the husks about the early-maturing ears will have started to turn brown. Early maturity is a vital point to consider in selecting seed-ears and this quality should never be sacrificed for the size of late unmaturing ears. In selecting seed for a field crop, seek systematically for stalks having little or no growth of stools and bearing single, large, and early-maturing ears. For garden use, seed from more productive stalks is desirable, even though the ears be smaller. The seed-ears should be dried at once by artificial heat so that the seed may better withstand unfavorable conditions of temperature or moisture. In many localities so-called kiln-dried seed is much in favor.

In the North, sweet corn should be planted as early as can be done without involving great risk of loss from frosts or from rotting of seed in the soil. In New York, field-planting is generally done from May 10 to May 20; in central Minnesota from May 10 to May 30. The ground having been plowed and prepared so as to make a seed-bed of fine, loose soil 3 inches deep, the seed should be planted to a depth of 1 to 3 inches. The drier and looser the soil, the greater should be the depth of planting. In planting small fields, the ground may be marked in check-rows so that the hills planted

at the intersection of the rows will stand about 3 feet 4 inches to 3 feet 6 inches apart each way, and the corn planted by a hand-planter, which each time it is thrust into the ground drops from four to five kernels, which is usually the number desired. Three feet apart is too close to allow the cultivators to work easily. For large fields, the check-row type of planter should be used. These planters drop and cover the seed in hills at uniform distances apart, planting two rows at one trip across the field. Two types of furrow-openers are now used on corn-planters; these are the runner furrow-openers and the disc furrow-openers. The former are less satisfactory on sod land or in fields covered with trash, as the runners will often ride out and leave the seed uncovered. It is better to use the disc furrow-opener on such land; besides opening the furrow better, it also pulverizes the soil about the seed. Field corn is often planted in drills by planters adapted to this purpose, but sweet corn should be in hills so that the surface of the ground may be kept loose and entirely free from weeds.

Till for the purpose of retaining soil-moisture as well as to kill weeds. This requires frequent shallow cultivation, pulverizing the surface of the soil so that it will act as a mulch to retard the evaporation of soil-moisture. Tillage should begin as soon as the planting is done, using the slanting-tooth harrow and the weeder types of implements until the corn is nearly 6 inches high, providing that the weeds are small and the ground is in friable condition. After this time the spring-tooth cultivators or the two-horse cultivators, having preferably three or four shovels on a side, are generally used, depending somewhat upon the kind of soil to be cultivated. This type of two-horse cultivator is preferable to the double-shovel type which was formerly much used. The two-horse revolving disc cultivator is sometimes used in damp, weedy ground. One great objection to this type is that too much earth is thrown toward the corn and the middles between the rows are usually left either untouched or bare of the loose soil which is needed for a mulch. For the later cultivations the two-horse surface cultivator is coming more and more into general use.

Till at intervals of seven to ten days. At first the cultivator may run from 2 inches deep near the plant to 4 inches deep midway between the rows. Each successive cultivation should gradually increase in depth towards the middle between the rows; throw  $\frac{1}{2}$  inch or more of earth towards the corn and cover the weeds. At the last cultivation the cultivator may be kept a little farther from the corn. It should leave the soil pulverized to a depth of 2 to 3 inches over the entire field. The earlier cultivation may be deepened, if necessary, to kill weeds, even though some corn roots are severed, but cutting the roots by deep cultivation near the plants late in the season is to be especially avoided. Till the soil until the corn gets so large as to prevent the use of a two-horse cultivator. Occasionally a later cultivation, with a one-horse cultivator, may be necessary if heavy rains leave the surface soil hard and start the weeds. Often catch-crops for late pasturage, cover-crops or crops of winter wheat or rye are sown in the cornfield and cultivated in with the last cultivation. The seed is covered deeply by cultivating it in because the weather is apt to be dry at this period. The lower part of the furrow-slice is thus left compact, furnishing a compact seed-bed, in which small grains delight.

The cultivation of sweet corn in the garden should follow the general lines indicated for field culture, but stable manure and commercial fertilizers may be used more liberally. Except on very fertile soils, it is well to put a small amount of a complete commercial fertilizer in each hill and mix it well with the soil before planting the corn. A fertilizer which has a large amount of nitrogen in quickly available form should be chosen

for this purpose. Dwarf early-maturing varieties may be planted, for early use, as soon as the ground is sufficiently dry and warm. A little later, when the ground is warmer, the second-early main crop and late varieties may be planted. Later successional plantings insure a supply of green corn till frost kills the plants.

Corn is not grown commercially as a forcing crop. Attempts to force it in winter have not given encouraging results, but it may be successfully forced in spring, following any of the crops of vegetables which are grown under glass, providing the houses are piped so as to maintain the minimum night temperature at 65° F. Provide good drainage. Give a liberal application of stable manure and thoroughly mix it with the soil. In the latitude of New York the planting may be made as early as the first of March. As soon as the first leaf has unfolded, the temperature may be allowed to run high in the sun, if the air is kept moist by wetting the floors and walls. The glass need not be shaded. Keep night temperature close to 65° F., not lower and not much higher. After the silk appears, jar the stalks every two or three days, when the atmosphere is dry, and thus insure abundant pollination. Early maturing varieties, like Cory, give edible corn in about sixty days when thus treated. Corn may be forced in the same house with tomatoes, eggplant, and other vegetables which require similar range of temperature.

#### *Varieties of sweet corn.*

Some of the desirable varieties for the garden, the market, and for canning are listed below. These varieties are named to show the range of variation and to indicate the leading groups or types, rather than to recommend these particular kinds. New varieties are continually supplanting the old.

For the home garden.—Extra-early: Golden Bantam, an extra-early sort, has recently become very popular, on account of its productiveness, good flavor, and desirable size for table use, and because the kernels separate very easily from the cob; many plant it in succession so as to cover the entire season with this variety alone. Peep o' Day and Minnesota are other good extra-early varieties. Second-early: Early Crosby; Early Evergreen. Medium or standard season: Hickox Improved, Stowell Evergreen, White Evergreen. Late: Black Mexican, Country Gentleman.

For market.—Extra-early: Cory (red cob), White Cob Cory, and Extra-Early Adams, which, though not a sweet corn, is largely grown for early use. This last-named variety is recommended in the South because of its comparative freedom from the attacks of the ear worm. Second-early: Shaker, Crosby, Early Champion; Early Adams also is extensively grown for market, though not a true sugar corn. Midseason and Late: Stowell Evergreen, Country Gentleman, Late Mammoth, Egyptian.

For canning.—Stowell Evergreen is the standard variety for canning factories everywhere. Country Gentleman is also grown to a considerable extent for fancy canned corn. Other varieties that are used for canning include Early Evergreen, White Evergreen, Egyptian, Potter Excelsior, and Hickox Improved.

#### *Diseases and pests of sweet corn.*

The most widespread and destructive disease of corn in the United States is the smut produced by the parasitic smut-fungus, *Ustilago Zeæ*. The sorghum-head smut, *Ustilago Reiliana*, also attacks maize. Smut causes most injury when it attacks the ears. The grains are transformed into a mass of dark-colored smut spores, and become exceedingly swollen and distorted out of all semblance to their normal outlines. Infection may take place at any growing point of the plant from early till late in the season, hence treatment of seed corn by fungicides is of no value as a

remedy for corn smut. The destruction of smutted parts of the plants, and taking especial care that the smut does not become mixed with manure which is used for the corn crop, are measures which may be expected to lessen the prevalence of the disease. No remedy is known.

Another disease of sweet corn in the United States is the bacterial blight caused by *Pseudomonas Stewartii*. It has been found in New York, New Jersey, and Michi-

1060. Golden Bantam sweet corn.

gan, but thus far has been seriously destructive only on Long Island on early dwarf varieties of sweet corn. It is characterized by wilting and complete drying of the whole plant, as if affected by drought, except that the leaves do not roll up. The fibro-vascular bundles become distinctly yellow, and are very noticeable when the stalk is cut open. The disease attacks the plant at any period of growth, but is most destructive about the time the silk appears. No remedy is known.

These two diseases are of the most economic importance in the United States. Two others of somewhat minor importance which deserve mention are rust and leaf blight. The leaf-blight fungus causes round, brownish, dead spots on the foliage. The maize rust, *Puccinia sorghi*, is found principally where rainfall is abundant. It is rather common throughout the corn-belt. The fungus is similar in nature to that which causes the rust of small grains. It cannot be controlled economically.

Over 200 species of insects are known to be injurious to corn, either to some part of the growing plant or to the stored product. The corn-ear worm, known South as the cotton-boll worm, is especially injurious to sweet corn. It burrows in tender green corn, ruining the ear for either canning or market purposes. It is known to do serious damage as far north as western New York and central Iowa. Recent experiments in dust-spraying promise well. Spraying is done weekly, beginning when silks appear, using equal weight powdered lead arsenate and lime. Shallow fall plowing to kill pupæ is a partial remedy. Wire-worms, northern corn-root worms, white grubs, and certain other grass insects attack corn plants. One of the best preventive measures is to plan the rotation so that corn does not immediately follow any cereal or grass crop.

**Pop-corn** (*Zea everta*, Sturt.). Fig. 1058. Pop-corn is characterized by the excessive proportion of the corneous endosperm and the small size of the kernel and ear. The kernel split laterally shows the chit and corneous matter enveloping, and in some cases a fine, starchy line. The small size of the kernel and the property of popping makes identification certain. This species-group extends throughout North and South America and has claims for prehistoric culture.

The preparation of the ground recommended for sweet corn holds for pop-corn. Tillage should be started early in the spring to conserve as much of the soil-moisture as possible, thus protecting the crop against possible injury from drought later in the season.

On good clean ground the pop-corn is very often drilled, dropping the kernels 6 to 8 inches apart in the row. More often, however, it is check-rowed with the rows 3 feet 4 inches apart and from four to six kernels in the hill. The ordinary corn-planters are

used with special plates for pop-corn planting. For dwarf varieties of pop-corn such as the Tom Thumb, when planted in home gardens and tilled by hand, the hills may be as near together as  $2\frac{1}{2}$  feet.

Pop-corn is much slower in germinating than field corn and the plant is not so vigorous a grower. Shallow cultivation is recommended just as for other corns, especially for the later cultivations, since deep cultivating cuts too many roots.

Pop-corn is planted earlier than field corn. It should be planted deep enough to reach the moist soil, usually  $1\frac{1}{2}$  to 2 inches, but in a dry season it may need to go 3 inches deep.

The White Rice, which is grown more extensively for market than any other variety, mixes with field corns readily. The resulting hybrid types have larger ears and larger, smoother kernels and give heavier yields than do the pure pop-corns. These hybrid types

were for a time quite in favor with the commercial growers because of their greater yield. Now they are being discriminated against by the buyers because of their inferior popping qualities, and the tendency among the growers is to get back to the pure types, even though they give smaller yields.

Pop-corn matures earlier than field corn. For this reason in many sections of the country it is regarded as a surer crop. In the region about Odebolt, Iowa, where pop-corn is grown more extensively than in any other district in the world, harvesting sometimes begins as early as the middle of September, but more often it is delayed till the first of October or later to let the corn dry on the stalk. There are two methods of harvesting. One is to snap the corn and pile it in the crib, then shuck it during the winter. However, this is not generally practised because it makes more work and takes more crib room. The other and common method is to pick and shuck the ears from the standing stalks directly into the wagon, the same as with field corn.

On account of the heavy expense of hand-picking, some are now using the harvesting apparatus called the corn-picker and husker. Opinions differ as to the economy of using this picker. The rows should be long and the corn should stand up well to justify its use. For hand-picking the price per bushel usually ranges from 10 to 12 cents. A good hand can pick about forty bushels in a ten-hour day if the corn is good.

It is very important that the pop-corn be thoroughly dried. After it is picked it is placed in the crib which usually has ventilators through the center. These extend along the middle of the floor, are slatted to admit air, and are about  $1\frac{1}{2}$  feet wide by  $2\frac{1}{2}$  feet high. The corn is usually left in the crib through the winter season. Sometimes it is marketed on the cob. Formerly it was a common practice to ship it on the cob in sacks, but now it is generally held over winter in the crib, shelled the next spring, and shipped in two-bushel sacks. It is usually marketed from June to September.

It is ready to use for popping just as soon as it is dry enough. It can be popped immediately after it is gathered if the season is dry and the corn is allowed to dry sufficiently in the field. Usually it is left on the stalk till it is so dry that it shells some when thrown into the wagon.

Various companies make a practice of contracting for a certain number of acres of pop-corn at a certain price in the spring of the year, so that the farmer may know just what price he will get for his corn in the fall or at some stated time at which it is to be delivered. The contracting firm does not as a rule supply the seed but does specify the grade of the corn and objects to the coarse hybrid types.

The prices for corn in the ear are ruling from 1 cent to 2 cents a pound; for shelled corn from  $1\frac{1}{2}$  cents

to 3 cents a pound. Pop-corn is considered a very profitable crop and less likely to fail than field corn because it matures earlier. A good return to the acre would be twenty to twenty-five bushels of ear corn, worth from \$20 to \$50, averaging about \$30. Field corn in the same region averages about fifty-five bushels, worth usually from \$20 to \$25 an acre.

#### Varieties.

In 1899, Sturtevant described twenty-five varieties of pop-corn. Tracy, in his "American Varieties of Vegetables for the Years 1901 and 1902," enumerated fifty-four varieties. The rice pop-corns are generally used for commercial plantings. White Rice is now the leading commercial variety of pop-corn, since it gives the greatest yield and also brings the highest price on the market. In the noted region about Odebolt, Iowa, this variety is grown almost exclusively. The following list includes the leading varieties:

**White Rice.**—Ear 4 to 8 inches long. This vigorous, late variety is widely cultivated. With other rice corns, it is characterized by deep, tapering, beaked kernels.

**White Pearl.**—Ear 4 to 8 inches long. Matures somewhat earlier than Rice and later than Dwarf Golden. Kernels round and silvery white.

**Dwarf Golden.**—Ear 1 to 3 inches long. An early-maturing sort, with broad, golden yellow kernels. A favorite garden variety.

**Golden Tom Thumb.**—Ear 2 to 2½ inches long. An ornamental variety for home gardens. The stalks only grow to a height of about 20 inches. The kernels are bright and golden yellow.

Other kinds of pop-corn worthy of mention are Golden Queen, Silver Lace, and California Yellow.

S. A. BEACH.

**CORN COCKLE:** *Lychnis Githago*.

**CORNEL, CORNELIAN CHERRY:** *Cornus mas*.

**CORNFLOWER:** *Centaurea Cyanus*.

**CORN POPPY** of Europe is the weed of the grain fields from which some of the garden poppies have been raised, *Papaver Rhæas*.

**CORN-SALAD** (*Valerianella olitoria*, Poll.). *Valerianaceæ*. A spring and summer salad and pot-herb plant.

Annual: mature plant 4-6 in. tall, forking; radical lvs. tufted (the parts used), oblong and obtuse, narrowed at the base, entire or few-toothed; st.-lvs. narrow, often clasping; fls. very small, in small terminal cymes, whitish; fr. (seed) nearly globular, gray, not crested. S. Eu. *V. eriocarpa*, Desv., of S. Eu. and N. Afr., is sometimes cult. as salad; lvs. longer and lighter-colored; fr. (seed) flattened, pale brown, crested. Known also as lamb's lettuce, fetticus, and vetticost.

Sow the seed of corn-salad in early spring, at the time of the first sowing of lettuce, and make successional plantings as often as desired. For very early salads the seeds are planted in September, and the young plants are covered with a light mulch and wintered exactly as spinach is often managed. Sow in drills a foot or 18 inches apart and cover lightly. Work the ground thoroughly, and give an abundance of water. The leaves may be blanched, but are usually eaten green. It matures in sixty to sixty-five days during good spring weather. Only one variety is offered by most American seedsmen, but several sorts are known to European gardeners. It is sometimes used for a pot-herb, being served like spinach, but is chiefly valuable for salads. It is rather tasteless, and is not so popular as cress or lettuce on that account, but persons who prefer a very mild salad, or who would rather taste the salad dressing, will doubtless fancy corn-salad.

It is best served in mixture with other herbs, as lettuce, water-cress or white mustard. It is easy to grow. There are no special enemies.

F. A. WAUGH.

**CÓRNUS** (ancient Latin name of *Cornus mas*). *Cornaceæ*. Dogwood. Woody plants (one or two infrequently cultivated herbs), grown for their attractive flowers and fruits; some species also for the winter effect of their brightly colored branches.

Shrubs or trees, rarely herbs: lvs. opposite, rarely alternate or whorled, deciduous, entire; fls. small, 4-merous, usually white, in terminal cymes (Fig. 1061) or heads; calyx-teeth minute; petals valvate; style simple, filiform or cylindric; ovary inferior, 2-celled: fr. a drupe with a 2-celled stone.—About 40 species in the temperate regions of the northern hemisphere and one in Peru. Monograph by Wangerin in Engler, Pflanzenreich, hft. 41, pp. 43-92, quoted below as Wang.

The dogwoods are hardy ornamental shrubs with handsome foliage, often assuming a brilliant fall coloring, and with attractive flowers and fruits. Nearly all are very desirable for planting in shrubberies. They grow nearly as well in shady places under large trees as in sunny exposed situations, and thrive in almost any soil. One of the most beautiful in bloom is *C. florida*, with extremely showy flowers in spring. *C. racemosa* is one of the best for shrubberies, blooming profusely in June. The red-branched species, as *C. alba*, *C. Amomum*, *C. Baileyi*, *C. sanguinea* are very attractive in winter. Propagated by seeds, which usually do not germinate until the second year. The species with willow-like soft wood, as *C. alba* and its allies, grow readily from cuttings of mature wood, while the others are sometimes increased by layers. They are often grown in this country from nearly ripened cuttings

1061. *Cornus* winter shoots, showing the opposite buds and terminal flower-clusters.—*Cornus Baileyi*.

1062. Cutting of *Cornus*.

(Fig. 1062), handled in frames in summer. Horticultural varieties of other species are mostly budded in summer on seedlings of the type, or grafted in early spring in the propagating-house.

Various species of *Cornus* have many interesting uses. Our native *C. florida*, which in flower is the showiest

1063. *Cornus alternifolia*.

member of the genus, furnishes a useful substitute for quinine. The bark of all parts contains the same substances found in cinchona, but in different proportions. It is inferior in effectiveness and more difficult to secure in large quantities. It is sometimes possible to ward off fevers by merely chewing the twigs. The powdered bark makes a good tooth-powder, and the fresh twigs can be used for the same purpose. The bark mixed with sulfate of iron makes a good black ink. The bark of the roots yields a scarlet dye. The wood, being hard, heavy, and close-grained, is good for tool handles. The cornelian cherry has pulpy fruits resembling cornelian in color and about the size and shape of olives, for which they can be substituted. The ripe fruits are soft and rather sweet. The name dogwood comes from the fact that a decoction of the bark of *C. sanguinea* was used in England to wash mangy dogs. The small red berries of *C. suecica* (not in the trade) are eaten by the Esquimaux.

#### A. Plants, shrubs or trees.

#### B. Fls. in cymes or panicles without involucre. (*Svida*.)

#### C. Foliage alternate: fls. in umbel-like cymes, cream-colored.

1. *alternifolia*, Linn. (*Svida alternifolia*, Small). Fig. 1063. Shrub or small tree, to 25 ft.: lvs. slender-

petioled, elliptic or ovate, usually cuneate, acuminate, nearly glabrous above, pale or whitish beneath and appressed pubescent, 3-5 in. long: cymes  $1\frac{1}{2}$ - $2\frac{1}{2}$  in. wide: fr. dark blue, globular,  $\frac{1}{2}$  in. across, on red peduncles. May, June. New Bruns. to Ga. and Ala., west to Minn. S.S. 5:216. Em. 463. Wang. 51.—Of very distinct habit, the branches being arranged in irregular whorls, forming flat, horizontally spreading tiers, as in the picture. A variety which shows this habit more distinctly than the common form is var. *umbraculifera*, Dieck. Var. *argentea*, Temple & Beard, is a form with white-marked foliage. Var. *ochroleuca*, Rehd., has yellowish frs.

2. *controversa*, Hemsl. (*C. brachypoda*, Koch, not C. A. Mey. *C. macrophylla*, Koehne, not Wall.). Tree, to 60 ft.: lvs. slender-petioled, broadly ovate or elliptic-ovate, usually rounded at the base, abruptly acuminate, whitish and slightly hairy beneath, 3-5 in. long: cymes 3-4 in. wide: fr. bluish black. June. Himalayas to Japan. B.M. 8261. S.I.F. 1:77. R.B. 30:63.—With the habit of the former, but of more vigorous growth: not hardy N. Var. *variegata*, Rehd. (*C. macrophylla variegata*, Barbier). Lvs. edged white. Gng. 3:67; 16:291. J.H. III. 28:129; 47:147.

cc. Foliage opposite.

d. Fr. white or blue.

e. The fls. in umbel-like flat cymes.

f. Color of fr. white or bluish white.

g. Under side of lvs. with appressed hairs, glaucous.

3. *stolonifera*, Michx. (*C. alba*, Wang.). RED-OSIER Dogwood. Fig. 1064. Shrub, to 8 ft., usually with dark blood-red branches and prostrate st., stoloniferous: lvs. obtuse at the base, ovate or oblong-lanceolate, acuminate, 2-5 in. long: cymes dense, 1-2 in. wide; disk usually red: fr. white, globose, with the stone broader than high. May, June. From Brit. N. Amer. to Ill. and Calif. G.C. II. 8:679.—Habit bush-like, as in Fig. 1064. Var. *flaviramea*, Spaeth. Branches yellow. There are also varieties with variegated lvs. Var. *nitida*, Schneid. (*C. alba* var. *nitida*, Koehne). Branches green: lvs. glossy above. Var. *coloradensis*, Schneid. (*C. alba* var. *C. coloradensis*, Koehne). Branches brownish red, strongly recurved: fr. bluish white. Colo. Var. *pendula*, Ell. Low shrub with pendulous branches.

4. *alba*, Linn. (*C. tatarica*, Mill.). Shrub, to 10 ft., with usually erect st. and bright blood-red branches, mostly with glaucous bloom when young: lvs. obtuse at the base, ovate or elliptic, somewhat bullate or rugose above, acute,  $1\frac{1}{2}$ - $3\frac{1}{2}$  in. long: cymes dense, small; disk

1064. *Cornus stolonifera*.

yellow: fr. ovoid, bluish white, sometimes whitish; stone usually higher than broad, flat. Siberia, N. China. Var. *argenteo-marginata*, Rehd. (*C. alba* var. *elephantissima variegata*, Hort.). Lvs. edged white. Var. *Spaethii*, Spaeth. Lvs. broadly edged yellow. Gn. 64, p. 378; 69, p. 343. Var. *Gouchaultii*, Rehd. (*C. sibirica Gouchaultii*, Carr.). Lvs. variegated with yellowish white and pink. Var. *sibirica*, Lodd. Branches bright coral-red. C.L.A. 21, No. 4:29. G.M. 54:249. Var. *Kesselringii*, Rehd. (*C. sibirica* var. *Kesselringii*, Wolf). Branches very dark purple, nearly purplish black. There are also some other varieties with variegated lvs.

GG. Under side of lvs. with woolly hairs.

5. *Baileyi*, Coult. & Evans. Fig. 1065. Erect shrub, with reddish branches: lvs. ovate to lanceolate, acute or acuminate, white beneath, with woolly and with appressed hairs, 2-5 in. long; fls. in small rather compact woolly cymes: stone of the white fr. much broader than high, compressed and flat-topped. Pa. to Minn. and Wyo. G.F. 3:465 (adapted in Fig. 1065).—A very handsome species of upright growth, with dark red branches, blooming nearly all summer, and of a distinct grayish hue due to the slightly upward curled lvs. The fall color of foliage and winter color of twigs are unequaled. Well adapted for sandy soil. Early observed on dunes, S. Haven, Mich., but brought to the attention of systematists from specimens collected in extreme N. E. Minn. in 1886.

6. *asperifolia*, Michx. Shrub, 8-15 ft.: branches reddish brown: lvs. slender-petioled, elliptic to ovate, acuminate, rough above, pale and woolly-pubescent beneath, 1-4 in. long; cymes rather loose, rough-pubescent: fr. globose, white; stone nearly globose, slightly furrowed. Ont. to Fla., west to Texas. G.F. 10:105.

FF. Color of fr. blue or bluish, sometimes partly white or greenish white.

G. Lvs. densely woolly-pubescent beneath.

7. *rugosa*, Lam. (*C. circinata*, L'Her.). Shrub, 3-10 ft.: the young branches green, blotched purple, older ones purplish: lvs. orbicular or broadly ovate, acute or short-acuminate, slightly pubescent above, pale and densely pubescent beneath, 2-6 in. long; cymes rather dense: fr. light blue or greenish white. May, June. Em. 464. Wang. 61.—Bark has medicinal properties.

GG. Lvs. pubescent only on the veins or nearly glabrous beneath.

8. *Amomum*, Mill. (*C. sericea*, Linn. *C. cœrulea*, Lam.). Shrub, 3-10 ft., with purple branches: lvs. usually rounded at the base, elliptic-ovate or elliptic, dark green and nearly glabrous above, pale green beneath, usually with brownish hairs on the veins, 2-4 in. long; cyme compact: fr. blue or sometimes partly white. June, July. Mass. to Ga., west to N. Y. and Tenn. Em. 466.—Bark has medicinal properties. Var. *variegata*, Hort. Lvs. variegated with yellowish white.

9. *obliqua*, Raf. (*C. Purpusii*, Koehne). Shrub, similar to the preceding, usually broader and more loosely branched: branches purple to yellowish red: lvs. usually narrowed at the base, elliptic-ovate to oblong, dark green and glabrous above, glaucous beneath, on the veins usually with whitish or brownish hairs, 2-3½ in. long; cyme compact: fr. blue or partly white. May, June in the S., July in the N. Que. to Minn. and Kans. south to Pa., Ill. and Mo. S.T.S. 1:39. R.H. 1888:444 (as *C. stolonifera*).

EE. The fls. in broad panicles: fr. white or pale blue.

10. *racemosa*, Lam. (*C. candidissima*, Marsh., not Mill. *C. paniculata*, L'Her. *C. oblongata*, Hort.). Shrub 6-15 ft., with gray branches: lvs. cuneate, ovate-lanceolate or lanceolate, acuminate, appressed-pubes-

cent or nearly smooth, whitish beneath, 1½-4 in. long: petals white, lanceolate: fr. white. May, June. Maine to N. C., west to Minn., and Neb. Wang. 58 (as *C. femina*).—Free-flowering; very handsome when in bloom, and with its white frs. on red peduncles in fall.

11. *femina*, Mill. (*C. stricta*, Lam. *C. fastigiata*, Michx.). Shrub, to 15 ft., with purplish branches: lvs. ovate or ovate-lanceolate, sparingly and minutely appressed-pubescent, green on both sides, 1½-3 in. long: petals white, ovate-lanceolate: fr. pale blue. April, May. Va. to Ga. and Fla.—Tender N. Closely allied to the former, and perhaps only variety.

DD. Fr. black (green in a var. of No. 16).

E. Fls. in broad panicles.

12. *brachypoda*, C. A. Mey. (*C. ignorata*, Shiras. *C. macrophylla*, Hemsl., not Wall. *C. Thelycanis*, Lebas. *C. Thelyana*, Hort.). Shrub or small tree: branches yellowish or reddish brown: lvs. slender-petioled, elliptic-ovate to elliptic-oblong, abruptly acuminate, rounded or broadly cuneate at the base, dark green

1065. *Cornus Baileyi*. (Spray  $\times \frac{1}{4}$ )

above and nearly glabrous, glaucous beneath and sparingly appressed hairy, with 6-8 pairs of veins, 2½-6 in. long; panicle rather loose, 3-6 in. across; style below the stigma abruptly enlarged into a disk: fr. bluish black. Aug. Japan, Cent. China. S.T.S. 1:41. S.I.F. 1:77. R.H. 1875, p. 395. F. 1876, p. 123.—One of the handsomest dogwoods on account of its large lvs. and large panicles of white fls.; not quite hardy N.

13. *Wilsoniana*, Wang. Tree, to 40 ft.: branches brownish: lvs. elliptic, narrowed at the base, acuminate, above sparingly, beneath more densely appressed-pubescent, green or glaucous beneath, with 3-4 pairs of veins, 2-4 in. long; panicle 2½-4 in. across; style cylindric, scarcely enlarged below the stigma: fr. bluish black. Cent. China. Wang. 66.—Very handsome, similar to the preceding, but harder. Page 3567.

EE. Fls. in umbel-like cymes: lvs. green beneath.

F. Lvs. with appressed hairs beneath.

14. *paucinervis*, Hance (*C. quinquenervis*, Franch.). Shrub 4-6 ft.: young branches quadrangular, usually reddish brown: lvs. short-petioled, of firm texture, oblong-obovate to elliptic-lanceolate, acute, cuneate at the base, dark green above, paler beneath with appressed hairs, with 3-4 pairs of veins, 1½-3½ in. long; cymes long peduncled; style thickened below the apex:

fr. black. June. Cent. China. G.C. III. 50:95. G.M. 54:593. Gt. 1896, p. 285. Wang. 72.—Handsome shrub nearly half-evergreen, but not hardy N. P. 3567.

15. *pumila*, Koehne (*C. más* var. *nana*, Dipp.). Dense shrub, to 6 ft.: branchlets terete, glabrous: lvs. crowded, broadly ovate to oblong-ovate, short-acuminate, abruptly contracted at the base, dark green and nearly glabrous above, paler and appressed-hairy beneath,  $1\frac{1}{2}$ – $3\frac{1}{2}$  in. long: cymes long-peduncled, 2–6 in. broad; style thickened below the apex: fr. black. July. Origin unknown.—Handsome with its dense dark green foliage, particularly when dotted with the white fl.-clusters; has proved hardy at the Arnold Arboretum.

FF. Lvs. with woolly hairs beneath: branches purple.

16. *sanguinea*, Linn. Shrub, to 12 ft., with purple or dark blood-red branches: lvs. broad-elliptic or ovate, rounded or narrowed at the base, usually pubescent on both sides, pale green beneath,  $1\frac{1}{2}$ – $3\frac{1}{2}$  in. long: fls. greenish white, in dense cymes: fr. black. May, June. Eu., Orient. Var. *variegata*, Dipp. Lvs. variegated with yellowish white. G.W. 9, p. 247. Var. *viridissima*, Dieck. With green branches and green fr.

BB. Fls. in dense heads or umbels, with an involucre.

c. Color of fls. yellow; involucre yellowish, not exceeding the fls. (*Macrocarpum*.)

17. *más*, Linn. (*C. mascula*, Hort.). CORNELIAN CHERRY. Fig. 1066. Shrub or small tree, to 20 ft.: lvs. ovate or elliptic, acute, appressed-pubescent, and green on both sides,  $1\frac{1}{2}$ –4 in. long: fls. in sessile opposite umbels, before the lvs.; pedicels not exceeding the involucre: fr. oblong, scarlet,  $\frac{3}{4}$  in. long, edible. March, April. S. Eu., Orient. Mn. 5:192. G.C. II. 9:399. H.W. 3, p. 61.—Handsome shrub of dense growth with glossy foliage, very attractive in early spring with its yellow fls., and again in fall with its shining scarlet frs. Var. *macrocarpa*, Dipp. Fr. larger. Var. *albicarpa*, Schneid. (var. *luteo-carpa*, Wang.). Fr. yellowish. Var. *aurea*, Schelle. Lvs. yellow. Var. *aureo-elegantissima*, Schelle. Lvs. variegated with pink or yellow. F. 1877: 109. G.Z. 21:169. Var. *argenteo-marginata*, Hort. Lvs. bordered white. Var. *nana*, Simon-Louis. Dwarf form. It has been confused with *C. pumila* (No. 15) which has lenticillate branchlets and usually 4 pairs of veins.

18. *officinalis*, Sieb. & Zucc. Shrub or small tree, to 15 ft.: lvs. elliptic, acuminate, pale green beneath and with large tufts of dark brown hairs in the axils of the veins: fls. like those of the former; pedicels longer than the involucre: fr. scarlet, oblong. Japan, China. S.Z. 50.—Very similar to the last.

cc. Color of fls. greenish yellow, sessile, with a showy white involucre, much exceeding the fls.

D. Frs. in dense clusters, but individually distinct. (*Benthamedia*, *Cynoxylon*.)

19. *florida*, Linn. (*Cynoxylon floridum*, Raf.). FLOWERING DOGWOOD. Fig. 1067. Shrub or small tree with spreading branches, 10–15 ft., rarely to 40 ft.: lvs. oval or ovate, acute, dark green and glabrous above, glaucous or whitish beneath, usually only pubescent on the veins, 3–6 in. long: involucre white or pinkish, 3–4 in. wide; bracts 4, obovate, emarginate: fr.  $\frac{1}{2}$  in. long, scarlet. May. Mass. to Fla., west to Ont. and Texas, also E. and S. Mex. S.S. 5:112–13. Em. 468. G.F. 3:431. B.M. 526. Gn. 33, p. 441; 43, p. 153; 52, p. 177; 53, p. 222. J.H.

III. 28:453.; 55:331. F.E. 23:511. G. 34:531. Gn. M. 5:138. M.D.G. 1898:405. V. 5:230; 20:51.—One of the most beautiful American flowering trees; hardy N. Var. *pendula*, Dipp. With pendulous branches. F.E. 17, p. 68. V. 13:333. Var. *rubra*, André. With pink involucre. R.H. 1894:500. A.G. 18:441. F.E. 9:572. B.M. 8315. G. 28:689. Neither variety as hardy as the type.

20. *Nuttallii*, Audubon. Tree, to 80 ft.: lvs. ovate or obovate, usually pubescent beneath, 4–5 in. long: involucre white or tinged with pink, 4–6 in. across; bracts 4–6, oblong or obovate, sometimes roundish, mostly acute: fr. bright red or orange, crowned with the broad, persistent calyx. Brit. Col. to S. Calif. S.S. 5:214–15. Gng. 6:274. B.M. 8311. G. 27:366.—This species surpasses the former in beauty, but is more tender, particularly while the plants are young, and has rarely been successfully cult. outside of its native country.

DD. Frs. connate into a globular fleshy head. (*Benthamedia*.)

21. *Kousa*, Buerg. (*Benthamedia japonica*, Sieb. & Zucc. *C. japonica*, Koehne, not Thunb.). Fig. 1068. Shrub or small tree, to 20 ft.: lvs. cuneate, elliptic-ovate, acuminate, dark green above, glaucous and appressed-pubescent beneath, 2–4 in. long: involucre creamy white,  $2\frac{1}{2}$ –3 in. wide; bracts ovate, acute: frs. forming a globular head. June. Japan, China. S.Z. 16. S.I.F. 2:59.

1066. *Cornus mas*. (Sprays  $\times \frac{1}{2}$ )

1067. *Cornus florida*. ( $\times \frac{1}{2}$ )

Gn. 43:152; 60, p. 165. G.C. III. 19:783. A.G. 9:329 (adapted in Fig. 1068); 13:674. Gng. 3:149. J.H. III. 35:9; 63:187. M.D.G. 1899:328-9. R.B. 30:64. G. 27:367. Gn.W. 8:741. G.M. 35, suppl. Oct. 8.—Fls. very showy, appearing after the lvs. in June and contrasting well with the bright green foliage; hardy as far north as Mass. Sometimes variegated.

1068. *Cornus Kousa*. ( $\times \frac{1}{2}$ )

22. *capitata*, Wall. (*Benthàmia fragifera*, Lindl.). Tree: lvs. coriaceous, elliptic-oblong, narrowed at both ends, appressed-pubescent above and more densely and whitish beneath, 2-4 in.: involucre about  $2\frac{1}{2}$ -3 in. wide; creamy white; bracts ovate, acute: fr.-head over 1 in. across, scarlet. June. Himalayas. B. R. 19:1579. Gn. 54, p. 310; 60, p. 165; 64, p. 135; 70, p. 123; 73, p. 411. G.C. III. 16:501; 45:83; 48:447. J. H.

III. 30:213. M.D.G. 1898:568.—Evergreen tree, with showy fls. and frs.; hardy only S.

AA. Plants low herbs: fls. in dense heads, with a white (or pinkish) involucre. (*Arctocrania*, *Chamaepericlymenum*.)

23. *canadensis*, Linn. Herb,  $\frac{1}{2}$ - $\frac{2}{3}$  ft. high, with creeping rootstock: lvs. whorled, sessile, elliptic or obovate, glabrous or nearly so, 1-3 in. long: head greenish, long-peduncled; involucre white, 1- $1\frac{1}{2}$  in. wide: fr. bright red, globose. May-July. N. Amer., south to Ind., Colo., and Calif. B.M. 880. G.C. III. 47:363.—Handsome plant for half-shady places.

*C. Arnoldiana*, Rehd. (*C. obliqua*  $\times$  *C. racemosa*). Intermediate between the parents: last year's branches purple, older gray or grayish brown: fls. as profusely as in *C. racemosa*, but the white or bluish white fr. appears rather sparingly. Originated at the Arnold Arboretum. S.T.S. 1:40.—*C. australis*, C. A. Mey. Closely allied and very similar to *C. sanguinea*, but lvs. beneath with appressed hairs and branches less brightly colored. Asia Minor, Caucasus.—*C. Bretschneideri*, Henry (*C. aspera*, Wang.) Shrub, to 12 ft.: branches green or purplish: lvs. ovate to elliptic-ovate, usually rounded at the base, rough-pubescent on both sides, 2-4 in. long: cyme dense: fr. bluish black. N. China. Hardy.—*C. corynostylis*, Koehne—*C. macrophylla*,—*C. glabrata*, Benth. Shrub, to 10 ft.: branches gray: lvs. small, nearly glabrous, green and shining on both sides: fr. white. Ore. to Calif.—*C. Hessei*, Koehne. Allied to *C. alba*. Dwarf, dense shrub: lvs. crowded, small, very dark green: fr. bluish white. Probably from E. Asia.—*C. Koenigii*, Schneid. (*C. australis* var. *Koenigii*, Wang.) Allied to *C. sanguinea*. Lvs. larger, 3-5½ in. long, sparingly appressed-pubescent beneath. Transcaucasia.—*C. macrophylla*, Wall. (*C. corynostylis*, Koehne). Allied to *C. brachypoda*. Tree, to 30 ft.: lvs. broadly ovate to elliptic-ovate, acuminate: inf. cymose; style club-shaped at the apex. Himalayas. B.M. 8261. J.H.S. 27, p. 860. Gt. 1896, p. 285.—*C. oblonga*, Wall. Shrub or tree, to 30 ft.: lvs. narrow-oblong, nearly glabrous, glaucous beneath, coriaceous: fls. white, fragrant, in cymose panicles. Himalayas.—*C. poliochylla*, Schneid. & Wang. Shrub, to 12 ft.: branches brown: lvs. subcoriaceous, elliptic or elliptic-ovate, slightly villous above, beneath more densely so and grayish white,  $2\frac{1}{2}$ -4½ in. long: cymes long-peduncled: fr. black. Cent. China.—*C. pubescens*, Nutt. Shrub, to 15 ft., with purple branches: lvs. nearly glabrous above, glaucous and woolly-pubescent beneath: fr. white. Brit. Col. to Calif.—*C. Stuebelii*, Rehd. (*C. rugosa*  $\times$  *C. stolonifera*). Intermediate between the parents: branches purple: lvs. more or less woolly beneath: fr. bluish, rarely white. Originated at Rochester, N. Y.—*C. suecica*, Linn. (*Chamaepericlymenum suecicum*, Aschers. & Graebn.) Allied to *C. canadensis*: lvs. all opposite: fl.-head purple, the white involucre 1 in. or less wide. Arctic Amer., N. Eu., N. Asia. Gn. 55, p. 239. S.E.B. 4:634.

ALFRED REHDER.

**CORÒKIA** (from the native name). *Cornàceæ*. Evergreen shrubs, adapted to outdoor planting in the S. Upright, with tortuous or straight branches and black

bark: lvs. alternate or fascicled, stalked, entire: fls. perfect, small, yellow, in axillary or terminal clusters; calyx-tube top-shaped, the limb 5-lobed; petals 5, each with a scale at base; stamens 5: fr. an ovoid or oblong 1-2-celled drupe. Three or four species in New Zeal. *C. Cotonéaster*, Raoul, is offered abroad as a bush of curious growth, very attractive when covered with its very small yellow star-like fls.: rigid, densely branched, 4-8 ft., the branches crooked and interlaced, tomentose: lvs. 1 in. or less long, the blade orbicular to obovate or oblong-ovate, obtuse or emarginate, shining above, flat, stalked. B.M. 8425. I.T. 2:73.

L. H. B.

**CORONÍLLA** (Latin, a little crown: from the arrangement of the flowers). *Leguminosæ*. CROWN VETCH. Shrubs and herbs, some grown in the hardy garden and some in greenhouses, for their yellow or purple bloom.

Annuals or perennials, often woody, smooth or rarely silky-hairy, with odd-pinnate lvs., entire lfts., and purple or yellow fls. in peduncled heads or umbels; calyx 5-toothed; corolla papilionaceous, the standard orbicular and the keel incurved, wings obovate or oblong; stamens 9 and 1: pod jointed, terete or 4-angled; seeds oblong.—Species about 20, Medit. region and Canary Isls., W. Asia. The shrubby *C. Emerus* and *C. glauca* are useful in S. Calif. and the southern states. The species are occasionally grown in borders. *C. glauca* is sometimes grown under glass for spring bloom, after the manner of *Cytisus*. All are of easy cult.

A. Fls. yellow.

B. Plant herbaceous.

*cappadocica*, Willd. (*C. ibérica*, Bieb.). Low perennial herb, about 1 ft. high: lfts. 9-11, obcordate, ciliate: umbels 7-8-fld.; fls. yellow, large, July, Aug.: stipules membranaceous, rounded, ciliate-toothed. Asia Minor. L.B.C. 8:789. B.M. 2646.—A good trailer for rock-gardens and the margins of borders.

BB. Plant shrubby, at least at base.

c. Claw of the petals much longer than the calyx.

*Émerus*, Linn. (*Émerus major*, Mill.). SCORPION SENNA. Fig. 1069. Dense, symmetrical shrub, 3-5 ft. high, the branches green and striate: lvs. deep glossy green; lfts. 5-7, obovate; stipules small: peduncles 3-fld.; fls. large, yellow, tipped with red. Blooms freely, May-July. Showy, half-hardy. S. Eu. B.M. 445. Gng. 5:36.—Evergreen in southern states.

*emeroides*, Boiss. & Sprun. (*C. Émerus* var. *emeroides*, Wöhlfl.). Bush, 3-6 ft.: branches glabrous or soft-hairy; lfts. 2-3 pairs, heart-shaped: peduncle 2-3 times as long as the lf., the umbel 5-8-fld.; fls. yellow; claw of petals about twice as long as the calyx: pod 2-3 in. long, very narrow. April, May. S. Eu.

cc. Claw of petals scarcely exceeding the calyx.

*júncea*, Linn. Glabrous gray-green shrub: branches rush-like, terete, nearly naked: lfts. 3-7, linear-

1069. *Coronilla Emerus*.

oblong, obtuse, somewhat fleshy, scattered: fls. golden yellow, in 5-7-fl. umbels: pod hanging, lance-linear. S. France. B.R. 820. L.B.C. 3:235.

*minima*, Linn. Glabrous, diffuse, soft gray-green sub-shrub, 3 or 4 in. high, procumbent: lfts. 7-13, ovate, obtuse or retuse, scattered or at base of plant: fls. golden yellow in 7-8-fl. umbels, sweet-scented. In dry sands. Eu. B.M. 2179.

*glauca*, Linn. Glabrous shrub 2-4 ft. high: stipules small, lanceolate: lfts. 5-7, obovate, very blunt, glaucous: fls. 7-8 in each umbel, yellow, heavy-scented. S. Eu. B.M. 13.—One of the common garden shrubs of S. Calif., flowering all the year. There is a variegated form.

AA. Fls. white and pink.

*viminàlis*, Salisb. Trailing shrub: stipules soon deciduous, ovate, membranaceous: lfts. 13-21, obovate, notched, glaucous: umbels 6-10-fl.; fls. pale red or white with a red stripe on the banner. Algeria.—Promising as a florists' plant for cut-fls. Fls. all the year in S. Calif.

*varia*, Linn. CROWN VETCH. Fig. 1070. Straggling or ascending smooth herb, 1-2 ft. high: lvs. sessile; lfts. 11-25, oblong or obovate, blunt and mucronate,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long: peduncles longer than lvs.; fls. in dense umbels,  $\frac{1}{2}$  in. long, pinkish white. June-Oct. Eu. B.M. 258. Gng. 5:337.—Trailing plant for hardy herbaceous border.

JARED G. SMITH.  
L. H. B.†

**CORRÊA** (after Jose Francesco Correa de Serra, Portuguese author, 1750-1823). *Rutacæ*. Tender Australian shrubs, rarely cultivated under glass.

1070.  
*Coronilla varia*.  
( $\times \frac{1}{2}$ )

Shrubs, usually with dense, minute, stellate hairs: lvs. opposite, stalked, entire, and with transparent dots: fls. rather large, showy, red, white, yellow or green, usually pendulous, solitary or 2 or 3 together; petals and sepals each 4; stamens 8: carpels 4, nearly distinct.—Seven species. *C. speciosa* is probably the

best and most variable species. It is a native of barren sandy plains, and belongs to the large and much-neglected class of Australian shrubs.

*speciosa*, Ait. (*C. cardinalis*, F. Muell.). Tender shrub, 2-3 ft. high: branches slender, brown, opposite, covered with minute rusty hairs: lvs. opposite, about 1 in. long, elliptic, about a fourth as wide as long, wrinkled, dark green above, whitish below, margin entire, recurved: peduncles opposite, axillary, longer than the lvs., 1-fl., with a pair of leafy bracts; fls.  $1\frac{1}{2}$  in. long, pendulous, tubular, bright scarlet, with a very short limb of 4 spreading, greenish yellow segms.; calyx small, cup-shaped, with 4 almost obsolete teeth; stamens 8, exserted, about  $\frac{1}{4}$  in. B.M. 4912.—There are several varieties.

*alba*, Andr. Fig. 1071. A compact and much-branched shrub, 3-4 ft., the branches rusty-tomentose: lvs. variable, orbicular to obovate or elliptic, very blunt,  $\frac{1}{2}$ -1 in. long: fls. white or pink, 2 or 3 together, not over  $\frac{1}{2}$  in. long, and not so showy as preceding. B.R. 515.—Offered in S. Calif.

WILHELM MILLER.  
N. TAYLOR.†

**CORTADERIA** (from *Cortadero*, the native name in Argentina). *Graminææ*. PAMPAS-GRASS. Large reed-like perennials with numerous long, narrow blades and a large striking plume-like inflorescence. Species six, South America. See *Gynèrium*.

*argentea*, Stapf (*Gynèrium argenteum*, Nees). PAMPAS-GRASS. Culms numerous, in large thick tussocks, 3-10 ft. high, excluding the panicle: lvs. mostly basal, the upper sheaths gradually elongated; blades firm, long and slender, very scabrous on the margins,  $\frac{1}{8}$ - $\frac{1}{4}$  in. wide, tapering to a slender point: panicle large, compact, 1-3 ft., silvery white or in cult. varieties tinged with purple, diocious; spikelets 2-3-fl., the pistillate silky with long hairs, the staminate naked; glumes white and papery, long and slender; lemmas bearing a long slender awn. A.G. 14:323. G. 1:412. G.C. III. 40:295; 43:195. Gn. 62, p. 346; 66, p. 375. G.W. 3:415. Gn.W. 5:85; 23:20. J.H. III. 35:483; 49:27. R.H. 1862, p. 150. V. 3:369, 391. S. Brazil and Argentina. *C. Lambleyi foliis variegatis*, Hort. G.C. III. 25:335, appears to be a form of *C. argentea*.

*Quila*, Stapf (*Gynèrium Quila*, Nees. *G. jubatum*, Lem. *G. arcuato-nebulosum*, Hort.). Differs from pampas-grass in the rather laxer, more graceful plume, with longer, more flexuous, nodding branches, somewhat smaller spikelets, and more delicate glumes, and in the longer, very slender staminodes of the pistillate fls.: plume lavender-colored, 1-2 ft. long, the spikelets 3-5-fl. B.M. 7607. G.C. III. 26:102. Gn. 15, p. 179; 55, p. 93. R.H. 1885, p. 200; 1899:52, 53.—Grows in a dense tuft; perennial, but with biennial culms; the plant has been killed by a temperature of 3° F. Intro. by Lemoine, of

1071. *Correa alba*.  
( $\times \frac{1}{2}$ )

Nancy, France. Probable synonyms are *Gynerium roseum Rendlateri* and *G. argenteum carminatum Rendlateri*. F.S. 20:2075. Not so well known as *C. argentea*.

A. S. ИТЧСКОК.

**CORTUSA** (named by the herbalist Matthioli after his friend Cortus, professor of botany at Padua). *Primulaceae*. Scapose, perennial, pubescent herbs with long-stalked, cordate-ovate lvs. and purple umbellate fls. *C. Matthioli*, Linn., from the Swiss Alps, has long been a choice and delicate but not very popular plant, suited for shady parts of the rockery. It was long considered the only species of the genus. It is an herbaceous perennial, about 6 in. high, pubescent, rhizomatous, with a few long-stalked, cordate, 7-9-lobed, dentate lvs., and a slender scape bearing an umbel of about 7 small, rosy purple, drooping fls., which appear in early spring. B.M. 987. L.B.C. 10:956. It has some resemblance to *Primula cortusoides*. The genus has possibly 4 species, and is distinguished from *Primula* and *Androsace* by its stamens attached to the base of the corolla, and its long-acuminate anthers. Its culture is similar to that of the hardy primulas, but it needs winter protection in the northern states. Prop. by division of the roots.

**CORYANTHES** (Greek, *korys*, helmet, and *anthos*, flower, referring to the shape of the lip). *Orchidaceae*. Epiphytic orchids requiring warmhouse conditions.

Pseudbulbous: lvs. plicate, lanceolate: fls. in racemes; sepals spreading, dilated, flexuose, conduplicate, lateral ones largest, distinct at the base; petals small, erect; lip large, tridentate, basal portion forming a hood, continued into the column; distal portion bucket- or pouch-like; column pointing downward, elongated, terete, bicornute at the base, apex recurved; pollinia 2, compressed, caudicle linear, arcuate. The bucket part of the lip is provided with a spout-like structure, by means of which the bucket overflows when about half full of a secretion which drops from a pair of glands near the base of the column. The fls. of the species known are not lasting, the sepals being of such delicate texture that although at first they fully expand, they soon collapse and become unsightly. Although much interest attaches to the species of *Coryanthes*, the genus is not generally cult., since the fls. last too short a time and are not particularly brilliant. This complex genus, which is closely related to *Stanhopea*, is represented by several interesting species inhabiting Trop. Amer. For cult. see *Stanhopea*.

**macrantha**, Hook. Fls. few, in drooping racemes; ground-color rich yellow dotted with red; hood and part of bucket brownish red. Caracas. P.M. 5:31. B.B. 1841. B.M. 7692. G.C. III. 28:355. O.R. 3:41.

**maculata**, Hook. Fls. in a drooping raceme; sepals and petals dull, pale yellow, bucket blotched on the inside with dull red. B.M. 3102; 3747. B.R. 1793. F.S. 8:755 (as *C. Albertinae*). A.F. 30:325. C.O. 1. Var. **punctata**, Hort., has the petals and sepals bright yellow, speckled with red, the hood yellow, blotched with reddish orange, the pouch pale, speckled and spotted with red. Demerara. *C. Cobbii* is an unspotted form of this.

*C. Balfouriana*, Hort. Similar in habit to a *stanhopea*, with a long pendulous scape bearing 2 or 3 large and curiously shaped fls. Peru.—*C. leucocorys*, Rolfe. Sepals yellowish green, marked with brownish purple, the petals white, marked with light purple, the lip white with the bucket marbled with light rosy purple. Peru. Lind. 7:293.—*C. Mastersiana*, Lehm. Raceme erect; fls. 2 or 3, yellowish, tinged and spotted with copper-red. Colombia. G.C. III. 29:19.—*C. Sanderi*, Hort. A very large-fl. plant allied to *C. macrantha*.—*C. speciosa*, Hook. Raceme of 2 or 3 fls.; sepals and petals pale yellow; lip brown-red, the stalk brownish yellow. Brazil. G.C. III. 36:106. B.M. 2755 (as *Gongora*). C.O. 2.

GEORGE V. NASH.†

**CORÝDALIS** (Greek, *lark*, the spur of the flower resembling a lark's spur). *Fumariaceae*. Hardy plants allied to the Dutchman's breeches.

Erect or prostrate herbs, usually perennially rooted,

but often annuals: lvs. lobed and finely dissected in nearly all the species: fls. racemose, often yellow, less frequently blue, purple or rose; petals 4, spurred as in the Dutchman's breeches; stamens 6, in 2 groups.—Ninety species, natives of the north temperate regions. They are all of easy cult. They prefer full sunlight but will grow in half-shade. Prop. by division or seed.

#### INDEX.

occidentalis, 10.  
ophiocarpa, 8.

solida, 1.  
thalictrifolia, 5.  
tomentosa, 12.  
Wilsonii, 6.

A. Fls. chiefly purple or rose, sometimes tipped yellow.

B. Plant perennial: root tuberous: st.-lvs. few.

1. **bulbosa**, DC. (*C. solida*, Swartz). Erect, 6 in. high: lvs. 3-4, stalked, biternately cut, segms. wedge-shaped or oblong: root solid: fls. large, purplish. Spring. Eu.

2. **Allenii**, Fedde. A perennial caulescent herb, with glaucescent foliage: lvs. usually alternate with finely divided segms., the whole lf. not over 10 in. long: fls. showy, rose-colored, pendulous, on a terminal dense-fl. raceme that is usually about the height of the lvs. N. W. N. Amer.—Perhaps not hardy in the northeastern states.

BB. Plant annual: root fibrous: st.-lvs. many.

3. **glauca**, Pursh. Annual, 1-2 ft. high, very glaucous: lobes of the lvs. mostly spatulate: racemes short, panicked at the naked summit of the

1072. *Corydalis nobilis*.

branches; fls. barely  $\frac{1}{2}$  in. long, rose or purple with yellow tips; spur short and round: caps. slender, linear; seeds with minute, transverse wrinkles. Summer. Rocky or sterile ground, Nova Scotia to Rocky Mts., and even Arctic coast, south to Texas. B.M. 179 (as *Fumaria*).—Not advertised for sale, but probably worth cult.

AA. Fls. chiefly yellow.

B. Foliage not tomentose.

C. Plant perennial: root tuberous or woody: st.-lvs. few or none.

D. The fls. at least 1 in. long.

4. **nobilis**, Pers. Fig. 1072. Perennial, erect: lvs. bipinnately cut; segms. wedge-shaped and lobed at the apex: fls. white, tipped with yellow, and a dark purple spot; spur 1 in. long. Spring. Siberia. B.M. 1953 (as *Fumaria nobilis*). G.C. II. 19:725.

5. **thalictrifolia**, Franch., not Jameson. Rhizome woody, elongated: lvs. large, long-petiolate, rigid, but spreading, the pinnæ of the finely dissected lvs. petiolulate: fls. yellow, in large spreading racemes, which are opposite the lvs.; sepals persistent, ovate.—A very showy species from China, the foliage strongly resembling *Thalictrum*.

6. **Wilsonii**, N. E. Br. A glabrous, often glaucescent perennial, with a rosette of radical much-dissected lvs. about 5 in. long: fls. in an erect raceme 7 in. high, which is usually leafless; corolla deep canary-yellow, about 1 in. long, the blunt spur about  $\frac{1}{2}$  in. long. G.C. III.

35:306.—Useful for the Alpine garden and more profuse bloomer than *C. tomentosa*, its nearest relative. China.

DD. The fls. not over  $\frac{1}{2}$  in. long.

7. *cheilanthisfolia*, Hemsl. A small low perennial with radical, fern-like, much-dissected, erect lvs. about 8 in. long: scape usually taller than the lvs., bearing numerous fls. not over  $\frac{1}{2}$  in. long, yellow. China. May.—Suitable for moist places in the alpine garden. Probably unknown in U. S. as it is a rare plant in nature.

CC. Plant annual or biennial: root fibrous: st.-lvs. numerous.

D. Height of plants 2 ft. or more.

8. *ophiocarpa*, Hook. f. & Thoms. Root fibrous, the st. 2-3 ft. and branched: lvs. pinnatisect, 4-8 in. long, and glaucous beneath: fls. yellow, in many-fl., lax racemes which are opposite the lvs.; sepals orbicular, finely toothed and fimbriate. Moist valleys of the Himalayas.

DD. Height of plants usually less than 1 ft.

E. Raceme spike-like; fls. almost sessile.

9. *curvisiliqua*, Engelm. Probably a perennial: commonly more robust than *C. aurea*, ascending or erect, 1 ft. high or less: fls. golden yellow, over  $\frac{1}{2}$  in. long, in a spike-like raceme; spur as long as the body, commonly ascending: caps. quadrangular,  $1\frac{1}{2}$  in. long; seeds turgid to lens-shaped, with acute margins densely and minutely netted. Woods in Texas.

EE. Raceme not spike-like; fls. pedicellate.

10. *aurea*, Willd. Annual, 6 in. high, commonly low and spreading: fls. golden yellow, about  $\frac{1}{2}$  in. long, on rather slender pedicels in a short raceme; spur barely half the length of the body, somewhat decurved: caps. spreading or pendulous, about 1 in. long; seeds 10-12, turgid, obtuse at margin, the shining surface obscurely netted. Rocky banks of Lower Canada and N. New England, northwest to latitude  $64^\circ$ , west to Brit. Col. and Ore., south to Texas, Ariz. and Mex.; not Japan.—The western forms have the spur almost as long as the body of the corolla and pass into

Var. *occidentalis*, Engelm. More erect and tufted, from a stouter and sometimes more enduring root: fls. larger; spur commonly ascending: caps. thicker; seeds less turgid, acutish at margins. Colo., New Mex., W. Texas, Ariz.

11. *lutea*, DC. Erect or spreading, 6-8 in. high, annual, or forming a tufted stock of several years' duration: lvs. delicate, pale green, much divided; segms. ovate or wedge-shaped, and 2-3-lobed: fls. pale yellow, about  $\frac{1}{2}$  in. long, in short racemes; spur short: pod  $\frac{1}{4}$  or  $\frac{1}{2}$  in. long. Stony places of S. Eu., and runs wild in Eu.

BB. Foliage tomentose.

12. *tomentosa*, N. E. Br. A low rock-loving perennial, with a rosette of radical lvs. 4-7 in. long, oblong in outline and tomentose, the tomentum whitish pink, pinnæ finely dissected: racemes erect, 5-7 in. tall; corolla about  $\frac{3}{4}$  in. long, light canary-yellow, the spur very blunt and about  $\frac{1}{4}$  in. long. China.—A good plant for the rock-garden.

*C. angustifolia*, DC., is a little-known perennial with bi-ternately divided lvs. and flesh-colored fls.—*Fumaria angustifolia*, Bieb. G. C. III. 35:307.—*C. cava*, Schweigg. & Kort. (probably a form of *C. tuberosa*, DC.) is somewhat larger than *C. bulbosa*, with pretty fls. varying into purplish and white. Eu.—*C. ochroleuca*, Koch. One ft. high, blooming June-Sept.: fls. yellow-white, the spur yellow: caps. linear; petiole winged. Italy.—*C. Scouleri*, Hook., grows 3 ft., and is cult. in some European gardens. W. Amer.

N. TAYLOR.†

**CORYLOPSIS** (*Corylus* and *opsis*, likeness; in foliage resembling the hazel). *Hamamelidaceæ*. Woody plants, grown chiefly for their yellow fragrant flowers appearing in early spring and for the handsome foliage.

Deciduous shrubs, rarely trees: lvs. alternate, strongly veined, dentate: fls. in nodding racemes with large bracts at the base, appearing before the lvs., yellow; calyx-lobes short; petals clawed, 5; stamens 5, alternating with entire or 2-3-parted short staminodes; styles 2; ovary half-superior, rarely entirely superior: fr. a 2-celled, dehiscent, 2-beaked caps., with 2 shining black seeds.—About 12 species in E. Asia and Himalayas.

These are low ornamental shrubs, with slender branches and pale bluish green distinct foliage; all are very attractive in early spring, when covered with numerous nodding spikes of yellow, fragrant flowers. Not hardy north of New York, except in sheltered positions. They grow best in peaty and sandy soil. Propagated by seeds sown in spring, best with slight bottom heat, and by cuttings of half-ripened wood in summer under glass; also by layers, rooting readily in moderately moist, peaty soil.

A. Fls. in many-fl. racemes.

B. Petals obovate to oblong-obovate.

C. Young branchlets and lvs. beneath pubescent, at least on the veins.

*spicata*, Sieb. & Zucc. Shrub, to 4 ft.: lvs. oblique and rounded or cordate at the base, roundish ovate or obovate, sinuate-dentate, glaucous beneath and pubescent, 2-3 in. long: racemes 7-10-fl., 1-2 in. long, their bracts ovate; fls. bright yellow; stamens slightly longer than the obovate petals; calyx hairy. Japan. S.Z. 19. B.M. 5458. F.S. 20:2135. R.H. 1869, p. 230; 1878, p. 198; 1907, p. 403. G.C. II. 15:510; III. 25:210. Gn. 33, p. 441. S.I.F. 2:26.—This species has larger and handsomer foliage and fls. of a deeper yellow, in longer racemes, but *C. pauciflora* flowers more profusely and is somewhat harder.

*sinensis*, Hemsl. Shrub, 6-15 ft.: lvs. obovate to oblong-obovate, abruptly acuminate, obliquely subcordate or cordate at the base, sinuate-denticulate, pubescent at least on the veins and grayish green beneath, 2-4 in. long: racemes about 2 in. long, their bracts nearly orbicular; petals orbicular-obovate, slightly longer than style and stamens; calyx hairy. Cent. China. G.C. III. 39:18. Var. *glandulifera*, Rehd. & Wilson (*C. glandulifera*, Hemsl.). Young branchlets and petioles with scattered glandular bristles: calyx glabrous. H.I. 29:2819.

CC. Young branchlets glabrous; lvs. glabrous or only with a few silky hairs on the veins beneath when young.

*Veitchiana*, Bean. Shrub, 3-6 ft.: lvs. short-petioled, elliptic, abruptly acuminate, subcordate at the base, sinuate-denticulate, glaucous beneath, 3-4 in. long: racemes 1-2 in. long; petals obovate, slightly shorter than the stamens; calyx hairy; nectaries 2-parted. Cent. China. B.M. 8349. Gn. 76, p. 184.

BB. Petals with the blade as broad as or broader than long.

*Willmottiae*, Rehd. & Wilson. Shrub, to 12 ft.: lvs. oval to obovate, cordate or truncate at the base, sinuate-denticulate, glaucous beneath, 1-3½ in. long: racemes 2-3 in. long; petals suborbicular; calyx glabrous; nectaries 2-parted, slightly shorter than the sepals. Cent. China. G.M. 55:191 (as *C. multiflora*).

*platypetala*, Rehd. & Wilson. Shrub, 3-8 ft.: young branchlets with scattered glandular bristles: lvs. on glandular petioles, ovate or broadly ovate, cordate or subcordate at base, sinuate-denticulate, on both sides sparingly silky-hairy when young, soon glabrous 2-4 in. long: racemes 1-2 in. long; petals hatchet-shaped,  $\frac{1}{2}$  in. broad; nectaries emarginate at the apex; stamens and styles much shorter than petals; calyx glabrous. Cent. China. Var. *lævis*, Rehd. & Wilson. Branchlets and petioles without any glands. W. China.—Less showy than most other species.

## AA. Fls. in 2-3-fld. racemes.

**pauciflora**, Sieb. & Zucc. Low, much-branched shrub, 2-3 ft.: lvs. obliquely cordate, ovate, sinuate-dentate, ciliate, pubescent and glaucous beneath, 1-2 in. long; racemes 2-3-fld.,  $\frac{1}{2}$ - $\frac{3}{4}$  in. long; fls. light yellow; petals obovate, about as long as stamens and style. Japan. S.Z. 20. G.F. 5:342. Gt. 48:1467. B.M. 7736. G.W. 15, p. 101. J.H. III. 48:381. S.I.F. 2:26.

*C. Griffithii*, Hemsl. (*C. himalayana*, Hook., not Griff.). Shrub or small tree, to 20 ft.: young branchlets and lvs. beneath densely pubescent; lvs. subcordate; racemes 1-2½ in. long; stamens and styles much shorter than the obovate petals. Himalayas. B.M. 6779.

ALFRED REHDER.

**CÓRYLUS** (ancient Greek name). *Betulaceæ*. HAZEL. FILBERT. COBNU. Woody plants grown for their handsome rather large foliage and some species for their edible nuts.

Deciduous shrubs, rarely trees: lvs. alternate, stipulate, petioled, serrate and usually more or less pubescent; fls. monœcious, appearing before the lvs.; staminate in long, pendulous catkins, formed the previous year, and remaining naked during the winter (Fig. 1073), each bract bearing 4 divided stamens; pistillate included in a small, scaly bud with only the red styles protruding (Fig. 1074): fr. a nut, included or surrounded by a leafy involucre, usually in clusters at the end of short branches.—Fifteen species in N. Amer., Eu. and Asia, all mentioned below. Monograph by Winkler in Engler, Pflanzenreich, hft. 19, pp. 44-56 (1904), quoted below as Winkl.

Numerous varieties are cultivated in Europe for their edible nuts. They are also valuable for planting shrubberies, and thrive in almost any soil. The foliage of some species turns bright yellow or red in autumn. Propagated by seeds sown in fall, or stratified and sown in spring; the varieties usually by suckers, or by layers, put down in fall or spring; they will be rooted the following fall. Budding in summer is sometimes practiced for growing standard trees, and grafting in spring in the greenhouse for scarce varieties. They may also be increased by cuttings of mature wood taken off in fall, kept during the winter in sand or moss in a cellar and planted in spring in a warm and sandy soil. Illustrated monograph of the cultivated varieties by Franz Goeschke, Die Haselnuss (1887). See, also, bulletin on Nut-

A. Husk or involucre consisting of 2 distinct bracts (sometimes partly connate).

B. Involucre densely spiny: lvs. nearly glabrous.

1. **ferox**, Wall. Tree, to 30 ft.: young branchlets silky-hairy: lvs. oblong to obovate-oblong, usually rounded at the base, acuminate, doubly serrate, glabrous except on the veins beneath, with 12-14 pairs of veins, 3-5 in. long; involucre tomentose, forming a spiny bur about  $\frac{1}{2}$  in. across, longer than the small nuts. Himalayas. Winkl. 45. Var. **thibetica**, Franch.

(*C. thibetica*, Batal.). Lvs. broadly ovate to obovate: involucre glabrescent. Cent. and W. China. R.H. 1910:204.

BB. Involucre not spiny.

c. Bracts of the involucre deeply divided into linear lobes, much longer than the nut: tree.

2. **Colurna**, Linn. Tree, to 70 ft.: petioles  $\frac{3}{4}$ -2 in. long, usually glabrescent: lvs. deeply cordate, roundish ovate to obovate, slightly lobed and doubly crenate-serrate, at length nearly glabrous above, pubescent beneath, 3-5 in. long; frs. 3-10, clustered: involucre open at the apex, usually densely beset with glandular hairs: nut roundish ovate,  $\frac{3}{4}$  in. long. From S. Eu. to Transcaspia. G.C. III. 40:256. Gn. 31, pp. 260-1. H.W. 2, p. 29. G.W. 14, p. 642. Gng. 16:163.—Ornamental tree, with regular pyramidal head, not quite aardy N. Rarely cult. for the fr. under name of filbert or of Constantinople or Constantinoople nut. Var. **glandulifera**, DC. Petioles and peduncles glandular-setose: lobes of the involucre less acute and more dentate.

3. **chinensis**, Franch. (*C. Colurna* var. *chinensis*, Burk.). Tree, to 120 ft.: petioles  $\frac{1}{2}$ -1 in. long, pubescent and setulose: lvs. ovate to ovate-oblong, cordate and very oblique at the base, glabrous above, pubescent on the veins beneath, doubly serrate, 4-7 in. long; fr. 4-6, clustered; involucre constricted above the nuts, with recurved and more or less forked lobes, finely pubescent, not glandular. W. China. Winkl. 49 and 50.

cc. Bracts of the involucre divided into lanceolate or triangular lobes: shrubs.

d. The involucre not or only slightly longer than the nut, open or spreading at the apex.

E. Lobes of bracts serrate or dentate.

4. **Avellana**, Linn. Shrub, to 15 ft.: lvs. slightly cordate, roundish oval or broadly obovate, doubly serrate and often slightly lobed, at length nearly glabrous above, pubescent on the veins beneath: involucre shorter than the nut, deeply and irregularly incised: nut roundish ovate,  $\frac{1}{2}$ - $\frac{3}{4}$  in. high. Eu., N. Afr., W. Asia. H.W. 2:16, p. 28. Var. **atropurpurea**, Kirchn. (var. *fusco-rubra*, Goeschke). Lvs. purple. Var. **aurea**, Kirchn. Lvs. yellow. Var. **laciniata**, Kirchn. (var. *heterophylla*, Loud.). Lvs. laciniately incised or lobed. Var. **pendula**, Goeschke. With pendulous branches. G.W. 2, p. 13. There are also many varieties cult. for their fr.

5. **pontica**, Koch. Shrub: lvs. cordate, roundish ovate or broad-oval, doubly serrate, pubescent beneath: involucre finely pubescent, with few glandular hairs at the base, campanulate, somewhat longer than the nut, with large spreading lobes: nut large, broad-ovate. W. Asia. F.S. 21:2223-4 (as *C. Colurna*).—From this species the cobnuts seem to have originated; also the Spanish nuts are probably mostly cross-breeds between this species and *C. Avellana* or *C. maxima*, or between the two latter species.

EE. Lobes of the bracts entire or sparingly dentate, triangular.

6. **heterophylla**, Fisch. Shrub, to 12 ft.: petioles about  $\frac{3}{4}$  in. long: lvs. orbicular-obovate, cordate at the base, nearly truncate at the apex and with a very short point, incisely serrate, pubescent on the veins beneath, 2-4 in. long; involucre somewhat longer than the nuts, striate, glandular-setose near the base. Japan to W. China. S.I.F. 1:20.—Several varieties apparently not yet in cult. occur in China: var. *Crista-Galli*, Burkill, var. *setchuenensis*, Franch., and var. *yunnanensis*, Franch.

1074. Pistillate flowers of *Corylus rostrata*. (Natural size)

DD. *The involucre about twice as long as the nut, usually tightly inclosing the nut.*

7. *americana*, Walt. Shrub, 3-8 ft.: young branchlets pubescent and glandular bristly: lvs. slightly cordate or rounded at the base, broadly ovate or oval, irregularly serrate, sparingly pubescent above, finely tomentose beneath, 3-6 in. long: involucre compressed, exceeding the nut, the 2 bracts sometimes more or less connate, with rather short, irregular, toothed lobes: nut roundish ovate, about  $\frac{1}{2}$  in. high. From Canada to Fla. west to Ont. and Dak. Var. *calyculata*, Winkl. (*C. calyculata*, Dipp.). Involucre with 2 very large bracts at the base.

AA. *Husk or involucre tubular, narrowed above the nut and forming an elongated beak.*

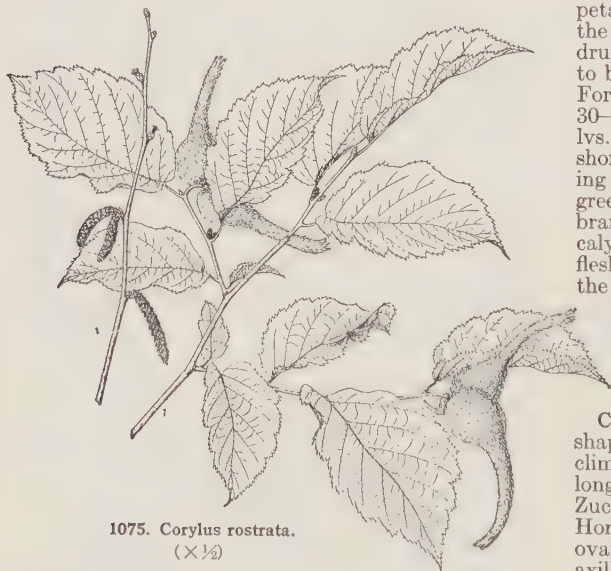

B. *Involucre finely pubescent outside with rather wide gradually narrowed beak.*

8. *máxima*, Mill. (*C. tubulosa*, Willd.). Shrub, sometimes small tree, to 30 ft.: lvs. cordate, roundish-ovate, slightly lobed and doubly serrate, 3-6 in. long: involucre finely pubescent outside: nut oblong, large; kernel with thin red or white skin. S. Eu. H.W. 2, p. 30. Winkl. 49. Var. *purpurea*, Rehd. (*C. Avellana purpurea*, Loud. *C. máxima* var. *atropurpurea*, Dochnahl). Lvs. deep purplish red darker than in *C. Avellana atropurpurea*. F.E. 21:325.—Many varieties, with large nuts, known as filberts or Lambert's filberts. The cult. forms are partly hybrids with *C. Avellana*.

BB. *Involucre densely beset with bristly hairs, and usually rather abruptly constricted into a narrow beak.*

c. *Petioles usually longer than  $\frac{1}{2}$  in.*

9. *mandshurica*, Maxim. (*C. rostrata* var. *mandshurica*, Regel). Shrub, to 15 ft.: young branchlets pubescent: lvs. suborbicular to elliptic or obovate,

1075. *Corylus rostrata*.  
( $\times \frac{1}{2}$ )

doubly serrate and slightly sinuately lobed, pubescent beneath, 3-5 in. long: involucre thickly beset with brown spreading bristles, about 2 in. long, about 3 times as long as the nut, divided at the apex into narrow entire segms. Manchuria, Korea. Winkl. 49.

10. *Sieboldiana*, Blume (*C. rostrata* var. *Sieboldiana*, Maxim.). Shrub, to 15 ft.: lvs. elliptic to oblong or obovate, usually rounded at the base, doubly serrate and slightly lobed, 2-4 in.; the young lvs. often with a purple blotch in the middle: involucre with less stiff bristles, about  $\frac{1}{2}$  in. long, 2 or sometimes 3 times as

long as the nut, narrowed toward the apex. Japan. S.I.F. 1:20.

cc. *Petioles shorter than  $\frac{1}{2}$  in.*

11. *rostrata*, Ait. Fig. 1075. Shrub, 2-6 ft.: branchlets pubescent or glabrous, not bristly: lvs. rounded or slightly cordate at the base, oval or obovate, densely serrate and sometimes slightly lobed, nearly glabrous at length, except sparingly pubescent on the veins beneath,  $2\frac{1}{2}$ -4 in. long: involucre densely beset with bristly hairs, beak long and narrow: nut ovoid,  $\frac{1}{2}$  in. long. E. N. Amer., west to Minn. and Colo. G.F. 8:345 (adapted in Fig. 1075).

12. *californica*, Rose (*C. rostrata* var. *californica*, DC.). Allied to *C. rostrata*. Shrub, to 20 ft.: lvs. more villous beneath: involucre with a short beak, which is often flaring and sometimes torn. Calif. to Wash.

*C. colchica*, Alboff. Low shrub, to 3 ft.: lvs. ovate or obovate, densely doubly serrate, sparingly pilose: involucre connate, with a short lacerated beak, pubescent. Caucasus. Winkl. 53. Not in cult.—*C. colurnoides*, Schneid. (*C. intermedia*, Lodd., not Fingerh., *C. Colurna* X *C. Avellana*). Similar to *C. Colurna*: small tree or large shrub. bark darker: involucre shorter, scarcely glandular. Garden origin.—*C. Fargesii*, Schneid. (*C. mandshurica* var. *Fargesii*, Burkill). Tree to 45 ft.: lvs. narrow-obovate to oblong: involucre soft-pubescent, sometimes only slightly so. W. China.—*C. Jacquemontii*, Deene. (*C. Colurna* var. *lacera*, DC.). Allied to *C. chinensis*. Tree: lvs. ovate, lobed toward the apex, less pubescent, 5-8 in. long: involucre pubescent, not constricted, lobes not or rarely forked, often dentate. Himalayas.

ALFRED REHDER.

**CORYNOCÁRPUS** (Greek, *club-fruit*, alluding to the shape). *Anacardiaceae*; by Engler made the sole representative of *Corynocarpaceae*. A very few New Zeal. and Polynesian evergreen trees, one of which is intro. in Calif. Glabrous: lvs. large, alternate, simple and entire, without stipules: fls. perfect, small, whitish green, inodorous, in terminal or subterminal panicles; calyx-lobes petal-like, unequal, 2 exterior smaller; petals much like the calyx-lobes; stamens 5, opposite the petals and shorter; staminodia 5, petal-like: fr. drupaceous, narrowly ovoid, 1-seeded, the pulp said to be edible; seed very bitter, poisonous. *C. laevigata*, Forst. NEW ZEALAND LAUREL. Attractive leafy tree, 30-40 ft., the trunk sometimes more than 2 ft. diam.: lvs. to 8 in. long, elliptic-oblong or oblong-ovate, with a short stout petiole, margins slightly recurved, suggesting those of *Magnolia grandiflora*: fls. very small, greenish or whitish, short-pedicelled, in a terminal branched panicle; petals concave, little exceeding the calyx-lobes: drupe  $1\frac{1}{2}$  in. or less long, orange-colored, fleshy, plum-like. N. Zeal., in lowlands not far from the sea. B.M. 4379.—*C. similis*, Hemsl., and *C. dissimilis*, Hemsl., from New Hebrides and New Caledonia respectively, are not listed among cult. plants.

L. H. B.

**CORYNOPHÁLLUS**: *Hydrocyme*.

**CORYNÓSTYLIS** (Greek, describing the club-shaped style). *Violaceae*. A monotypic genus of woody climbers, with alternate lvs. and terminal racemes of long-stalked violet-like fls. *C. Hybanthus*, Mart. & Zucc. (*Calyptrion Aubletii*, Ging. *Corynostylis Aubletii*, Hort.), is native of Trop. Amer. The lvs. are 2-5 in. long, ovate, or orbicular, bright green, serrate: fls. white, in axillary showy racemes which are contiguous along the st., long-spurred, 2 or 3 times as large as a violet, the spur half-twisted. F.S. 21:2213. B.M. 5960.—A handsome, vigorous warmhouse climber, and cult. in the open in S. Calif. Prop. by cuttings and seeds.

**CÓRYPHA** (Greek for *summit* or *top*,—where the leaves grow). *Palmaceae*, tribe *Corypheae*. Tall fan-leaved palms with a spineless stout trunk.

Leaves terminal, large, orbicular, flabellately divided to the middle into numerous linear-lanceolate segms.; segms. induplicate in the bud; rachis none; ligule small; petiole long, stout, concave above, spiny on the

XXX. Chrysanthemum.—Two of the florist's types.

margins; sheaths split; spadix solitary, erect, paniculately much branched; spathes many, tubular, sheathing the peduncle and branches; fls. green, the plant dying after once flowering and fruiting: frs. as large as a cherry, with a fleshy pericarp.—Species 6, Trop. Asia and Malay Archipelago. G.C. II. 24:362. These fan-palms are cult. the same as *Chamærops* and *Livistona*. They are warmhouse plants, prop. by seeds. Large fans, umbrellas and tents are made of the talipot palm by the natives of Ceylon. *Coryphas* are but little grown commercially, the growth of young plants being slow. Good loam well enriched with stable manure, a night temperature of 65° and abundant moisture, are the chief requisites in their cult., with a moderately shaded house during the summer.

*elata*, Roxbg. (*C. Gebanga*, Blume). Fig. 1076. Trunk straight, 60–70 ft. high, 2 ft. diam., spirally ridged: lvs. lunate, 8–10 ft. diam.; segms. 80–100, separated nearly to the middle, ensiform, obtuse or bifid; petioles 6–12 ft., with black margins and curved spines; spadix about one-fourth the length of the trunk, but narrow. Bengal and Burma.

*umbraculifera*, Linn. TALIPOT PALM. Trunk ringed, 60–80 ft.: lvs. sub-lunate, 6 ft. long by 13 ft. wide, palmately pinnatifid, folded lengthwise above the middle; segms. obtusely bifid; petiole 7 ft., the spines along its margins often in pairs: spadix sometimes 20 ft. long, with spreading branches. Malabar coast and Ceylon. A.F. 12:313. Gng. 5: 213.—Lvs. used as a substitute for paper.

*C. australis*, R. Br.=*Livistona*.—*C. macrophylla*, Hort.= (?).—*C. minor*, Jacq.=*Sabal*.—*C. Woganii*, Hort., is a dwarf round-lvd. plant. A.G. 15:307.

N. TAYLOR.†

**CORYSANTHES** (*helmet-flower*, Greek). *Orchidaceæ*. Not to be confounded with *Coryanthes*. Fifteen or more terrestrial orchids of Austral., New Zeal. and Malaysia, little cult. Dwarf, delicate, tuberous-rooted or fleshy-rooted herbs, bearing a solitary broad lf. and a large solitary fl.: upper sepal large, helmet-shaped; lateral sepals free, linear or filiform; petals (sometimes wanting) smaller than lateral sepals and similar to them; lip large, tubular at base, the margins inclosing the column, the upper part extended into a broad reflexed limb; pollinia 4. *C. picta*, Lindl., Malaya, is 3–4 in. high: upper part of fl. deep purple and yellow, and lower part with four long awl-like segms. and a bract at base of ovary. *C. limbata*, Hook. f., Java, is mostly even lower, with fl. purple and white, the ovate-cordate lf. with reticulating white veins. B.M. 5357.

**CORYTHOLOMA** (referring to the helmet-shape). *Gesneriaceæ*. By some referred to *Gesneria*: a half-hundred or more leafy-stemmed tuberous herbs of Trop. S. Amer., with mostly red or speckled tubular fls. in terminal umbels or racemes, or solitary or few in the axils: lip of corolla erect, concave; disk 5-glandular; stamens didynamous. It is doubtful whether any of the species are in the trade. *C. macropodium*, Sprague, recently mentioned, is a glandular-hirsute herb, 6–9 in. high, from a subglobose tuber: lvs. 3–5 in. across, suborbicular: fls. in solitary axillary cymes, 5–7-fld., cinnabar-red, the corolla-tube about 1 in. long and nearly cylindric, the limb only slightly 2-lipped, the 3 lower lobes blotched purple. S. Brazil. B.M. 8228.—A handsome little plant. These plants are probably to be handled after the manner of gloxinias and similar things.

**COSMANTHUS**: *Phacelia*.

**CÓSMEA**: *Cosmos*.

**COSMÍDIUM**: *Thelesperma*.

**COSMOPHYLLUM**: *Podachænum*

**CÓSμος** (from the Greek word with a root idea of orderliness; hence an ornament or beautiful thing). Syn., *Cósmea*. *Compositæ*. Annual or perennial herbs, now popular as flower-garden subjects.

Often tall, usually glabrous: lvs. opposite, pinnately cut in the garden kinds fls. typically shades of rose, crimson and purple, with one yellow species, and white horticultural varieties, long peduncled, solitary or in a loose corymbose panicle: achenes glabrous: chaff of the receptacle

in *C. bipinnatus* with a long and slender apex, in other species with a blunt and short apex.—Perhaps 20 species, all Trop. American, mostly Mexican. The genus is distinguished from *Bidens* chiefly by the seeds, which are beaked in *Cosmos* but not distinctly so in *Bidens*, and by the color of the rays, which in *Cosmos* is typically some form of crimson, while in *Bidens* the rays are yellow or white.

The "black cosmos" (*C. diversifolius*) is, perhaps, better known to the trade as a *Bidens* or *Dahlia*. It has the dwarf habit and dark red early flowers of some dahlias, but the achenes are very puzzling. They resemble those of *Bidens* in being four-angled, and not distinctly beaked. They are unlike *Bidens*, and like *Cosmos*, in being not distinctly compressed on the back. They resemble both genera in having two rigid persistent awns, but, unlike these genera, the awns have no retrorse barbs or prickles. The achenes are linear, as in *Cosmos* and all our native tropical species of *Bidens*; but, although narrowed at the apex, they are not distinctly beaked, as in most species of the genus *Cosmos*. The plant is, perhaps, nearest to *Bidens*.

Until 1895 there were in the two leading species only three strongly marked colors: white, pink and crimson. These and the less clearly defined intermediate shades have come from *C. bipinnatus*; and the yellow forms have come from *C. sulphureus*, which was introduced in 1896. At first cosmos flowers were only an inch or two across. The best varieties now average 3 inches, and sometimes reach 4 or 5 without thinning or disbudding. Pure white flowers of cosmos are rarely if ever found wild, but some of the cultivated varieties are clear white. The group is lacking in bright deep reds. There are no full double forms of cosmos as yet, and, as regards strongly marked types of doubling, the cosmos may be decades behind the China asters. In the single forms, flat, incurved, or cupping, and reflexed flowers are to be looked for. Stellate forms are now offered; and also dwarfs, and other variants.

It is a mistake to grow cosmos in too rich soil, as one gets too vigorous growth and too few flowers, which are also late. A sandy soil is to be preferred as being earlier, and not too rich. It is well to pinch out the leading shoots of young plants in order to make them bushy and symmetrical, instead of tall and straggling. In the East, for best results it is still neces-

sary to sow seed indoors in April and transplant outdoors as soon as danger of frost is past. Seed sown in the open ground often fails to produce flowers in some northern localities before frost. The early frost kills the typical species, but some of the new strains are said to resist a degree or two of frost.

1076. *Corypha elata*, having spent itself in blooming.

*A. Rays white, pink or crimson: disk yellow.*

*bipinnatus*, Cav. Fig. 1077. Glabrous annual, 7-10 ft. high: lvs. bipinnately cut, lobes linear, remote, entire: involucrel scales ovate-lanceolate, acuminate: fls. white, pink or crimson: seeds smooth, with an abrupt beak much shorter than the body. Mex. B.M. 1535. Gn. 41:10. R.H. 1892:372.—The older and commoner species. *C. hybridus*, Hort., is presumably a trade name for mixed varieties of *C. bipinnatus*, but see G.F. 1:474 for note.

*AA. Rays yellow: disk yellow.*

*sulphureus*, Cav. Fig. 1078. Pubescent, 4-7 ft. high, much branched: lvs. often 1 ft. or more long, 2- or 3-pinnately cut, lobes lanceolate, mucronate, with rachis and midrib ciliate or hispid; pinnae alternate, entire or 2-3-toothed: peduncles 7-10 in. long, naked: outer involucrel bracts 8, linear, acuminate, green, 2 lines long; inner ones 8, oblong, obtuse, scarious, 5 lines long; fls. 2-3 in. across, pale, pure or golden yellow; rays 8, broadly obovate, strongly 3-toothed at the apex, ribbed beneath; anthers of the disk exerted, black, with orange tips: seeds linear, 1 in. long, including the slender beak. Mex. G.F. 8:485 (adapted in Fig. 1078).—Intro. 1896; parent of the yellow forms.

*AAA. Rays dark red: disk red.*

*diversifolius*, Otto (*Bidens atrosanguinea*, Ortg. *B. dahlioides*, Wats. *Dahlia Zimapani*, Roezl). BLACK COSMOS. Tender annual, 12-16 in. high, with tubers more slender, and requiring more care in winter than those of common dahlias: lvs. pinnately parted; lfts. 5-7, entire or slightly serrate, the terminal lfts. largest: peduncles each bearing 1 head 6 in. or more above foliage; rays dark velvety red, sometimes tinged dark purple. Mex. B.M. 5227. Gt. 1861:347. F.C. 2:47. J.H. III. 33:403. Var. *superba*, Hort., is sold.—Prop. almost exclusively by seeds. WILHELM MILLER. †

**COSSÍGNIA** (Jos. Fr. Charpentier de Cossigny, 1730-1789, French naturalist). *Sapindaceæ*. Shrubs or little trees of about 3 species, sometimes mentioned for cult. in warmhouses. *C. pinnata*, Comm., of Mauri-

tius, has white fls. in terminal panicle corymbs, and odd-pinnate lvs., with 3-5 oblong and entire lfts.

**COST-ACCOUNTING.** The keeping of profit-and-loss records, and the drawing of conclusions from them for the improvement of the business.

In recent years, the application of cost-accounting and efficiency methods to farming operations has opened practically a new approach to the discussion of agricultural problems and is forcing a reorganization in practices and in the sub-divisions of the business. Careful and extended studies have not yet been made of the efficiency principles in most horticultural occupations; but the suggestions drawn from orchard records may show the nature and scope of the work.

#### *Annual inventory.*

There is no single account that is more important than the annual inventory. This inventory should list the land and each important building separately. The total value of these items should equal the value of the farm. It should list each cow, horse and important piece of machinery separately. All the cash, notes, mortgages and accounts due the farmer should be recorded with his property. A separate list should be made of all notes, mortgages or accounts due to others. The difference between these and the value of property owned gives the net worth of the farmer. A comparison of the net worth at the beginning and end of the year shows the gain or loss for the year unless money or property has been added to the business from some other sources or taken from it.

#### *Cost-accounts.*

But an inventory does not show on which enterprises gains or losses have occurred. Usually a business is made up of both profitable and unprofitable enterprises, or of enterprises that are unequally profitable. In order to know how to develop the business to the best advantage, it is important to know which enterprises pay best for the use of land and labor. Cost accounts also have very many uses aside from determining the relative profitableness of different enterprises. If all the time spent, labor costs, and other costs, and the receipts are known, it is often possible to see ways of changing the management of a crop so as to increase profits.

In order to keep a complete cost-account with any crop, it is necessary to know all the labor of men, teams and machinery for the crop; to know all receipts and expenses caused by the cropping, and to keep track of any outlays contributed to the crop from the farm or other enterprises, also whatever this crop contributes to other enterprises.

A work-report of the time of man and horse should be kept in an ordinary account-book. At the end of the year, the total time is charged to each crop-account in the ledger. The ledger should have wide pages, so that there may be room for full descriptions. The left-hand page is used for charges, and the right-hand page for credits.

Each evening one should record any cash spent during the day under the proper crop or enterprise. The number of hours that have been spent on each enterprise for both man and horse labor are also recorded in the form shown on the next page. For convenience, the horse time is reduced to terms of one horse. A three-horse team working 10 hours is put down as 30 hours. If one desires, he may keep an account with only one enterprise. It is better to keep accounts with all the enterprises on the farm, so that one may study each part of his business and the business as a whole.

The best method of discussing the subject is to show an account as kept by a farmer. The following account with a 3-acre apple orchard was kept by a New York farmer in 1912:—

1077. *Cosmos bipinnatus*.

	25 bus. drops to chickens.....	2 50
	Total.....	\$340 42

This mere keeping of cost-accounts is not the end. The accounts must be studied. The following are a few of the facts that the farmer used in the preceding records and the suggestions derived from them:

Total crop:	Bus.	Total crop:	Bus.
Baldwin.....	421	Brought forward.....	611
Greening.....	93	Wagener.....	21
Hubbardston.....	30	Spitzenberg.....	6
Spy.....	23	Fall Pippin.....	3
King.....	22		
Snow.....	22		641
		Drops and culls.....	105
Carried forward.....	611		

From the foregoing records he was able to determine the yields per tree or different varieties.

Yields per acre good apples, 214 bushels.

Yield per acre culls and drops, 33 bushels.

Per cent of culls and drops, 14.

Total receipts, good apples, less cost of barrels, \$233.07.

Average price per bushel, good apples, without barrels, 36 cents

Hours of man-labor, per acre, 164.

Hours of horse-labor, per acre, 65.

Profit, per acre, \$17.

Profit, per hour, of man-labor, 10 cts.

Cost, per bushel, good apples, without barrels, 28 cents.

Profit, per bushel, 8 cents.

It will be seen that the cost of barrels was very high owing to buying late in the season. Ten cents a barrel extra cost is more than equal to the profit on a bushel of apples, or one-third the entire profit. Usually the profit on an enterprise can be greatly changed by small changes in cost.

The profit per acre is in addition to pay for use of land. If all the profit is expressed in terms of land, the orchard paid \$27 per acre rent, or gave a profit of \$14 per acre.

If the profit is all expressed in terms of labor, the orchard paid 28 cents per hour for time spent on it, or gave a profit of 10 cents per hour.

Records similar to those given above may be kept with each crop or enterprise on the farm. If this is done, an account is kept with horses from which the cost of an hour of horse-labor is determined. At the end of the year, the labor on each crop for the year is charged at this rate. Similarly, the cost of man-labor is found and charged. The cost of machinery-labor is charged in proportion to the hours that horses worked for the enterprise. This is how the costs per hour given above were determined. But if a complete set of accounts is not kept, the charge for labor of men and horses is placed at the usual rate of pay for such work in the region, including the cost of board. References: "Farm Management," G. F. Warren, pp. 428-93 (1913). Minnesota Bulletins, Nos. 97, 117, and 124. "Farm Accounts," J. A. Vye. G. F. WARREN.

**COSTMARY:** The rayless form of *Chrysanthemum Balsamita*, known as var. *tanacetoides*.

**CÓSTUS** (old classical name). *Zingiberaceæ*. **SPIRAL FLAG.** Perennial thick-rooted tropical herbs, cultivated under glass for their flowing-limbed showy flowers, which are in terminal bracteate spikes.

Stems short or tall and leafy (plant rarely acaulescent), roots often tuberous; fls. golden yellow, red, saffron-colored or white; corolla tubular, cleft, not showy; 1 staminodium, enlarged and bell-shaped, usually with a crispy limb, and forming the showy part of the fl. (called the lip), cleft down the back; ovary 3-loculed; filaments petaloid. — About 100 species, widely distributed in the tropics. More or less fleshy plants, prized in warm-houses, and grown in the open in S. Fla. and other warm regions. Monogr. by Schumann in Engler's *Pflanzenreich* hft. 20 (1904).

This interesting genus of tropical herbs thrives in any rich moist soil, but luxuriates in that of a gravelly or sandy character, when under partial shade. The plants are readily propagated by cutting the canes, or stalks, into short pieces of an inch or two in length, and planting in sifted peat, or fine moss and sand, covering but lightly. The roots may also be divided, but this is a slow means of propagation. Specimen plants require rather high temperature to bring out the rich colors of the leaves, which in some species are prettily marked with a purplish

tint, and are usually arranged spirally on the ascending stem. This gives rise to the name "spiral flag." (E. N. Reasoner.)

**speciosus**, Smith. Somewhat woody at base, 4-10 ft., stout, erect; lvs. oblong or oblanceolate, acuminate, nearly 1 ft. long, silky beneath; bracts red; fl. large, with a flowing white limb and yellowish center, 3-4 in. across, not lasting. E. Indies. I.H. 43:56. Gn. 47:166.

**igneus**, N. E. Br. One to 2 ft.: lvs. oblong or elliptic-lanceolate, 4-6 in. long; bracts not colored nor conspicuous; fls. clustered, orange-red. Brazil. I.H. 31:511. B.M. 6821. J.H. III. 28:11.

Few species of *Costus* are offered in this country, but others may occur in special collections. — *C. Friedrichsenii*, Petersen. 6 ft. or more: lvs. sessile, lanceolate, acuminate,  $1\frac{1}{2}$  ft. or less long; fls. very large, bright yellow in thick terminal spikes. Gt. 52:15-21. Cent. Amer. (?) — *C. micranthus*, Gagnep. 5-6 ft.: lvs. spirally placed, lanceolate; fls. very small with red tube and orange-red yellow-tipped lobes, the lip tubular and purple, in cone-like spikes 3 in. long. Martinique. — *C. muscarius*, Hort. Lvs. obliquely lanceolate, 4-5 in. long, dark green, marked and tessellated with silvery gray. W. Afr. — *C. zebrinus* is very likely the same as last. L. H. B.

**CÓTINUS** (ancient Greek name of a tree with red wood). *Anacardiaceæ*. **SMOKE-TREE.** **CHITTAM-WOOD.** Woody plants, grown chiefly for the attractive feathery fruiting panicles and for the handsome foliage turning brilliant colors in autumn.

Deciduous shrubs or trees with a strong-smelling juice; lvs. slender-petioled, entire, without stipules; fls. dioecious or polygamous, small, greenish or yellowish, in large and loose terminal panicles; the pedicels of the numerous sterile fls. lengthen after the fls. have dropped and become clothed with spreading hairs; petals 5, twice as long as the pointed calyx-lobes, the 5 stamens shorter than the petals, inserted between the lobes of the disk; ovary superior with 3 short styles; fr. a small compressed oblique-obovate dry drupelet with the style on one side. — Two species, one in N. Amer. and one in S. Eu. to Cent. Asia. Formerly usually included under *Rhus*, which differs chiefly in its usually compound and more or less serrate lvs., the globose fr. with terminal style, the absence of plumose pedicels and in the milky juice. Often planted, particularly the European species, for its loose feathery panicles which give almost the effect of a dense cloud of smoke, from which the shrub derives its name. The panicles of the American species are much less showy, but the autumnal coloring is more brilliant. Both species hardy as far north as Mass., the American being somewhat more tender. They prefer a sunny, and in the N., a somewhat sheltered position and well-drained soil, and are adapted for planting in dry and rocky ground. Prop. by seeds; also by root-cuttings and layers.

**Coggýgia**, Scop. (*C. Cótinus*, Sarg. *C. Coccýgea*, Koch. *Rhus Cótinus*, Linn.) **SMOKE-TREE.** Fig. 1079. Spreading, rather dense shrub, to 15 ft.: lvs. slender-petioled, oval or ob-

1079. *Cotinus*  
*Coggýgia*.  
( $\times \frac{1}{5}$ )

ovate, abruptly narrowed at the base, rounded at the apex, glabrous,  $1\frac{1}{2}$ – $3\frac{1}{2}$  in. long: panicles to 8 in. long, densely plumose, usually purplish: frs. few, about  $\frac{1}{8}$  in. long. June, July: fr. Aug., Sept. S. Eu. to Cent. China and Himalayas. Gn. 34, p. 162; 54, p. 505; 71, p. 552. Gng. 5:118. M.D.G. 1902:217. G.C. III. 29:92. H.W. 3, p. 32. Var. *atropurpurea*, Dipp. Panicles with dark purple hairs. Var. *péndula*, Dipp.

1080. *Cotoneaster horizontalis*.

Branches pendulous. Var. *pubescens*, Engler. Lvs., at least beneath, and often also the young branches, pubescent.

*americanus*, Nutt. (*C. cotinoides*, Brit. *Rhus cotinoides*, Nutt.). Upright shrub or small tree, to 35 ft.: lvs. gradually narrowed at the base, obovate to elliptic-obovate, rounded at the apex, silky beneath when young, at maturity glabrous or nearly so, 4–6 in. long: panicles 5–6 in. long, with short and rather inconspicuous pale purple or brownish hairs. June, July. Ala. to W. Texas and E. Tenn. S.S. 3:98, 99.—The autumnal tints orange and scarlet, as in the preceding species, but more brilliant.

ALFRED REHDER.

**COTONEÁSTER** (*cotoneum*, quince, and *aster*, similar: the leaves of some species resemble those of the quince). *Rosaceæ*, subfamily *Poméæ*. Shrubs, rarely small trees, chiefly grown for their ornamental red or black fruits and some species also for their foliage which turns brilliant colors in autumn.

Leaves alternate, deciduous or persistent, short-petioled, entire, stipulate: fls. solitary or in cymes, terminal, on short lateral branchlets, white or pinkish; petals 5; stamens about 20: fr. a black or red pomaceous drupe, with 2–5 stones.—About 40 species, in the temperate regions of Eu. and Asia, also in N. Afr., but none in Japan.

Cotoneasters are ornamental shrubs, many of them with decorative fruits remaining usually through the whole winter, while only a few, like the hardy *C. hupehensis* and *C. multiflora* and the tender *C. frigida*, and also *C. racemiflora* and *C. salicifolia*, are conspicuous with abundant white flowers. Of the species with decorative red fruits, *C. tomentosa*, *C. racemiflora* and *C. integerrima* are quite hardy, and *C. Simonsii*, *C. acuminata*, *C. rotundifolia*, *C. microphylla* and others are hardy at least as far north as New York, while *C. frigida* and its allies are the most tender. The foliage of some of the species assumes brilliant colors in autumn; dark crimson in *C. Simonsii*, *C. horizontalis*, *C. divaricata* and *C. Dielsiana*; scarlet and orange in *C. foveolata*, bright yellow in *C. Zabelii*. The half-evergreen *C. horizontalis* and *C. adpressa*, and the evergreen *C. Dammeri* and *C. microphylla*, with its allied species, are well adapted for rockeries on account of their low, spreading or prostrate habit. Cotoneasters thrive in any good, well-drained garden soil, but dislike very moist and shady positions. Propagation is effected by seeds, sown in fall or stratified; the evergreen species grow readily from cuttings of half-ripened wood in August under glass; increased also by layers, put down in fall, or by grafting on *C. vulgaris*, hawthorn, mountain ash or quince.

glacialis, 24.		

A. Petals upright, small, usually pinkish; cymes usually few-fl'd. or nodding, if many-fl'd. (*Orthopetalum*.)

B. Fr. red.

C. Under side of lvs. glabrous or only pubescent.

D. Habit prostrate.

1. *adpressa*, Bois (*C. horizontalis* var. *adpressa*, Schneid.). Prostrate shrub, with creeping and often rooting sts. irregularly branched: lvs. oval, acutish, wavy at the margin, nearly glabrous,  $\frac{1}{8}$ – $\frac{1}{2}$  in. long: fls. 1–2, pinkish: fr. subglobose, usually with 2 stones. June: fr. Aug., Sept. W. China. V.F. 116.—Hardy at the Arnold Arboretum.

2. *horizontalis*, Decne. Fig. 1080. Low shrub: branches almost horizontal and densely distichously branched: lvs. round-oval, acute at both ends, glabrous above, sparingly setosely hairy beneath,  $\frac{1}{8}$ – $\frac{2}{3}$  in. long: fls. erect, 1–2, pink: fr. ovoid, bright red, usually with 3 stones, smaller than in the preceding species. June; fr. Sept., Oct. China. R.H. 1885, p. 136; 1889:348, fig. 1. G.C. III. 32:91. Gn. 66, p. 407. Var. *perpusilla*, Schneid. Lvs. less than  $\frac{1}{2}$  in. long: fr.  $\frac{1}{4}$  in. across.—Like the preceding species, one of the most effective fruiting shrubs for rockeries.

DD. Habit upright.

E. Lvs. small, not exceeding 1 in., nearly glabrous beneath.

3. *Simonsii*, Baker (*C. acuminata* var. *Simonsii*, Decne.). Shrub, with spreading branches, to 4 ft. lvs. roundish oval, acute, glabrous above,  $\frac{1}{2}$ –1 in. long, semi-persistent: cymes 2–5-fl'd.; fls. white, slightly pinkish; calyx appressed-pubescent: fr. bright red, usually with 3–4 stones. June, July. Himalayas. Refug. Bot. 1:55. B.M. 8010 (excl. fls.; as *C. rotundifolia*). One of the best red-fruited species, often under the name *C. Simonsii* or *C. Symonsi*.

4. *divaricata*, Rehd. & Wilson. Upright shrub, to 6 ft.: lvs. deciduous, oval or broadly oval, acute or obtusish, broadly cuneate at the base, lustrous above,  $\frac{1}{8}$ – $\frac{3}{4}$  in. long: fls. usually 3, pink; calyx appressed-pubescent: fr. ovoid, nearly sessile, bright red,  $\frac{1}{2}$  in. long, usually with 2 stones. June; fr. Sept. Cent. and W. China.—Very handsome when studded with its bright red frs.; hardy at the Arnold Arboretum.

EE. Lvs. larger,  $1\frac{1}{2}$ –3 in. long, deciduous.

5. *acuminata*, Lindl. Erect shrub, to 6 ft.: lvs. oblong to ovate-oblong, acute or acuminate, appressed-hairy on both sides, dull above to light green beneath: cymes 2–5-fl'd., nodding; fls. white or slightly pinkish; calyx pubescent: fr. deep scarlet, turbinate, with 2–3 stones. June; fr. Sept., Oct. Himalayas. L.B.C. 10:919 (as *Mespilus*). R.H. 1889:348, fig. 5 (as *C. nepalensis*).

6. *bullata*, Bois. Spreading shrub, to 6 ft.: lvs. ovate, acuminate, rounded or broadly cuneate at the base, rugose and finally nearly glabrous above, reticulate, pale grayish green and pubescent beneath: fls. pinkish, few; calyx glabrous: fr. red, subglobose, with 4–5

stones. May, June; fr. Sept., Oct. W. China. V.F. 119. Var. *floribunda*, Rehd. & Wilson (*C. moupinensis floribunda*, Stapf). Cymes many-fl.; calyx slightly pubescent. B.M. 8284. Var. *macrophylla*, Rehd. & Wilson. Lvs. elliptic to lanceolate-oblong, narrowed at the base, often nearly glabrous, 2-6 in. long; cymes many-fl.—The varieties are much handsomer than the type.

cc. Under side of lvs. whitish or grayish tomentose: young branchlets densely pubescent.

d. Lvs.  $\frac{3}{4}$ –2½ in. long, rounded at base.

7. *integerrima*, Medikus (*C. vulgaris*, Lindl.). Shrub, to 4 ft.: lvs. ovate or oval, acute or obtuse and mucronulate, glabrous and dark green above, whitish and at length greenish tomentose beneath,  $\frac{3}{4}$ –2 in. long; cymes nodding, 2-4-fl.; fls. pale pinkish; calyx glabrous outside: fr. globular, bright red. May, June; fr. Aug. Eu., W. Asia, Siberia. H.W. 3, p. 73, figs. a-i.

8. *tomentosa*, Lindl. Shrub, to 6 ft.: lvs. broadly oval, obtuse, dull green above and pubescent when young, whitish tomentose beneath, 1-2½ in. long; fls. 3-12, white, calyx tomentose outside: fr. bright brick-red. June; fr. Sept., Oct. Eu., W. Asia. H.W. 3, p. 73, figs. k-o. G.O.H. 105.—Sometimes cult. as *C. speciosa*, Hort.

DD. Lvs. about 1 in. or less long, slightly pubescent above.

E. Apex of lvs. mostly obtuse, base rounded.

9. *Zabelii*, Schneid. Shrub, to 6 ft. with slender spreading branches: lvs. oval to ovate, dull green and loosely pubescent above, grayish or yellowish tomentose below, on young plants sometimes more glabrescent and acutish,  $\frac{3}{4}$ –1¼ in. long; fls. 5-9 in loose corymbs, pinkish; calyx villous outside, with obtuse teeth: fr. ovoid, red, about ½ in. long, with 2 stones. May; fr. in Sept., Oct. Cent. China.

EE. Apex of lvs. mostly acute, base often cuneate.

10. *Dielsiana*, Pritz. (*C. applanata*, Duthie). Shrub, to 6 ft. with slender spreading and arching branches: lvs. deciduous, firm, ovate or elliptic, acutish, rounded or broadly cuneate at base, yellowish gray tomentose beneath, ½–1 in. long; fls. few, short-stalked; calyx pubescent: fr. 1-3, subglobose, ¼ in. across, red, with 3-4 stones. June; fr. Sept., Oct. Cent. China. Var. *major*, Rehd. & Wilson. Lvs. larger and broader: fr. larger. Var. *elegans*, Rehd. & Wilson. Lvs. smaller, sub-persistent, finally nearly glabrous and somewhat shining above: fr. pendulous, coral-red. W. China.

11. *Franchetii*, Bois. Upright densely branched shrub with spreading branches: lvs. thickish, elliptic or ovate, acute or acuminate, usually cuneate at base,

yellowish white tomentose beneath,  $\frac{3}{4}$ –1½ in. long; fls. 6-15, in short and dense corymbs, pinkish, small; calyx pubescent outside, with acute teeth: fr. orange-red, ovoid, over ½ in. long, with usually 3 stones. June; fr. Sept., Oct. W. China. R.H. 1902, p. 379; 1907:256. V.F. 118.

BB. Fr. black or nearly black.

c. Lvs. acute or acuminate, pubescent or nearly glabrous beneath.

d. Upper surface of lvs. glabrous and somewhat lustrous: calyx slightly pubescent or glabrous.

12. *lucida*, Schlecht. (*C. acutifolia*, Lindl. *C. sinensis*, Hort.). Upright, rather dense shrub, to 12 ft.: lvs. elliptic or elliptic-ovate, acute, usually cuneate at the base, slightly pubescent beneath, 1-1½ in. long; fls. 3-6, in nodding corymbs: fr. purplish black, subglobose, with 3-4 stones. May, June; fr. Sept. Altai Mts. G.W. 5, p. 247 (as *C. acutifolia*).—Foliage dark green, remaining green until very late in autumn.

DD. Upper surface of lvs. pubescent, at least when young, dull green: calyx pubescent.

13. *acutifolia*, Turcz. (*C. pekinensis*, Zabel. *C. acutifolia* var. *pekinensis*, Koehne). Shrub, to 12 ft., with spreading slender branches: lvs. elliptic-ovate to oblong-ovate, acute or acuminate, usually rounded at base, slightly appressed-pilose beneath, becoming nearly glabrous, 1½–2 in. long; fls. 2-5, nodding: fr. ovoid, black, to ½ in. long, with usually 2 stones. May, June; fr. Sept., Oct. N. China. Var. *villösula*, Rehd. & Wilson. Lvs. more densely villous beneath, somewhat larger: calyx densely villous: fr. thinly pubescent. Cent. and W. China.

14. *foveolata*, Rehd. & Wilson. Shrub, to 10 ft. with spreading branches: lvs. elliptic to elliptic-ovate, rarely ovate-oblong, acute or acuminate, soon glabrous above, pubescent beneath, chiefly on the veins, finally nearly glabrous, 2-3 in. long; fls. 3-6, pinkish; calyx pubescent: fr. black, subglobose, ½ in. across, with 3-4 stones. June; fr. Sept. Cent. China.—The foliage turns bright scarlet and orange in autumn.

cc. Lvs. obtuse or acutish, tomentose beneath.

15. *melanocarpa*, Lodd. (*C. nigra*, Wahlb.). Shrub with spreading branches, to 6 ft.: lvs. oval or ovate, usually rounded at base, dark green and sparingly pubescent above, grayish white tomentose beneath, 1-3 in. long; fls. 3-8; calyx glabrous: fr. black, globose, with 2-3 stones. May, June; fr. Aug. N. and E. Eu. to Siberia. L.B.C. 16:1531. Var. *laxiflora*, Koehne (*C. laxiflora*, Jacq.). Corymbs 12- to many-fl., elongated, pendulous. B.R. 14:1305. Var. *commixta*, Schneid. (*C. laxiflora*, Hook.). Lvs. acutish, 2 in. long; corymbs 8-15-fl. B.M. 3519.

AA. Petals spreading, white, roundish: fr. red. (*Chaenopetalum*.)

B. Fls. in many-fl. corymbs: upright shrubs.

c. Lvs. broadly ovate or oval, obtuse or acute, ½–1½ in. long, deciduous.

d. The lvs. glabrous beneath at maturity.

16. *multiflora*, Bunge (*C. reflexa*, Carr.). Shrub, to 6 ft., with usually slender, arching branches: lvs. broad-ovate, usually acute, slightly tomentose at first beneath, soon becoming glabrous: cymes very numerous, 6-20-fl.; calyx and peduncles glabrous: fr. red, ½ in. across. May. Spain, W. Asia to Himalayas

1081. *Cotoneaster hupehensis*. (× ½)

and China. R.H. 1892, p. 327; 1893, p. 29. G.W. 6, p. 62. M.D.G. 1914: 7.—Very decorative in bloom, and hardy, but less free fruiting. Var. *calocarpa*, Rehd. & Wilson. Lvs. larger and narrower, slightly hairy below; fr. larger, nearly  $\frac{1}{2}$  in. across, freely produced. W. China.

DD. *The lvs. tomentose beneath.*

17. *hupehensis*, Rehd. & Wilson. Fig. 1081. Shrub, to 5 ft., with slender spreading branches, villous while young; lvs. ovate to elliptic, obtuse or acutish; mucronulate, rarely emarginate, above finally glabrous, thinly grayish tomentose beneath,  $\frac{1}{2}$ –1 in. long; corymbs very numerous, with 6–12 or more white fls.; peduncle and calyx villous; anthers yellow; fr. red, subglobose, about  $\frac{1}{2}$  in. across, with 2 stones. May. Cent. and W. China. M.D.G. 1914: 6 (as *C. acutifolia* var.).—One of the handsomest species in bloom; hardy as far north as Mass.

18. *racemiflora*, Koch (*C. nummularia*, Fisch. & Mey. *C. Fontanèsii*, Spach). Shrub, to 4 ft., with erect or spreading branches, rarely prostrate; lvs. roundish or broad-ovate, obtuse or acute, whitish or grayish tomentose beneath, glabrous above; cymes very short-peduncled, 3–12-fl.; peduncle and calyx tomentose; fr. red. May, June. From N. Afr. and W. Asia to Himalayas and Turkestan. R.H. 1867: 31.—Very decorative and hardy. Var. *soongarica*, Schneid. Lvs. oval, usually obtusish, less pubescent. Var. *microcarpa*, Rehd. & Wilson. Similar to the preceding, but fr. ovoid, smaller. Var. *orbicularis*, Wenz. (*C. Wheeleri*, Hort.). Low and divaricate; lvs. roundish or obovate,  $\frac{1}{2}$ – $\frac{3}{4}$  in. long; cymes 3–6-flid.

CC. *Lvs. elliptic to oblong, acute at both ends, subcoriaceous.*

D. *Length of lvs.  $\frac{1}{2}$ –1½ in.: corymbs 1 in. across or less.*

19. *pannosa*, Franch. Half-evergreen shrub, to 6 ft.: lvs. elliptic to ovate-oblong, mucronate at the apex, glabrous above, densely grayish white-tomentose beneath; calyx tomentose; fr. red, globose-ovoid,  $\frac{1}{2}$  in. long with 2 stones. S. W. China. R.H. 1907: 256. G. 25: 408. Gn. 67, p. 118. J. 12: 120.—Very handsome, but tender.

DD. *Length of lvs. 1½–4 in.: corymbs 1–2 in. across.*

20. *salicifolia*, Franch. Half-evergreen shrub, to 15 ft.: young branchlets floccose-tomentose; lvs. elliptic-oblong to ovate-lanceolate, acute or acuminate, rugose and glabrous above, floccose-tomentose beneath, 1½–3 in. long; fls. white in dense corymbs 1–2 in. across; fr. subglobose, bright red,  $\frac{1}{2}$  in. across, with 2–3 stones. June; fr. Oct., Nov. W. China. Var. *rugosa*, Rehd. & Wilson (*C. rugosa*, Pritz.). Lvs. broader and shorter, elliptic-oblong, dull green above, more woolly-tomentose beneath; fr. larger, usually with 2 stones. Cent. China. Var. *floccosa*, Rehd. & Wilson. Lvs. oblong to oblong-lanceolate, floccose-tomentose beneath while young, later becoming partly glabrous and glaucous, bright green and lustrous above; fr. larger, usually with 3 stones. W. China.—This species is very handsome, particularly in autumn when studded with its clusters of bright red berries. The var. *floccosa* which has been advertised as var. *glaciola* (misspelled for *floccosa*) seems to be the hardiest and most desirable.

21. *frigida*, Wall. Large half-evergreen shrub, to 20 ft.: lvs. oblong, acute at both ends, glabrous above, tomentose beneath when young, 2–4 in. long; cymes long-peduncled, very many-flid., pubescent; fr. scarlet. April, May. Himalayas. B.R. 15: 1229. L.B.C. 16: 1512.—One of the most beautiful in fl. and fr., but not hardy N.

BB. *Fls. 1–3: low prostrate or trailing shrubs: lvs. persistent.*

C. *Lvs. green beneath.*

22. *Dammeri*, Schneid. (*C. humifusa*, Duthie). Prostrate shrub with trailing often rooting branches; lvs. elliptic, usually cuneate at the base, obtusish and

usually mucronulate, glabrous or nearly so, about 1 in. long; fls. usually solitary; calyx sparingly pubescent or nearly glabrous; fr. bright red. May, June; fr. Oct., Nov. Cent. China. Var. *radicans*, Schneid. Lvs. often obovate, slender-petioled; fls. 1–2, on peduncles about  $\frac{1}{2}$  in. long.

CC. *Lvs. glaucous or whitish tomentose beneath.*

23. *rotundifolia*, Wall. (*C. microphylla* *Üva-ürsi*, Lindl. *C. prostrata*, Baker). Low or prostrate shrub; lvs. nearly orbicular or broadly oval, dark green above and somewhat pubescent, loosely pubescent beneath or glabrescent and glaucous,  $\frac{1}{3}$ – $\frac{1}{2}$  in. long; fls. 1–3, about  $\frac{1}{2}$  in. across; fr. bright red, subglobose, more than  $\frac{1}{2}$  in. across. Himalayas. May, June; fr. Sept. B.R. 14: 1187. Var. *lanata*, Schneid. (*C. buxifolia*, Baker, not Wall. *C. Wheeleri*, Hort.). Lvs. elliptic to elliptic-oblong, tomentose beneath; fr.  $\frac{1}{2}$  in. across. Refug. Bot. 1: 52 (fls. in bud). Gn. 55: 186. R.H. 1889, 348, fig. 4.

24. *microphylla*, Wall. Low, prostrate shrub, densely branched; lvs. cuneate-oblong or obovate, acute, shining above, densely pubescent beneath,  $\frac{1}{4}$  in. long; fls. usually solitary; calyx pubescent; fr. bright red. May, June. Himalayas. B.R. 13: 1114. L.B.C. 14: 1374. R.H. 1889: 348, fig. 3. G.C. II. 12: 333; 18: 681. Gn. 4, p. 165. Var. *thymifolia*, Koehne (*C. thymifolia*, Baker). Very dwarf; lvs. linear-oblong, smaller; fls. and fr. smaller. R.H. 1889: 348, fig. 2. G.C. II. 12: 333; 18: 681. Refug. Bot. 1: 50. Var. *glacialis*, Hook. (*C. congesta*, Baker). Lvs. glabrous beneath, oval; fls. smaller, often pinkish. Refug. Bot. 1: 51.

*C. affinis*, Lindl. Allied to *C. frigida*. Lvs. broad-elliptic; fr. dark brown, globose. Himalayas. L.B.C. 16: 1522.—*C. ambigua*, Rehd. & Wilson. Related to *C. acutifolia*. Shrub, to 6 ft.: lvs. elliptic-ovate to rhombic-ovate, villous beneath; fls. 5–10; calyx slightly pubescent or nearly glabrous; fr. ovoid, black. W. China.—*C. amana*, Wilson. Related to *C. Franchetii*. Dense shrub, to 5 ft.: lvs. ovate or elliptic, usually  $\frac{1}{2}$  in. long; corymbs 6–10-flid.; sepals acuminate; fr. globose, orange-red. Yunnan. G.C. III. 51: 2.—*C. angustifolia*, Franch.—*Pyracantha angustifolia*.—*C. apiculata*, Rehd. & Wilson. Related to *C. Simonsii*. Shrub, to 6 ft.: lvs. orbicular to roundish ovate, apiculate, bright green and lustrous, nearly glabrous,  $\frac{1}{4}$ – $\frac{1}{2}$  in. long; fr. nearly sessile, globose, bright red. W. China.—*C. arborescens*, Zabel=*C. Lindleyi*.—*C. bacillaris*, Wall. Related to *C. frigida*. Lvs. smaller, usually glabrous beneath at length; fr. dark brown. Himalayas.—*C. buxifolia*, Wall. Related to *C. rotundifolia*. Lvs. elliptic, slightly pubescent above at first, grayish tomentose beneath; fls. 2–4,  $\frac{1}{2}$  in. across; fr. red. India. Wight, Icon. 3: 992. Tender.—*C. disticha*, Lange. Related to *C. Simonsii*. Half-evergreen, upright shrub, to 4 ft.: lvs. suborbicular to broadly obovate, apiculate, sparingly pubescent above, nearly glabrous beneath,  $\frac{1}{2}$  in. or less long; fls. 1–2; calyx glabrous or nearly so; fr. scarlet. Himalayas.—*C. Harrisoniana*, Wilson. Related to *C. salicifolia*. Shrub, to 6 ft.: lvs. elliptic-oblong, sometimes oval, 1–2 in. long, densely villous beneath; corymbs  $\frac{1}{2}$  in. across. S. W. China.—*C. Henryana*, Rehd. & Wilson (*C. rugosa* var. *Henryana*, Schneid.). Related to *C. salicifolia*. Shrub, to 12 ft.: lvs. thinner, elliptic-oblong to oblong-lanceolate, 2–3½ in. long, and about 1 in. broad, pubescent and only slightly pubescent above, densely grayish pubescent beneath; corymbs many-flid., about 2 in. across; calyx pubescent; fr. red, ovoid,  $\frac{1}{4}$  in. across, with 2–3 stones. Cent. China. G. C. III. 46: 339 (not good). M.D.G. 1914: 15.—*C. ignava*, Wolf. Related to *C. melanocarpa*. Shrub, to 5 ft.: lvs. ovate or oval, greenish white beneath, pubescent, 1–2 in. long; fls. 8–13, pinkish; calyx pubescent at the base; fr. dark reddish brown, nearly black. E. Turkestan. Yearb. For. Inst., Petersburg, 15: 240.—*C. Lindleyi*, Steud. (*C. arborescens*, Zabel). Similar to *C. racemiflora* but fr. black. Himalayas.—*C. mowpinensis*, Franch. Related to *C. foveolata*. Shrub, to 15 ft.: lvs. elliptic to ovate-oblong, thicker, rugose above, pubescent beneath, at least on the veins, 2–5 in. long; corymbs many-flid.; fls. white or pinkish; calyx sparingly pubescent; fr. black, with 4–5 stones. W. China.—*C. nitens*, Rehd. & Wilson. Related to *C. divaricata*. Lvs. broadly oval or roundish ovate, glabrous and lustrous above,  $\frac{1}{2}$ – $\frac{1}{2}$  in. long; fr. ovoid, purplish black, stalked, pendulous. W. China.—*C. obscura*, Rehd. & Wilson. Related to *C. acuminata*. Shrub, to 10 ft.: lvs. elliptic-ovate, finally glabrous above, yellowish gray-tomentose beneath, 1–2 in. long; fr. dull brownish red, ovoid,  $\frac{1}{2}$  in. long, usually with 3 stones. W. China.—*C. Pyracantha*, Spach=*Pyracantha coccinea*.—*C. rosea*, Edgew. Related to *C. integririma*. Shrub, with slender upright branches; lvs. elliptic to ovate-oblong, nearly glabrous, grayish green beneath, 1–1½ in. long; fls. 4–9, pinkish with slightly spreading petals; fr. subglobose, dull red. Himalayas.—*C. Silvestrii*, Pampanini. Allied to *C. integririma*. Lvs. elliptic-ovate, densely hairy and cream-colored beneath, 1–2 in. long; calyx pubescent outside; fr. orange-colored. Cent. China.—*C. uniflora*, Bunge. Allied to *P. vulgaris*. Lvs. oval to oval-oblong, glabrous when older; fls. solitary; fr. red. Altai Mts.

ALFRED REHDER.

**COTTON** belongs to the genus *Gossypium* (name used by Pliny), of the *Malvaceæ*. The species are now much confused, but it is generally agreed that the sea island cotton is of the species *G. barbadense*, Linn. The upland cotton is probably derived chiefly or wholly from *G. hirsutum*, Linn. The former is native in the West Indies. The nativity of the latter is in dispute, but it is probably Asian. The cotton flower is mallow-like, with a subtending involucre of three large heart-shaped bracts. The carpels or cells of the pod are three to five. These carpels break open, and the cotton covering of the seeds makes a globular mass,—the cotton boll (Fig. 1082). Cotton is not a horticultural

1082. A cotton boll.

crop, and is therefore not considered in this work. The reader will find "The Cotton Plant" (published by the Dept. of Agric., Bull. 33), a useful monograph. Consult Cyclo. Amer. Agric., Vol. II, p. 247.

**COTTONWOOD:** species of *Populus*.

**CÓTULA** (Greek, *small cup*, the bases of the clasping leaves forming a hollow or basin). *Compósitæ*. Small diffuse or much-branched strong-smelling annual or perennial yellow-flowered herbs, a few of the perennials sometimes used as carpeters in rock-gardens.

Leaves alternate, toothed, lobed or pinnatisect: heads pedunculate, hemispherical or bell-shaped, many-fl. and discoid; outer or marginal florets nearly or quite apetalous, usually pistillate and fertile; disk-florets 4-toothed, fertile or male; torus naked; pappus not evident; achene glabrous, compressed.—About 50 or 60 species, largely in the southern hemisphere.

**dioica**, Hook. f. (*Leptinella dioica*, Hook. f.). Sts. glabrous or slightly hairy, 1 ft. or less long, creeping: lvs. solitary or tufted, not thick or stiff, stalked, 2 in. or less long, linear-obovate to spatulate, obtuse, serrate to pinnatifid or even pinnate: heads on axillary naked peduncles that are longer or shorter than the lvs., unisexual, the males  $\frac{1}{2}$  in. or less diam., and the females a little larger: achene obovoid, curved. New Zeal.—Very variable. A compact dwarf carpeter.

**Muëlleri**, Kirk. (*C. potentilliana*, Hort.? *Leptinella potentillina*, Muell.). Sts. long and rather stout, creeping and rooting, the branches ascending and somewhat villous towards the tips: lvs. 2–5 in. long, stalk and all, linear-obovate, deeply pinnatifid, glandular-dotted: heads on peduncles that usually are shorter than the lvs., bisexual, about  $\frac{1}{2}$  in. diam.: achene club-shaped and 4-angled. New Zeal.

**C. lanata**, Hook. f. (*Leptinella lanata*, Hook. f.). Stout and woolly: lvs. rather fleshy, pinnate or pinnatifid: florets glandular. New Zeal.—**C. lobata**, Linn.—*Lidbeckia*.—**C. plumosa**, Hook. f. (*Leptinella plumosa*, Hook. f.). Stout, soft-woolly: lvs. 3–4 times pinnatisect: florets not glandular. New Zeal.—**C. squalida**, Hook. f. (*Leptinella squalida*, Hook. f.). Allied to *C. dioica*, with lvs. deeply pinnatifid and segms. incised. New Zeal.

L. H. B.

**COTYLÉDON** (a name used by Pliny, meaning a cavity, having reference to the concaved or cup-like leaves of some kinds). *Crassulaceæ*. Succulent herbs or shrubs, rarely annual, grown mostly for their oddity, but some of them making good winter bloomers in pots and some used for summer bedding because of the stiff thick foliage; some are half-hardy North.

Habit very various, rosulate or erect, sometimes of a scandent tendency: branches and lvs. thick and fleshy: lvs. opposite or alternate, petiolate or sessile: calyx 5-parted, as long as or shorter than the corolla-tube; corolla tubular, cylindrical or urn-shaped, sometimes 5-angled, the parts or petals 5, erect or spreading, connate to the middle, longer than the usually 10 stamens; ovary of 5 free carpels, each with a narrow scale at base; fls. erect or pendent, sometimes showy, in terminal racemes or cymes. Differs from *Sedum* in the connate petals.—Species about 100, in Calif. to Texas, and Mex., Afr., Asia and Eu. See I.H. 10:76 for an account of many of the species. Some of the species make dense rosettes of stiff lvs. on the ground and send up a small bracted scape; they remind one of the house-leek (*Sempervivum tectorum* and related species).

As above defined, Cotyledon comprises the broad group habitually known under that name. Recently, however, Britton and Rose have revised the group, excluding Cotyledon from America, reinstating *Echeveria* and *Pachyphytum* for some of the American species and making new genera for others, as *Dudleya*, *Oliveranthus*, *Urbinia*, *Stylophyllum*. For the convenience of the gardener, the cult. species are here brought together under Cotyledon, and they are also listed at other places under their new generic names.

Cotyledons are little known in this country except among fanciers and for carpet-bedding. Culturally, there are two groups,—the greenhouse kinds and the bedding kinds. The greenhouse kinds are well represented by *C. gibbiflora*. It is attractive both in foliage and flower. It may be expected to begin bloom in January or February. Its period of bloom is short, after which it may be propagated. The top of the main shoot (or of strong side shoots) may be cut off with 2 or 3 inches of stem, and stood in pots so that the cut end will rest on moss in the bottom and the leaves on the rim of the pot, using no earth; fine roots will soon form and the young plant may then be repotted into dryish soil. The old stems of this and similar tall kinds may be placed rather close together in shallow boxes, when it is desired to propagate them, and kept in a warm dry place, where they will form small growths along the stems; these, when large enough, may be put into boxes of dry sand, and potted in thumb- or 3-inch pots when they have made a sufficient quantity of roots. This species should be kept in a warmhouse in winter, where it is rather dry and not exposed to drip. *C. fulgens* is a good greenhouse species, producing showy waxy red flowers in winter; also *C. coccinea*. For this purpose the large plants should be lifted from the beds and carefully potted, as they make a much finer growth in the open ground than when grown in pots.—When it is desired to increase the low-growing carpet-bedding kinds on a larger scale, the plants should be lifted before the ground gets too wet and cold. They may either be boxed in dry soil and kept in a cool dry house, or placed thickly together in a frame, taking care that no drip is allowed on the plants, and giving no water. The most convenient time for propagation by leaves is during the months of November and December, when the fall work of rooting soft-wooded plants is over. Leaves rooted at this time will make plants large enough for planting out the following season. They will take from three to four weeks to root, according to the kind. The leaves must be taken from the plant as follows: Grasp each leaf between the thumb and forefinger, give a gentle twist first to one side then to the other until the leaf comes off, taking care that the dormant bud in the

axil of the leaf accompanies it, otherwise the leaf will root but a plant will not form from it. Make a depression about 2 inches deep in the center and 4 inches wide across the sand-bed, in this lay two rows of leaves with their bases touching each at the bottom of the depression; give no water until the small roots make their appearance, and only slightly afterwards. When the little plants are large enough they should be boxed, using sandy loam, and kept in a temperature of not less than 60° F. at night.—For summer bedding purposes the following have been employed very successfully, being lower growers: *C. atropurpurea*, *C. fulgens*, *C. coccinea*, *C. fascicularis*, *C. gibbiflora* var. *metallica*, *C. Pachyphytum*, *C. Peacockii*, *C. Purpusii*, *C. roseata*, *C. secunda*, *C. secunda* var. *glauca*, *C. mexicana*. (G. W. Oliver.)

Other species of *Cotyledon* occur in collections of succulent plants, but the following probably represent those of commerce in this country.

## INDEX.

agavoides, 12.	fulgens, 18.	pulverulenta, 22.
Aizoon, 1.	gibbiflora, 19.	Purpusii, 23.

farinosa, 22.	Peacockii, 15.	Umbilicus, 5.
fascicularis, 6.	pendulinus, 5.	

A. *Plants of the Old World, of various habit: corolla-tube elongated, usually much longer than the calyx. (Cotyledon and Umbilicus.)*

B. *Lvs. crowded in a rosette (rosulate) at the base of the st.: plant low, more or less stemless; species of the houseleek or hen-and-chickens type, used in rock-gardens and for carpet-bedding.*

c. *Fls. yellow or milk-white.*

1. *Aizoon*, Schoenl. (*Umbilicus Aizoon*, Fenzl). Plant small, minutely pubescent, the st. very short: lvs. densely rosulate, lingulate, obtuse, ciliate, those on the st. oblong-obtuse: fls. golden yellow, on very short pedicels; calyx spreading; corolla-parts lanceolate-acuminate and keeled. Asia Minor.

cc. *Fls. red or greenish.*

2. *Bárbeyi*, Schweinf. Whole plant hoary-white, tall and branching: lvs. thick, fleshy, shovel-shaped: fls. olive-green and red, 1 in. long, in a close panicle. Blooms freely in spring and summer. Abyssinia. Gt. 45, p. 465.—An exquisite plant for carpet-bedding.

BB. *Lvs. variously scattered along the st., or sometimes in rosettes or clusters at the ends of the branches: mostly branching plants, grown in greenhouses, window-gardens, and sometimes used in summer bedding-out but not in carpet-bedding designs.*

c. *Fls. white or ochroleucus.*

3. *reticulata*, Thunb. Sts. much branched, fleshy: lvs. few at the ends of the branches cylindrical, acute, erect, fleshy, soft, smooth,  $\frac{1}{2}$  in. or less long: fls.  $\frac{1}{2}$  in. or less long, whitish, in an erect, dichotomous panicle. Cape. G.C. III. 21:282.—The wiry fl.-stalks remain on the plant and give it the appearance of being inclosed in a network. Odd.

4. *chrysántha*, Hort. (*Umbilicus chrysanthus*, Boiss.). Plant pubescent, glandular above, the st. short: lvs. rosulate, short, oblong-spatulate, obtuse, those on the st. elliptic and somewhat acute: fls. large, ochroleucous (milk-white or yellow-

ish), red-striped on the back of the oblong-lanceolate keeled lobes or parts of the corolla. Perennial. Asia Minor.

cc. *Fls. yellow or greenish.*

5. *Umbilicus*, Linn. (*Umbilicus pendulinus*, DC.). PENNYWORT. NAVELWORT. Perennial, 6–12 in. high in flower, simple or slightly branched, leafy at base: radical and lower lvs. fleshy, orbicular, crenate, more or less peltate: fls. yellowish green, pendulous, in a raceme; calyx very small; corolla cylindrical,  $\frac{1}{4}$  in. long but somewhat enlarging, with 5 short teeth.—On rocks and walls, W. Eu. Adaptable in rock-gardens.

ccc. *Fls. red or purple.*

6. *fasciculâris*, Soland. Smooth, 1–2 ft. high, thick-stemmed, branched: lvs. pale greenish white with a yellowish margin, glaucous, few, sessile, cuneate-obovate, thick, flattened, slightly concave, cuspidate: panicle branches long, scorpioid; fls. large, 1 in. long, pendent; calyx-lobes short, broadly ovate-acute; corolla-tube much longer than the calyx, with a greenish tube and reddish revolute limb. S. Afr. B.M. 5602. J.H. III. 29:443.

7. *Sempervivum*, Bieb. (*Umbilicus Sempervivum*, DC.). HOUSELEEK COTYLEDON. Plant green, glandular: radical lvs. spatulate, obtuse, attenuate-cuneate at base, the margin denticulate; st.-lvs. oblong: fls. purplish and papillose on the outside, on second branches in a corymbose panicle; corolla thrice longer than calyx, parted to the middle, the parts lanceolate-acuminate and somewhat recurved. Perennial.—Not to be confounded with *Sempervivum tectorum*.

8. *orbiculâta*, Linn. Erect, 2–4 ft. high: lvs. opposite, flat, obovate-spatulate, obtuse, mucronate, glaucous and mealy, with red margins: fls. large, reddish, panicked. Fls. June–Sept. S. Afr. B.M. 321. R.H. 1857, p. 347.—Grows well from cuttings. Variable, and has several named forms as var. *elata*, *oblonga*, *ramosa*, *rotundifolia*.

9. *hispánica*, Linn. (*Pistortinia hispánica*, DC.). Annual or biennial, branched, 6 in. high, erect: lvs. small, nearly cylindrical, oblong, few, sessile: fls. erect, in cymes, reddish; corolla trumpet-shaped, lobes spreading. Spain, Morocco. R.H. 1895, p. 472.

AA. *Plants of the New World: corolla-tube usually short, perhaps always shorter than the calyx.*

B. *Lvs. terete. (Stylophyllum.)*

10. *edulis*, Brewer (*Sedum edule*, Nutt. *Stylophyllum edule*, Brit. & Rose). Sts. cespitose, very short and thick: lvs. cylindrical, 3–4 in. long, erect, whitish or glaucous green, not mealy: fls. white, tinged with green, resembling those of *Sedum*,  $\frac{1}{2}$  in. diam., short-pedicelled, along the upper sides of the flexuous branches of the cymose panicle; scape 1 ft. high. San Diego, Calif.—Young lvs. eaten by Indians.

BB. *Lvs. linear or nearly so.*

11. *mexicana*, Hemsl. Plant glabrous, 3–4 in. high, erect, the branches woody: lvs. few, alternate,

1083. *Cotyledon secunda*. (Detail  $\times \frac{1}{2}$ )

crowded or sterile shoots, somewhat fleshy, linear or linear-spatulate, obtuse,  $\frac{1}{4}$ – $\frac{1}{2}$  in. long: fls. few short-pedicelled, cymose; sepals free, linear, obtuse; petals plane and strongly coherent, forming a tube,  $\frac{1}{2}$  in.; or less long, the lobes ovate, acute, erect. S. Mex.—One of the dozen known species of *Altamiranoa* (see p. 267, Vol. I), in that genus becoming *A. mexicana*, Rose.

BBB. Lvs. broader, flat, often very fleshy.

c. Calyx minute. (*Urbinia*.)

12. *agavoides*, Baker (*Echeveria agavoides*, Lem. *Urbinia agavoides*, Brit. & Rose). Small and compact: lvs. densely rosulate, stiff, acuminate and very sharp-pointed, pale gray-green on both sides, papillose: fls. 4–6, orange, on long pedicels; sepals several times shorter than the corolla. Mex.—Useful for carpet-beddings.

cc. Calyx evident or prominent.

d. Petals always appendaged at insertion of stamens. (*Pachyphytum*.)

13. *Pachyphytum*, Baker (*Pachyphytum bracteolum*, Klotzsch). SILVER-BRACT. Somewhat shrubby, very succulent, pale glaucous blue throughout: lvs. clothing upper part of st., more or less rosulate, large and thick, spreading, obovate, obtuse or obtuse-pointed, the scars from the fallen lvs. orbicular: fls. in spikes 4–6 in. long on lateral peduncles; corolla red, immersed in the large calyx which is about 1 in. long; stamens 5 large and 5 small. Mex. B.M. 4951.—A singular plant, blooming in summer. 1 ft.

DD. Petals not appendaged.

E. Corolla strongly 5-angled. (*Echeveria*.)

F. Color of plant (or of lvs.) dark purple.

14. *atropurpurea*, Baker (*Echeveria sanguinea*, Morr.). St. short and stout: lvs. in rosette at top of st., dark purple and glaucous, obovate-spatulate: fls. bright red, in a long raceme terminating the erect st.; corolla 5-angled, white toward base. Mex. See p. 1086.

FF. Color green, or ordinarily glaucous (except var. of No. 19).

G. St. wanting or nearly so (acaulescent species).

15. *Peacockii*, Baker (*Echeveria Peacockii*, Crouch.). Acaulescent: lvs. about 50 in a dense rosette 6 in. across and standing 4 in. high, obovate-spatulate, mucronate, reddish toward tip, glaucous: st. 12–24 in., with small lf.-like bracts: fls. bright red, in a scirpioid spike; calyx-lobes linear, unequal; corolla about  $\frac{1}{2}$  in. long, the parts lanceolate-acute. Mex.(?)—Interesting for its glaucous coloring and waxy coating of the lvs. Named for Mr. Peacock, of Hammersmith, England, in whose collection it flowered. See p. 1086.

16. *secunda*, Baker (*Echeveria secunda*, Booth). Fig. 1083. Stemless: lvs. in a rosette, crowded, cuneiform, mucronate, glaucous, curving upward: fls. in a 1-sided, recurved spike, reddish yellow; peduncle long, 6–12 in. high. June–Aug. Mex. B.R. 26:57.—Probably the most common species in gardens. Distinguished by its pale green red-tipped rosettes; several forms. Half-hardy. E. *glauca*, Baker (*E. secunda* var. *glauca*, Otto), has glaucous-green foliage. See pp. 1086–7.

GG. St. evident, often tall (caulescent species).

17. *Scheerii*, Baker (*Echeveria Scheerii*, Lindl.). Caulescent, branching: lvs. large, glaucous, oval, acute, narrowed into a long plane petiole-like part: fls. dingy red with yellow tips, broadest at base, in drooping racemes; sepals linear, acute, green, spreading, shorter than the corolla. Mex. B.R. 31:27. P. 1087.

18. *fulgens*, Baker (*Echeveria fulgens*, Lem.). St. 4–8 in. tall, but bearing long leafy fl.-branches: lvs. obovate-spatulate, pale glaucous green, clustered: fls. bright red with yellow base, in nodding racemes. Mex.

19. *gibbiflora*, Moc. & Sessé (*Echeveria gibbiflora*, DC.). Sts. 1–2 ft. high: lvs. flat, wedge-shaped, acutely mucronate, crowded at the ends of the branches: fls. short-petioled; panicle branches 1-sided, spreading; corolla gibbous at the base between the calyx-lobes, the tube white, the tips touched with crimson. Mex. B.R. 1247. Var. *metallica*, Baker (*Echeveria metallica*, Hort.). Lvs. large, obovate-spatulate, 6 in. wide by 7 in. long, a beautiful glaucous purple with metallic reflections: fls. yellowish with red tips. Mex.—An excellent plant for summer bedding. P. 1087.

20. *coccinea*, Cav. (*Echeveria coccinea*, DC.). Plant soft-pubescent, 1–2 ft.: lvs. lance-spatulate: fls. scarlet and yellow or paler within, in axillary long leafy, 15–25-fld., loose spikes. Mex. B.M. 2572. P. 1086.

EE. Corolla not strongly angled.

F. Fls. in a dense spike. (*Courantia*.)

21. *roseata*, Baker (*Echeveria rosea*, Lindl. *Courantia rosea*, Lem.). Sts. branching, 1 ft.: lvs. oval, erect, acute, mostly in terminal rosettes on the sterile shoots: fls. yellow, in dense rose-bracted spikes; sepals linear-acute, rose-colored; corolla bell-shaped, 5-parted. Mex. B.R. 28:22.

FF. Fls. in cymes or panicles. (*Dudleya*.)

22. *pulverulenta*, Baker (*Echeveria pulverulenta*, Nutt. *E. farinosa*, Hort. *Dudleya pulverulenta*, Brit. & Rose). Lvs. in a rosette, silvery green, very mealy, spatulate, acute, the tips reflexed, the cauline lvs. gradually diminishing into broadly cordate, clasping bracts: panicles dichotomously branched; pedicels slightly longer than the pale scarlet or coral fls. Plants 1 ft. diam. S. Calif. F.S. 19:1927–8.—A fine plant for carpet-bedding.

23. *Purpusii*, Nichols. (*Echeveria Purpusii*, Schum., not Brit. *Dudleya Purpusii*, Brit. & Rose). Cespitose, with powdered snow-white foliage: lvs. densely rosulate, broadly spatulate, acuminate: fls. in a branching upright cluster; corolla conico-tubular, much exceeding calyx; segms. scarlet with golden yellow tips. S. Calif. B.M. 7713. G.C. III. 20:698. Gt. 45, p. 609.

1084. *Couroupita guianensis*, the cannon-ball tree, showing the trunk and the hanging flowers and fruits.

24. *lanceolata*, Benth. & Hook. (*Echeveria lanceolata*, Nutt. *Dudleya lanceolata*, Brit. & Rose). Green or slightly glaucous, acaulescent: lvs. in a rosette, lanceolate, acuminate, slightly mealy; st.-lvs. or bracts small, cordate, clasping, distant: panicle narrow, dichotomous: fls. red and yellow; calyx-lobes broad-ovate,  $\frac{1}{2}$  in. long; corolla  $\frac{1}{2}$  in. or more long. S. Calif.

25. *californica*, Baker (D. *Cotyledon*, Brit. & Rose. *Sedum Cotyledon*, Jacq. *Echeveria californica*, Baker). Plant acaulescent, tinged red: lvs. in a rosette, concave, ligulate, lanceolate, acute, glaucous, mealy, slightly yellowish, 8 in. long: fls. pale yellow, on weak lateral flowering sts. 1-2 ft. long, with short, ovate, clasping lvs. or bracts and bi- or trifid racemes. Calif.

Many garden names occur in *Cotyledon*, some of which are unidentifiable and some of which probably represent hybrids. *C. devensis*, Hort. Hybrid between probably *C. glauca* and *C. gibbiflora*: fl.-sts. 5-7 ft. long. B.M. 8104. — *C. elegans*, N. E. Br. = *Oliverianthus*. — *C. eximia*, Hort. = (?). — *C. globosa*, Hort., see page 1087. — *C. globularifolia*, Baker. Rosulate, 8 in.: lvs. 30-40, obovate-spatulate,  $2\frac{1}{2}$  in. or less long: fls. white tinged red, 20-40 in a dense thyrselike cluster. Syria. — *C. imbricata*, Hort., described on p. 1087. — *C. insignis*, N. E. Br. About 2 ft., wholly glabrous, erect, light green: lvs. opposite, broad, to 5 in. long: fls. light red with lobes greenish yellow inside,  $1\frac{1}{2}$  in. long, in terminal and axillary cymes. Cent. Afr. B.M. 8036. — *C. mirabilis*, Hort., hybrid. — *C. mucronata*, Baker. = *Echeveria*, p. 1086. — *C. nana*, Marl. Very dwarf,  $1\frac{1}{2}$  in. or less high, densely branched and forming a tuft: lvs. yellowish green, not apiculate. S. Afr. — *C. Pestalozzei*, Mast. Lvs. distributed, the radical ones spatulate-obtuse and margins slightly denticulate, the cauline obovate-oblong: fls. pale rose, somewhat secund in a glandular-hairy panicle. Cilicia. — *C. pulvinata*, Hook. f. = *Echeveria*, p. 1086. — *C. sedoides*, DC. Annual, creeping, smooth: lvs. sedum-like, oblong and obtuse, convex: fls. few, pink, in summer. Pyrenees. Distinguished from *Sedum* by the gamopetalous corolla. — *C. spinosus*, Linn. Small and quaint, Apicra-like, with a rosette of flat spoon-shaped spine-tipped lvs., 12 in. or more tall: fls. yellow, in early summer. Siberia to China and Japan, but not hardy. — *C. superba*, Hort., is an annual with yellow fls. — *C. teretifolia*, Thunb. St. somewhat woody, 6-8 in. high, simple or branched: lvs. 4-5 in. long, opposite, nearly terete, acute or cuspidate, hirsute or subglabrous: fls. many, corymbed, the peduncle to 18 in., yellow; corolla-tube a little shorter than calyx. S. Afr.

L. H. B.†

COUCH GRASS: *Agropyron repens*.

COURÁNTIA (personal name). *Crassulaceæ*. Caulescent: lvs. alternate, closely set, broad: fls. in a dense bracteate spike; calyx-lobes nearly equal, linear, brightly colored; corolla not angled, yellow; stamens 10; filaments united into a tube for half their length. Only one species. First brought into cult. about 1842. For cult., see *Cotyledon*. *C. rosea*, Lem. (*Cotyledon roseata*, Baker). See No. 21, p. 870.

J. N. ROSE.

COUROUPÏTA (from a vernacular name in Guiana). *Lecythidaceæ*. Trees of Trop. Amer. (about 9 species) sometimes planted as oddities or for shade, particularly for the curiosity of the great ball-like frs. borne on the trunk. Lvs. alternate, oblong, reticulate, entire or crenate-serrate: fls. showy and odd, borne in racemes, often from the trunk and larger branches; calyx-tube top-shaped, the limb 6-lobed or -divided; petals 6, somewhat unequal, spreading and more or less incurved, borne on a disk; stamens many, in 2 sets,—one series forming a ring or cup in the center of the fl. and about the single 5-7-celled ovary, the other longer and rising from one side like a fringed palm or ladle over the pistil: fr. a large nearly or quite globular ball, coriaceous or woody, indehiscent, with many seeds imbedded in the pulp. *C. guianensis*, Aubl. CANNON-BALL TREE. Figs. 1034, 1085. Tall soft-wooded tree in Guiana, where it is native: lvs. oblong-obovate, elliptic or broad-lanceolate, acute, entire or very obscurely toothed: fls. with concave petals about 2 in. long, yellow- and red-tinged on the exterior and crimson-lilac within, very showy, in racemes 2-3 ft. long: fr. nearly or quite globular, 6-8 in. diam., reddish, hard on the exterior, pulpy inside, with very disagreeable odor when ripe. B.M. 3158-9.—Sometimes planted in the tropics, in botanic gardens and elsewhere. Shell of the fr. used for utensils, and the pulp said to be eaten by negroes and to be used for the making of beverages. L. H. B.

COUSSAPÔA (Caribbean name). *Moraceæ*. Fifteen to 20 milky-juiced trees or shrubs of Trop. S. Amer., 1 or 2 sometimes grown under glass, but apparently not in the American trade. They are sometimes scandent and epiphytic, like other *Ficus*-like things, sending down branches and completely enveloping the supporting tree and strangling it. Lvs. alternate, stalked, thick, penninerved or 3-nerved, entire: fls. dioecious, in globose heads, the peduncles solitary or in pairs and axillary, the male clusters few-fl. and often paniculate, the females on shorter peduncles: fr. oblong, becoming succulent and with the including thickened perianth forming a mulberry-like multiple fruiting body. *C. dealbata*, André (*Ficus dealbata*, Hort.), is described as a very beautiful greenhouse subject, with coriaceous elliptic lvs. 1 ft. long and half as broad, white-silky beneath and deep green above. I.H. 17:4.

L. H. B.

COVER-CROPS. Green temporary crops, grown for the purpose of improving the soil, either as protection or to be turned down as green manure; word used chiefly in speaking of fruit-growing operations.

The use of cover-crops has become an essential part of orchard management. The name is derived from the fact that the seed is sown in the fall or late summer, and sufficient growth results so that the ground is covered and protected during the winter. The crops are grown for their effect upon the orchard, not for the direct value of the crop. The term was first used in this connection by Bailey, Bulletin No. 61, of the New York Station at Cornell, p. 333, December, 1893.

Cover-crops make use of the available plant-food at a time when the trees are beginning to use it less and less. In this way, food that otherwise might be lost is stored up until it becomes available to the trees the following spring through the rotting of the cover-crops. The presence of the cover-crop, with its mat of roots, also prevents soil-washing and erosion with its accompanying loss of plant-food. The legumes, through the action of the bacteria found in their root-nodes, are able to add to the total amount of nitrogen present in the soil. This is the only way in which cover-crops increase the total supply of the plant-food elements, but the decay of the cover-crops increases the humus in the soil and, by the activities thus set up, the locked-up plant-food is released in a soluble form and thus the total available plant-food is increased. The ability of a soil to absorb and retain water is greatly increased in proportion to the humus that the soil contains. For this reason, soils rich in humus are less likely to be injured by erosion from the rapid run-off of the rainfall and less liable to suffer from drought. In soils plentifully supplied with moisture and plant-food, the trees are likely to continue growth so long that the wood does not mature and harden before winter, thus rendering them liable to injury during a severe winter. Such trees usually bear fruit that is poor in quality and in color. To produce mature, well-colored apples, it is essential that excessive growth after midsummer be prevented. The best means of doing this is to grow a crop in the orchard that will compete with the trees for the food and water. Soil protected by a cover-crop does not freeze so quickly or so deeply as when uncovered, and therefore the tree roots under a cover-crop are less likely to be injured by freezing and by heaving. Many

of our best fruit soils contain a large proportion of clay. When the humus-content of such soils becomes low, they are stiff and difficult to work and they dry out and bake quickly. Plowing under cover-crops restores the needed humus. This is important from the farm-management point of view. The period of time during which a clay field may successfully be plowed may frequently be doubled by thus increasing the humus supply. As the physical condition of the soil is bettered, the rootlets of the tree can more easily penetrate it in their search for food, and this larger feeding area means a greater supply of food. Orchards that are to be cultivated should be plowed as early as the land can be worked, in order to prevent excessive loss of moisture through evaporation and the demands of any growing cover-crop. This is especially true when rye, clover, or vetch are grown. Fall plowing is seldom advisable, as much of the benefit of the cover-crop is then lost. The time of seeding depends upon the needs of the fruit and the supply of moisture available. In seasons of plentiful rainfall the cover-crop should be put in early, but in a period of drought the trees need all the moisture there is in the soil and the seeding should be late. In the North Atlantic States, the cover-crops are planted from the latter part of July to the middle of August.

#### Kinds of cover-crops.

In general, cover-crops may be divided into the leguminous or nitrogen-gathering, and the non-leguminous crops.

1. Leguminous cover-crops.—Red and mammoth clover, Canada field peas, and winter vetch are used in the northern states; soybean, cowpea, crimson clover, and vetch in the central and southern states.

2. Non-leguminous cover-crops.—Rye, wheat, and barley; rape and turnips; buckwheat and nearly all weeds.

#### Average quantity of seed per acre.

Barley.....	2	to	2½ bushels.
Buckwheat.....			1 bushel.
Clover, red.....	10	to	15 pounds.
Clover, mammoth.....	10	to	15 pounds.
Clover, crimson.....	15	to	20 pounds.
Cowpea.....	1½	to	2 bushels.
Millet.....			1½ bushels.
Oats.....	2	to	3 bushels.
Peas.....	2	to	3 bushels.
Rape.....	2	to	5 pounds.
Rye.....	1½	to	2 bushels.
Soybean.....	1	to	1½ bushels.
Turnip.....			4 pounds.
Vetch.....	½	to	1 bushel.
Wheat.....	2	to	2½ bushels.

3. Combinations of cover-crops.—An ideal cover-crop should possess certain characters. It should make a vigorous vegetative growth by fall so as to furnish an abundance of humus and to hasten the maturity of the trees. The seed should be of such a nature that it will catch well when planted at a time of year when the soil is very dry. Preferably, the cover-crop should winter over. All these characters are seldom found in a single crop and, hence, combinations are desirable. Thus buckwheat, which makes a quick growth, does not live through the winter as does the slower-growing rye, so the two combine well. The following combinations are frequently used:

1.	{ Clover (red or mammoth).....	10	pounds.
	{ Winter vetch.....	15	pounds.
	{ Oats.....	½	bushel.
	{ Cowhorn turnips.....	½	pound.
2.	{ Buckwheat.....	½	bushel.
	{ Oats.....	1	bushel.
	{ Rye.....	1	bushel.

3.	{ Oats.....	1½	bushel.
	{ Clover.....	15	pounds.
4.	{ Buckwheat.....	¾	bushel.
	{ Oats.....	1	bushel.
5.	{ Oats.....	1½	bushel.
	{ Rye.....	1	bushel.

In the peach orchard, where large annual growth is not desirable, or in apple orchards making excessive growth, the leguminous crops should be used sparingly, if at all.

C. S. WILSON.

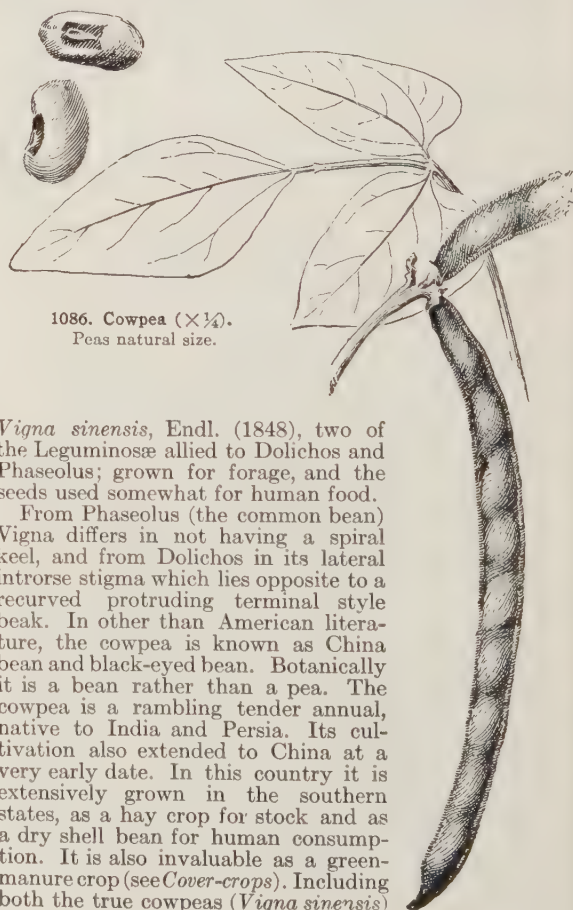

**COWANIA** (after James Cowan, an English merchant, who intro. many Peruvian and Mexican plants into England). *Rosaceæ*. Some 4 or 5 small shrubs from the S. W. U. S. and from Mex., with small crowded lvs. and handsome white or purple fls.; rarely cult. in botanical collections. Closely related to *Fallugia*, but differing in the absence of bracts at the base of the calyx. Cult. and prop. like *Fallugia*, but apparently more tender: like that plant well adapted for planting in rockeries. **C. mexicana**, Don (*C. Stansburiana*, Torr.), has small crowded cuneate 3-7-lobed lvs. and white fls. about 1 in. across. **C. plicata**, Don (*C. purpurea*, Zucc.), has incisely serrate lvs. and purple fls.

ALFRED REHDER.

**COWBERRY**: Usually means *Vaccinium Vitis-Idæa*. In parts of Scotland, *Comarum palustre*.

**COW-HERB**: *Saponaria Vaccaria*.

**COWPEA**. Fig. 1086. The American name for the cultivated forms of *Vigna catjang*, Walp. (1839), and

*Vigna sinensis*, Endl. (1848), two of the Leguminosæ allied to *Dolichos* and *Phaseolus*; grown for forage, and the seeds used somewhat for human food.

From *Phaseolus* (the common bean) *Vigna* differs in not having a spiral keel, and from *Dolichos* in its lateral introrse stigma which lies opposite to a recurved protruding terminal style beak. In other than American literature, the cowpea is known as China bean and black-eyed bean. Botanically it is a bean rather than a pea. The cowpea is a rambling tender annual, native to India and Persia. Its cultivation also extended to China at a very early date. In this country it is extensively grown in the southern states, as a hay crop for stock and as a dry shell bean for human consumption. It is also invaluable as a green-manure crop (see *Cover-crops*). Including both the true cowpeas (*Vigna sinensis*)

and the catjangs (*V. catjang*), Piper lists 270 varieties. As a class the catjangs may be distinguished from the true cowpeas by the smaller size of the seeds and pods and by the latter remaining upright throughout their growth period, never becoming strictly pendulous even after ripening. At the present time the true cowpeas are much more widely grown than the catjangs but the latter may yet come into more prominence on account of the resistance to the weevil of their small hard seeds. The cowpea is to the South what clover is to the North and alfalfa is to the West. It is sown broadcast after the manner of field peas. From three to five pecks of seed are used to the acre. See Cowpeas, Farmers' Bulletin No. 89, U. S. Dept. of Agric., by Jared G. Smith; Bulletin No. 102, pt. VI, and Bulletin No. 229 of the Bureau of Plant Industry, U. S. Dept. of Agric.; Cyclo. Amer. Agric., Vol. II, p. 260. For a botanical discussion of the cowpea and its taxonomic relatives, see *Vigna*.

GEO. F. FREEMAN.

**COWSLIP.** The true English cowslip is *Primula officinalis*. The plant wrongly called cowslip in America is the marsh marigold, *Caltha palustris*. The "American cowslip" is a popular name for *Dodecatheon Meadia*. The name "Virginian cowslip" is sometimes used for *Mertensia virginica*.

**CRAB'S-EYE VINE:** *Abrus*.

**CRAB-APPLE** in its widest sense means a small apple. The crab-apples of botanists are particularly fruits of *Pyrus baccata*. For more restricted uses of the word crab, see *Pyrus*.

**CRAB-GRASS:** One of several names for *Eleusine indica*; also for certain Panicums, as *P. sanguinale* (or *Digitaria sanguinalis*).

**CRÁMBE** (old Greek substantive). *Cruciferae*. Herbs or sub-shrubs, one grown in the vegetable-garden, and one or two in the hardy herbary.

Annuals, biennials or perennials, with thickened sts., and more or less fleshy lvs., glaucous: lvs. mostly large, more or less cut, lyrate or pinnatifid: fls. small, white, fragrant, in paniced racemes: fr. 2-jointed, indehiscent, the lower joint st.-like and seedless, the upper one globular and 1-seeded.—About 20 species in Eu., Asia, and 1 in Patagonia. Of easy cult.

**cordifolia**, Stev. Excellent foliage plant, withstanding the winters in the northern states: lvs. very large and heavy, cordate and ovate, toothed, glabrous or nearly so: fls. small but very numerous, in great branchy panicles 5–7 ft. high and nearly as broad, overtopping the mass of root-lvs. Caucasus. Gn. 50, p. 349. Gng. 4:291.—For the first 2 years from seed the plant makes only lvs.; but the third year it may be expected to bloom, after which the plant usually becomes weak and dies.

**maritima**, Linn. **SEA-KALE.** Perennial, smooth, stout, to 2 ft.: lvs. large, heavy and cut, more or less fringed or curled, glaucous green: fls. many, white, broad, honey-scented, in a tall panicle, in May. Coasts of Eu.—Grown as a garden vegetable. See *Sea-kale*.

**C. júncea**, Bieb. Biennial: small species with white fls. in an attractively slender-branched panicle. Iberia.—*C. Kotschyana*, Boiss. Perennial: lvs. somewhat hairy, the radical ones cordate-ovate with rounded dentate lobes, the st.-lvs. few, ovate-oblong, lobed. W. Asia.—*C. tatárca*, Jacq. Perennial, said to be grown in Hungary as "Tartarian bread." Glaucous, more or less rough-hairy: radical lvs. decomposed, with linear segms. Hungary, E. L. H. B.

**CRANBERRY.** A name applied to trailing species of the genus *Vaccinium* (*Ericaceae*); much grown in North America for the fruit. Plate XXIX.

Of the true cranberries, there are two species in North America, the small (*Vaccinium Oxycoccus*), and the large (*V. macrocarpon*). The large cranberry, *V. macrocarpon* (Fig. 1087), is now cultivated on thousands of acres in the United States and this cranberry culture is one of the most special and interesting of all

pomological pursuits. This cranberry grows wild only in North America, where it is native to acid swamps in the cooler parts of the United States and in Canada. Here it trails its slender stems and small oval evergreen leaves over the sphagnum and boggy turf, and the firm red berries which ripen during September and October often persist on the vines till the following spring or even longer. The curve of the slender pedicel in connection with the bud just before the blossom opens, with its resemblance to the head and neck of a crane, is said to have suggested the name craneberry which is now shortened to cranberry.

The low-bush cranberry, or wolfberry (*V. Vitis Idæa*), is much used in Nova Scotia and other parts, and is gathered and shipped in large quantities to Boston; but it is not cultivated. This berry is also common in Europe, where it is much prized. The quantities of this fruit imported into the United States from various sources is considerable.

The ideal bog for cranberry-culture should have the following qualifications: (1) Capability of being drained of all surface water, so that free water does not stand higher than 1 foot below the surface in the growing season. (2) Soil that retains moisture through the summer, for cranberries suffer greatly in drought. (3) Sufficient water-supply to enable it to be flooded. (4) A fairly level or even surface, so that the flooding will be of approximately uniform depth over the entire area. (5) Not over liability to frosts.

The water of the streams and pools in the acid swamps or bogs, which are the natural habitat of the cranberry, is usually, but not invariably, of a brownish or amber color, and some of the most common associate plants are the swamp huckleberry or blueberry (*Vaccinium corymbosum*), the cassandra or leather-leaf (*Chamaedaphne calyculata*), the red maple (*Acer rubrum*) and the swamp cedar (*Chamaecyparis thyoides*).

There are three centers for the production of cranberries in the United States: Massachusetts, where cranberry-culture began and from which come the most berries; New Jersey second; and Wisconsin third. While the culture is in most respects similar in these three centers, each has its own characteristic methods of preparation and care of the bogs. There is also an important and growing cranberry industry in Nova Scotia.

*The cranberry bog.* Figs. 1088–1090.

To insure success in cranberry-culture, a prime requisite is to locate the bog on soil on which wild cranberries or some of their common associate plants flourish. This is usually a black peaty formation from a few inches to 7 or 8 feet in depth, overlying sand which in turn is frequently underlaid by a "hardpan" that is nearly impervious to water and the presence of which had much to do with the formation of the peat. Another requisite is to make sure of an ample supply of water, preferably of the brownish color, for winter flooding and for protection from frost in spring and fall. Flooding at special times is also the safest and surest weapon against many kinds of insects

1087. *Vaccinium macrocarpon*, the common cranberry. ( $\times \frac{1}{2}$ )

Without an ample supply of water, cranberry-culture is so hazardous as hardly to be worth undertaking.

The building of the dams is the first step necessary for the improvement of a bog. A foundation for these should be made by digging a trench entirely through the peat, even if it should be 8 feet or more thick, to the clean sand, and this trench should be filled with sand free from all foreign material; above this foundation, embankments are built of clean sand and faced up with sods of live turf to prevent their being washed by the waves of the lake formed. The dams should be sufficiently high to flood the higher parts of the bog a foot deep, which will frequently make the water in the deeper parts 3 to 6 feet or more in depth. Gates or flumes must be constructed at the lowest point in these dams to provide for drawing the water off the bog and provision made for surface drainage. The latter is generally accomplished by opening the natural stream, if there should be one, or by digging an open ditch through the natural drainage center of the piece

ample supply of water permits reflooding when a later severe frost threatens. Reflooding about the first of June, provided the water has not been withdrawn earlier than May 5 to 10, will also furnish protection from a number of damaging insects and will not injure the crop, provided care is taken that the water does not stand on any part of the bog more than forty-eight hours. If a bog should become seriously infested with insects later in the season, it is occasionally profitable to sacrifice what remains of the year's crop and clear the bog of insects by flooding. This sometimes results in a greatly increased yield the following year. Damage from a light frost in the fall, before the berries are picked, may be prevented by raising the water in the ditches and about the roots of the vines. Protection from a heavy frost requires covering the plants with water, but this will cause immature berries to rot and should be done with great caution or the damage from water may be greater than it would have been from frost. During summer the irrigation of

the crop is accomplished by holding the water low or high in the ditches, as the varying season may demand.

#### *Preparation and tillage.*

Before cranberries are planted, the land must be cleared of all its natural growth, the stumps and roots removed and the ground leveled to a greater or less extent. The more nearly level a bog is made, so that proper drainage is provided for, the more economical it is in the use of water and the easier it is to provide the optimum amount of irrigation during the summer. The first cost of such perfect leveling, however, may be prohibitive or it may require the removal of all the good peaty soil over a considerable area,

1088. A Massachusetts cranberry bog.—Picking the fruit.

of land being improved. Side ditches should be dug leading into the stream, or main ditch, in sufficient number to drain off all surface water; they may be made from 1 to 3 feet deep, according to the character of the land to be drained. A reservoir built above the bog is very desirable in facilitating control of the water. In frosty Wisconsin it is considered almost necessary to have three times the area of the bog in reservoir to insure the crops. If a bog is situated on a stream subject to high water, provision must be made for keeping the flood water from the bog, as the crop would be destroyed if it were flooded during blooming time or seriously injured by flooding at any time during the active growing season. Winter flooding of cranberry bogs is to prevent heaving and winter-killing. The water is put on about the first of December or after the vines have become thoroughly reddened by cold weather.

Cranberry bogs, being always lower than the surrounding land, are peculiarly liable to damage by frost, serious loss frequently occurring when an ordinary farmer would not dream of danger, and a good supply of water is the only preventive that has been found efficient. The time of starting growth in the spring may be controlled by the time the water is drained off, and the earlier spring frosts may so be avoided while an

leaving nothing but pure sand in which the cranberries will not grow well. In many places, the removal of the natural growth may best be accomplished by cutting off the tops of the bushes and trees so that they will not extend above the surface of the water and flooding for two years, thus killing all vegetation. While this flooding entails loss of time, it is much easier and cheaper to clear away the dead roots and stumps than live ones, and when no sand is applied to the surface, as is the rule in New Jersey, it greatly lessens the expense of keeping the bog free from weeds for there are no live roots in the ground to send up suckers. In some places, as in most of Wisconsin, this method of drowning out is impracticable, because the surface soil, in which are the roots of all the living plants, will separate from the more perfectly decomposed peat below and rise to the surface of the water in floating islands making death to vegetation by drowning impossible. In such situations the ground must be turfed and all roots and stumps grubbed out. In either case the roots and stumps are best disposed of by piling in heaps and burning. In Massachusetts, it is the custom to cover the cleared and leveled bog with 3 to 5 inches of sand, which makes it still easier to keep the bogs free from weeds and acts as a moisture-retaining mulch for the

underlying peat. Where sanding is practised, it is the custom to apply a fresh coat of sand an inch or less in depth every two or three years; this keeps the vines short and close.

Cuttings for planting are secured by mowing vigorous vines from an old bog with a scythe. These cuttings, preferably not more than 8 or 10 inches long, are thrust diagonally into the surface of the bog from 12 to 14 inches apart. Not more than 3 or 4 inches of the top should be exposed, and if the bog is sanded, care should be taken that the cutting extends well into the muck below. As the vines grow they send out runners in all directions, netting the ground completely over. These sometimes grow as much as 6 feet in length and root in the soil at frequent intervals. From the runners grow upright stems which, in time, cover the bog with a solid mat of vegetation. The uprights are preferably not more than 6 inches high but under some soil conditions grow to a foot or more when the fruit is likely to be scanty. From the time of planting, three to five years must pass before the ground is matted over and a crop may be expected.

The character of the growth of cranberry vines precludes any cultivation in the ordinary sense of the word. The care of the bogs consists in keeping them free from other plants, which is accomplished almost entirely by hand-pulling; the regulation of the irrigation water, and preventive and curative measures for the many diseases and insect enemies to which they are subject.

Fertilizing of cranberries has met with considerable success in increased crops, various brands of commercial fertilizer having been employed. The subject is not well understood, however, and is attracting the attention of many thoughtful growers and their scientific helpers in the state experiment stations.

The pretty little pinkish white flowers of the cranberry open during June, when the bogs are not flooded, but the holding of the winter water till May throws the fullest bloom into the early part of July.

#### *Diseases and insects.*

Spraying with bordeaux mixture is very generally practised to prevent "scald," a fungous disease which has been especially injurious to the growers of New Jersey and which was so named because it was long thought to be caused by the scalding effect of the hot sun shining on berries wet with dew. As it is seldom possible to run heavy spraying machinery over the bogs, spraying involves the use of very long lines of hose or the laying of pipe lines, or both, the spraying of each

property being a separate engineering problem.

Insects of many kinds attack the roots, the leaves, the blossoms and the fruit of the cranberry. Knowledge of the life history of each of these is necessary for successful warfare against it, and detailed information is best secured from the various bulletins of the

United States Department of Agriculture and the agricultural experiment stations of New Jersey, Wisconsin and Massachusetts. More varieties of insects may be successfully combated with water than with any other one thing, as already explained. Arsenical poisons are expensive to apply, of indifferent success in destroying insects on the bogs, and they are suspected of being an actual poison to the vines.

#### *Varieties.*

There are now many varieties of cranberries in cultivation, all of them having been selected from wild vines or vines that appeared naturally in cultivated bogs. These varieties vary in shape, color, size, productiveness, time of ripening and adaptation to different soils. Some of the forms are shown in Figs. 1091-1093. The most generally cultivated are the Early Blacks and the Howes, both of which originated in the Cape Cod district and which together make

about 50 per cent of the berries marketed from all three of the cranberry states.

The Early Blacks are ready to harvest about the first of September both in Massachusetts and New Jersey, and the last of the Howes are seldom picked before the middle of October. As the pickers advance over a cranberry bog, they pick clean as they go and do not go back for successive relays of ripening berries as with most other small fruits.

#### *Picking and grading.*

In Massachusetts most of the picking is done by a scoop, by which the berries are raked from the vines. When the vines are short, the uprights not tangled, and the picker is experienced, berries can be harvested in this way very rapidly and with very little damage to either fruit or vines. The bogs are kept in good condition for "scooping" by pruning every three or four years with a rake the teeth of which are knives placed about 6 inches apart. The scoop (Fig. 1094) is also used to a considerable extent in New Jersey and Wisconsin but in these states a great many berries are still picked by hand.

Some of the berries, especially in Massachusetts, are cleaned and packed on the bog as they are picked, and sent directly to market, but this immediate packing tends to poor keeping. Most cranberries, after picking, are put in boxes which are packed in well-ventilated storehouses. Here they are kept from a few days to several months and the cleaning and packing for market is done immediately before they are shipped.

The machine which has been the standard for cleaning cranberries for many years is provided with a fan to blow away all grass, pieces of vine, dried-up berries or anything of like nature that may have gotten in the berries while being picked. The berries are then allowed to roll down a series of steps; those that are sound are elastic and will bounce like little rubber balls. There are bands of cloth stretched above the steps in such a way that when a berry bounces in the right direc-

1089. A cranberry bog flooded in winter.

1090. The flume or outlet at the bottom of a cranberry bog.

1091. The oblong or bugle-form type of cranberry. ( $\times \frac{1}{2}$ )

tion it is received on the cloth and slides down into the box placed for the good berries without more bouncing. The rotten berries having lost their elasticity are not able to bounce over the cloth partition that separates the good from the bad. With berries that are nearly spherical and not too juicy this machine works very well, provided there are no frozen berries

1092. The obovoid or bell-shaped form of cranberry. ( $\times \frac{1}{2}$ )

to be taken out. Berries damaged by frost are even more elastic than sound

ones and will all go into the box for good fruit. Neither will the bounce machines work well with long or oval berries; when these strike on their pointed ends they fail to bounce and there is always a considerable percentage of sound fruit found in the refuse box. As there may be anywhere from ten to thirty or more steps, it is easily understood that berries going over these machines are not in the best possible condition for long keeping after they are put on the market. Some varieties of berries which are very juicy and tender can not be put through these machines at all as the steps get so sticky with the juice that the berries will not bounce.

In 1903, a machine was patented by Joseph J. White, which avoids the defects of the bounce machines. This has since been put on the market and its use is spreading among the more careful packers of Massachusetts and New Jersey, but the more complicated machinery and greater cost have prevented its adoption by other growers. This machine is provided with a hopper into which the cranberries are emptied through a screen which removes the coarser grass and vines; from the hopper the berries are fed, single file, to screw conveyors on which they are held by trough-like guards. These guards do not quite touch the screw, leaving a crack through which the remaining bits of grass, vines and dried berries are dropped into a box placed below to receive them.

The screw conveyor passes the berries over a series of selecting plates made of some resilient material, the best found so far being the selected spruce wood prepared for piano sounding-boards. These plates are tapped by small hammers placed beneath, the strength of the blow being regulated by a thumb-screw. The sound berries respond to this gentle tapping by jumping off the screw conveyor and falling on an endless belt a few inches below, which delivers all the sound fruit at one end of the machine. The rotten berries do not respond to the tapping of the selecting plates and are carried to the ends of the screw conveyors where they drop in the same box under the machine that receives the fine grass and the like. Frozen berries are removed by this machine nearly as well as

rotten ones and the shape of the berries is of no importance, while the berries only drop twice, a few inches each time, and are in much better condition for long keeping than those that go over the bounce machines. After the berries have been cleaned by machine it is customary to place them on tables where women remove any defective berries that may have been missed by the machines.

1093. The globular or cherry-shaped cranberry. ( $\times \frac{1}{2}$ )

### Marketing; yield.

Most cranberries are marketed in barrels holding about 100 quarts; a few are marketed in crates three of which fill a barrel. Some dealers prefer to buy cranberries "in the chaff," that is, just as they come from the bogs without having been run through any machine. Berries sold in this way are always packed in crates and are cleaned by the dealer, a few crates at a time, as his trade calls for them; they keep better than those that have been cleaned before being shipped.

Evaporated cranberries have been on the market for a number of years and are excellent, there being less difference between the sauce made from them and from fresh fruit than is the case with most kinds of fruit.

From the cranberry centers, the fruit is shipped in carload lots to the large cities of the United States, and from these distributed to the surrounding towns. There is also a small but steadily growing export trade.

A bog in good bearing should yield fifty barrels to the acre, but as many as 200 barrels have been secured.

In 1895 coöperative selling of cranberries was inaugurated by some of the New Jersey growers, who organized the Growers' Cranberry Co., with Joseph J. White as president and Theodore Budd as vice-president. This company was joined by a number of large New England growers and, though handling only 25 per cent of the crop, prospered greatly. Later, A. U. Chaney organized another coöperative selling company. These two companies consolidated in 1910, forming the American Cranberry Exchange, with George W. Briggs, of Massachusetts, as president. The Exchange controls about 50 per cent of the crop of the country and has been remarkably successful in securing good prices for its members while keeping the retail price as low as during the years of fiercest competition.

### History.

Cranberry-culture began about a century ago in Massachusetts on the Cape Cod Peninsula. William Kenrick, writing in 1832 in the "Orchardist," says that "Capt. Henry Hall, of Barnstable, has cultivated the cranberry twenty years;" "Mr. F. A. Hayden, of Lincoln, Massachusetts, is stated to have gathered from his farm in 1830, 400 bushels of cranberries, which brought him in Boston market \$600." In the second and subsequent editions, Kenrick makes the figure \$400. It is not said whether Hayden's berries were wild or cultivated. At the present day, with all the

increase in production, prices are higher than those received by Hayden. In the third (1841) and subsequent editions, it is said that "an acre of cranberries in full bearing will produce over 200 bushels; and the fruit generally sells, in the markets of Boston, for \$1.50 per bushel, and much higher than in former years." It was as late as 1850, however, that cranberry-culture gained much prominence. It was in 1856 that the first treatise appeared: B. Eastwood's "Complete Manual for the Cultivation of the Cranberry." About 1845, cranberry-culture began to establish itself in New Jersey.

The culture of cranberries began in Nova Scotia about thirty years ago. The first attempt consisted in improving some of the patches of wild berries found growing around the central district of the Annapolis Valley. Gradually the idea was entertained of planting new areas, and as this proved successful the new industry was soon fairly established. Farmers in the vicinity of Auburn soon took up the industry, and in the fall of 1892 the first carload of cranberries was shipped to Montreal. Since then, Nova Scotia cranberries have met with a ready sale throughout Canada.

1094. Cranberry scoop, sometimes used in picking the berries.

#### Literature.

The standard books on the cultivation of cranberries are Webb's "Cape Cod Cranberries," and "Cranberry-Culture," by Joseph J. White; these are old books and in many respects out-of-date. The best literature on the subject is to be found in the various publications of the United States Department of Agriculture, the bulletins of the agricultural experiment stations of New Jersey, Wisconsin and Massachusetts, the proceedings of the American Cranberry Growers' Association which have been published biennially since 1880, the reports of the Cape Cod Cranberry Growers' Association, and the reports of the Wisconsin State Cranberry Growers' Association.

ELIZABETH C. WHITE.

**CRANBERRY TREE:** *High-bush cranberry, Viburnum Opulus.*

**CRANESBILL.** Loosely applied to the whole genus *Geranium*. In America it usually means *G. maculatum*.

**CRANIOIOLARIA** (from a fancied resemblance of the pod to a skull or cranium). *Martyniaceæ*. Coarse but interesting flower-garden annual.

Wide-spreading low viscid-hairy rank forking herb: lvs. large, opposite, long-petioled, broadly cordate, reniform or palmately lobed; fls. white, racemed; calyx 3-5-lobed, more or less inflated; corolla very long-tubed, the tube slender and cylindrical, campanulate at the throat, more or less 2-lipped, the 5 lobes rounded and somewhat undulate, the anterior largest; perfect stamens 4, didynamous, affixed at or near the throat; ovary 1-celled; fr. a 2-valved caps. with a long incurved beak, many-seeded.—Two species, Venezuela to Paraguay. Usually confused with *Martynia*, from which it is distinguished readily by having 4 rather than 2 fertile stamens and by the very long and slender corolla-

tube which widens at the throat; the closely related *Proboscidea* has a much broader tube widening nearly from the base.

**ánua**, Linn. (*Martynia Craniolària*, Glox.). Two feet high: lvs. palmately lobed, the margins dentate: calyx 2-bracted, cut down one side, about one-third the length of the slender straightish corolla-tube; lobes of corolla rounded and not much undulate; style 2-lobed, equaling or slightly exceeding the 2 pairs of stamens. N. S. Amer.—The thick fleshy root is preserved in sugar as a comfit; plant known as "Creole scorzonera" in S. Amer. There appears to be confusion in the seed sold as *Martynia Craniolària*; some of it may be *M. louisiana* or other species. L. H. B.

**CRÁSSULA** (Latin *thickish*; referring to the thick leaves and stems). *Crassulacæ*. Fleshy and leafy greenhouse shrubs or herbs, grown for the grotesque appearance of some of the kinds and also for the bloom.

Variable in habit and foliage, mostly erect; rarely annual: lvs. opposite, usually sessile and often connate, fleshy, very entire and the margins sometimes cartilaginous, glabrous or pubescent or scaly: fls. usually small, white, rose or rarely yellow, commonly in cymes but sometimes capitate, usually 5-merous; calyx 5-parted, the lobes erect or spreading; petals 5, free or joined at the base, erect or spreading; stamens 5, shorter than the petals; carpels 5, many-ovuled.—Species 150 or more, mostly in S. Afr., but a few in Abyssinia and Asia. Many species have been intro. to cult., but only a few are actually grown outside of fanciers' collections. The rocheas sometimes pass as crassulas. See *Rochea*.

The genus *Crassula* gives the name to the order *Crassulacæ*, which contains many cultivated succulent plants, and also others of widely different habit. The order is closely related to the *Saxifragacæ*, but differs in having the carpels of the ovary entirely free and equal in number to the petals, but the forms pass easily into the *Saxifragacæ* through *Francoa* and *Tetilla*, and back again through *Triactina*. The genera, as usually treated, are ill defined, and certain species of *Sedum* cross over the lines of *Crassula*, *Cotyledon* and *Sempervivum*, while between *Crassula* and *Tillæa* no very clear distinction can be made.

*Crassulas* are greenhouse plants requiring a dry atmosphere during the resting-period. While making growth, they may be treated like other greenhouse plants in the way of watering, placing them in the lightest and airiest part of the house. The pots must be drained so that any surplus moisture will easily pass through. The soil should consist of sand, loam, broken brick, and a very small quantity of leaf-soil or thoroughly rotted cow-manure. Propagation is usually from cuttings. Some of the species, such as *C. falcata*, do not give much material for this purpose, and they should, therefore, be headed over and the tops put in dry sand in the spring, allowing water only when they show signs of shriveling. The cut-over plants should

1095. *Crassula quadrifida*.  
( $\times \frac{1}{2}$ )

be encouraged to make side shoots, which may be rooted after they are large enough. (G. W. Oliver.)

A. *Floral parts in 4's.*

**quadrifida**, Baker. Fig. 1095. Perennial: lvs. oblong-spatulate, the upper ones rounder, decussate: fls. with their parts in 4's, paniced, white, tinged red. Cape.

AA. *Floral parts in 5's, which is considered to be normal in the genus.*

B. *Lvs. petioled.*

**cordata**, Soland. Plant slender and shrubby, 1-3 ft., erect or diffused and sometimes rooting at the joints: lvs. dotted, stalked, cordate-reniform, obtuse, entire, glabrous: cymes panicle-like; fls. reddish, sometimes pure white; petals free, lanceolate, spreading. Cape. Winter.—Closely allied to *C. spathulata*.

**spathulata**, Thunb. Somewhat shrubby, more slender and trailing than *C. cordata*, decumbent, branching: lvs. stalked, roundish, crenate, glabrous, shining above: corymbs panicle-like; fls. rosy or flesh-colored: petals acute. Cape. L.B.C. 4:359 as *C. cordata*.—Likely to be cult. as *C. cordata*.

BB. *Lvs. not petioled (or only tapering to base).*

c. *Foliage glaucous.*

**falcata**, Wendl. (*Röchea falcata*, DC.). Height 3-8 ft.: lvs. grown together at the base, thick, glaucous, oblong, falcate: fls. small, numerous (50 or more), in a crimson, rarely white, dense, terminal corymb; corolla-tube  $\frac{1}{2}$  in. long, as long as the limb or shorter. Cape. B.M. 2035.

cc. *Foliage not glaucous.*

**lacteæ**, Soland. Plant shrubby, branching, tortuous below, 1-2 ft.: lvs. narrow-obovate, acutish or acuminate, narrowed and grown together at the base, glabrous, spotted along the margin: cymes panicle-like, many-fl.; fls. white, small. Cape. Winter. B.M. 1771. L.B.C. 8:735.—A free-flowering window plant of easy cult. There is a form with variegated lvs. Differs from *C. arborescens* in the narrower acute lvs. that are more tapering at base, and in the color of the fls.

**arborescens**, Willd. Fleshy erect shrub, reaching 8-10 ft.: lvs. roundish-obovate and obtuse, tapering to base, fleshy, flat and glaucous, dotted above, the edges smooth: fls. rather large, rose-colored, in trichotomous paniced cymes. Cape. B.M. 384 (as *C. Cotyledon*).

*C. atrosanguinea*, Barbey. Erect, 12-20 in., rigid; st. reddish, branched at top: lvs. aloë-like, straight or recurved, glabrous, narrowed from base to apex, often 8 in. long, rosulate and on the st.: fls. dark red, in a dense terminal many-fl. cluster. Transvaal.—*C. coccinea*, Linn.—*Röchea coccinea*.—*C. congesta*, N. E. Br. Only  $3\frac{1}{2}$  in. high: lvs. thick and fleshy, ovate-lanceolate: fls. numerous, densely crowded in a sessile terminal head, the petals scarcely  $\frac{1}{2}$  in. long, white. S. Afr.—*C. conjuncta*, N. E. Br. Lvs. concave: fls. pure white in a compact narrow cluster. S. Afr.—*C. decipiens*, N. E. Br. Dwarf tufted perennial: lvs. densely covered with blunt papillæ or nipple-like projections, fleshy, oblong: fls. very small, white, in terminal 3-branched cymes. S. Afr. (?)—*C. jasmineæ*, Ker-Gawl.—*Röchea jasmineæ*.—*C. sedifolia*, N. E. Br. Only 1-2 in. high when in bloom: lvs. in small tufts at the base and 3 or 4 pairs on the fl.-sts., bright green, ciliate, with red-brown spots along the margin: fls. white, 3-9 together in terminal cymes. S. Afr.—*C. varidiblis*, N. E. Br. Plant 3-6 in. high, branched at base: lvs. in 4 rows, densely imbricated, ovate, small ( $\frac{1}{2}$  in. or less long), ciliate on margin: fls. white, or red outside, 5-7 in. small cymes disposed in a narrow terminal panicle. S. Afr. L. H. B.†

CRATÆ-MÉSPILUS: *Cratægus grandiflora*.

**CRATÆGO-MÉSPILUS**. This name has been bestowed on a graft hybrid between *Cratægus monogyna* and *Mespilus germanica*, discovered in 1894 in the garden of M. Dardar at Bronvaux near Metz, Germany. Like *Laburnum Adamii*, which is probably the best known of the graft hybrids, it produces at the same time branches intermediate in their characters between the parents and branches resembling more or less closely the parent plants. Two distinct forms pro-

duced on different branches of the parent tree have been prop. and distributed under the names *C. Dardari* and *C. Asnieresii*. The first form (*C. Dardari*, Simon-Louis), has the lvs. and the frs. very similar to those of the medlar, but the branches are spiny, the fls. appear in corymbs, are distinctly pedicelled and have 15-20 stamens and the frs. have only 1-3 stones, measure  $\frac{1}{2}$ - $\frac{3}{4}$  in. across, and are crowned by persistent upright connivent calyx-lobes. M.D.G. 1912:101. The second form, *C. Asnieresii*, Schneid. (*C. Jules d'Asnières*, Simon-Louis) resembles more *Cratægus monogyna*, but is pubescent; the lvs. on the flowering branchlets are usually oval to obovate and often entire, while those of the shoots are ovate or rhombic-ovate and usually with 1 to 3 rounded or rarely acute lobes on either side; the fls. are borne in pubescent, 6-12-fl. corymbs, have 20 stamens and 1-2 styles; the fr. is subglobose and less than  $\frac{1}{2}$  in. across. G.C. III. 50:183, 185. Gn. 75, p. 310. M.D.G. 1912:100.—While *C. Dardari* is botanically more interesting, *C. Asnieresii* is more ornamental and forms a handsome small tree with gracefully arching branches studded with numerous fl.-clusters. It is prop. by budding or grafting like the horticultural varieties of *Cratægus*.

ALFRED REHDER.

**CRATÆGUS** (ancient Greek name, derived from *kratos*, strength, on account of the hardness of the wood). *Rosaceæ*, subfam. *Pômææ*. CRATÆGUS. HAWTHORN. Woody plants grown for their handsome foliage, attractive flowers and decorative fruit which, in a few species, is edible, and also for their picturesque habit: very valuable for ornament.

Shrubs or small trees, usually spiny: lvs. alternate, deciduous, stipulate, serrate, often lobed or pinnatifid: fls. white, in some varieties red, in corymbs, rarely solitary; petals and calyx-lobes 5; stamens 5-25, usually 10 or 20; styles 1-5: fr. a drupe-like pome, with 1-5 1-seeded bony stones.—A large genus, widely distributed in the temperate regions of the northern hemisphere, most abundant in N. Amer., where between 800 and 900 species have been described, while from the Old World only about 60 species are known. There exists no recent monograph of the genus; a systematic enumeration of the arborescent American species will be found in Sargent, "Manual of the Trees of North America," pp. 363-504; of the species of the southern states in Small, "Flora of the Southeastern United States," pp. 532-569; and of the species of the north-eastern states in Gray's Manual, ed. 7, p. 460-79, and in Britton and Brown, Ill. Flor. (ed. 2) 2:294-321; for the species cult. in European gardens, see Lange, "Revisio Specierum Generis Cratægi" (1897), quoted below as Lange.

The hawthorns are hardy ornamental shrubs and trees, mostly of dense and low growth, with handsome foliage, turning, in most species, to a brilliant coloring in the fall. Almost all have attractive white flowers, pink or crimson in some varieties of *C. Oxyacantha* and *C. monogyna*. Most of the species have very decorative fruit which in *C. Phænopryum*, *C. nitida*, *C. viridis*, *C.*

1096. Thorns of *Cratægus*. They are modified branches, being in the axils of leaves; sometimes, as in the lower figure, some of the short branches bear leaves.

*fecunda*, *C. pruinosa*, *C. Carrierei*, *C. persistens*, *C. Oxyacantha*, *C. monogyna* and others persist on the trees until late into the winter, while some species, as *C. Arnoldiana*, ripen their large fruits, which soon drop, in August; also *C. dahurica*, *C. sanguinea* and the black-fruited *C. nigra* ripen about the same time, and *C. submollis* only a little later, but the earliest of all is the southern *C. æstivalis*, which ripens its fruits in May. This and the blue-fruited *C. brachyacantha* are among the most decorative hawthorns for the southern states. The fruit of *C. æstivalis*, and that of *C. mexicana* is made into preserves and jellies; also the fruits of the Molles group are suited for jelly-making, and in South Carolina an excellent jelly similar in quality and taste to Guava jelly is made from the fruits of some species of the Flavæ group. In Europe, *C. monogyna* and *C. Oxyacantha* are counted among the best hedge plants; also many American species like *C. Phænopyrum*, *C. Crus-galli* and possibly *C. macracantha*, *C. intricata*, *C. pastorum*, *C. rotundifolia*, may be used for hedges, but they are stronger growers and cannot be pruned so closely as the European species. The hawthorns grow well in exposed positions and as a rule do not like much shade; they are not particular as to the soil, but grow best in limestone soil, also in a rich, loamy, somewhat moist one, and even in strong clay. Propagated by seeds, sown in fall or stratified; before stratifying, most of the pulp may be removed by laying the fruits in shallow piles and allowing them to decay. Then they are mixed with sand or sifted soil and buried in the ground or kept in boxes in a cool cellar. The young plants should not be allowed to remain over one year in the seed-beds, as they form long tap-roots and are then difficult to transplant. Varieties and rarer kinds are easily budded or grafted on seedling stock of *C. Oxyacantha*, or other common strong-growing species.

The spines of crategus are modified branches (see Fig. 1096). The fruits are pomes (Fig. 1097), with structure similar to that of the apple.

ALFRED REHDER.

The American hawthorns are highly ornamental subjects for the planting of parks and private estates. The showy flowers in spring and early summer, the conspicuous red, crimson, and scarlet fruits of nearly all of them, which extend amongst the different species from August to early winter and midwinter,—and some of the species markedly retain their fruits without shrinkage of pulp or loss of color until early winter,—the absolute hardihood, and the bold rugged branching habits characteristic to most of them, make them very interesting objects when their leafless forms are outlined in a winter landscape. The landscape gardener cannot make any mistake in planting them in liberal quantities in private estates or public parks.

They are easily transplanted. They are much benefited by liberal pruning when transplanted from nursery rows or from the woodland. The side branches should be pruned in severely, and as the centers of good-sized plants are likely to be full of intricate and congested branches, these should be carefully thinned. In a young state they should be grown to one stem whether they are arborescent or shrubby species. Under this treatment they make beautiful garden plants.

The American hawthorns are almost invariably found growing in heavy limestone clay. They may occasionally overlap into sandy soil. In planting them in sandy soil, it should be liberally enriched with well-rotted manure, and they should be kept well mulched.

The seeds of all of the species of American hawthorns germinate slowly. None of the species germinates before the second year after sowing, and many of the seeds in the same "flat" will not germinate before the third year. In many instances, part of the seeds germinate the second year, and the remainder the third. The seeds of *Cratægus geneseensis* have been known to be

dormant for three years, and all come up thickly at the same time. In some of the groups the seeds of the species germinate more freely than in others. The species in the Molles, Flabellatæ and Tomentosæ groups germinate abundantly. The germination of the species in the Pruinosa group have a much lower per-

1097. Pomes of *Cratægus*, one of the large-fruited forms. (Half size.)

centage than in the former. The species in the Intricatæ group germinate badly.

The fruit can be sown broadcast in beds without any separation of the seeds, and heavily mulched until the spring of the second year, when the mulching should be removed. This method, however, is not considered good, and has been given up. The best way is to soak the fruits in water, and by maceration the seeds or nutlets are separated from the pulp, and the seeds will sink to the bottom of the tub or vessel. The seeds are then dried in the sun as they can then be handled easily. They are sown in "flats" of convenient size to handle, and piled up in the corner of the shade house and fitted tightly above each other to prevent mice getting at them. During this period of rest they must not be allowed to become dry. In the spring of the second year they are spread out to allow the seeds to germinate. Numbered zinc tags are nailed on the "flats" and the corresponding numbers with the names of the species are recorded.

The American hawthorns can be grafted readily on potted seedling stocks in the greenhouse in winter, any of the species in the Crus-galli group being good to use. They are grafted at the crown. This, however, is an unnecessary operation. All of the species of American hawthorns (and there are over 900 of them) come absolutely true from seed, and whilst they germinate slowly, they start to grow rapidly into plants of good stocky size from about two years after they germinate.

Some of the species of American hawthorns have highly colored foliage in the fall. The species in the Pruinosa, Medioximæ and Intricatæ groups have perhaps the most highly colored foliage. Notable examples are *Cratægus opulens*, *C. diffusa*, *C. maineana*, *C. discolor*, *C. cognata*, *C. conspecta*, *C. promissa*, *C. ezornata*, *C. perjucunda*, *C. fetida*, and *C. verecunda*.

The different species vary greatly in the time of ripening their fruits and in the period of duration. In many instances the fruit drops soon after ripening and in others hangs on for a long period. A selection

of twenty-six species that would give a good fruit display from August until early or mid-winter, would be as follows: *Cratægus matura*, *C. præcox*, *C. Arnoldiana*, *C. Dayana*, *C. Robesoniana*, *C. pedicellata*, *C. gloriosa*, *C. Ellwangeriana*, *C. lauta*, *C. submollis*, *C. champlainensis*, *C. arkansana*, *C. Dunbari*, *C. ferentaria*, *C. opulens*, *C. compta*, *C. gemmosa*, *C. lyoniana*, *C. geneseensis*, *C. persimilis*, *C. maineana*, *C. Barryana*, *C. coccinioides*, *C. leiophylla*, *C. durobriensis*, and *C. cordata*. (See pp. 887-889 for some of these.)

## KEY TO THE SPECIES.

A. Veins of the lvs. extending to the points of the lobes or to the teeth only; lvs. usually slightly or not lobed; fr. not black or blue, except in No. 37.

B. Stones plain on the inner surfaces.

C. Petioles elongated, usually slender.

D. The petioles glandular at the apex or sparingly glandular throughout.

E. Corymbs many-fl.: petioles glandular only at the apex; lvs. broad at the base, truncate to broadly cuneate.

F. Lvs. tomentose or pubescent beneath, at least on the veins.

G. Stamens 20; anthers pale yellow; lvs. thick and leathery.

H. Fr. ripening in Aug. and Sept.: lvs. broadly ovate. . . . . 1. *mollis*

HH. Fr. ripening at the end of Oct.: lvs. oblong-ovate to oval. . . . . 2. *arkansana*

GG. Stamens 10; lvs. membranous at maturity.

H. Anthers yellow.

I. Fr. crimson, villous, ripening the middle of Aug.: lvs. dark green and smooth above. . . . . 3. *Arnoldiana*

II. Fr. orange-red, lustrous, puberulous at the base; lvs. dark yellowish green, scabrate above. . . . . 4. *submollis*

HH. Anthers rose-color: lvs. scabrate above.

I. Plant a tree: lvs. with short lobes; corymbs many-fl. . . . . 5. *Ellwangeriana*

II. Plant a shrub: lvs. rather deeply lobed; corymbs 4-6-fl. . . . . 6. *Robesoniana*

FF. Lvs. glabrous beneath or nearly so.

G. Fr. bloomy until nearly fully ripe.

H. Stamens 20; lvs. glabrous; fr. subglobose, often 5-angled. . . . . 7. *pruinosa*

HH. Stamens 10; lvs. scabrate above, while young; fr. obovoid. . . . . 8. *Barryana*

GG. Fr. not bloomy.

H. Stamens 20, anthers pink; lvs. truncate at the base.

I. The lvs. dull above, villous beneath when young; fr. with conspicuous calyx and with red flesh. . . . . 9. *coccinioides*

II. The lvs. lustrous above, quite glabrous; fr. with yellow flesh and small calyx. . . . . 10. *speciosa*

HH. Stamens 5-10; lvs. broadly cuneate.

I. Anthers pink or rose-purple; stamens usually 10.

J. Calyx-lobes coarsely glandular-serrate; stones usually 5; lvs. distinctly lobed. . . . . 11. *pedicellata*

JJ. Calyx-lobes entire or obscurely serrate; stones 2-3; lvs. slightly lobed. . . . . 12. *pastorum*

II. Anthers yellow; stamens 5-10; lvs. orbicular-ovate; fr. with 2-3 stones. . . . . 13. *rotundifolia*

EE. Corymbs usually few-fl.: petioles sparingly glandular throughout; lvs. cuneate at the base; stamens 10.

F. Calyx-lobes glandular-ciliate; corymbs slightly villous; anthers yellow. . . . . 14. *intricata*

FF. Calyx-lobes entire or glandular above the middle; corymbs glabrous.

G. Anthers purplish; calyx-lobes glandular above the middle. . . . . 15. *Buckleyi*

GG. Anthers yellow; calyx-lobes without glands. . . . . 16. *Boyntonii*

DD. The petioles glandless or with a few minute glands; lvs. cuneate at the base, ovate to lanceolate, not or very slightly lobed, lustrous above, glabrous at maturity; stamens 20.

E. Fr. subglobose,  $\frac{1}{4}$  in. across or less, bright scarlet or orange; lvs. oblong-obovate to ovate. . . . . 17. *viridis*

EE. Fr. ovoid, about  $\frac{1}{2}$  in. across, dull brick-red, bloomy; lvs. lanceolate to oblong-obovate. . . . . 18. *nitida*

CC. Petioles short; lvs. cuneate at the base, not or very slightly lobed.

D. The petioles glandless.

E. Corymbs many-fl.

F. Lvs. dark green and shining above.

G. Stamens 10; under side of lvs. glabrous or nearly so.

- H. Anthers rose-color or purple.
- I. Fr. glabrous: corymbs glabrous.
- J. Shape of lvs. cuneate-obovate to oblanceolate: fr. dull red; stones usually 2. .... 19. *Crus-galli*
- JJ. Shape of lvs. oblong to ovate: fr. crimson, lustrous; stones 3-5. .... 20. *Canbyi*
- II. Fr. villous until nearly fully grown: lvs. oblong-obovate to broadly ovate: corymbs slightly villous. .... 21. *fecunda*
- HH. Anthers yellow: lvs. obovate: fr. dull dark crimson. .... 22. *Arduennæ*
- GG. Stamens 20.
- H. Under side of lvs. villous: corymbs densely pubescent. .... 23. *Carrierei*
- HH. Under side of lvs. glabrous: corymbs slightly pubescent. .... 24. *persistens*
- FF. Lvs. dull above: stamens 20.
- G. Fr. juicy, edible: lvs. cuneate-oblong or elliptic-lanceolate, tomentose beneath. .... 25. *mexicana*
- GG. Fr. dry, mealy: lvs. obovate or oval.
- H. Length of lvs. 2-4 in., pubescent beneath: fr. ovoid,  $\frac{1}{2}$ -1 in. long, with large dots. .... 26. *punctata*
- HH. Length of lvs.  $1\frac{1}{2}$ -2 in., at maturity hairy only on the midrib beneath: fr. globose,  $\frac{1}{2}$ - $\frac{1}{2}$  in. across, with small dots. .... 27. *collina*
- EE. Corymbs few-fl.: lvs.  $\frac{1}{2}$ -2 in. long, pubescent beneath: stamens 20-25.
- F. Fls. with or before the lvs.: fr. ripening in May, juicy, bright red: lvs.  $1\frac{1}{2}$ -2 in. long. .... 28. *æstivalis*
- FF. Fls. after the lvs.: fr. ripening very late, dry, dull red or yellow: lvs. less than  $1\frac{1}{2}$  in. long.
- G. Lvs. obovate, mostly obtuse, crenately serrate: fls. usually solitary. .... 29. *uniflora*
- GG. Lvs. oval or ovate, acute, serrate and often lobed: fls. 2-6. .... 30. *Vailiæ*
- DD. The petioles, margin of lvs. and corymbs densely glandular: corymbs 3-7-fl.
- E. Stamens 20, anthers purple: fr. ovoid. .... 31. *flava*
- EE. Stamens 10.
- F. Fr. pyriform: anthers purplish. .... 31. *flava* var. [lobata]
- FF. Fr. globose: anthers yellow. .... 32. *aprica*
- BB. Stones with furrows or irregular cavities on the inner surfaces; fr. lustrous, soft at maturity.
- C. Lvs. not or only slightly lobed.
- D. Color of fr. scarlet or orange; stones 2-3: lvs. with impressed veins.
- E. Fr. small, ovoid or pear-shaped, upright, orange-red: lvs. thin, dull above, pubescent below. .... 33. *tomentosa*
- EE. Fr. subglobose, larger, nodding, scarlet: lvs. subcoriaceous, pubescent only on the veins beneath.
- F. Anthers rose-color; stamens usually 20. .... 34. *succulenta*
- FF. Anthers yellow; stamens 10.
- G. Foliage glabrous below: stones deeply grooved on the inner surface. .... 35. *macracantha*
- GG. Foliage usually pubescent on the veins below while young; stones slightly grooved. .... 36. *prunifolia*
- DD. Color of fr. black; nutlets 5: lvs. broadly elliptic to obovate, glabrous (see also No. 42 with blue frs.). .... 37. *Douglasii*
- CC. Lvs. more or less distinctly lobed.
- D. Length of lvs. more than 2 in.: lvs. pubescent: fr. nearly  $\frac{1}{2}$  in. across. .... 38. *sanguinea*
- DD. Length of lvs. less than 2 in.: lvs. quite glabrous: fr.  $\frac{1}{2}$  in. or less across. .... 39. *dahurica*
- AA. Veins of the lvs. extending to the points of the lobes and to the sinuses; lvs. usually distinctly lobed.
- B. Fr. very small,  $\frac{1}{2}$  in. long or less, red: calyx deciduous.
- C. Lvs. triangular-ovate, with shallow and broad lobes, often 3-lobed: fr. subglobose, lustrous; nutlets 3-5. .... 40. *Phænopyrum*
- CC. Lvs. ovate, deeply 5-7-lobed: fr. ovoid; nutlets 1-3. .... 41. *apiifolia*
- BB. Fr. larger: calyx-teeth persistent.
- C. Color of fr. black or blue.
- D. The fr. blue, bloomy: lvs. obovate to obovate-oblong, crenate-serrate, usually not lobed. .... 42. *brachy-*  
[cantha]
- DD. The fr. black; stones with cavities on the inner surfaces.
- E. Lvs. with about 5 pairs of lobes: fr. lustrous, subglobose, juicy. .... 43. *nigra*
- EE. Lvs. with 2-3 pairs of lobes: fr. ovoid, dull black or purplish black. .... 44. *pentagyna*
- CC. Color of fr. red or yellow.
- D. Stones with cavities on the inner surfaces, 1-2.
- E. Styles 2: lvs. 3-5-lobed with short and broad serrulate lobes. .... 45. *Oxyacantha*
- EE. Style 1: lvs. deeply 3-7-lobed, with acute, entire or sparingly toothed lobes. .... 46. *monogyna*
- DD. Stones plain on the inner surfaces, 2-5.
- E. Branchlets and lvs. pubescent.
- F. Lvs. with glandular toothed lobes, pubescent. .... 47. *tanacetifolia*
- FF. Lvs. not glandular-toothed, lobes often nearly entire.
- G. Upper surface of lvs. dull, pubescent, under surface villous. .... 48. *orientalis*
- GG. Upper surface of lvs. glabrescent, lustrous, under surface finely pubescent. .... 49. *Azarolus*
- EE. Branchlets glabrous: lvs. deeply lobed, glabrous. .... 50. *pinnatifida*

## 1. MOLLES.

1. *móllis*, Scheele (*C. tiliifolia*, Koch. *C. acerifolia*, Hort. *C. coccinea* var. *móllis*, Torr. & Gray). Tree, to 30 ft., with short, stout thorns: lvs. broadly ovate, sharply and doubly serrate and with 4-5 pairs of short acute lobes, densely pubescent beneath, 3-4 in. long: corymbs densely villous-pubescent; fls. with red disk: fr. about  $\frac{1}{2}$  in. across, usually pear-shaped, more or less pubescent, with thick mealy flesh and 4-5 stones. April, May: fr. end of Aug., Sept. Ohio to S. Dak. and Kans. S.S. 13:659. Em. 494 (as *C. tomentosa*). G.F. 5:221.—One of the most decorative species, with large, bright green foliage and showy fls. and frs., ripening in Sept., but dropping soon after maturity.

2. *arkansana*, Sarg. Tree, to 20 ft.: branches wide-spreading, forming an irregular open head, unarmed or

with straight spines  $\frac{1}{4}$ – $\frac{1}{2}$  in. long: lvs. oval or oblong-ovate, acute, truncate or broadly cuneate at the base, serrate and with 3–4 pairs of short lobes, pubescent on both sides at first, at maturity dull dark green and glabrous above, villous on the veins below, 2–3 in. long: corymbs villous; fls. nearly 1 in. across: fr. ovoid, bright crimson, slightly villous at the ends,  $\frac{3}{4}$ –1 in. long, with thick subacid flesh and usually 5 stones.

1098. *Cratægus Arnoldiana* ( $\times \frac{3}{4}$ ). No. 3.

May; fr. end of Oct., falling gradually. Ark. S.S. 13:660.—Very handsome in autumn with its abundant brilliant frs. persistent for some time; the lvs. turn clear yellow.

3. *Arnoldiana*, Sarg. Fig. 1098. Tree, to 20 ft., with stout ascending branches forming an open head with zigzag branchlets, armed with stout spines 2–3 in. long: lvs. broadly ovate to oval, acute, truncate to broadly cuneate at the base, doubly serrate and with many shallow broad lobes, at first hairy above and soft-pubescent below; later smooth, dark green and lustrous above, slightly villous on the veins below, 2–3 in. long: corymbs tomentose; fls.  $\frac{3}{4}$  in. across: fr. subglobose, bright crimson, villous toward the ends,  $\frac{3}{4}$  in. long, with thick subacid flesh and 3–4 stones. May; fr. middle of Aug., soon falling. Mass. S.S. 13:668.

4. *submollis*, Sarg. Tree, to 25 ft., with ascending or spreading branches forming a broad handsome head: spines numerous, thin, usually straight, 2–3 in. long: lvs. ovate, acute, broadly cuneate at the base, doubly serrate and with 3–4 pairs of acute short lobes, scabrous above, below at first soft-pubescent, later only puberulous on the veins, 2–3 in. long: corymbs tomentose; fls. 1 in. across: fr. pear-shaped or ovoid, bright orange-red and lustrous,  $\frac{3}{4}$  in. long with persistent erect calyx; flesh yellow, mealy; stones usually 5. May; fr. early in Sept., soon falling. Que. to Mass. and E. N. Y. S.S. 4:182 (as *C. mollis*).

5. *Ellwangeriana*, Sarg. Tree, sometimes to 20 ft., with stout ascending branches forming a broad symmetrical head, and with zigzag branchlets: lvs. oval, acute, rounded or broadly cuneate at the base, coarsely and often doubly serrate with many short acute lobes, at first hairy above and villous below on the veins, later scabrous and light green above, nearly glabrous below,  $2\frac{1}{2}$ – $3\frac{1}{2}$  in. long: corymbs densely villous; pedicels short; fls. 1 in. across: fr. ovoid, bright crimson, very lustrous, slightly villous at the ends, 1 in. long, with thin yellow acid flesh and 3–5 nutlets. May; fr. at the end of Sept., soon falling. N. Y. and Ont. to Mich., south to W. Pa. S.S. 13:671. G.C. III. 47:130. A.F. 24:325. F.E. 33:488.

6. *Robesoniana*, Sarg. (*C. spissiflora*, Sarg.) Shrub, with numerous erect sts., to 12 ft., or occasionally small tree, to 20 ft.: spines few, stout, 1– $1\frac{1}{2}$  in. long: lvs. oblong-ovate, acute, or acuminate, rounded or broadly cuneate at the base, sharply doubly serrate with many broad acute lobes, pubescent below on the veins while young, glabrous at maturity, scabrate above, 2–3 in. long: corymbs pubescent, 4–6-flid., compact; calyx villous, lobes glabrous outside: fr. ovoid, scarlet,  $\frac{3}{4}$  in. long, with small calyx; flesh thin, mealy; stones 4–5. May; fr. Sept., soon falling. N. Y. to S. Ont.—This species was formerly sold by Ellwanger & Barry under the name *C. coccinea*.

## 2. PRUINOSÆ.

7. *pruinosa*, Koch (*C. coccinea* var. *viridis*, Torr. & Gray). Shrub or tree, to 20 ft.: branches spreading with numerous stout straight spines: lvs. elliptic or ovate, acute, usually broadly cuneate at the base, irregularly and often doubly serrate, with 3–4 pairs of short acute lobes, red when unfolding, later dark bluish green above, paler below, glabrous, 1–2 in. long: corymbs rather few-flid.; fls. slender-pedicelled,  $\frac{3}{4}$ –1 in. across; stamens 20; anthers pinkish: fr. subglobose, apple-green and glaucous until nearly fully ripe, finely dark purple with yellow sweet flesh and 5 stones: calyx prominent with a well-developed tube. May; fr. Oct. Vt. to Va., and Ill. S.S. 13:648.

8. *Barryana*, Sarg. Shrub, to 15 ft.: branches spreading or ascending with slender spines: lvs. broadly ovate, rounded or abruptly cuneate at the base, sharply doubly serrate and slightly lobed, scabrate above, glabrous and glaucous below, 2–3 in. long: corymbs glabrous; calyx-lobes entire or sparingly dentate; fls.  $\frac{3}{4}$  in. across; stamens 7–10, with purple anthers: fr. obovoid, crimson with small pale dots, pruinose,  $\frac{3}{4}$  in. long, with usually 3 nutlets. May; fr. in Oct. W. N. Y.

## 3. DELTOIDES.

9. *coccinioides*, Ashe. Fig. 1099. Tree, sometimes 20 ft.: branches stout, spreading, forming a broad handsome head: spines thick,  $1\frac{1}{2}$ –2 in. long: lvs. broadly ovate, acute, rounded or truncate at the base, doubly serrate, with several pairs of broad acute lobes, at first yellowish green and lustrous above, villous on the veins beneath, later dull dark green above, paler and nearly glabrous beneath, 2–3 in. long: fls.  $\frac{3}{4}$  in. across, in compact 5–7-flid., sometimes slightly villous: corymbs: fr. subglobose, dark crimson and lustrous,  $\frac{3}{4}$  in. across, with thick subacid reddish flesh and 4–5 stones. May; fr. early in Oct. and falling gradually. Mo., Ind., and Kans. S.S. 13:674. M.D.G. 1901: 358, 359.—Very handsome small tree, the foliage tinged red when unfolding and turning scarlet and orange in autumn.

10. *speciosa*, Sarg. Shrub, to 15 ft., usually with many sts.: spines numerous, 1–2 in. long: lvs. ovate, acute or acuminate, rounded or subcordate at the base, doubly serrate and with 4–5 pairs of broad and short acute lobes, tinged red when unfolding and nearly glabrous, at maturity thick, dark green and lustrous

above, paler below and quite glabrous, 2-3 in. long: corymbs glabrous, 5-8-fld.; fls. 1. in. across: fr. depressed-globose, bright crimson and lustrous, nearly 1 in. broad, with thin yellow flesh and 5 stones. May; fr. the middle of Sept., soon falling. Mo. S.T.S. 1:33.—Very handsome with its lustrous lvs., large fls. and brilliant fr.

#### 4. COCCINEÆ.

11. *pedicellâta*, Sarg. Tree, to 20 ft., with rather slender spreading or ascending branches forming a symmetrical head: spines straight or slightly curved,  $1\frac{1}{2}$ -2 in. long: lvs. broadly ovate, broadly cuneate or truncate at the base, coarsely and often doubly serrate, above the middle with 4-5 pairs of short acute lobes, at maturity membranous, dark green and scabrous above, paler and nearly glabrous below, 2-4 in. long: fls.  $\frac{1}{2}$  in. across in loose slightly villous corymbs; calyx-lobes coarsely glandular-serrate: fr. pear-shaped or ovoid, bright scarlet, lustrous, with conspicuous persistent calyx; flesh thin, mealy; stones 4-5. May; fr. Sept. Pa. to Conn., N. Y., and Ont. S.S. 13:677.

#### 5. TENUIFOLIÆ.

12. *pastòrum*, Sarg. (*C. macrospërma* var. *pastòrum*, Eggleston). Glabrous shrub, sometimes to 15 ft., with many erect sts., armed with numerous stout or slender spines: lvs. ovate, acute, usually rounded at the base, doubly serrate, slightly lobed, at maturity thick, dark dull blue-green, glaucescent below,  $1\frac{1}{2}$ -2 in. long: fls.  $\frac{3}{4}$  in. across in many-fld. corymbs; calyx-lobes lanceolate, entire or obscurely serrate: fr. ovoid, bright scarlet, lustrous, about  $\frac{1}{2}$  in. long, with thick, yellow and mealy flesh and 2-3 stones. New England. May; fr. Sept. S.S. 4:180 (as *C. coccinea*).

#### 6. ROTUNDIFOLIÆ.

13. *rotundifolia*, Moench (*C. coccinea* var. *rotundifolia*, Sarg. *C. glandulosa*, Willd.) Shrub or bushy tree, sometimes to 20 ft., with slender, straight or curved spines: lvs. ovate-orbicular to oval, or obovate, acute, broadly cuneate at the base, rather coarsely serrate and usually with 3-4 pairs of short acute lobes, glabrous, 1-2 $\frac{1}{2}$  in. long: corymbs glabrous or slightly villous; fls.  $\frac{3}{4}$ -1 in. across; calyx-lobes and bractlets very glandular: fr. subglobose, about  $\frac{1}{2}$  in. long, red with yellow sweet flesh and 2-3 stones. May; fr. Sept. Nova Scotia to Sask., Ill. and Va. G.C. II. 14:557. Gn. 22, p. 145; 33, p. 464.—The most northern species. Var. *pùbera*, Sarg. (*C. coccinea*, Linn., in part). Branchlets, petioles and the lvs. on the veins more or less pubescent below while young.

#### 7. INTRICATÆ.

14. *intricatâ*, Lange. Shrub, to 10 ft.: branches upright or spreading, with rather long curved spines: lvs. elliptic-ovate, acute, cuneate at the base, doubly serrate with 3-4 pairs of short acute lobes, at first slightly pubescent, later scabrate above, bright green, slightly paler beneath and nearly glabrous, 1-2 $\frac{1}{2}$  in. long: corymbs slightly villous; fls. about 1 in. across; calyx-lobes serrate: fr. subglobose to ovoid, sparingly villous or glabrous, dull reddish brown, with usually 3-4 stones. May; fr. Oct., Nov. Mass. and Vt. to Pa. Lange 1.

15. *Bückleyi*, Beadle. Large shrub or tree, often to 25 ft., with stout spreading or ascending branches and stout straight spines  $\frac{1}{2}$  in. long: lvs. broadly ovate or oval, acute, usually rounded at the base, coarsely serrate and incisedly lobed with acuminate lobes, glabrous and thick and firm at maturity: corymbs 3-7-fld., compact, glabrous; fls.  $\frac{3}{4}$  in. across; sepals serrate toward the apex and stipitate-glandular: fr. subglobose, usually angled, about  $\frac{1}{2}$  in. across, yellowish green and flushed red or red, with 3-5 stones. May; fr. Sept. and Oct. Va. to N. C. and Tenn. S.M. 464.

16. *Boýntonii*, Beadle. Tree, occasionally to 20 ft., with stout ascending branches: spines straight, thin,  $1\frac{1}{2}$ -2 in. long: lvs. broadly ovate to oval, acute, sharply serrate with glandular teeth and often with 2-3 pairs of short acute lobes, bronzy red when unfolding and slightly viscid, at maturity yellowish green, thick and firm and glabrous, 1-2 $\frac{1}{2}$  in. long; petioles glandular: fls.  $\frac{3}{4}$  in. across, in 4-10-fld. glabrous corymbs; calyx-lobes entire or obscurely glandular-serrate above the middle: fr. depressed-globose, yellowish green flushed with red, about  $\frac{1}{2}$  in. across, with 3-5 stones. May; fr. Oct. Va. to Ky., Tenn. and Ala. S.S. 13:650.

#### 8. VIRIDES.

17. *viridis*, Linn. (*C. arborëscens*, Ell.). Tree, to 35 ft., with spreading branches forming a round, rather compact head: spines slender: lvs. oblong-ovate to oval, acute or acuminate, serrate above the cuneate base, dark green and lustrous above, paler below, finally glabrous, 1-3 in. long: corymbs glabrous; pedicels slender; calyx-lobes lanceolate, entire: fr. globose, bright red,  $\frac{1}{6}$ - $\frac{1}{4}$  in. across, with usually 5 stones. Md., Va. to Ill., Iowa, Texas and Fla. May; fr. Oct., persisting through the winter. S.S. 4:187.

18. *nítida*, Sarg. Tree, to 30 ft., with spreading branches unarmed or with thin straight spines: lvs. elliptic to oblong-obovate, acuminate, coarsely serrate except at the cuneate base, often slightly lobed, dark green and lustrous above, paler below, glabrous, 1-3 in. long: corymbs glabrous, calyx-lobes elongated, entire or sparingly glandular-serrate: fr. ovoid or subglobose, dark dull red, about  $\frac{1}{2}$  in. long with thick mealy flesh and 2-5 stones. May; fr. Oct., persistent through the winter. Ill., Kans. S.S. 13:703.—Like *C. viridis* very ornamental with its lustrous foliage and persistent frs.

1099. *Cratægus coccinioides* ( $\times \frac{2}{3}$ ). No. 9.

## 9. CRUS-GALLI.

19. *Crus-galli*, Linn. COCKSPUR THORN. Shrub or tree, to 40 ft.: branches wide-spreading, rigid, often pendulous, with numerous slender spines: lvs. obovate or oblanceolate, irregularly and sharply serrate, usually rounded at the apex, quite glabrous, 1-2½ in. long, often semi-persistent: corymbs glabrous; calyx-lobes entire or minutely serrate: fr. usually globose, red, with usually 2 stones; flesh thin and dry. May, June: fr. late in Oct. Que., south to N. C., west to Mich. S.S. 4:178. Em. 492. R.B. 1:116. G.F. 7:295. G.C. III. 28:244, suppl. Sept. 29.—A very decorative species of distinct habit, handsome in bloom and with showy, bright red fr., remaining on the branches often until spring; the lvs. assume a brilliant orange and scarlet color in fall. Often used for hedges. Var. *inermis*, Lange. Spineless form. Var. *linearis*, Ser. Lvs. linear-lanceolate. Var. *nana*, Nichols. Dwarf form. Var. *pyracanthifolia*, Ait. Lvs. elliptic or obovate, usually acute: fr. smaller, brighter red. W. N. Y. and Pa. to Fla. and Tenn. S.S. 13:637. Var. *salicifolia*, Ait. Lvs. oblanceolate or lanceolate, thinner. Var. *splendens*, Ait. (var. *lucida*, Hort.). Lvs. elliptic-oblanceolate, very shining. Var. *ovalifolia*, Lindl. (*C. pennsylvanica*, Hort., not Ashe). Lvs. elliptic or elliptic-obovate, less lustrous: fr. ovoid. B.R. 22:1860. Gn. 22, p. 146; 33, p. 468.—This is probably not a variety of *C. Crus-galli*, but a distinct species identical with one of the recently described species of this group.

20. *Cánbyi*, Sarg. Shrub or bushy tree, to 20 ft.: branches wide-spreading, with thick usually straight spines: lvs. oblong-obovate to elliptic, acute or obtuse, coarsely and often doubly serrate above the middle, glabrous, 1½-3 in. long: corymbs glabrous; calyx-lobes entire or sparingly serrate: fr. subglobose or ovoid, about ½ in. long, dark crimson, with juicy flesh and 3-5 stones. May; fr. Oct. E. Pa., Del., Md. S.S. 13:638.

21. *fecúnda*, Sarg. Small tree, to 25 ft.: branches wide-spreading, with slender spines: lvs. oblong-ovate to oval, usually acute, doubly serrate, with strongly marked veins, 1½-3 in. long: corymbs slightly villous; calyx-lobes glandular-serrate: fr. subglobose to ovoid, ½-¾ in. long, orange-red, with thick flesh and 2-3 stones. May; fr. Oct. Mo., Ill. S.S. 13:641.

22. *Arduénnae*, Sarg. Shrub or tree, to 20 ft.: branches spreading, forming a round-topped head: spines slender: lvs. oblong-obovate, acute, acuminate or rounded, crenulate-serrate from below the middle, with obscure veins, 1½-2½ in. long: corymbs glabrous, pedicels slender; calyx-lobes entire or slightly serrate:

1100. *Cratægus punctata*. No. 26.

fr. ovoid, dull dark crimson, about ½ in. long, with 1-2 stones. May; fr. the middle of Sept. Pa. to Ill., Mich. and Ont. S.M. 373.

23. *Carrièrei*, Vauv. Small tree, to 20 ft., with spreading branches and stout spines: lvs. elliptic or oblong-obovate, acute, pubescent below, glabrous above at

length and lustrous, irregularly serrate, 3-4 in. long: corymbs rather few-fl., pubescent; fls. large, with red disk; calyx-lobes linear, serrulate: fr. bright orange or brick-red, ovoid, about ½ in. long, with 1-3 stones. May. R.H. 1883:108. G.C. III. 21:118, 119.—Probably hybrid between *C. Crus-galli* and *C. mexicana*, originated in France. Possibly not different is *C. Lavallei*, Herincq, described with larger subglobose fr.

24. *persistens*, Sarg. Low tree, 12 ft. or more: branches wide-spreading, with numerous stout spines to 2 in. long: lvs. lanceolate to oblong-obovate, acuminate, cuneate at the base, coarsely serrate above the middle, at maturity glabrous, dark green and lustrous above, pale beneath, 2-3 in. long: corymbs slightly villous; fls. over ¾ in. across; calyx-lobes glandular-serrate above the middle or entire; stamens 20, anthers white; styles surrounded at the base by a broad ring of pale tomentum: fr. ovoid or slightly obovate, crimson, not lustrous, over ½ in. across; flesh thick and mealy, with 2-3 stones. May: fr. in Oct. S.T.S. 2:190.—Of unknown origin, possibly a hybrid of *C. Crus-galli*. Raised at the Arnold Arboretum. The lvs. remain on the branches unchanged until those of all the other hawthorns have fallen and the frs. persist until late into the winter. One of the most conspicuous of winter fruiting plants.

## 10. MEXICANÆ.

25. *mexicana*, Sess. & Moc. (*C. hypolasia*, Koch). Small tree, to 30 ft.: branchlets tomentose, unarmed or with short spines: lvs. cuneate-oblong or elliptic-lanceolate, obtuse or acute, crenate-serrate and often slightly lobed toward the apex, pubescent above, sometimes nearly glabrous, tomentose below, 1½-3½ in. long: corymbs white-tomentose; fls. ¾ in. wide; calyx-lobes entire or with a few teeth at the apex; stamens 20, with pink anthers: fr. ovoid to pyriform, orange or dull orange-red, ¾-1 in. thick, edible, with 3-5 nutlets. March; fr. Oct., Nov. Mex. B.R. 22:1910.

## 11. PUNCTATÆ.

26. *punctata*, Jacq. Fig. 1100. Tree, to 25 ft.: branches horizontally spreading, with short, stout spines or unarmed: lvs. obovate, obtuse or acute, narrowed at the base into a rather long margined petiole, irregularly serrate, on the shoots often slightly lobed, villous below, with impressed veins above, 2-4 in. long: corymbs villous; fls. large; calyx-lobes entire: fr. pyriform or subglobose, dull red, dotted, about ½ in. across, with 5 stones. May; fr. Oct., falling soon. From Que. to Ont., Ill. and Ga. S.S. 4:184. A.F. 28:805. Var. *aurea*, Ait. (var. *xanthocarpa*, Roem. *C. crocata*, Ashe). Fr. yellow.

27. *collina*, Chapm. Shrub or small tree, occasionally 25 ft.: branches wide-spreading, with stout spines, on the trunk with large branched spines: lvs. obovate or oval, acute, broadly cuneate at the base, irregularly, often doubly serrate, at maturity yellowish green above, paler below and glabrous except on the midrib: corymbs villous; calyx-lobes glandular-ciliate; anthers yellow: fr. subglobose, dull red, ½-¾ in. long, with yellow mealy flesh and usually 5 stones. May; fr. Oct. Va. to Tenn. and Ala. S.S. 13:654.

## 12. ÆSTIVALES.

28. *æstivalis*, Torr. & Gray. MAY HAW. APPLE HAW. Tree, to 30 ft., with a round compact head, unarmed or with stout straight spines 1-1½ in. long: lvs. elliptic to oblong-obovate, acute or rounded, gradually narrowed into the ¼-1 in. long petiole, sinuate-dentate or crenate-serrate, at maturity dark green and lustrous above, below, particularly on the veins, densely rusty-pubescent, 1½-2½ in. long: fls. with the lvs., 1 in. across, in 2-5-fl. glabrous corymbs; calyx-lobes entire or minutely glandular-serrate: fr. depressed-

globose, fragrant,  $\frac{1}{2}$ – $\frac{3}{4}$  in. across, bright red, crowned by the conspicuous calyx, with juicy subacid flesh and 3–5 stones. Feb., March; fr. May. Fla. to Ark. and Texas. S.S. 4:192.—The fr. is made into preserves and jellies.

### 13. UNIFLORÆ.

29. *uniflora*, Moench (*C. parvifolia*, Ait. *C. tomentosa*, Eggleston, not Linn. *C. florida*, Loud.). Dense, low shrub, with numerous slender spines, rarely spineless, 3–8 ft.: lvs. on short not glandular petioles, cuneate, obovate or oblong-obovate, irregularly or doubly crenate-serrate, pubescent on both sides, at length glabrous above,  $\frac{1}{2}$ – $1\frac{1}{2}$  in. long; fls.  $\frac{1}{2}$  in. across, 1–3-fl. corymbs; calyx pubescent, with large serrate lobes: fr. pyriform or globose, yellow,  $\frac{1}{2}$  in. across, with 3–5 stones. May, June. Ga. and Ala. to Fla. S.S. 4:191.

30. *Vailiæ*, Brit. Shrub, to 12 ft., with slender straight spines: lvs. oval or ovate, acute, cuneate at the base, crenate-serrate and often slightly lobed, at maturity glabrous and lustrous above, pubescent below,  $\frac{1}{2}$ – $1\frac{1}{2}$  in. long; fls.  $\frac{1}{2}$  in. across, in 2–6-fl., pubescent corymbs; calyx-lobes glandular-serrate: fr. globose,  $\frac{1}{2}$  in. across, dull red, with 3–5 stones. May; fr. Oct. Va. to Ga. and Ala.

### 14. FLAVÆ.

31. *flava*, Ait. Tree, to 20 ft.: branches wide-spreading, with thin nearly straight spines: lvs. broadly obovate or elliptic, acute or nearly rounded, cuneate at base, coarsely and doubly serrate, on vigorous shoots usually slightly lobed, the teeth tipped with red glands, at maturity puberulous only on the veins below, about 2 in. long; petioles glandular, short: corymbs few-fl., slightly villous; calyx-lobes glandular-serrate; fls.  $\frac{3}{4}$  in. across; stamens 20, with purple anthers: fr. ovoid, dark orange-brown,  $\frac{1}{2}$  in. long, with dry and mealy flesh and 5 stones. April; fr. in Oct. Ga. and Fla. S.S. 13:693.—The true *C. flava* is not in cult.; the plant now cult. as *C. flava* is quite different and is apparently not very closely related to this species; it has so far not been found growing wild in E. N. Amer., though it was apparently intro. from the southern states. As it has not yet been determined to which species it belongs, it may be enumerated here as var. *lobata*, Lindl. Shrub or small tree: lvs. ovate or obovate, cuneate at the base, acute, crenately serrate and often slightly lobed, at maturity pubescent on the veins beneath, 1–2 in. long; corymbs pubescent, few-fl.; stamens 10: fr. pyriform, green or reddish with hard flesh, and 3–5 stones. B.R. 23:1932, 1939. G.C. III. 27:404.—Tender.

32. *ápica*, Beadle. A shrub or small tree, sometimes to 20 ft., with spreading branches and slender zigzag branchlets armed with thin straight spines 1– $1\frac{1}{2}$  in. long: lvs. broadly obovate or oval, acute or rounded at the apex, narrowed into the short petiole, serrate usually only above the middle and often slightly lobed, with gland-tipped teeth, pubescent on both sides while young, at maturity glabrous, dark yellow-green and thickish,  $\frac{3}{4}$ – $1\frac{1}{2}$  in. long; fls.  $\frac{3}{4}$  in. across, in 3–6-fl. compact pubescent corymbs; calyx-lobes glandular-serrate: fr. globose,  $\frac{1}{2}$  in. across, dull orange-red, with 3–5 stones. May; fr. Oct. Va. to Ga. and Tenn. S.S. 13:698.—This species has proved hardy at the Arnold Arboretum.

### 15. TOMENTOSÆ.

33. *tomentosa*, Linn. (*C. Calpodendron*, Medikus. *C. pyrifolia*, Ait. *C. leucophlæos*, Moench. *C. Chapmani*, Ashe). Fig. 1101. Shrub or small tree, to 20 ft., with spreading branches unarmed or with short spines: lvs. cuneate, obovate-oblong or elliptic, acute, serrate and often slightly lobed, dull green and usually finely glabrous above, below pubescent, 2–5 in. long; corymbs pubescent, compound and many-fl.; fls.  $\frac{1}{2}$  in. across; calyx-lobes serrate: fr. usually oval, dull yellow or

yellowish red,  $\frac{1}{4}$ – $\frac{1}{2}$  in. across, sweet and succulent, in upright corymbs; stones 2–3, with 2 furrows on the inner side. June; fr. Oct. Ont. to Minn., south to Tenn. and Mo. S.S. 4:183. G.F. 2:425 (adapted in Fig. 1101). Gn. 22, p. 145. B.R. 22:1877.

34. *succulenta*, Link. (*C. macracantha* var. *succulenta*, Rehd.). Tree, sometimes to 20 ft., with stout ascending branches, armed with numerous stout

1101. *Cratægus tomentosa*.  
( $\times \frac{1}{2}$ ). No. 33.

slightly curved spines: lvs. elliptic, acute or acuminate, gradually narrowed into the stout winged petiole, coarsely and usually doubly serrate and with many short acute lobes, at maturity dark green, thickish and somewhat lustrous above, pale green and usually puberulous on the veins below, 2–3 in. long; fls.  $\frac{2}{3}$  in. across, in many-fl. villous corymbs; stamens usually 20, sometimes 15: fr. globose, bright scarlet,  $\frac{1}{2}$ – $\frac{2}{3}$  in. across, with juicy sweet flesh and 2–3 stones. May; fr. Sept., Oct. Que. and Ont. to Mass. and Ill. S.S. 4:181 (as *C. coccinea* var. *macracantha*).

35. *macracantha*, Lodd. (*C. coccinea* var. *macracantha*, Dudley). Fig. 1102. Shrub or small tree, to 20 ft., of dense growth, with numerous long and slender spines: lvs. rather slender-petioled, broadly elliptic or ovate, doubly serrate, glabrous, at maturity thickish, shining and dark green above, almost glabrous beneath, 1– $2\frac{1}{2}$  in. long; corymbs slightly villous; fls.  $\frac{3}{4}$  in. across; stamens 10; calyx-teeth glandular-serrate: fr. subglobose,  $\frac{1}{2}$  in. diam., dark cherry-red, shining, with usually 2–3 stones. May, June. W. N. Y. and Vt. to Pa. S.S. 13:689. B.R. 22:1912. L.B.C. 11:1012 (as *C. glandulosa*). A.G. 11:509. M.D.G. 1906:561. G.W. 5:245.—Sometimes cult. under the name of *C. Douglasii*. See page 3567.

36. *prunifolia*, Pers. Shrub or tree, to 30 ft.: branches spreading or somewhat ascending, spiny: lvs. obovate, or roundish obovate, doubly serrate, glabrous or pubescent on the veins beneath when young, 2–3 in. long; corymbs pubescent; stamens 10; anthers pink: fr. red; stones with 2 furrows on the inner side, sometimes nearly plain. May, June.—Origin unknown; by some thought to be a hybrid between *C. Crus-galli* and *C. macracantha* or *C. succulenta*. B.R. 22:1868. G.W. 8:114. Var. *variegata*, Hort. Lvs. variegated with yellowish white. F.W. 1877:65.

## 16. DOUGLASIANÆ (page 3567).

37. *Doùglasii*, Lindl. (*C. sanguinea* var. *Doùglasii*, Torr. & Gray). Tree, to 40 ft., with slender, often pendulous branches, unarmed or with short spines: lvs. short-petioled, broadly ovate or oblong-ovate, acute, gradually narrowed at the base, serrate and slightly lobed, nearly glabrous, pubescent on the midrib above, chartaceous, 1-4 in. long: corymbs glabrous; fls.  $\frac{1}{3}$ - $\frac{1}{2}$  in. across; stamens 20; calyx-lobes triangular-ovate, usually glandular-serrate above the middle: fr. ovoid,  $\frac{1}{2}$  in. long, black and lustrous, with sweet, light yellow flesh and 3-5 nutlets. May; fr. Aug., Sept. Brit. Col. and N. Calif. to Wyo. S.S. 4:175. B.R. 21:1810.

## 17. SANGUINEÆ.

38. *sanguinea*, Pall. Shrub or small tree, to 20 ft., with upright, spreading branches and short spines: lvs. ovate or broadly ovate, narrowed into the petiole, irreg-

1102. *Cratægus macracantha* ( $\times \frac{1}{2}$ ). No. 35.

ularly serrate and slightly lobed, more deeply lobed on vigorous shoots, at first hairy above and often also below, at maturity glabrous or nearly glabrous,  $1\frac{1}{2}$ -3 in. long: corymbs pubescent or glabrous; fls. large; stamens 20, with purple anthers: fr.  $\frac{1}{2}$  in. diam. May; fr. in Aug., Sept. E. Siberia. Var. *chlorocarpa*, Schneid. (var. *xanthocarpa*, Regel). Fr. yellow, smaller: anthers whitish.

39. *dahùrica*, Koehne (*C. purpurea*, Bosc. *C. sanguinea* var. *altàica*, Loud.). Shrub or small tree: spines to  $1\frac{1}{2}$  in. long: lvs. ovate or broadly elliptic-ovate, acute, broadly cuneate at the base, sharply serrate, those of the flowering branches very slightly or scarcely lobed, those of the shoots distinctly and acutely lobed, glabrous,  $\frac{3}{4}$ -2 in. long: corymbs glabrous; fls.  $\frac{1}{2}$  in. across: fr. subglobose,  $\frac{1}{2}$  in. across, orange-red. April, May; fr. Aug. E. Siberia.—The earliest leafing species of all hawthorns; very graceful; hardy.

## 18. CORDATÆ.

40. *Phænopyrum*, Medikus (*C. cordata*, Ait. *C. acerifolia*, Moench. *C. populifolia*, Walt.). WASHINGTON THORN. Tree, to 30 ft., with slender spines: lvs.

slender, petioled, triangular or broadly ovate, usually truncate at the base, 3-5-lobed, sharply serrate,  $1\frac{1}{2}$ -2 $\frac{1}{2}$  in. long: corymbs many-fl., glabrous; styles 5: fr. depressed-globose,  $\frac{1}{4}$  in. across, shining, bright coral-red; calyx deciduous, leaving a circular scar; stones 3-5. May, June; fr. Sept., Oct. Va. to Ala. and Mo. S.S. 4:186. B.R. 14:1151. F.E. 28, p. 103 (habit).—A very desirable species, with beautiful fall-coloring and large clusters of bright red fr. remaining a long time on the branches. Formerly much used for hedges.

## 19. APIIFOLLÆ.

41. *apiifolia*, Michx. (*C. Marshallii*, Eggleston). Shrub or small tree, rarely 20 ft., with stout spines and the branchlets pubescent when young: lvs. slender-petioled, broadly ovate, pinnately 5-7-cleft, serrate, glabrous or pubescent,  $\frac{3}{4}$ -1 $\frac{1}{2}$  in. long: corymbs few-fl., villous; styles 1-3: fr. ovoid,  $\frac{1}{4}$  in. high, scarlet, with 1-3 stones; calyx often deciduous. April, May; fr. Oct. Va. to Fla., Ark. and Texas. S.S. 4:188.—A handsome species with graceful foliage and an abundance of white fls. in spring and small but brightly colored frs. in fall.

## 20. BRACHYACANTHÆ.

42. *brachyacantha*, Sarg. & Engelm. Tree, to 50 ft., with stout spreading branches, armed with numerous short usually curved spines,  $\frac{1}{3}$ - $\frac{1}{2}$  in. long: lvs. obovate-oblong, oblong-lanceolate or elliptic, acute or sometimes obtuse, cuneate at the base, crenulate-serrate, rarely slightly lobed, glabrous at maturity, lustrous above,  $\frac{3}{4}$ -2 in. long: corymbs many-fl., glabrous; fls.  $\frac{1}{3}$  in. across, turning orange in fading; stamens 15-20: fr. subglobose,  $\frac{1}{3}$ - $\frac{1}{2}$  in. across, bright blue and bloomy, with 3-5 stones. April, May; fr. Aug. La. and Texas. S.S. 4:177.—The only species with blue fr.; hardy only S.

## 21. PENTAGYNÆ.

43. *nigra*, Kit. (*C. carpathica*, Lodd.). Shrub or small tree: branches pubescent or tomentose, with short spines: lvs. short-petioled, ovate or ovate-elliptic, deeply pinnately 5-9-lobed with serrate lobes, slightly pubescent above, densely pubescent beneath, 2-3 in. long: corymbs dense, 10-15-fl., tomentose; pedicels short; fls. white, becoming slightly red; anthers yellowish: fr. subglobose,  $\frac{1}{2}$  in. across, black, lustrous, juicy, with 5 stones. May; fr. in Aug. S.E. Eu. L.B.C. 11:1021. L.I. 30.

44. *pentágyna*, Waldst. & Kit. (*C. melanocarpa*, Bieb.). Shrub or small tree, to 15 ft.: young branchlets pubescent, with short spines: lvs. ovate to obovate, irregularly and usually sparingly serrate, pinnately 3-7-lobed, hairy above while young, finally nearly glabrous above, pubescent below, 1-2 in. long: corymbs villous; fls.  $\frac{1}{2}$  in. across, anthers red: fr. ovoid or obovoid, purplish black,  $\frac{1}{2}$  in. long, with 4-5 stones. May; fr. Sept., Oct. S. E. Eu., Caucasus. B.R. 22:1874; 23:1933 (as *C. Oxyacantha Oliveriana*). R.H. 1901, p. 310.

## 22. OXYACANTHÆ.

45. *Oxyacantha*, Linn. HAWTHORN or MAY of English literature. Shrub or small tree, to 15 ft., with spreading glabrous branches and stout spines: lvs. short-petioled, cuneate or truncate at the base, roundish or broadly ovate, 3-5-lobed, with broad, serrulate lobes, 1-2 in. long: corymbs 5-10-fl., glabrous: fr. globular or roundish oval,  $\frac{1}{3}$ - $\frac{1}{2}$  in. high, scarlet; stones 2, with 2 furrows on the inner side. May. Eu., N. Afr. B.R. 13:1128 (as *C. oxyacanthoides*). Var. *bicolor*, Rehd. (*C. Oxyacantha* var. *Gumpperi bicolor*, Hort. *C. Oxyacantha rubra*, Schneid.). Fls. white in the center, edged red. F.S. 16:1651. Var. *Paùlii*, Rehd. (var. *coccinea*, Hort. Var. Paul's New Double Scarlet. *C. Oxyacantha* var. *spléndens*, Schneid.). Fig. 1103. With

double, bright scarlet fls.; one of the most showy. I.H. 14:536. F. 1867:117. Var. *aurea*, Loud. (*C. Oxyacantha* var. *xanthocarpa*, Lange). With yellow fr. Var. *quercifolia*, Loud. Lvs. with broad, rounded and crenate lobes.—Most of the garden forms usually listed as varieties of *C. Oxyacantha* belong to the following species. Even the varieties enumerated above are by some botanists not considered true *C. Oxyacantha*, but referred to *C. media*, Bechst., a hybrid between this and the following species; the existence of hybrid forms makes the distinction between the two species still more difficult.

46. *monogyna*, Jacq. (*C. Oxyacantha*, Hort.). Shrub or tree, to 20 ft., with stout spines: lvs. on rather slender petioles, ovate, 3-7-lobed, lobes with few teeth at the apex, 1-2 in. long; corymbs many-fl., with usually hairy pedicels: fr. oval, with usually 1 stone,  $\frac{1}{2}$ - $\frac{1}{2}$  in. high. May, June. Eu. and N. Afr. to Himalayas. Gn. 33, p. 465; 37, p. 467; 40, p. 500; 52, p. 266; 55, p. 452. R.H. 1900, p. 72 (all as *C. Oxyacantha*).—Many garden forms are cult.; some of the most distinct are the following: Var. *punicea*, Rehd. Fls. deep red, single. F.S. 15:1509, fig. 1. L.B.C. 14:1363. Var. *rosea*, Hort. Fls. pink, petals with white claw. Var. *albo-plena*, Schneid. With white double fls. F.S. 15:1509, fig. 2. Var. *rubro-plena*, Schneid. With double red fls. F.S. 15:1509, fig. 3. Varieties differing in lvs. and habit: Var. *laciniata*, Loud. Lvs. deeply pinnatifid with incised serrate lobes. Var. *pteridifolia*, Rehd. (*C. Oxyacantha* var. *pteridifolia*, Loud. Var. *flicifolia*, Hort.). Similar, but lvs. longer, with narrower and more incised lobes. F.S. 20:2076. Var. *ferox*, Schneid. (*C. Oxyacantha* var. *ferox* Carr. *C. Oxyacantha* var. *horrida*, Carr.) Branches with fascicles of numerous stout spines. F.S. 14:1468. G.C. III. 24:13. Var. *inermis*, Rehd. (*C. Oxyacantha* *inermis*, Dauthenay). A spineless form. R.H. 1900, p. 72, 73. Var. *pendula*, Loud. With pendulous branches. Gn. 68, p. 288. G.M. 44:827. M.D.G. 1902:25, 26. Var. *roseo-pendula*, Rehd. (*C. Oxyacantha* var. *pendula rosea*, Hort.). A pendulous form, with pink fls. Var. *stricta*, Loud. (var. *pyramidalis*, Hort.). Of fastigate, upright habit. G.C. III. 41:184. M.D.G. 1906:390. Var. *semperflorens*, Rehd. (var. *Briantii*, Carr.). Low, graceful shrub, flowering until fall. R.H. 1883, p. 140. Gn. 29, p. 431; 33, p. 465. There are also some varieties with variegated lvs.

## 23. ORIENTALES.

47. *tanacetifolia*, Pers. Shrub or small tree: branches with short spines or unarmed, branchlets tomentose: lvs. cuneate, obovate, pinnately 5-7-cleft, with the lobes glandular-serrate, villous-pubescent, 1-2 in. long; corymb dense, 5-7-fl.; calyx-lobes large, deeply glandular-serrate; fls. large: fr. pubescent, yellow, 1 in. or more across, with laciniate bracts at the base. May, June. Asia Minor. B.R. 22:1884. Gt. 43, p. 215.

48. *orientalis*, Pall. (*C. odoratissima*, Lindl. *C. apifolia*, Hort.). Shrub or small tree, with spreading, almost unarmed branches and tomentose branchlets: lvs. short-petioled, cuneate, obovate or oblong, pinnately 3-5-cleft, with the lobes incisely serrate at the apex, tomentose pubescent, 1-2 in. long; corymb dense, tomentose; calyx-lobes entire: fr. depressed globose, brick- or orange-red,  $\frac{3}{4}$ -1 in. across, with 4-5 stones. June. S. E. Eu., Asia Minor. B.M. 2314. B.R. 22:1885 (as *C. odoratissima*). Gn. 28:632 (as *C. tanacetifolia*), and p. 635. G.M. 40:824. Var. *sanguinea*, Rehd. (*C. sanguinea*, Schrad., not Pall. *C. Tournefortii*, Griseb.). Lvs. more glabrescent: fr. dark red, with 2-4 stones. B.R. 22:1852.

49. *Azàrolus*, Linn. (*C. Aronia*, Ser. *C. maïra*, Linn. f.). Shrub or tree, to 25 ft., with pubescent branchlets: lvs. short-petioled, cuneate-obovate, deeply 3-5-lobed, with the lobes nearly entire or incised at the apex,

grayish green, pubescent,  $1\frac{1}{2}$ -2 $\frac{1}{2}$  in. long; corymbs few-fl., densely tomentose: fr. orange-red or yellow, globular or ovoid,  $\frac{3}{4}$ -1 in. across. May. N. Afr., Asia Minor. B.R. 22:1897. (as *C. Aronia*). R.H. 1856:441. Var. *sinaica*, Boiss. Lvs. glabrous: fr. smaller, reddish yellow. B.R. 22:1855 (as *C. maroccana*). Gn. 22, p. 146; 28, p. 634.

## 24. PINNATIFIDÆ.

50. *pinnatifida*, Bunge. Fig. 1104. Shrub or small tree, to 20 ft.: lvs. slender-petioled, cuneate, elliptic-ovate, pinnately 5-9-cleft, incisely serrate: corymbs many-fl., usually pubescent: fr. globular or pyriform, dark red, punctate,  $\frac{1}{2}$ - $\frac{3}{4}$  in. high; stones 3-5. June. N. China, E. Siberia to Korea. R.H. 1901:308. Gt. 1862:366. Var. *major*, N. E. Br. (*C. Korolkowii*, Schneid., not Henry. *C. Bretschneideri*, Schneid. *C. californica*, Hort. *C. tatarica*, Hort.). Lvs. larger, less deeply lobed: fr. pyriform, 1 in. long. G.C. II. 26:620. R.H. 1901:308.

*C. altica*, Lange = *C. Wattiana*.—*C. ambigua*, C. A. Mey. Related to *C. monogyna*. Lvs. deeply 4-7-lobed, sparingly hairy on both sides, 1-2 in. long; corymbs slightly hairy: fr. ovoid, usually with 2 stones. S. Russia.—*C. Bætzleri*, Sarg.—*C. fœtida*.—*C. beata*, Sarg. Allied to *C. pruinosa*. Shrub, to 15 ft.: lvs. oblong-ovate, villous above while young; anthers dark maroon-color: fr.

1103. Paul's thorn—*Crataegus Oxyacantha* var. *Paulii*. (×  $\frac{1}{2}$ )

crimson, pruinose, ripens end of Sept. N. Y.—*C. Beckwithæ*, Sarg. Allied to *C. pastorum*. Shrub or tree, to 18 ft.: lvs. ovate, usually truncate at the base, at maturity thin; calyx-lobes glandular-serrate: fr. subglobose, crimson, with 5 stones. N. Y.—*C. bellula*, Sarg. Related to *C. pruinosa*. Shrub, to 12 ft.; glabrous: lvs. ovate, bluish green and lustrous above, 2-3 in. long; stamens 8-10: fr. dull crimson, bloomy,  $\frac{3}{4}$  in. across, with usually 4 stones. Mich. S.T.S. 1:56.—*C. berberifolia*, Torr. & Gray. Related to *C. Crugalli*. Lvs. obovate or obovate-oblong, obtuse, pubescent below, lustrous and nearly glabrous above,  $1\frac{1}{2}$ -2 in. long; corymbs pubescent; anthers yellow: fr. orange with red cheek. La. S.S. 4:179.—*C. Celsiana*, Bosc. Shrub: lvs. pinnately lobed, slightly pubescent beneath: corymbs many-fl.: fr. ovoid, red. Origin unknown, probably hybrid of *C. pentagyna*.—*C. champlainensis*, Sarg. Allied to *C. mollis*. Tree, to 20 ft., spiny: lvs. ovate, usually truncate at the base, lobed, glabrous above, pubescent on the veins below, 2-2 $\frac{1}{2}$  in. long; corymbs villous, usually 4-5-fl.; stamens 10: fr. obovoid or ovoid, scarlet,  $\frac{1}{2}$  in. long, in Sept. Que. and Ont. to Vt. and N. Y. S.S. 13:669.—*C. chlorosarca*, Maxim. Allied to *C. sanguinea*. Lvs. pinnately lobed, truncate at the base, with short lobes, glabrous at length: corymbs many-fl., nearly glabrous: fr. black, with green flesh. Japan.—*C. cognata*, Sarg. Closely related to *C. pruinosa*. Shrub, to 10 ft., spiny: lvs. ovate, acute or acuminate, slightly lobed, dull bluish green, glabrous: corymbs 5-7-fl.; anthers yellow: fr. ovoid or pyriform, pruinose, dull crimson at maturity, over  $\frac{1}{2}$  in. long, in Oct. Mass.—*C. compta*, Sarg. (*C. silvicola* var. *compta*, Eggleston). Allied to *C. pruinosa*. Shrub, spiny, glabrous: lvs. oblong-ovate, usually rounded at the base, slightly lobed, glabrous: corymbs many-fl.; stamens 7-10; anthers dark rose: fr. obovoid, light cherry-red,  $\frac{1}{2}$  in. long, in Oct. W. N. Y.—*C. conspecta*, Sarg. Allied to *C. pruinosa*. Tree, to 20 ft., spiny: lvs. broadly ovate, rounded or subcordate at the base, lobed, yellow-green, pubescent on the midrib below: corymbs 5-6-fl., slightly hairy, compact; anthers white: fr. subglobose, crimson, over  $\frac{1}{2}$  in. across, in Oct. Ont.—*C. crenulata*, Roxbg. = *Pyracantha crenulata*.—*C. cuneata*, Sieb. & Zucc. Belongs to group *Cuneata*. Shrub: young branchlets villous: lvs. short-petioled, cuneate-obovate or cuneate-oblong, crenate-serrate, glabrous and lustrous above, sparingly hairy below: corymbs villous, 3-7-fl.; stamens 20; anthers red: fr. red, with 5 stones, plain inside. China and Japan. L. I. 5.—*C. cupulifera*, Sarg. Allied to *C. rotundifolia*. Shrub, to 20 ft.: lvs. obovate or rhombic, slightly lobed, lustrous and scabrate above: corymbs slightly villous; fls. cup-shaped; stamens 10, anthers pink: fr. scarlet, with 3-4 stones. N. Y.—*C. Dayana*, Sarg. Allied to *C.*

pedicellata. Tree, to 15 ft., spiny: lvs. broadly ovate, acuminate, rounded or cuneate at the base, dark yellow-green, slightly hairy on the veins below while young; corymbs 10-14-fld.; fls.  $\frac{3}{4}$  in. across; stamens 20; fr. obovoid, crimson, in Sept., soon falling. W. N. Y.—*C. diffusa*, Sarg. Allied to *C. pruinosa*. Intricately branched spiny shrub, to 15 ft., glabrous: lvs. ovate, acuminate, rounded or cuneate at the base, dark bluish green and slightly scabrate above; corymbs 6-12-fld.; stamens 10; fr. subglobose, scarlet, less than  $\frac{1}{2}$  in. across, in Oct. W. N. Y.—*C. Dippehiana*, Lange (*C. tanacetifolia* var. *Leeana*, Hort. *C. tanacetifolia*  $\times$  *C. punctata*?). Small tree, spiny: lvs. rhombic-elliptic, lobed, sparingly pubescent above, densely beneath; corymbs densely villous; stamens 20; fr. subglobose, reddish yellow or dull red. Origin unknown. Gn. 33, p. 468.—*C. dissona*, Sarg. (*C. pruinosa* var. *dissona*, Eggleston). Allied to *C. pruinosa*. Slender spiny shrub, to 10 ft., glabrous: lvs. ovate to rhombic, cuneate at the base, dark bluish green; corymbs 5-7-fld.; stamens 10; anthers purple; fr. subglobose, crimson, in Oct. Mass.—*C. dsungarica*, Zabel. Allied to *C. sanguinea*. Tree:

lvs. deeply lobed, sparingly pubescent or nearly glabrous; corymbs slightly pubescent; fr. black; stones without or with slight furrows. Of unknown origin.—*C. Dúnbari*, Sarg. Shrub, to 12 ft., spiny: lvs. ovate to suborbicular, usually rounded at the base, slightly lobed, glabrous or slightly rough above; corymbs 10-14-fld.; fr. subglobose, crimson,  $\frac{1}{2}$  in. across, in Oct. W. N. Y. Belongs to group *Anomala*, allied to *Tenifolia*.—*C. durobriensis*, Sarg. Allied to *C. coccinioides*. Shrub, to 20 ft., spiny: lvs. ovate, with 3-4 pairs of short lobes, glabrous; corymbs glabrous; stamens 20; fr. bright red, in Oct. N. Y. S.T.S. 1:2.—*C. elliptica*, Ait. (*C. glandulosa*, Moench; *C. flava* var. *pubescens*, Gray). Allied to *C. flava*. Lvs. broader, of firmer texture, more pubescent and glandular; fr. subglobose, red or yellow. Southern states. B.R. 22: 1890 (as *C. spathulata*).—*C. elliptica*, Beadle, is *C. senta*, Beadle, a species allied to *C. flava*. S.S. 13:697.—*C. elliptica*, Mohr, is *C. signata*, Beadle, a species allied to *C. Crus-galli*. S.S. 13:644.—*C. exornata*, Sarg. Allied to *C. pruinosa*. Shrub, to 10 ft., spiny: lvs. ovate, usually rounded at the base, slightly lobed, dark yellow-green and rough above; corymbs 5-6-fld.; stamens 7-10; anthers pink; fr. subglobose, scarlet, less than  $\frac{1}{2}$  in. across, in Sept. Ont.—*C. Pázonii*, Sarg. Allied to *C. rotundifolia*. Shrub, to

10 ft., spiny: lvs. broadly ovate, with 4-5 pairs of short lobes, nearly glabrous at maturity; corymbs villous; stamens 5-10; fr. dark crimson, in Sept. N.H. S.T.S. 1:60.—*C. ferentaria*, Sarg. Allied to *C. macracantha*. Intricately branched shrub, to 12 ft., with stout spines; lvs. rhombic or obovate, puberulous below on the veins; corymbs slightly villous; stamens 7-10; anthers white; fr. subglobose or ovoid,  $\frac{1}{2}$  in. long, scarlet, with usually 2 stones, ripening in Oct. W. N. Y.—*C. flabellata*, Spach (*C. Grayana*, Eggleston). Allied to *C. pedicellata*. Shrub, to 20 ft.: lvs. ovate, with short acute lobes, at first sparingly hairy above and villous at the veins beneath; corymbs slightly villous; calyx-lobes sparingly glandular-serrate; stamens 20; fr. ovoid, crimson, with 3-5 stones, in Sept. Que.—*C. florentina*, Zaccagni—*Pyrus cratægifolia*.—*C. fétida*, Ashe (*C. Baxteri*, Sarg.). Allied to *C. intricata*. Intricately branched, spiny shrub, to 12 ft., glabrous: lvs. ovate or oval; corymbs usually 5-6-fld.; calyx-lobes serrate; fr. subglobose, orange-red or reddish brown, about  $\frac{1}{2}$  in. thick, with 3-4 stones, in Oct. Mass. to Ont. and Va.—*C. Fontanesiana*, Steud. Allied to *C. Crus-galli*. Lvs. elliptic or elliptic-lanceolate, almost glabrous, shining above; corymbs many-fld., pubescent; fr. red. Probably hybrid of *C. Crus-galli*.—*C. Förbesæ*, Sarg. Allied to *C. pastorum*. Shrub, to 15 ft.: lvs. ovate to oval, cuneate or rounded at the base, slightly lobed; stamens 20; anthers dark rose-color; fr. globose or ovoid, scarlet, with thin and juicy flesh. Mass.—*C. formosa*, Sarg. Allied to *C. pruinosa*. Shrub, to 15 ft.: lvs. oblong-ovate, rounded or cuneate at the base, slightly lobed, slightly hairy above while young; corymbs many-fld.; fr. ovoid or obovoid, scarlet, pruinose, with 4-5 stones. N. Y.—*C. gemmōsa*, Sarg. Allied to *C. succulenta*. Tree, to 30 ft., spiny: lvs. broadly obovate to broadly elliptic, doubly serrate and often slightly lobed, at maturity pubescent on the midrib beneath; corymbs villous; fr. scarlet, lustrous, in Oct. N. Y. to Mich. and Ont. S.S. 13:686.—*C. genesensis*, Sarg. Allied to *C. Crus-galli*. Small tree, to 12 ft., spiny, glabrous: lvs. obovate-oblong, pointed at the rounded or acute apex, with prominent veins; corymbs many-fld., lax; anthers pink; fr. ovoid, scarlet,  $\frac{1}{2}$  in. long, with 1-3 nutlets, in Oct. W. N. Y. G.C. III. 53:115.—*C. glandulosa*, Moench=*C. elliptica*.—*C. gloriosa*, Sarg. Allied to *C. pedicellata*. Tree, to 25 ft., with few spines: lvs. ovate, cuneate or rounded at the base, rough above, slightly pubescent on the veins below, sometimes finally glabrous; corymbs 10-15-fld.; stamens 7-10; fr. ovoid, often unsymmetrical, deep crimson, in Sept. W. N. Y.—*C. grandiflora*, Koch (*C. lobata*, Bosc. *Cratægus-mespilus grandiflora*, Camus). Small tree: lvs. elliptic, serrate, often slightly lobed toward the apex, pubescent; fls. 1-3, large; fr. brown, globose, large. Supposed to be a hybrid between *Mespilus germanica* and a *Cratægus*. G.F. 10:35. R.H. 1869, p. 80.—*C. Grayana*, Eggleston=*C. flabellata*.—*C. Hábisonii*, Beadle. Belongs to group *Bracteata* allied to *Intricata*. Tree, to 25 ft.: lvs. oval or broadly obovate, coarsely serrate; petioles glandular; corymbs many-fld., with conspicuous glandular bracts; fr. red or bright red, in Oct. S.S. 13:691.—*C. heterophylla*, Fluegge. Allied to *C. monogyna*. Lvs. larger, usually trifid; fr. larger, bright red; corymbs many-fld. B.R. 14:1161; 22:1847.—*C. hiemalis*, Lange. Possibly *C. Crus-galli*  $\times$  *C. pentagyna*. Lvs. elliptic to ovate, densely serrate or slightly lobed, lustrous above, pubescent on the veins beneath; corymbs villous; stamens 15, with purple anthers; fr. purplish black. Origin unknown.—*C. Holmesiana*, Sarg. Allied to *C. pedicellata*. Tree, to 30 ft.: lvs. oval or ovate, slightly lobed, at maturity yellowish green, glabrous; fls.  $\frac{1}{2}$ - $\frac{3}{4}$  in. across; stamens usually 5, anthers purple; fr. ovoid, crimson, with usually 3 stones. Montreal to Pa., W. N. Y. and Ont. S.S. 13:676.—*C. integriloba*, Sarg. Allied to *C. tomentosa*. Tree, to 10 ft., spiny: lvs. broadly obovate or oval, broadly cuneate at the base, slightly lobed, glabrous; corymbs villous; calyx-lobes entire; fr. subglobose,  $\frac{1}{2}$ - $\frac{3}{4}$  in. across, scarlet, lustrous. Que. G.C. III. 47:60.—*C. irritata*, Sarg. Allied to *C. pedicellata*. Shrub, to 12 ft.: lvs. ovate, cuneate or rounded at the base, slightly lobed, lustrous and glabrous above; stamens 20, anthers yellow; fr. ovoid, dark red, lustrous. Que.—*C. Korolkowii*, Henry=*C. Wattiana*. See also No. 50.—*C. laeta*, Sarg. Allied to *C. Ellwangeriana*. Arborescent shrub, spiny: lvs. ovate, acuminate, scabrate above, sparingly pubescent on the veins below; corymbs 8-12-fld., compact; fr. ovoid, bright orange-red,  $\frac{1}{2}$  in. long, with 5 nutlets, in Sept. Origin unknown, much planted in Boston parks.—*C. leiophylla*, Sarg. Allied to *C. pruinosa*. Slender intricate, spiny shrub, to 15 ft., glabrous: lvs. broadly ovate, usually rounded or truncate at the base, dark dull blue-green above; corymbs 5-7-fld., compact; anthers yellow; fr. obovoid, bright red,  $\frac{1}{2}$  in. long, with usually 4 stones, in Nov. W. N. Y.—*C. livoniana*, Sarg. Allied to *C. Crus-galli*. Tree, to 20 ft., spiny, glabrous: lvs. oblong-obovate, acute or rounded at the apex, finely and often doubly serrate; corymbs lax, 10-18-fld.; calyx-lobes glandular-serrate; fr. subglobose to ovoid, dark crimson,  $\frac{1}{2}$  in. long, with 2-4 stones, in Oct. N. Y. S.T.S. 2:129.—*C. lobata*, Bosc=*C. grandiflora*.—*C. lucorum*, Sarg. Allied to *C. pastorum*. Tree to 25 ft., spiny: lvs. broadly ovate to obovate, slightly lobed, glabrous; corymbs villous, few-fld.; stamens 20, with purple anthers; fr. ovoid, crimson, in Sept. Ill. S.S. 13:679.—*C. maineana*, Sarg. *C. leiophylla* var. *maineana*, (Eggleston). Allied to *C. pruinosa*. Tree-like shrub, to 15 ft., spiny, glabrous: lvs. ovate to deltoid, acuminate, hairy while young; corymbs many-fld.; stamens 10; anthers dark purple; fr. globose, scarlet, scarcely pruinose, about  $\frac{1}{2}$  in. thick, in Oct. W. N. Y.—*C. matra*, Sarg. Allied to *C. pastorum*. Shrub, to 10 ft., with few spines, glabrous: lvs. oval to ovate-oblong, usually cuneate at the base, dark green above, yellow-green below; corymbs many-fld.; stamens 5-10; anthers red; fr. ovoid, dark purplish crimson,  $\frac{1}{2}$  in. long, in Aug. Vt., Mass., N. Y.—*C. Mazimowiczii*, Schneid. (*C. sanguinea* var. *villosa*, Maxim.). Allied to *C. sanguinea*. Small tree, to 20 ft.: lvs. ovate, slightly lobed, pilose below; corymbs densely pilose; fr. pilose when young, finally glabrous. Amurland, Manchuria.—*C. microcarpa*, Lindl.=*C. spathulata*.—*C. opulens*, Sarg. Allied to *C. pruinosa*. Shrub, to 15 ft., spiny, glabrous: lvs. oblong-ovate to oval, acuminate, hairy above while young; corymbs 5-8-

fld., compact: fr. subglobose, obscurely angled, crimson, slightly pruinose,  $\frac{1}{2}$  in. long, in Oct. W. N. Y.—*C. Palmieri*, Sarg. Allied to *C. Crus-galli*. Tree, to 25 ft.: lvs. broadly ovate to oblong, rounded or acute at the apex, coarsely serrate, glabrous: corymbs glabrous; stamens 10, with yellow anthers: fr. dull green, tinged with red, in Oct. S.M. 381.—*C. peregrina*, Sarg. Allied to *C. mollis*. Tree: lvs. ovate, broadly cuneate, with 5-6 pairs of narrow lobes, glabrous above, villous beneath: corymbs many-fld., villous: fr. ovate-globose, dark dull purple, pubescent at the base and apex,  $\frac{1}{2}$  in. across. Origin unknown, probably S. W. Asia. S.T.S. 2:191.—*C. perjuvanda*, Sarg. Allied to *C. pruinosa*. Spiny shrub, glabrous: lvs. ovate, acuminate, dark green above: corymbs 8-10-fld.; anthers white: fr. ovoid, orange-red, finally crimson, slender-stalked, less than  $\frac{1}{2}$  in. long, in Oct. Ont., N. Y.—*C. persimilis*, Sarg. Allied to *C. Crus-galli*. Shrub, to 8 ft.: lvs. oblong-obovate to oval, usually acute, veins prominent, slightly hairy while young: corymbs slightly villous; stamens 10-20: fr. subglobose or ovoid, crimson, lustrous, with 1-2 stones. N. Y.—*C. præcox*, Sarg. (*C. præcoqua*, Sarg.). Allied to *C. rotundifolia*. Shrub, to 10 ft., spiny: lvs. rhomboidal to oval, slightly hairy while young, glabrous at maturity and scabrous above: corymbs slightly villous, many-fld.; stamens 10: fr. subglobose, dark crimson,  $\frac{1}{2}$  in. thick, in Aug. Vt., Que.—*C. promissa*, Sarg. Allied to *C. pruinosa*. Shrub, to 12 ft., spiny, glabrous: lvs. oblong-ovate, acuminate, deeply lobed: corymbs lax, many-fld.; stamens 5-7; anthers pink: fr. ovoid, crimson, not pruinose, less than  $\frac{1}{2}$  in. long, in Sept. W. N. Y.—*C. Pyracantha*, Pers.—*Pyracantha coccinea*.—*C. rivularis*, Nutt. Allied to *C. Douglasii*. Shrub: lvs. ovate-lanceolate, serrate, glabrous at length. Wyo. to Colo. and Utah. S.S. 4:176.—*C. Sargentii*, Beade. Allied to *C. intricata*. Tree, to 20 ft.: lvs. elliptic to oblong-ovate, slightly lobed, glabrous at maturity: corymbs slightly villous or glabrous; stamens 20, with purple anthers: fr. yellow or orange-yellow, tinged with red, in Sept. Ga. to Tenn. and Ala.—*C. songarica*, Regel.—*C. Wattiana*.—*C. spathulata*, Michx. Shrub or tree, to 20 ft.: lvs. cuneate, oblanceolate, crenately serrate or 3-lobed at the apex: corymbs many-fld.: fr. scarlet, globular,  $\frac{1}{4}$  in. across. Southern states. S.S. 4:185. B.R. 22:1846 (as *C. microcarpa*). The only species of the group *Microcarpæ* allied to the *Apiifoliæ*.—*C. triflora*, Chapm. Shrub or small tree, to 20 ft.: lvs. ovate or elliptic, serrate, often slightly lobed, pubescent, 1-2  $\frac{1}{2}$  in. long: corymbs 3-fld., hirsute; fls. 1 in. across; stamens 20; anthers yellow: fr. globose, red. Ga., Ala. Belongs to the group *Trifloræ*, allied to *Intricatæ*.—Very distinct and handsome; has proved hardy at the Arnold Arboretum.—*C. verecunda*, Sarg. Allied to *C. intricata*. Shrub, about 3 ft., spiny, glabrous: lvs. oblong-obovate or oval, acute or acuminate, light bluish green: corymbs 6-10-fld.; stamens 7; anthers white: fr. ovoid or obovoid, less than  $\frac{1}{2}$  in. long, with 2-3 stones, in Sept. or Oct. W. N. Y.—*C. Wattiana*, Hemsl. & Lace. (*C. altaica*, Lange. *C. songarica*, Regel). Allied to *C. sanguinea*. Lvs. smaller, truncate at the base, glabrous: corymbs glabrous: fr. yellow or reddish yellow, smaller. Cent. Asia. Var. *incisa*, Schneid. (*C. Korolkowii*, Henry. *C. sanguinea* var. *incisa*, Regel). Lvs. more deeply and acutely lobed. R.H. 1901:301.—*C. Wilsonii*, Sarg. Allied to *C. tomentosa*. Shrub, to 20 ft.: lvs. ovate or obovate, acute or obtuse, lustrous above, sparingly villous beneath: fr. ovoid, red, nearly  $\frac{1}{2}$  in. long, with 1-3 stones. Cent. China.

ALFRED REHDER.

**CRATÆVA** (after Cratevas, an obscure writer on medicinal plants, not, as sometimes stated, at the time of Hippocrates, but at the beginning of the first century B. C., since he named a plant after Mithridates). *Caparidææ*. Tropical trees and shrubs, sometimes planted in the warm parts of the country.

Leaves 3-foliolate: fls. in corymbs, usually polygamous, with the odor of garlic; sepals and petals 4; stamens 8-20; torus elongated: berries ovate-globose, with a slender stripe.—Ten species, around the globe. The bark of the garlic pear, *C. gynandra*, blisters like cantharides. *C. religiosa*, from Malabar and the Society Isls. is a sacred tree, and is planted in native graveyards. The bitter, aromatic lvs. and bark are used by them in stomach troubles. The above and some other species are cult. in Eu. as ornamental greenhouse shrubs.

*religiōsa*, Forst. f. (*C. Nurvāla*, Buch-Ham.). A spreading unarmed deciduous tree of graceful proportions: lvs. long-petioled, the lfts. 2  $\frac{1}{2}$ -3 times as long as broad: fls. 2-3 in. across, showy, yellow, or purplish yellow, the petals long-clawed.—Once cult. by Franceschi, Santa Barbara, Calif., but reported by him as no longer in cult. there. Excellent greenhouse plant N.

N. TAYLOR.†

**CRATEROSTIGMA** (Greek, referring to character of stigma). *Scrophulariææ*. *Torenia*-like perennial low nearly stemless herbs of E. and S. Afr., sometimes grown under glass. Lvs. radical, plantago-like, many-nerved, entire: fls. lilac and purple, spicate, racemose or even solitary; calyx tubular, 5-ribbed and narrowly 5-toothed; corolla tubular, 5-ribbed and 5-toothed, the

tube enlarged toward the top, the limb 2-lipped, the dorsal lip concave and entire or emarginate, the other large and spreading and 3-lobed; stamens 4 and perfect, in unequal pairs; style filiform, 2-lobed and dilated at apex: fr. an oblong caps. included in the calyx. Differs from *Torenia* in technical floral characters and in being nearly or quite stemless and with only radical lvs.—About 4 species. *C. pumilum*, Hochst. (*Torenia auriculæfolia*, Dombr.) has fls. on slender pedicels  $\frac{1}{2}$ -1  $\frac{1}{4}$  in. long, the corolla-lobes pale lilac blotched with purple and veined with white: lvs. sessile, ovate, in a basal rosette, pubescent beneath and nearly glabrous above. E. Africa. F.M. 10:534.—A stemless perennial.

L. H. B.

**CRÊPIS** (Greek for *Sandal*; application obscure). *Compositæ*. A large group of annual, biennial and perennial herbs, a few of which are now and then grown in outdoor gardens for the showy flowers.

Much like *Hieracium*, differing mostly in the simpler involucre, white soft pappus, and beaked achene: lvs. radical and cauline, the former mostly runcinate, repand or pinnatisect, the latter mostly clasping: heads pedunculate, solitary or paniculate, all the florets perfect and ligulate, the rays yellow, orange or red: fr. a smooth achene.—Perhaps 250 species in the north temperate zone, some of them weedy and widely dispersed. Among the cult. kinds is *C. sibirica*, which resembles a sow-thistle in habit, and has corymbs of reddish blue fls. about the size of a hawkweed, or a small dandelion. It is one of the coarser border plants, and rare. Rather light, sandy soil, and full exposure to the sun are essentials to the welfare of this plant. It is contented in a rather dry position, either in the rockery, or in the border. It is prop. by division. A common plant on the moss of English thatched cottages is *C. virens*, a yellow-fld. plant, resembling a dandelion. *C. rubra* appears to be the commonest annual species cult. abroad.

1105. *Crepis rubra*. (×  $\frac{1}{4}$ )

*sibirica*, Linn. Perennial, 2-3 ft. high, and at least as wide when in bloom: plant covered with short rough hairs: root large, fleshy: lvs. rough, wrinkled, the lower coarsely dentate, the upper often somewhat cordate, 12 in. long, including a petiole half as long: fls. bright yellow in a strictly terminal corymb; involucre loose, hairy. July. Eu., Asia Minor, Himalayas. Gn. 53, p. 493.—The tallest and largest-fld. of the genus. Its white plummy masses of seeds are also attractive.

*auræa*, Reichb. Black-hairy: height 1 ft. or less: fls. orange, mostly solitary: lower lvs. spatulate-oblong, toothed, shining. June. Alps.—One of the commonest perennial species of the genus abroad. Repays rich soil.

*rubra*, Linn. Fig. 1105. Annual: height  $\frac{1}{2}$ -1  $\frac{1}{2}$  ft.: fls. red, usually solitary, the involucre being hispid. An attractive little flower-garden plant. Var. *alba*, Hort., has flesh-colored or whitish fls. Italy, Greece.

*C. barbata*, Linn.=Tolpis.—*C. montana*, Reich. 12-18 in.; lvs. unequally dentate; fls. yellow in a large head. High mts., Switzerland, etc. Mentioned as grown in this country, but apparently not in the trade. L. H. B.†

**CRESCÉNTIA** (after Crescenzi, thirteenth century Italian agricultural writer). *Bignoniaceæ*. This genus is chiefly interesting for the calabash tree, which has

1106. *Crescentia Cujete*.—The calabash. ( $\times \frac{1}{2}$ )

no near allies of horticultural importance; yields the calabash fruit.

Tropical trees, glabrous: lvs. alternate, solitary or clustered at nodes; fls. large, tubular, with a fluted 5-cut limb, yellowish, with red or purple veins; calyx 2-parted or deeply 5-cut.—About 5 species, in Mex. and Cent. Amer. The calabash tree is a native of Trop. Amer., is especially familiar in the W. Indies, and can be grown outdoors in extreme S. Fla. and S. Calif. The outer skin of the fr. is removed and the seeds and pulp from within, and the hard woody shell is used for water-gourds and for all sorts of domestic vessels, according to size and shape. The growing fr. can be made to assume various forms by skilful tying. It is a tree 20-40 ft. high, and readily distinguished from all others by its peculiar habit of growth, as it bears large, horizontal, scarcely divided branches, which bear clusters of lvs. at intervals. The tree is becoming important in the manufacture of tobacco-pipes.

*Cujète*, Linn. Fig. 1106. A handsome tree when growing in the open, with wide-spreading well-foliated branches: lvs. 4-6 in. long, broadly lanceolate, tapering at the base, dark glossy green; fls. solitary, pendulous; calyx 2-parted; corolla constricted below the middle, and then swollen above, malodorous when decaying; stamens 4, sometimes 5; fr. frequently 18-20 in. through. The growing tree has somewhat the habit of a Burbank plum tree. B.M. 3430. N. TAYLOR.†

**CRESS.** A name applied to the pungent herbage of several species of the *Cruciferae*, used as salad.

The leaves of the ordinary garden cress (*Lepidium sativum*), sometimes called peppergrass, have a pleasant pungency, somewhat like that of the water-cress, which makes the plant well adapted to be used as a popular condiment, served with salads, especially lettuce, and also for garnishing purposes. The quick sprouting habit of the seed is proverbial. Often the plants show above ground the third day after seed is sown. But if cress is wanted in its prime continuously, new sowings must be made every few days. Sow seed rather thickly in rows a foot apart, selecting any good garden loam. The reason that this useful plant is seldom seen in the average home garden is probably

its liability to be attacked by hordes of flea-beetles which seem to have a particular fondness for cress pungency. But it is easily grown under glass, in flower pots, flats, or on a bench, in any light and fairly warm place and in any good soil. Grown thus it is usually free from flea-beetle injury, and goes well with forced lettuce. Seed is easily grown, either in the open or under glass. The plants are allowed to mature their seeds, are then pulled and the seed rubbed or thrashed out and cleaned. There are slight variations in the form of the leaves, some of which are more or less curled, others more of the broad-leaved type.

Water-cress (*Nasturtium officinale* of the older books, but known as *Radicula Nasturtium-aquaticum* and *Roripa Nasturtium* in recent books), Fig. 1107, is a hardy perennial, and finds a congenial place in small, running streams, shallow pools or ditches, wintering well when covered with water. It is usually found freely 'bunched' in most of our markets and at green grocers'. It grows readily from seed as well as from freshly cut pieces of branches, and soon spreads over a large area. The best product comes from clear running water.

Similar to water-cress in pungency is the upland cress (*Barbarea praecox*), a hardy biennial. It also grows easily from seed sown in the open or under glass in ordinary soils and situations. The root-leaves are used for garnishing and seasoning, but they are not of the highest quality. See p. 454, Vol. I.

Other plants sometimes grown under the name of cress are *Cardamine pratensis* (p. 661) and *Spilanthes oleracea* (which see). The very pungent root-leaves of the former are said to be eaten, but apparently the plant is not cultivated for this purpose.

T. GREINER.

**CRĪNUM** (Greek name for a lily). *Amaryllidaceæ*. Large and showy flowering bulbs, mostly tender, closely allied to *Amaryllis* and distinguished by the longer perianth-tube; flowers usually white or in shades of red; largely summer bloomers, but differing widely in this respect.

Stems arising from a tunicated bulb with a more or less elongated neck: lvs. mostly persistent, usually broad, sometimes several feet long; fls. few or many in a 2-bracted umbel, often very fragrant and with 3 types of coloring, pure white, banded red or purplish down the center, or flushed with the same colors; perianth salverform or funnel-shaped, the tube straight or curved, long-cylindrical; segms. linear, lanceolate or oblong, nearly or quite equal; stamens 6, attached on the throat of the corolla, with long filiform filaments and very narrow versatile anthers; ovary 3-celled, the ovules few in each cell, the style long and filiform, somewhat bent

1107. Water-cress—*Radicula Nasturtium-aquaticum*.

downward, the stigma not lobed; fr. a roundish or irregular caps., at length dehiscing; seeds large, green, thick.—Probably 100 species in warm and tropical regions around the world, in moist or wet places. The crinums are amaryllis-like plants of great beauty. They are widely grown, often under the name of "lilies," some of them as greenhouse plants, some as

coolhouse subjects, and a few as hardy border plants. The bulbs are often very large, sometimes as much as 2 or 3 feet long, neck and all, the leek-like neck gradually tapering from the bulb proper. In some species the bulb is short and onion-like. Fig. 1108 shows forms of crinum bulbs. In some species the flowers are 1 foot long and half as broad; and sometimes the leaves reach the length of 6 feet and a width of 5 or 6 inches. The flower-stalk is solid, leafless, usually arising from the side of the bulb-neck. The genus might be roughly divided into the evergreen kinds, mostly with leek-like bulbs and symmetrical star-like straight-tubed usually erect flowers; and the deciduous-leaved kinds, mostly with roundish bulbs and nodding bell-shaped more or less irregular flowers.

The crinums require so much room that they are not often seen in commercial collections in this country. They are particularly adapted to mild and warm climates, and therefore full notes on such handling of them are given here. They are not much grown in American greenhouses. The species cross freely, and many fine hybrids are known, some of them under Latin species-names.

#### Hardy crinums.

The species of *Crinum* require widely different culture, and their geographical distribution furnishes an important clue as to the degree of warmth required. There are two species hardy in the northern states, *C. longifolium* and *C. Moorei*, the latter being less reliable than the former but with finer flowers. These two species differ from others in blooming all summer instead of during a short period, and in the more lasting qualities of their flowers. An interesting hybrid between the two, *C. Powellii*, is hardier than *C. Moorei*, and the flower, though better than *C. longifolium*, is not quite so showy as that of *C. Moorei*. The hybrid has three well-marked colors, white, rosy and purplish. A single bulb of the white variety has given fifty flowering bulbs in four years. It is excellent for placing in conspicuous positions on terraces or lawns, or in corners where flowers are wanted to combine with architecture or statuary for summer effect. The *Agapanthus* is frequently grown also for such purposes. Of course large specimens are needed for this use, but they are easily secured and they last from year to year. The bulbs of crinums are mostly grown in Holland and in Florida. The only native species, *C. americanum*, the "swamp lily of Florida," makes a brilliant and striking spectacle when seen in places far from cultivation, as in the Everglades.

The most reliable of the hardy crinums in the North is probably *C. Powellii*. If the bulbs are planted  $2\frac{1}{2}$  to 3 feet deep (to the bottom of the bulb) in well-drained soil, the plant stands without protection in the neighborhood of New York City. Let them stand 2 to 3 feet apart. This crinum makes a very ornamental summer plant, even the strong foliage producing a tropical effect. It produces offsets very freely, but they are deep in the ground. It seems not to produce seed in the North. *C. longifolium* is also hardy, but is better with a covering in winter; and it is inferior to *C. Powellii* in leaf and flower. *C. Moorei* is equally hardy except that the bulbs grow near the surface and are therefore so much exposed as often to be ruined by frost. It is a very desirable summer species. It often seeds in the latitude of New York City; and these fleshy seeds germinate readily if placed on the surface of moist soil. It produces offsets freely, which are used in propagation. It has very strong fleshy roots; and when grown in pots or tubs (which is a desirable practice) it should be given plenty of room. This species has a long columnar neck with a spreading cap or crown of leaves, and large white or pink flowers. *C. variabile* (*C. capense*) is hardy south of the Ohio. There are a number of half-hardy species; and most of the

greenhouse kinds make very desirable lawn or porch plants when well established in large pots or tubs.

#### Tender crinums.

There are more than fifty species of greenhouse crinums, all of them worth growing because of their handsome flowers; some of them have very ornamental foliage. Most of the species are seldom seen in this country, possibly because they occupy too much space and give a comparatively small number of flowers to recompense the grower for their upkeep. It is not necessary to keep the evergreen species growing all the time after the flowers have been produced. The plants may be put out-of-doors under a lath-house for four or five months. The soil should be of a lasting nature with good drainage so that frequent repotting will not be necessary. When the plants are in a growing state, frequent applications of manure water will be found to be beneficial. In the warmer parts of the country,

1108. *Crinum* bulbs as named in the trade. Left to right, *C. Moorei*, *C. giganteum*, *C. Kirkii*, *C. Powellii*.

many of the tropical species should be plunged or planted out in the open border, where they often give a satisfactory quantity of flowers. In winter, the plants may be carried over under the bench of a temperate house. They should be given water occasionally during April and the first half of May to encourage new root-growth. When planted out in rich soil, nearly all of them will produce their gorgeous flowers out-of-doors; and during winter they are best treated as dormant bulbs with a little more heat than given such plants as cannas and richardias, planting them out as soon as the weather is favorable. A few of the tropical crinums are grown for their foliage principally, and are often seen in public conservatories and palm-houses where they suffer but little from dense shade. The flowers of most species are exceedingly handsome but only for a comparatively short time; during the remainder of the year when out of bloom there are hosts of things that are much more ornamental. Tropical crinums should be grown in this country nearly altogether for outdoor work; we then get the best out of them because our hot summers are favorable to their growth and for the production of bloom. Those species not amenable to this treatment do not give results at all in keeping with the space and time devoted to them. (G. W. Oliver.)

*Crinums in Florida and the South.*

The various species of Crinum belong to the most important, the most beautiful and the most popular of Florida garden plants. No plants grow so easily, with so little attention, and no plants are so floriferous and so deliciously fragrant. Some of the species, as *C. zeylanicum*, *C. erubescens* and *C. Sanderianum*, are so common in gardens, that they are little appreciated by people in general. Planted together in masses or in borders and in front of shrubbery, they look extremely beautiful. They grow best in rich, somewhat moist soil, but they are also perfectly at home in the high pineland ridges when well fertilized and cultivated. There is great confusion in the nomenclature of these plants, scarcely half a dozen being correctly named in the various catalogues. The following notes are based on many years' experience with crinums in Florida, and the names represent plants that the author considers to be proper representatives of the species.

*C. abyssinicum* has white flowers and is attractive, but it does not grow well in the sandy soils of Florida.

*C. amabile*. Very much like *C. augustum* in growth and the flowers also much the same, but it is considerably smaller and multiplies rapidly by offsets. Every three or four years it must be replanted in fresh rich ground, and the offsets must then be removed. It is a very beautiful plant, and much more floriferous than the *C. augustum*, flowering in every month of the year. The perfume of the masses of flowers in spring and summer is so strong that it pervades the entire garden. It does not bear seeds in Florida, but the pollen is fertile and can be used in cross-breeding.

*C. americanum*. Common along muddy banks of lakes and rivers. A very beautiful pure white, intensely fragrant species and very valuable in hybridizing work. Flower-stem usually 3 feet high, bearing mostly four flowers. Grows well in gardens, particularly in rich moist soil.

*C. amatum*. A rather small-growing Asiatic species with long slender bulbs and white flowers tinged red on the outside. Rare.

*C. asiaticum*. The columnar stem-like bulb, about 12 to 15 inches long, grows mostly above the ground. In planting it should never be set deep in the ground; a few inches is sufficient. The leaves are arranged in a rosette. They are about 3 feet long, very broad near the bulb, gradually narrowing to a sharp point at the end. The color is light bluish green. Flowers almost all the year round, even in winter when the weather is warm, usually 20 flowers in an umbel being borne always a little above the foliage on a strong stem. The flowers are pure white, with linear narrow segments; filaments and stigma purplish red, yellowish white in the lower third. Strangely and deliciously fragrant. A real gem among our garden flowers. Hardy all over the Gulf Coast region, where it forms in time large and impressive clumps of tropical foliage. Bears large pea-green fleshy seeds abundantly. Excellent for raising hybrids.

*C. augustum*. "Great Mogul" of Barbados. The largest-growing of all our crinums, specimens 4 feet high and 6 to 8 feet in diameter being not uncommon. It needs rich moist soil and a fair amount of good fertilizer. Leaves are very broad, 4 to 5 feet long, narrowing gradually to a sharp point, deeply channeled. It blooms continually for months. Flower-stem an inch in diameter, purplish-red, 4 feet high, bearing a large umbel of glossy purplish crimson flower-buds which are pink inside after opening. Nearly twenty flowers to each umbel, giving a large mass of very beautiful and deliciously fragrant blossoms. This umbel is so large and heavy that it soon bends over and finally lies on the ground. For this reason, it is necessary to tie it to a strong bamboo stake. It is difficult to propagate, as offsets are formed slowly. A plant five years old has formed only two side-shoots. Although it affords good pollen for hybridizing purposes, it does not seed. Hardy in New Orleans.

*C. campanulatum* (*C. cafrum*). Very distinct, with beautiful glaucous green leaves and umbels of six to eight rosy red campanulate flowers. The flowers are much recurved at their edges. It blooms several times each year. One plant, although eighteen years old, never made a side-shoot. It grows wild in ponds in southern Africa and very likely needs moist soil.

*C. Careyianum* (offered in the trade as *C. virginicum* which is really a white-flowering species from Brazil). It also goes under the name of *C. grandum*. This is a doubtful plant, being perhaps an old English hybrid. It is very distinct from all other crinums, very beautiful and deliciously fragrant and a night-bloomer. Flower-stem 3 feet high, with an umbel of six to eight pure white flowers with a faint red band in the center. The buds are reddish and the stem is purplish grayish green. Bears no seed.

*C. caribaeum*. Reminds one of *C. americanum*, but flower-stem grayish purple on a green ground. Flowers pure white, very fragrant. Rare.

*C. crassipes*. Bulbs conical, very large, 8 to 10 inches in diameter. Forms offsets tardily, if at all. Flower-stem short. Flowers fifteen to twenty in an umbel, white, bell-shaped, faintly keeled with pink.

*C. erubescens* (usually advertised as *C. fimbriatulum*). One of the most common species in Florida gardens. Increases rapidly by offsets. Leaves long, thin and narrow, 2 to 3 feet long; flower-stem 2 to 3 feet tall, purplish green, carrying usually four to six very beautiful fragrant flowers, pure white with a faint pink keel,

outside purplish red. Does not bear seeds, and pollen, and is useless for cross-breeding. Found everywhere in gardens.

*C. fimbriatulum*. Extremely rare, and not in the trade. Flowers pure white, with a soft red band in the center of each petal. One plant formed only five offsets in the course of eight years.

*C. giganteum*. Perhaps the most beautiful species, the leaves being as ornamental as an aspidistra or a dracena. Evergreen like *C. pedunculatum*, *C. amabile*, *C. augustum*, and *C. asiaticum*. The leaves are about 3 feet long, rich deep green with a slight bluish tint. It forms large clumps in the course of a few years. Flowers six to eight in an umbel, bell-shaped, creamy white in the bud, pure white when fully expanded, exhaling a very strong vanilla-like perfume. They appear six or eight times during the year, even in winter when the weather is warm. Needs rich moist soil and does not thrive satisfactorily on high dry land. An excellent species for hybridization.

*C. imbricatum*. Allied to *C. giganteum*, but bulbs much larger and leaves rather glaucous green, strongly nerved, with serrated edges. Flowers similar, but creamy white. Flowers usually two or three times during the year. This is as beautiful as *C. giganteum*, but it does not form such large clumps in the course of a few years. Seeds freely.

*C. Kunthianum*. A large-growing species, with a fine rosette of bright green spreading leaves and large umbels of pure white flowers. Its variety *nicaraguaense* is a still larger-growing plant. The flower-stem is quite short, about a foot high, bearing five or six very large white flowers with a faint pink band in the center, purplish on the outside. The flowers of both are strongly fragrant.

*C. longifolium*. An excellent plant for hybridizing. The leaves are glaucous green, flowers eight to twelve in an umbel, pink, flushed with deeper red on the outside. A fine foliage plant, though flowers not very showy. The white variety, *C. longifolium album*, with very beautiful pure white bell-shaped flowers, is a very showy plant and much superior to the type.

*C. Macowanii*. Forms very large bulbs with long slender necks. A beautiful species with pink flowers, but very difficult to grow in light soils. It does not flower regularly each year.

*C. Moorei*. Bulb very large, 6 to 8 inches in diameter, with a very long slender, stem-like neck about 10 to 12 inches long. The leaves are very beautiful, long and thin and very wavy. It usually flowers in March in central Florida. Flowers four to ten in an umbel, bell-shaped, rosy or pinkish red and deliciously fragrant. There is a beautiful white form of this extremely beautiful species. Var. *Schmidtii*, which usually flowers also in March or April. Both kinds bear seeds if hand-pollinated with their own pollen or crossed with different other species. This crinum will not thrive well in the light sandy soils. It requires a heavier soil with some clay in it, and it grows well only in a lath-house.

*C. pedunculatum*. Very rare in Florida gardens. Reminds one of *C. asiaticum*, but the bulb is shorter, more massive and the leaves thinner and of a brighter green. Flowers twenty to twenty-five in an umbel, pure white and strongly fragrant. This plant needs rich mucky soil to do its best. It does not thrive on dry ground. It is a much shyer bloomer than *C. asiaticum*, with which it is often confounded.

*C. podophyllum*. This is another evergreen species, almost a miniature *C. imbricatum*. Leaves glaucous green, strongly nerved, with serrated edges. Bulb only a few inches in diameter and very short. Flower-stem about 10 inches high bearing only a few pure white strongly fragrant flowers. Flowers only once during the summer.

*C. pratense*. Bulb 5 to 6 inches in diameter. Flowers white. Requires moist rich soil. Rare.

*C. purpurascens*. This small species, with linear undulated leaves about a foot long, forms large clumps in rich moist soil, thriving with caladiums, marantas, ferns, and other shade-loving plants. Flowers five to six in an umbel, slightly red in bud and pink when expanded. Flower-stem purplish, only about 6 to 8 inches high.

*C. Sanderianum* (Milk-and-Wine Lily). Common in Florida gardens. Flowers white, keeled with bright red, deeper red on the outside. Flower-stems 3 feet high, carrying five or six flowers in the umbel. Bears no seed.

*C. scabrum*. One of the showiest. Flowers large, amaryllis-like, pure white, banded crimson, reminding one of *Hippeastrum vittatum*. Very fragrant, but flowers of short duration. Flowers three or four times during spring and summer. Bears seed abundantly and can be easily cross-fertilized with other species. Grows well on high dry pine land, but, like all crinums, requires rich soil.

*C. variabile*. When in bloom, this is the showiest of all the species. Bulbs very large, conical. Flower-umbels consist of fifteen to twenty large pure white bell-shaped flowers, being borne well above the foliage, standing upright. The flowers are faintly striped with pink. Three or four stems are usually pushed up at the same time from one large bulb, and beds consisting of twenty-five or fifty bulbs are a magnificent sight, as almost all the buds open at the same time. This crinum is strictly a night-bloomer, the flowers beginning to open in the dusk of evening, remaining in perfect condition until sunrise. A clump or a bed of this species in full bloom during a moonlight night has a wonderful effect. It looks particularly beautiful under palms. This species is hardy as far north as southern Missouri and Kentucky, with a little protection in the form of stable manure or dry leaves. It has been received under the names *C. Kirkii*, *C. ornatum* and *C. latifolium*. Does not bear seeds.

*C. yemense*. Flowers pure white, bell-shaped and somewhat fragrant. Bears seeds. Excellent for cross-breeding purposes.

*C. zeylanicum* (often sold as *C. Kirkii*). Perhaps the most common of all the crinums, being found in almost every garden, even in the backwoods. The flowers which are intensely fragrant are borne on tall purplish stems. They are deep crimson in the bud

state, white with a red stripe, when fully expanded. They usually flower in June and July after the rainy season has set in. Bears large grayish green fleshy seeds abundantly and is a fine plant to be used in hybridizing.

A. Perianth erect, salver-shaped, with linear segms.; stamens spreading. (*Stenaster*.)

B. Color of perianth white; tube greenish.

1. *asiaticum*, Linn. (*C. toxicarium*, Roxbg.). Bulb 4-5 in. thick; neck 6-9 in. long; lvs. 20-30 to a bulb, 3-4 ft. long, 3-4 in. broad; peduncle  $1\frac{1}{2}$ -2 ft. long, 1 in. thick; fls. 20-50 in an umbel; spathe-valves 2-4 in. long; pedicels  $\frac{1}{2}$ -1 in. long; perianth white; tube erect, tinged with green, 3-4 in. long; segms.  $2\frac{1}{2}$ -3 in. long; filaments tinged red, 2 in. long; ovule 1 in a cell. Trop. Asia. B.M. 1073. G.F. 4:283. Baker gives 5 botanical varieties, of which the most important in the American trade is probably var. *sinicum*, Baker (*C. sinicum*, Roxbg. *C. pedunculatum*, Hort., not R. Br.). St. JOHN'S LILY. Bulb 6 in. thick, 18 in. long; lvs. 5 in. broad, with undulated edges, forming a massive crown 4-5 ft. high; peduncle 2-3 ft. long; fls. 20 or more, the tube and segms. longer than in the type; perianth white. China. The bulb usually divides into 2 of equal size; small offsets are rarely produced. Seedlings flower in 5 years. Var. *declinatum*, Baker (*C. declinatum*, Herb.), has a declined instead of erect bud; perianth-segms. tinged red at tip. B.M. 2231. Var. *procerum*, Baker (*C. procerum*, Carey), is larger than the type with lvs. 5 ft. long, 6 in. wide; perianth-tube and limb 5 in. long, the latter tinged red outside. Rangoon. B.M. 2684. Var. *anomalum*, Baker, is freakish-looking, its lvs. being expanded into a broad, membranous, striated and plaited wing. B.M. 2908 (as *C. plicatum*). *C. eboraci*, Herb. (*C. hybridum* Toddæ, Hort.). Similar to the variety next mentioned, but half the size. Garden hybrid between a small form of *C. asiaticum* and *C. longifolium*. *C. eboraci* var. *cappedum*, Reasoner (*C. cappedum*, Reasoner). Habit much like *C. asiaticum*, but lvs. tapering to a slender point, semi-erect, 4 ft. high; fls. about 20, segms. 4 in. long,  $\frac{1}{2}$  in. broad, spreading, white, sometimes changing to pink. Garden hybrid between *C. asiaticum* var. *sinicum* and *C. longifolium*. Increases both by offsets and splitting of the bulb into two. *C. sinico-scabrum*, Hort., hybrid of *C. asiaticum* var. crossed with *C. scabrum*, and intermediate in aspect and fl.—*C. asiaticum* is the largest of the cult. species, good specimens standing 5 ft. high and having a greater spread. The evergreen reticulated lvs. are ornamental. It blooms several times each year in good warmhouse or greenhouse conditions.

2. *pedunculatum*, R. Br. (*C. australe*, and *C. exaltatum*, Herb. *C. canaliculatum*, Roxbg.). Bulb 4 in. thick; neck 6 in. long. lvs. 25-30 to a bulb; fls. 20-30 in an umbel; spathe-valves 3-4 in. long; pedicels  $1\frac{1}{2}$  in.; perianth greenish white, not tinged with red outside,

the segms. linear and spreading and shorter than the tube; filaments short, bright red; style shorter than the filaments; ovules 3 in a cell. Austral. B.R. 52.—The bulb grows above ground on a large rootstock; summer; coolhouse.

3. *caribæum*, Baker<sup>e</sup> (*C. floridatum*, Griseb., not Fraser). Lvs. lorate-oblong, 1 ft. or less, 3-4 in. broad, narrowed to the base; umbels 3-4 fld.; perianth-tube 3-4 in. long, nearly straight; segms. white, linear, spreading, nearly as long as tube. W. Indies.

BB. Color of perianth purplish red outside; tube purplish red.

4. *amabile*, Donn. Bulb small; neck 1 ft. or more long; lvs. 25-30 to a bulb, 3-4 ft. long, strap-shaped, tapering to the point, the margin entire; peduncle 2-3 ft. long; fls. 20-30 in an umbel, very fragrant; spathe-valves 4-5 in. long; pedicels  $\frac{1}{2}$ -1 in. long; perianth with a crimson center band, tinged outside bright purplish red; tube bright red; segms. 4-5 in. long; stamens an inch shorter than the segms. Sumatra. B.M. 1605. R.H. 1856:241.—Summer; warmhouse. Supposed by Herbert to be a spontaneous hybrid between *C. asiaticum*

1109. *Crinum americanum*. ( $\times \frac{1}{2}$ )

var. *procerum* and *C. zeylanicum*: fls. sterile; bulb increases by small offsets; has been sold under the name of *C. augustum* (Hort., not Roxbg.), which is a similar but smaller natural hybrid presumably between *C. bracteatum* and *C. zeylanicum*, and has more obtuse lvs. than *C. amabile*.

AA. Perianth erect, salver-shaped, with lanceolate segms.; stamens spreading. (*Platyaster*.)

B. Lvs. few, 6-12 to a bulb.

5. *americanum*, Linn. Fig. 1109. FLORIDA SWAMP LILY. Bulb stoloniferous, ovoid, 3-4 in. thick; neck short: lvs.  $1\frac{1}{2}$ -2 in. broad and 2-4 ft. long, curved, denticulate: fls. 3-6, usually 4 on an erect scape 20-30 in. high; pedicels 0 or very short; perianth creamy white, the lobes linear or lance-linear; tube greenish, equaling or exceeding the lobes. Native in river swamps Ga. and Fla. and westward. B.M. 1034.—Blooms in spring and summer, but some fls. may occur in winter far S.

6. *pratense*, Herb. Bulb ovoid, 4-5 in. thick; neck short: lvs. 6-8, linear, suberect,  $1\frac{1}{2}$ -2 ft. long,  $1\frac{1}{2}$ -2 in. wide, channeled, narrowed to point, margin entire: fls. 6-12 on a lateral compressed peduncle 1 ft. or more high; perianth white, the tube greenish and 3-4 in. long, the segms. nearly or quite as long,  $\frac{1}{2}$  in. broad, lanceolate; filaments shorter than segms., bright red. Low grounds, India. Summer. Var. *elegans*, Carey, has a longer-necked bulb, decumbent, peduncle, and tube an

inch shorter than the segms. B.M. 2592. Var. *venustum*, Carey, has about 30 fls. in an umbel. India.

7. *amœnum*, Roxbg. Bulb globose, 2-3 in. diam., with a very short neck: lvs. 10-12, suberect, linear, 2 ft. or less long, rough-edged, tapering to the apex: fls. 6-12, the peduncle standing 1-2 ft. high; perianth-tube greenish, 3-4 in. long; segms. white tinged red outside, 2-3 in. long, lanceolate; filaments bright red, shorter than segms. India. Summer; warmhouse. Var. *Mearsii*, Bedd. (*C. Mearsii*, Bedd.). Very small: lvs. 1 ft. or more long, 1 in. wide, very smooth: peduncle 3-5 in. long, 6-10 fld.; fls. white, the tube slender and 5 in. long; segms. lanceolate,  $2\frac{1}{2}$  in. long and  $\frac{1}{2}$  in. broad. Upper Burma. G.C. III. 42:62.—Whole plant not more than 2 or 3 in. high when not in bloom; blooms well in a 3-in. pot.

BB. Lvs. numerous, 20 or more to a bulb.

8. *augustum*, Roxbg. (*C. amabile* var. *augustum*, Gawl). Bulb conical, 6 in. thick; neck long: lvs. 20-30, strap-shaped, 2-3 ft. long, 3-4 in. broad: fls. 12-30, on a lateral much-compressed peduncle 2-3 ft. high; pedicels sometimes an inch long; color strong purplish red outside, banded within; tube purplish; segms. lanceolate, 4-5 in. long; filaments half length of segms., red. Mauritius, Seychelles. B.M. 2397. B.R. 679.—Warmhouse; effective.

9. *erubescens*, Ait. Bulb ovoid, 3-4 in. thick, the neck short: lvs. many, curved, strap-shaped, thin, 2-3 ft. long and 2-3 in. broad, slightly rough on edges: fls. 4-12, on peduncle 2 ft. or more high, the pedicels 0 or very short; color reddish outside, white within; tube bright red, 5-6 in. long; segms. half as long as tube, lanceolate, reflexing. Trop. Amer. B.M. 1232. L.B.C. 1:31.—Summer; warmhouse.

10. *Kunthianum*, Roem. (*C. erubescens*, HBK., not Ait.). Bulb ovoid, 3 in. diam., with a short neck: lvs. about 20, strap-shaped, spreading, 2-3 in. broad, undulate but entire: fls. 4-5 in an umbel, the peduncle 1 ft. high, the pedicels 0 or very short, pure white; tube 7-8 in. long; segms. lanceolate,  $2\frac{1}{2}$  in. long; filaments less than 2 in. long, bright red. Colombia. Var. *nicaraguense*, Baker, is purple outside, the segms. a little longer and lvs. longer and narrower.

11. *purpurascens*, Herb. Bulb ovoid, short-necked, 2 in. diam., stoloniferous: lvs. 20 or more, linear, thin, 3 ft. or less, prominently undulate: fls. 5-9, on a peduncle 1 ft. or less long; tube very slender, 5-6 in. long; segms. lanceolate, half as long as tube, pink or purplish; filaments bright red. Upper and Lower Guinea, in streams and lakes, the lvs. often floating. B.M. 6525. G.C. III. 47:114.—Amphibious. Summer; warmhouse.

AAA. Perianth funnel-shaped; tube permanently curved; segms. oblong ascending; stamens and style contiguous and declined. (*Codonocrinum*.)

B. Bulbs long-necked (No. 30 omitted).

c. Margin of lvs. not ciliate, but often scabrous.

12. *longifolium*, Thunb. (*Amaryllis longifolia*, Linn. *C. riparium*, Herb. *C. capense*, Herb.). Bulb ovoid, 3-4 in. diam.: lvs. 12 or more, strap-shaped, 2-3 ft. long, 2-3 in. wide, margins rough: fls. 6-12, pedicels 1-2 in. long; perianth tinged red on the back, and sometimes on the face, with a white variety; tube cylindrical, 3-4 in. long, about equaling the limb; segms. oblong, acute, 1 in. or less broad; stamens nearly as long as segms.; filaments red. Cape. Natal. B.M. 661. Var. *album*, Hort. Gn. 52, p. 123.—Probably the hardest pure species of crinum, enduring the win-

ter of the Middle States, if protected with litter during cold weather. Prop. by offsets or seed, which latter is produced abundantly. *C. grandiflorum*, Hort., is a hybrid with *C. Careyianum*, said to partake of the hardness of *C. longifolium*. Sometimes described as having a short-necked bulb.

13. *Macowanii*, Baker. Bulb globular, 9-10 in. diam., with neck 6-9 in. long: lvs. 12-15, strap-shaped, thin, 2-3 ft. long, 4 in. or less broad: fls. 10-15, on a stout green peduncle 2-3 ft. high; tube curved, green, 3-4 in. long; segms. about equaling the tube, pink, oblong, acute,  $1\frac{1}{2}$  in. broad. Natal.—Late autumn; greenhouse, or half-hardy.

14. *Modrei*, Hook. f. (*C. Makoyanum*, Carr. *C. Colensoi*, *C. Mackenii* and *C. natalense*, Hort.). Fig. 1110. Bulb ovoid, neck 12-18 in. long: lvs. 12-15, strap-shaped, 2-3 ft. long, 3-4 in. wide, margin entire, veins rather distant, distinct: fls. 6-12, on peduncle 2-3 ft. high, the pedicels  $1\frac{1}{2}$ -3 in. long; tube greenish, about 3 in. long and with a funnel-shaped pinkish limb of equal length, the segms. oblong, nearly acute, connivent; filaments pink, an inch shorter than segms. Natal and Kaffraria. B.M. 6113. G.C. III. 2:499; 48:59. R.H. 1887:300 and p. 417. R.B. 22, p. 196; 23:61. Var. *album*, Hort. Gt. 31:1072. Gn. 52, p. 122, and var. *platypetalum*, Hort., are cult. *C. Colensoi* has a longer tube, smaller fl., with a paler and narrower limb. *C. Schmidtii*, Regel, is probably a pure white-fl. form of this species.

15. *Powellii*, Hort. Fig. 1111. Bulb about 3 in. diam., with a long slender neck: lvs. about 20, spreading, ensiform, acuminate, 3-4 ft. long, 3-4 in. broad near the base, margin smooth: fls. about 8; perianth dark rose-color; pedicels  $1\frac{1}{2}$  in. long.—Garden hybrid of *C. longifolium* and *C. Moorei*.—A valuable outdoor crinum. Var. *album*, Hort., white. Var. *intermedium*, Hort., light rose-color.

cc. Margin of lvs. ciliated.

16. *Kirkii*, Baker. Bulb globose, 6-8 in. thick, neck 6 in. long: lvs. 12 or more,  $3\frac{1}{2}$ -4 ft. long, 4-4½ in. wide and long-tapering to a point; margin rough, veins close: fls. 12-15 on a stout compressed peduncle  $1\frac{1}{2}$  ft. high; pedicels 0 or very short; color white, with a very distinct bright red band down the center of each oblong acute segm.; tube greenish, 4 in., about equaled by the segms. E. Afr. B.M. 6512.—Probably not in commerce. See No. 17. Sept.; warmhouse.

BB. Bulbs short-necked (not considering No. 30).

c. Fls. numerous, usually more than 8 in an umbel.

17. *zeylanicum*, Linn. Bulb globose, 5-6 in. thick: lvs. 6-10, thin, sword-shaped, 2-3 ft. long, 3-4 in. wide, wavy, margin roughish; peduncle long and not very stout, often tinged red; fls. 10-20 on very short pedicels; tube 3-4 in. long, curved; segms. oblong, acute, 3-4 in. long, 1 in. broad, white with a broad red keel; stamens an inch shorter than segms. Spring to midsummer; warmhouse. Trop. Asia and Afr. B.M. 1171 (as *Amaryllis ornata*).—A warmhouse species. Usually sold as *C. Kirkii*, which is an allied species from E. Afr., probably not known outside of botanic gardens.

18. *variabile*, Herb. (*C. crassifolium*, Herb.). Bulb ovoid, 3-4 in. thick, without distinct neck: lvs. 10-12, linear, glabrous and entire, the outer ones 2 ft. and more long, 2 in. wide, weak: fls. 10-12, on a compressed erect peduncle  $1\frac{1}{2}$  ft. high, the pedicels  $\frac{1}{2}$ -1 in. long; tube greenish,  $1\frac{1}{2}$  in. long; segms. white with red tinge down the keel, oblong, acute,  $2\frac{1}{2}$ -3½ in. long; filaments red, an inch shorter than segms. Cape region. Spring.

19. *latifolium*, Linn. (*C. ornatum* var. *latifolium*, Herb. *C. Linnei*, Roem. *C. jemense*, *C. jemenicum* and *C. yemensse*, Hort.). Bulb nearly globose, 6-8 in. diam., with a short neck: lvs. many, strap-shaped, thin,

1110.  
A young plant of  
*Crinum Moorei*.

2-3 ft. long and 3-4 in. broad, slightly scabrous on the margins: fls. 10-20, on a peduncle 2 ft. or less high; tube curved, 3-4 in. long, greenish; segms. about as long as the tube, oblong-lanceolate and acute, 1 in. broad at middle, whitish tinged red. Trop. Asia.—An excellent species; summer; warmhouse.

20. *Jónstonii*, Baker. Bulb globose, 3-4 in. diam., without neck: lvs. about 20, long-pointed, the outer ones 5-6 ft. long and sword-shaped, the inner linear: fls. about 20 on a peduncle 2 ft. high; tube slightly curved, tinged green, 4 in.; limb shorter than tube, the segms. ovate or oblong, acute, white and tinged pink on the back; stamens nearly as long as limb. Mts. British Cent. Afr. B.M. 7812. G.C. III. 50:170.—Closely allied to *C. longifolium*. Fls. fragrant, 8 in. long.

21. *crassipes*, Baker. Bulb very large, conical, without neck: lvs. sword-shaped, 3-4 ft. long, 4 in. broad and long-tapering to the apex, entire: fls. 15-20, in a stout compressed peduncle less than 1 ft. long, the pedicels 1-1½ in. long; tube about 3 in. long, slightly curved, green; segms. oblanceolate, ½ in. broad, equaling the tube, ascending, white tinged red on the back; filaments purple, nearly equaling the segms. Probably Trop. Afr.

cc. Fls. fewer, usually less than 8 in an umbel.

d. Segms. of perianth red, striped or tinted with red.

e. Tube of perianth usually 3 in. or more long.

22. *Sanderianum*, Baker (*C. ornatum*, Bury). Bulb globose, 2 in. thick; neck short, 2-3 in. long: lvs. 10-12, thin, 1½-2 ft. long, 1½ in. broad, margin denticulate, tapering to a long point: fls. 3-6, nearly sessile, white, keeled with red; tube 5-6 in. long, curved; segms. oblong, acute, ascending, 3-4 in. long and 1 in. or less broad; stamens much shorter than segms. Upper Guinea. Gn. 52:122.—Closely allied to *C. scabrum*. Intermediate house; blooms at intervals.

23. *scabrum*, Herb. Bulb globose, 5-6 in. diam., with short neck: lvs. 12 or more, 2-3 ft. long, 1½-2 in. wide, closely veined, margin scabrous: fls. 4-8, the peduncle 1-2 ft. high; pedicels 0 or very short; tube greenish, 4-5 in. long; segms. white with distinct red keel, oblong, acute, 3 in. or less long; filaments rather shorter than segms. Apr. May. Trop. Afr. B.M. 2180. F.S. 21:2216. A very showy and easily cult. species; spring or early summer; warmhouse. *C. Hébertii*, Sweet (*C. scabro-capense*, Hort. *C. Kunthianum*, Hort., not Roem.). Fls. similar to *C. scabrum*, but color lighter, the plant taller and larger. Garden hybrid between *C. scabrum* and *C. longifolium*. This is a doubtful name. *C. Herbertianum*, Wall. = *C. zeylanicum*. *C. Herbertianum*, Roem. & Schulte = *C. strictum*. *C. virginicum*, garden hybrid, resembles *C. Hébertii*, but the plant is smaller and the fls. larger and brighter in color. See also No. 32.

24. *Careyanum*, Herb. (*C. ornatum* var. *Careyanum*, Herb.). Regarded by Baker as "scarcely more than a variety of *C. latifolium*," confused in cult.: fls. only 4-6 in the umbel, on a subterete green peduncle about 1 ft. high: bulb globose, 3-4 in. diam., short-

necked, with brown coverings: lvs. 8-10, strap-shaped, undulate, thin, 2 ft. or less long, 2-3 in. broad, the margin entire: perianth-tube curved, greenish, 3-4 in. long; segms. (or limb) about as long as the tube, oblong-acute, 1 in. broad, lightly red-tinged at center; stamens a little shorter than segms. Mauritius and Seychelles. B.M. 2466.—Autumn; greenhouse.

25. *fimbriatulum*, Baker. Lvs. linear, 4-5 ft. long, 2 in. broad toward base but long-pointed, glaucous green, margins ciliated with small membranous scales: fls. 3-7, nearly sessile, on peduncle 2 ft. high; tube curved, 4-5 in. long; segms. white with distinct red keel, oblong, acute, ascending, 3 in. long and 1 in. broad; stamens an inch shorter than segms. Lower Guinea. Gn. 55:92. Allied to *C. scabrum*.—A different plant is passing in the trade under this name.

EE. Tube short,—3 in. or less.

26. *campanulatum*, Herb. (*C. aquaticum*, Herb. *C. cæfrum*, Herb.). Bulb small and ovoid: lvs. linear, deeply channeled, 3-4 ft.: fls. 6-8, on a slender peduncle 1 ft. or more long, the pedicels ½-1 in. long; tube slender, 3 in. or less long, about as long as the campanulate limb; segms. bright rose-red, oblong, obtuse, much exceeding the filaments. Cape region. B.M. 2352.—A very distinct species; warmhouse.

27. *lineare*, Linn. f. Bulb small, ovoid: lvs. linear, 1½-2 ft. long, ½ in. broad, glaucous, channeled on the face, the margin entire: fls. 5-6, the peduncle slender and about 1 ft. long, the pedicels ¾ in. or less long; tube slender, 2½ in. or less long; segms. 2-3 in. long, white tinged with red in center, oblong or oblanceolate, acute; stamens much shorter than segms. Cape region. B.M. 915 (as *Amaryllis revoluta*). B.R. 623 (as *A. revoluta* var. *gracilior*).

DD. Segms. of perianth pure white (exception in one form of No. 29).

E. Pedicels very short or 0.

28. *podophyllum*, Baker. Bulb subglobose, 2 in. or less diam., without evident neck: lvs. 5 or 6, 1 ft. long, 2 in. or less wide, oblanceolate, acute, thin, narrowed to base: fls. 2, sessile, the slender compressed peduncle 1 ft. long; tube 5-6 in. long, slender and curved; limb somewhat erect, the segms. oblong-spatulate, pure white; filaments nearly as long as limb. Upper Guinea. B.M. 6483.—Perhaps a form of *C. giganteum*: late autumn; warmhouse.

29. *giganteum*, Andr. Bulb globose, 5-6 in. thick, the neck short:

1111. *Crinum Powellii*.

lvs. 12 or more, lanceolate, narrowed both ways, 2-3 ft. long, 3-4 in. broad, veins distant, with distinct cross veinlets; fls. 4-6, rarely 8-12 on a stout compressed peduncle 2-3 ft. long; tube 5-7 in. long; segms. pure white, much imbricated, oblong; filaments pure white, an inch shorter than segms. Trop. Afr. B.M. 5205. F.S. 23:2443. G.F. 4:223. I.H. 33:617. —A very fragrant species. Var. *nobile*, Baker (*C. nobile*, Bull.), has the peduncle and fl. suffused with tinge of red.—*C. giganteum* is large or gigantic only in its fls.; summer; warmhouse.

30. *Rátrayii*, Hort. Excellent stove plant, 20 in.: lvs. ascending, strap-shaped, acute, entire, dark green; fls. pure white, with a spread of 6 in., in few-fl. umbels; segms. ovate-elliptic, acute or sometimes erose; stamens strongly declined, nearly equaling the segms. Uganda. G.C. III. 38:11 and suppl.

31. *abyssinicum*, Hochst. Bulb ovoid, 3 in. thick, the neck short: lvs. about 6, linear, 1-1½ ft. long, ½-1 in. wide, veins close, margin rough, narrowed to a point: fls. 4-6, on a peduncle 1-2 ft. high, the pedicels very short or 0; perianth white, the tube slender, 2 in. or less long, the segms. oblong, acute, 2-3 in. long and ¾ in. or less broad; filaments less than 1 in. long. Mts. of Abyssinia. Greenhouse.

32. *virgineum*, Mart. Bulb large and brown: foliage as in *C. giganteum*, the lvs. 2-3 ft. long and 3-4 in. broad at the middle, narrowed both ways, pointed: fls. about 6, sessile or very nearly so; tube 3-4 in. long; segms. pure white, connivent, acute, as long as the tube; filaments much shorter than the segms. S. Brazil. See also *C. virginicum* under No. 23.

EE. *Pedicels 1 in. long.*

33. *imbricatum*, Baker. Bulb very large, globose: lvs. strap-shaped, very thin, 3 ft. long, 3 in. broad at middle and narrower toward base, distinctly veined: fls. 5-6, on a stout peduncle 1 ft. or more long; tube slender and curved, 3 in. long, the campanulate limb of equal length; segms. imbricated, oblong-obtuse; filaments 1 in. shorter than segms. S. Afr.—Allied to *C. giganteum*.

Crinums hybridize so freely, and the progeny is so likely to be interesting, that many mongrel forms have been recorded under Latin names. It is not feasible to account for all such names here. Many of the forms are soon lost.—*C. Lugardæ*, N. E. Br. Bulb small: lvs. long and narrow, rough-edged: fls. 2-6, the peduncle 1 ft. or less high; tube nearly or quite 4 in. long; segms. lanceolate, about or nearly as long as tube, white with light pink median stripe. Trop. Afr.—*C. nātans*, Baker. Allied to *C. purpurascens*, but aquatic, the 20 or so strap-shaped undulate lvs. submerged: bulb small, narrow-ovoid, with many long fibrous roots: fls. few, white, the narrow segms. recurved. Upper Guinea. B.M. 7862.—*C. rhodanthum*, Baker. Lvs. lorate, exceeding 1 ft., thick, ciliate-edged: fls. many; tube 3 in. long; segms. red, lanceolate, 2½ in. long, erect-spreading and curved in upper part; stamens as long as segms., the filaments red. Cent. Afr. G.C. III. 33:315.—*C. Samuelii*, Worsley. Bulb 3 in. diam. and 2½ in. long; lvs. sometimes 4 ft. long, rough-edged: fls. 2, sessile, on peduncle 1 ft. high, white slightly flushed with pink, not fragrant, 4½ in. across. Cent. Afr.—*C. Vássel*, Boiss. Bulb ovoid, 4 in. across, without distinct neck: lvs. linear-lorate, 2 ft. or less long, 2 in. broad, rough-edged: fls. about 15, on peduncle 1 ft. or less high, white with red median stripes; perianth funnel-shaped, 8 in. long, the tube curved and red, the segms. linear-lanceolate, and a little shorter than tube. Mozambique. R.H. 1908: 132.—*C. Wimbushii*, Worsley. Differs from *C. Samuelii* in lvs. not rough-edged, fls. on short pedicels, faintly fragrant, less lasting and with longer style. Cent. Afr.—*C. zanzibarëse*, Hort.=(?).

L. H. B.†

**CRÍTHMUM** (Greek for barley, from some resemblance in the seed). *Umbelliferae*. **SAMPHIRE**. A single species, *C. maritimum*, Linn., on shores in Great Britain, W. Continental Eu., and the Medit. region, rarely planted in wild gardens or borders. It is a fleshy glabrous perennial herb, seldom more than 1 ft. high, somewhat woody at the base: lvs. 2-3-ternate, the segms. thick and linear: umbels compound, of 15-20 rays, involucrate, the umbellules with involuclers;

petals very minute, entire, fugacious: fr. ovoid, not compressed, about ¼ in. long. Thrives well in a sunny situation, and will grow at considerable distance from the sea. Prop. by division, and by seeds sown as soon as ripe.

**CROCÓSMIA** (Greek, *odor of saffron*, which is perceivable when the dried flowers are placed in warm water). *Iridaceae*. Gladiolus-like garden plant.

This genus has but one species, and is not clearly distinguished from the closely allied *Tritonia*, but it differs in the stamens being separated at equal distances instead of grouped at one side, the form of the limb, the tube not swollen at the top, and the fr. 3-seeded, sometimes 5-seeded, instead of many-seeded.

The name of this genus is spelled *Crocospma* by Baker, but it was first spelled *Crocospmia*. The fls. with coppery tips shading into orange-yellow are very distinct and attractive. Pax, in Engler & Prantl, combines the genus with *Tritonia*.

*Crocospmia aurea* is a showy bulbous autumn-blooming plant, which is hardy south of Washington, D. C., with slight protection, and in the North is treated like gladioli, the bulbs being set out in the spring, after

danger of frost, and lifted in the fall for winter storage. It is of easy culture, and is propagated by offsets or by seeds which should be sown in pots, under glass, as soon as ripe. Corms should be stored in peat or sphagnum to prevent them from becoming too dry.

*aurea*, Planch. (*Tritonia aurea*, Pappe.). Height 2 ft.: corm globose, emitting offsets from clefts in the side: scape 1½-2 ft. high, leafy below, naked or only bracted above, compressed, 2-winged: lvs. distichous, shorter than the scape, linear, ensiform,

1112. *Crocospmia aurea* var. *imperialis*. (×½)

striated, but with a distinct midrib: fls. sessile in the panicle, perhaps 25 scattered over a long season, with buds, fls. and seeds at the same time; perianth bright orange-yellow toward center; tube slender, curved, 1 in. long; segms. longer than the tube: caps. 3-celled. Trop. and S. Afr. July-Oct. F.S. 7:702. B.M. 4335. B.R. 33:61 (*Tritonia*). Also interesting as one parent of a bigeneric cross resulting in *Tritonia* (*Montbretia*) *crocospmaeflora*. Var. *imperialis*, Hort., Fig. 1112, grows about 4 ft. high. Var. *maculata*, Baker, has dark blotches above the base of the 3 inner segms. J.H. III. 33:567.

J. N. GERARD.

WILHELM MILLER.

**CRÒCUS** (Greek name of saffron). *Iridaceae*. Low spring-flowering and autumn-flowering garden bulbs; showy, and well known.

Stemless plants (the grass-like lvs. rising from the

ground or corm), with solid bulbs or corms: fls. showy, in many colors, funnel-shaped and erect, with a very long tube and 6 nearly or quite equal segms.; stamens 3, attached in the throat of the perianth and shorter than the segms.; style 3-cleft, the branches entire or forked or much fimbriated; ovary 3-loculed: seeds many, nearly globular: fr. an oblong 3-valved caps.—Probably 75 species, many of them variable, in the Medit. region and extending into S. W. Asia. The fls. open in sunshine. They come in fall or spring, but the best-known species are spring-flowering, which are amongst the earliest and brightest of spring bloom. Crocuses force easily (see *Bulb*). A half-dozen corms may be planted in a 4-in. pot for this purpose. Crocuses are scarcely known in the American trade under their species names. Inasmuch as the flowers of the common crocus close when taken out of the sun, they are not popular as window-garden or house subjects. Crocuses have been much hybridized and varied. There are many color-forms. The common crocuses of the trade have descended from *C. vernus* chiefly, but *C. susianus*, *C. mæsiacus*, *C. stellaris*, *C. biflorus* and *C. sativus* are frequent. The Dutch bulb-growers cult. many species, and these are offered for sale in their American lists; the species are therefore included in the following synopsis. In this account, the treatment by Baker is followed (*Handbook of the Iridæ*).

Botanically, the genus divides itself into three groups on the characters of the style-branches: the branches entire, once-forked or fimbriated at the apex, or cut into several capillary divisions. Horticulturally, the species fall into two groups,—the spring-flowering and the autumn-flowering. These groups are not so definitely separated as it would seem, however. Some of the species bloom in winter in regions in which the ground does not freeze hard; others begin to bloom in July or August; some may continue to bloom till winter closes in. Yet these two flowering periods mark very important differences in the utilization of the plants and the primary division in the following treatment is made on this basis. The colors are now much varied by cultivation and hybridizing, but they are well marked in the specific types as a rule. They run largely in yellow, white and purple.

The covering or tunic of the bulbs may be uniformly membranaceous, or it may be composed of strongly reticulated or parallel fibers. Fig. 1113. The flowers appear usually just in advance of the grass-like foliage-leaves. The floral leaves are small and more or less dry or scarious and arise directly from the corm and may be seen as a spathe-like structure inside the leaf-tuft; this is usually known as the basal spathe. The real spathe subtends the bloom, and it is always one-flowered; this floral spathe may be one-leaved or two-leaved.

*Culture*.—Many forms of crocus are well known, where they are justly valued as among the showiest and brightest of winter and spring flowers. They thrive in any ordinary soil. About two-thirds of the species are classed as vernal and the remainder as autumnal flowering; but the various members of the tribe would furnish nearly continuous bloom from August to May were the season open. While there are numerous species interesting to a botanist or a collector, practically the best for general cultivation are *Crocus Imperati*, *C. susianus* (Cloth of Gold crocus) and the Dutch hybrids, mostly of *C. mæsiacus*. These bloom in about the order named. The rosy flowers of *C. Imperati* may be expected with the earliest snowdrops. The named species, having shorter flower-tubes than the Dutch hybrids, are not so liable to injury by the severe weather of the early year. The autumnal species are not satisfactory garden plants, the flowers mostly appearing before the leaves, and being easily injured. *C. speciosus* and *C. sativus* are probably the most satisfactory. The latter species has been cultivated from time immemorial, the stamens having a medi-

cinal reputation, and being a source of color (saffron). The cultivation of this species is a small industry in France, Spain and Italy.—The corms of crocuses should be planted about 3 or 4 inches deep, in a well-worked and perfectly drained soil which is free from clay or the decaying humus of manure. They should be set only 2 or 3 inches apart if mass effects are desired. They may be planted in September or October for bloom in the spring or the following autumn; or the autumn kinds may be planted early in spring. The corms should be carefully examined and all bruised and imperfect ones rejected, as they are very susceptible to attacks of fungi, which, gaining a footing on decrepit corms, will spread to others.—The careful gardener will examine all exotic small bulbs annually, or at least biennially, until they show by the perfection of their new bulbs that they have become naturalized, or are suited to their new environment. In this case they may be allowed to remain until crowding requires their division. This examination should take place after the leaves are matured and dried up. Inasmuch as new corms form on top of the old ones, the plants tend to get out of the ground; it is well therefore to replant the strongest ones every two or three years. Increase may be had from new corms which are produced more or less freely in different species on top or on the sides of old corms.—Seeds are often produced freely, but are likely to be overlooked, as they are formed at the surface of the soil. These germinate readily and most freely at the growing time of the plant. They should preferably be germinated in seed-pans, which should be exposed to freezing before the natural germinating time. Seedlings usually flower the third season.—The dutch hybrid crocus is often useful for naturalizing in the lawn, although the grass may run out the plants in a few years, if the bulbs are not replaced by strong ones; they will not last more than a year or two if the foliage is mown off, but if the foliage is allowed to remain until ripe and if the lawn is fertile, the plants may remain in fair condition three or four years or more. (J. N. Gerard.)

1113. Reticulated and membranaceous tunics. *Crocus susianus* (left) and *C. sativus* (right).

A. *Blooming in spring (sometimes in midwinter and continuing toward spring).*

B. *Style-branches entire or merely toothed.*

C. *Fls. yellow, at least inside (varying to whitish forms): basal spathe absent.*

D. *Outer segms. striped or feathered outside.*

1. *susianus*, Ker. CLOTH-OF-GOLD CROCUS. Fig. 1114. Corm  $\frac{3}{4}$  in. diam.: lvs. 6-8 in a tuft, reaching to the fl., narrow-linear, with revolute edges and a central band of white: upper spathe 2-lvd.: perianth-segms.  $1\frac{1}{2}$  in. or less long, orange-yellow, becoming reflexed, the outer ones brownish or striped on the outside; anthers orange, longer than the filaments; style-branches long and spreading. Crimea. B.M. 652 (adapted in Fig. 1114).—Blossoms very early, Feb., Mar.

2. *chrysanthus*, Herb. (not B.R. 33:4, fig. 1, which = *C. Olivieri* var. *Suterianus*). Corm small: lvs. as high as the fl., very narrow: upper spathe 2-lvd., nearly as long as perianth-tube: perianth-tube 2-3 times as long as the segms., the latter  $1\frac{1}{4}$  in. or less long, and plain orange-yellow (varying tinted or striped on the outside, or even nearly white); throat glabrous; anthers orange, twice as long as the roughened filaments; style-branches red-orange. Macedonia and Asia Minor. Gn. 74, p. 140. Var. *albidus*, Hort. Fls. whitish. Gn.W. 25:229.

1114. *Crocus susianus*. ( $\times \frac{1}{2}$ )

per spathe 2-lvd.: perianth-tube short, the segms.  $1-1\frac{1}{2}$  in. long, bright orange, the outer ones striped and feathered with brown on the back; anthers pale orange, a little longer than the filaments; style-branches somewhat overtopping the anthers. Mar.

DD. *Outer segms. not striped (at least not in the specific types).*

4. *mæsiacus*, Ker (*C. aureus*, Sibth. & Smith). DUTCH CROCUS. Later: corm larger: lvs. 6-8 in a tuft, overtopping the fl., narrow-linear, with reflexed edges and white central band: upper spathe 2-lvd., inner valve very narrow or obsolete; segms. very obtuse, bright yellow,  $1\frac{1}{2}$  in. long, one-half to a third the length of the tube: anthers pale yellow, hastate at the base, somewhat longer than the filaments; style-branches overtopped by the anthers. Transylvania to Asia Minor. B.M. 2986.—Variable. A sulfur-yellow form is *C. sulphureus*, Ker. B.M. 1384. There is a striped form. B.M. 938. A cream-white form is *C. lacteus*, Sabine.

5. *ancyrénsis*, Maw. Corm  $\frac{3}{4}$  in. diam.: lvs. 3-4, as tall as the fl., very narrow: upper spathe 2-lvd.: perianth-tube exserted; segms. bright orange-yellow, 1 in. or less long, not striped nor colored outside; anthers orange-yellow, much longer than the filaments; style-branches red-orange. Asia Minor.—Blossoms early.

6. *Korolkôwii*, Maw & Regel. Corm globose, 1 in. diam. with matted fibers: lvs. 8-12, very narrow, with

reflexed edges and a central white band: upper spathe of 1 or 2 membranous valves: perianth-tube shortly exserted; segms. about 1 in. long, bright orange-yellow and not striped, the outer ones grayish brown on the outside; anthers orange-yellow; style-branches entire and orange-yellow. Turkestan, etc. Var. *dytiscus*, Bowles, has the outer segms. deep brown outside and with narrower margins of yellow.

CC. *Fls. lilac, purple or white.*

D. *Basal spathe (rising directly from the corm inside the lvs.) absent.*

7. *biflorus*, Mill. SCOTCH CROCUS. Corm  $\frac{3}{4}$  in. or less in diam.: lvs. 4-6, overtopping the fls., very narrow, with deflexed edges and a white central band: upper spathe 2-lvd.: perianth-tube exserted, the segms.  $1\frac{1}{2}$  in. long, purple-tinged, the outer ones 3-striped down the back, the throat bearded and yellowish; anthers orange, exceeding the filaments; style-branches orange-red. S. and S. W. Eu. B.M. 845.—Runs into many forms, some of them almost white. Some of the named botanical forms are: Var. *argenteus*, Baker (*C. argenteus*, Sabine, *C. præcox*, Haw. *C. lineatus*, Jan). Less robust and with only 3 or 4 lvs. to a tuft and smaller fls. more tinged with purple and the outer segms. dark-striped outside. Italy. B.M. 2991 (as *C. minimus*). Var. *pusillus*, Baker (*C. pusillus*, Tenore). Fls. smaller than in var. *argenteus*, paler, the 3 outer segms. striped with dark purple. Italy. B.R. 1987 (var. *estriatus*, with petals pale purple and not striped). Var. *Weldenii*, Baker (*C. Weldenii*, Hoppe), with uniform slaty purple limb. Dalmatia. B.M. 6211. Var. *Adamii*, Baker (*C. Adamii*, Gay). Limb pale purple, the outer segms. 1-colored or with 3 pale purple stripes. Caucasus. B.M. 3868 (as *C. annulatus* var. *Adamicus*). Var. *nubigenus*, Herb. Segms. very small and nearly white, the outer ones with a broad band of purple on the back. Asia Minor. Var. *Pestalózzæ* (*C. Pestalózzæ*, Boiss.). Small-fl., with 1-colored whitish segms. Asia Minor. Var. *Alexándri*, Hort. (*C. Alexándri*, Velen. Fls. larger than in *C. biflorus* type; outer segms. flushed all over the back with bright lilac and with a narrow margin of white, or often with only feather-like stripes on white grounds. B.M. 7740.

8. *ærius*, Herb. (*C. Sibthorpianus* var. *stauricus*, Herb.). Corm globose,  $\frac{3}{4}$  in. or less diam., the tunic bristle-ringed at top: lvs. 3-6 in the tuft, as high as the fl., very narrow, with reflexed margins and a white band: upper spathe 2-lvd.: perianth-tube little exserted; segms. 1 in. or less long, unstriped, pale or dark lilac, the throat yellow and glabrous; anthers orange, twice the length of the slightly papillose filaments. Armenia, Kurdistan. B.M. 6852B. Gn. 74, p. 212. Early.

DD. *Basal spathe present.*

E. *Throat of perianth glabrous.*

9. *versicolor*, Ker (*C. fragrans*, Haw. *C. Reinwardtii*, Reichb.). Corm  $\frac{3}{4}$  in. or less in diam., with tunics of matted parallel fibers: lvs. 4-5, as high as the fls., otherwise like the last: upper spathe 1- or 2-lvd.: perianth-tube exserted; segms.  $1\frac{1}{2}$  in. long, pale or dark purple, often striped and feathered with dark purple; throats glabrous, whitish or yellowish; anthers yellow, twice as long as the filament; style-branches, orange-yellow, equaling or overtopping the anthers. S. France. B.M. 1110.

10. *banaticus*, Heuff. Corm globular,  $\frac{1}{2}$  in. diam.: lvs. usually 2, thin and flattish, and becoming  $\frac{1}{4}$  in. broad, glaucous beneath: upper spathe 1-lvd.: perianth-tube scarcely exserted; segms.  $1\frac{1}{2}$  in. or less long, bright purple, and never striped, but often dark-blotched toward the tip; throat glabrous; anthers orange, a little longer than the white filaments; style-branches short, orange-yellow, somewhat fringed at the tip. Hungary.

11. *Tommasiniäus*, Herb. Corm globular,  $\frac{1}{2}$  in. diam.: lvs. appearing with the fls., narrow ( $\frac{1}{8}$  in. broad): upper spathe 1-lvd.: perianth-tube little exserted; segms.  $1\frac{1}{2}$  in. or less long, pale red-bluish, sometimes dark-blotched at the tip; throat glabrous; anthers orange, a little longer than the white glandular filaments; style-branches short, orange-yellow. Dalmatia and Servia.—Distinguished from *C. vernus* by its glabrous throat.

12. *Sièberi*, Gay. Corm globular,  $\frac{3}{4}$  in. diam.: lvs. 4-6, as high as the fl., glaucous beneath,  $\frac{1}{8}$  in. broad: upper spathe 2-lvd.: perianth-tube short-exserted; segms.  $1-1\frac{1}{2}$  in. long, color of *C. vernus*; throat yellow and glabrous; anthers orange, twice as long as filaments; style-branches nearly entire, orange-red. Greece, Crete. Gn. W. 22:287. G.M. 49:54. Var. *purpureus*, Hort. Fls. darker purple than the type. Var. *versicolor*, Hort. Outer perianth-segms. white feathered with purple or dark violet; inner segms. white, yellow at base inside. Gn. 73, p. 201.

13. *reticulatus*, Bieb. Corm  $\frac{3}{4}$  in. diam., covered with honeycombed fibers: lvs. 3-5, as high as the fl., very narrow, with reflexed edge and a white band: upper spathe 2-lvd.: perianth-tube much exserted; segms.  $1-1\frac{1}{2}$  in. long, white to purple, the 3 outer ones striped; throat glabrous; anthers orange, twice the length of the orange filaments; style-branches scarlet, overtopping the anthers. S. E. Eu.—Varies to white.

EE. Throat of perianth pubescent or bearded.

14. *vérus*, All. Fig. 1115. Corm 1 in. or less diam.: lvs. 2-4, as high as the fl., often  $\frac{1}{4}$  in. broad, glaucous beneath, but green above, with reflexed edges, and a central white band: upper spathe 1-lvd., about as long as perianth-tube: perianth-segms.  $1-1\frac{1}{2}$  in. long, lilac, white or purple-striped; throat pubescent, never yellow; anthers lemon-yellow, exceeding the filaments; style-branches orange-yellow. S. Eu. B.M. 860, 2240. R.H. 1869, p. 331. Gn. 54, p. 79.—The commonest garden crocus.

15. *etrúscus*, Parl. Corm 1 in. or less in diam.: lvs. about 3, very narrow, as tall as the fl.: upper spathe 1-lvd.: perianth-tube short exserted; segms.  $1-1\frac{1}{2}$  in. long, lilac, or the outer ones cream-colored and sometimes purple-feathered outside; throat yellow, slightly pubescent; anthers orange, twice as long as the glabrous filaments; style-branches nearly entire, orange. Italy.

16. *Mályi*, Vis. Corm depressed-globose, 1 in. or less diam., with fine parallel fibers in the tunic which is slightly reticulated upward: lvs. narrow-linear, not so tall as the fl., with reflexed margins and white central band: upper spathe 2-lvd., foliaceous: perianth-tube yellow, scarcely exserted; segms. white,  $1\frac{3}{4}$  in. long; throat orange-yellow and bearded; anthers orange, twice as long as the filaments; style-branches orange, slightly divided at tip. Dalmatia. G.C. III. 37:163. G. M. 51:455.

BB. Style-branches fimbriate at the top, or once-forked.

17. *Imperati*, Tenore. Fig. 1116. Corm nearly or quite 1 in. diam.: basal spathe present: lvs. 4-6, exceeding the fls., very narrow: upper spathe 1- or 2-lvd.:

perianth-tube little exserted; segms.  $1-1\frac{1}{2}$  in. long, lilac or even white, the outer ones buff and 3-striped on the outside; anthers yellow, exceeding the filaments; style-branches fimbriate. Italy. B.R. 1993. Gn. 54, p. 79. Very early.

18. *Ólivieri*, Gay. Corm nearly globose,  $\frac{1}{2}-\frac{3}{4}$  in. diam.: basal spathe absent: lvs. 4-5, as tall as the fl., becoming  $\frac{1}{4}$  in. broad: upper spathe 2-lvd.: perianth-tube little exserted; segms. bright orange-yellow and never striped,  $1\frac{1}{2}$  in. or less long; throat glabrous; anthers orange, twice the length of the roughish filaments; style-branches orange, slender-forked. Var. *Suterianus*, Baker (*C. chrysanthus*, Bot. Reg.) has narrower and more rolled lvs. Greece to Asia Minor. No. 2.

BBB. Style-branches cut into capillary divisions: basal spathe absent: upper spathe 2-lvd.

19. *vitellinus*, Wahl. (*C. syriacus*, Boiss. & Gaill.). Corm  $\frac{3}{4}$  in. or less diam.: lvs. 4-6, as high as the fls., narrow-linear: perianth-tube short, exserted; segms. 1 in. or less long, orange-yellow, the outer brown-tinged outside; style-branches divided into many capillary parts. Asia Minor. B.M. 6416.—Rare in cult. Var. *graveolens*, Baker (*C. graveolens*, Boiss. & Reut. *C. syriacus*, Baker). Lvs. narrower: outer segms. flushed with black or bearing 3 distinct stripes of black down the back.

20. *Fleischeri*, Gay (*C. Fleischerianus*, Herb. *C. smyrnensis*, Poech). Corm  $\frac{3}{4}$  in. or less diam., the tunics a dense mass of regularly interlacing fibers: lvs. about 6 to a tuft, as high as the fls., very narrow and having reflexed edges and a white band: perianth-tube not exserted; segms.  $1-1\frac{1}{4}$  in. long, white, acute, the outer with 3 slender lilac lines on the back; throat yellow and glabrous; anthers small, orange, about as long as the filaments; style-branches brick-red. Asia Minor, on limestone hills.

21. *cándidus*, Clarke (*C. Kirkii*, Maw). Corm globose,  $\frac{3}{4}$  in. diam.; tunics of matted parallel fibers: lvs. as high as the fl., becoming  $\frac{1}{4}$  in. broad, the margin ciliated and the keel very narrow: perianth-tube little exserted; segms.  $1-1\frac{1}{4}$  in. long, white tinged yellow towards throat (which is glabrous), the outer ones tinged or feathered with purple on back; anthers orange, about as long as the filaments; style-branches cream-white. Asia Minor. G. 31:17. Var. *luteus*, Hort. Fls. yellow, more deeply colored at the base, 3 outer segms. veined and mottled with purple.

22. *hyemális*, Boiss. & Blanche. Corm globose,  $\frac{3}{4}$  in. or less diam., the tunic membranous: lvs. about 4 to the tuft, as high as the fl., with reflexed margins and a white band: perianth-tube little exserted; segms.  $1-1\frac{1}{2}$  in. long, white, with a long central purple line and three shorter lines; throat yellow, glabrous; anthers orange, twice as long as filaments; style-branches red. Palestine. Var. *Fóxi*, Maw, has nearly black anthers. Gn. 74, p. 188.

AA. Blooming in autumn (sometimes in late summer and continuing toward autumn).

B. Style-branches entire or very nearly so.

C. Fls. white or lilac: basal spathe present (except in No. 26); upper spathe 2-lvd.

23. *sativus*, Linn. SAFFRON CROCUS. Fig. 1117. Corm 1 in.

1115. *Crocus vernus*. ( $\times \frac{1}{2}$ )

1116. *Crocus Imperati*. ( $\times \frac{1}{2}$ )

or more diam.: lvs. 6–10, as tall as the fl., very narrow, ciliate-edged: perianth-tube little exserted; segms. oblong and obtuse, bright lilac or even white; throat pubescent; anthers yellow, longer than filaments; style-branches 1 in. or more long, bright red (the source of saffron). Asia Minor. R.H. 1895, p. 573.—The commonest fall-blooming species.

24. *hadriaticus*, Herb. Much like *C. sativus*: usually smaller-fl., pure white, the segms. pubescent at base: anthers bright orange, more than twice longer than the white or purple filaments. Greece, etc.—Runs into several forms. Var. *melitensis*, Hort. Fls. feathered with purple and brown. Malta. Var. *Wilhelmii*, Hort. Fls. pale, with purple markings outside near the throat.

25. *zonatus*, Gay. Corm somewhat flattened or deflexed,  $\frac{1}{2}$ – $\frac{3}{4}$  in. diam.: lvs. appearing after the fls., narrow-linear: perianth-tube exserted, 2–3 in.; segms. 1–2 in. long, rose-lilac, purple-veined and orange-spotted within; throat yellow, pubescent; anthers white, 2–3 times longer than the yellow filaments; style-branches short and yellow. Cilicia. G.C. III. 23:85.

26. *caspicus*, Fisch. & Mey. Corm ovoid,  $\frac{3}{4}$  in. or less diam., with rigid tunic that has matted parallel fibers toward base: lvs. 4–5 in a tuft, not reaching the fl., very narrow, with a white band and reflexed margins: perianth-tube much exserted; segms. white, not striped, 1– $1\frac{1}{4}$  in. long; throat yellow, glabrous or slightly pubescent; anthers pale yellow or cream-colored, twice the length of filament, style-branches much exceeding anthers, slender, yellow. Near Caspian Sea. Oct. G.C. III. 34:443.

cc. Fls. yellow: basal spathe present; upper spathe 1-lvd.

27. *Scharojänii*, Rupr. Corm globose and very small, the tunic membranous: lvs. developed in spring and remaining till the fl. appears; perianth-tube much exserted; segms. bright yellow, 1-colored,  $1\frac{1}{2}$ – $1\frac{3}{4}$  in. long; throat yellowish white; anthers pale yellow; style-branches nearly entire, orange-red, shorter than the stamens. Caucasus, Armenia, blooming end of July and in Aug. G.C. III. 32:321.

BB. Style-branches fimbriated or forked at the top: basal spathe present; upper spathe 1-lvd.

28. *longiflorus*, Raf. Corm  $\frac{1}{2}$  in. diam.: lvs. 3–4, very short at flowering time, very narrow: perianth-tube much exserted; segms. oblong and bright lilac,  $1\frac{1}{2}$  in., never striped; throat slightly pubescent, yellow; anthers orange, more than twice as long as the filaments; style-branches scarlet, slightly compound. S. Eu. B.R. 30:3.—Not frequent.

29. *serotinus*, Salisb. Corm 1 in. or less: lvs. 4–6, as high as the fl., very narrow: perianth-tube little exserted; segms. oblong,  $1\frac{1}{2}$  in., lilac or purple, indistinctly or not at all striped; throat glabrous; anthers yellow, much exceeding the filaments; style-branches orange-yellow, fimbriated. Spain. B.M. 1267.—Not frequent.

30. *Sälzmännii*, Gay (*C. tingitanus*, Herb.). Corm somewhat depressed, 1 in. diam.: lvs. about 6, not prominent at flowering time, very narrow: perianth-tube much exserted; segms.  $1\frac{1}{2}$  in. long, plain lilac; throat pubescent, yellowish; anthers orange, longer than the filaments; style-branches slender, orange. Morocco. B.M. 6000.

1117. *Crocus sativus* (X $\frac{3}{4}$ )

1118. *Crocus speciosus* var. *Aitchisonii*. (X $\frac{1}{2}$ )

BBB. Style-branches capillary-divided.

c. Fls. white.

D. Basal spathe present.

31. *niveus*, Bowles. Very robust and vigorous: corm globose,  $\frac{3}{4}$ –1 in. diam., the tunic of fine reticulated fibers; lvs. 6 in the tuft, equaling the fls.: basal spathe  $2\frac{1}{2}$  in. long; spathe 2-lvd., 4 in. long, leafy at top: perianth-tube  $5\frac{1}{2}$  in. long, the segms. white but with an orange glabrous throat; anthers yellow, 3 times as long as the filament. Probably Greece.—Differs from *C. Boryi*, to which it is closely related, by the basal spathe being present, yellow anthers, naked filaments, and reticulated tunic.

DD. Basal spathe absent.

32. *laevigatus*, Bory & Chaub. Corm ovoid,  $\frac{3}{4}$  in. or less diam., with rigid tunic broken into many small imbricated parts: lvs. 3–4 in a tuft, as high as the fl., very narrow, with reflexed margins and a white band: upper spathe 2-lvd., very short: perianth much exserted; segms. about 1 in. long, white and 1-colored or with 3–5 stripes of lilac on the back of outer segms.; throat yellow, glabrous; anthers white, about as long as the papillose filaments; style-branches bright yellow, exceeding the anthers. Greece. Var. *Fontenayi*, Bowles, is very late-blooming, and the fl. has a buff tint, outside finely feathered with purple, and clear lilac inside. Gn. 74, p. 176.

33. *Boryi*, Gay. Corm globular,  $\frac{3}{4}$  in. or less diam.: lvs. 3–6, narrow-linear, as high as the fls.: upper spathe 2-lvd.: perianth-tube short-exserted; segms. 1– $1\frac{1}{2}$  in. long, white, sometimes lilac-lined at the base outside; throat yellow, glabrous; anthers white, somewhat longer than the orange filaments; style-branches scarlet, divided into many capillary segms. and exceeding the anthers. Greece. Var. *Tournefortii*, Baker (*C. Orphanidis*,

Hook. f. B.M. 5776), has lilac fls. Var. *marathoniseus*, Baker (*C. marathonienseus*, Heldr.), has style-branches less divided than in the type, shorter and not overtopping the anthers. G.C. III. 40:335. Gn. 70, p. 273. G.M. 49:767.

cc. Fls. lilac (varying to white in No. 39).

D. Basal spathe present; upper spathe 1-lvd.

34. *mèdius*, Balb. Corm globular, 1 in. or less diam.: lvs. 2–3, appearing in spring, narrow, becoming a foot or more high: perianth-tube much exserted; segms.  $1\frac{1}{2}$ –2 in. long, bright lilac; throat glabrous, whitish; anthers pale orange, twice the length of the yellow filaments; style-branches scarlet, with many capillary divisions. S. France, Italy.

35. *nudiflorus*, Smith. Corm very small, stoloniferous: lvs. 3–4, appearing after the fls., very narrow: perianth-tube much exserted; segms.  $1\frac{1}{2}$ –2 in., lilac; throat glabrous; anthers large and yellow, twice as long as the filaments. Mts. S. France and Spain.—Long known in cult., but not common.

36. *astiricus*, Herb. Corm globular,  $\frac{3}{4}$  in. or less in diam.: lvs. about 3, appearing in fall but not maturing till spring: perianth-tube short-protruded; segms.  $1\frac{1}{2}$  in. long, lilac; throat pubescent; anthers bright yellow, longer than the white filaments; style-branches orange, with many capillary divisions. Spain.

XXXI. The White Spine cucumber.

37. *byzantinus*, Ker (*C. iridiflorus*, Heuff.). Corm  $\frac{1}{2}$  in. diam.: lvs. 2-4, developing after the fls.: perianth-tube much exserted; segms. 2 in. or less long, the outer ones dark lilac and acute, the inner ones shorter and pale lilac or white; anthers orange, longer than the filaments. S. E. Eu. B.M. 6141. B.R. 33:4.—An old garden plant, but rarely seen in this country.

dd. *Basal spathe absent; upper spathe 2-lvd.*

38. *pulchellus*, Herb. Corm small, somewhat depressed: lvs. produced after flowering, maturing in spring; perianth-tube much exserted; segms.  $1\frac{1}{2}$  in. long, bright lilac, more or less indistinctly striped; throat glabrous, bright yellow; anthers white, longer than the pubescent yellow filaments; style-branches orange, with many capillary branches. Greece to Asia Minor. B.R. 30:3.

39. *speciosus*, Bieb. Corm not stoloniferous, 1 in. or less. lvs. usually 3, developing after the fls., thin, very narrow, becoming 1 ft. long: perianth-tube much exserted; segms.  $1\frac{1}{2}$ -2 in., lilac and feathered with darker color; anthers very large, bright orange, much exceeding the filaments. S. E. Eu. and Asia. B.M. 3861. Gn. 62, p. 265; 71, p. 613. B.R. 25:40.—Handsome and variable. Var. *albus*, Hort. Fls. white. Var. *Aitchisonii*, Foster (*C. Aitchisonii*, Hort.). Fig. 1118. More graceful than the type and larger, fls. paler in color, the segms. more pointed, divisions of stigma more numerous and more spreading or even drooping: fls. very pale bluish lilac. Asia. G. 28:415. Gn. M. 8:228.

L. H. B.

**CROP.** The product secured from an area of cultivated plants; as, a crop of wheat, a crop of mushrooms, a crop of violets. The word is used generically for classes of products, as grain crop, root crop, forest or timber crop, fiber crop, flower crop, seed crop, salad crop. It is employed also as a verb,—the cropping of the land, to crop to fruit.

Other limitations of the word refer to duration and inter-relations: *catch-crop*, a secondary crop grown between the succession of other crops, as in the time between a crop of radishes and a crop of cabbages; or between the rows or stands of other plants; *companion-crop*, a catch-crop grown between other growing plants, as lettuce between rows or hills of beans; *succession-crop*, a catch-crop succeeding another crop as late celery following early potatoes; *cover-crop*, a catch-crop grown usually late in the season, or in winter, to protect the land and to afford green-manure. Rotation-cropping is a form of succession-cropping. Double-cropping may be either companion-cropping or succession-cropping, or both.

L. H. B.

**CROSSÁNDRA** (Greek, *fringed anthers*). *Acanthaceæ*. Warmhouse evergreen shrubs of minor importance.

Upright, with entire or somewhat toothed, often verticillate lvs., glabrous, or the infl. hairy: fls. in dense sessile spikes, red or yellow, with prominent bracts; corolla cylindrical, more or less curved, somewhat enlarged at the throat, with a flat or spreading oblique limb; stamens 4, in pairs.—Perhaps 20-25 species from India, Trop. Afr., and Madagascar. The one commonly in the trade has handsome 4-sided spikes of scarlet-orange fls.; perianth has 5 segms., the 2 upper ones being smaller; stamens 4, of 2 lengths: caps. oblong, acute, 4-seeded. It is cult. S. outdoors to a slight extent, and also rarely in northern greenhouses. Should be grown in rich loam, peat or leaf-mold, and sand. Prop. by cuttings in sand over bottom heat, preferably under a bell-jar.

*undulæfolia*, Salisb. (*C. infundibuliformis*, Nees). Height 1 ft., rarely 3 ft.: lvs. opposite, ovate-acuminate, stalked: fls. scarlet-orange, overlapping one another in dense closely bracted, æchmea-like spikes, 3-5 in. long. India. B.M. 2186. R.H. 1891:156. B.R. 69.

*C. flava*, Hook. Unbranched shrub, 6-8 in. high: st. green, glabrous: lvs. opposite, close together, large for the size of the plant, 6 in. long, obovate-lanceolate, dark green above, paler beneath, wavy, more obtuse than in the above; lower lvs. stalked, upper ones sessile: spike 4-sided, spiny; fls. yellow; tube much exserted, jointed. Trop. W. Afr. B.M. 4710.—*C. guineensis*, Nees. Height 2-6 in.: st. light red, rusty pubescent: lvs. 2-4 pairs, 3-5 in. long, elliptic, green above, with golden netted nerves, reddish beneath: spike solitary, terminal, slender, 3-5 in. high; fls. numerous, small, pale lilac, with 2 darker spots on the 2 smallest segms. and a white eye. Guinea. B.M. 6346.—A handsome foliage plant.

N. TAYLOR.†

**CROSSOSÔMA** (Greek, referring to a fringe-like body on the seeds). *Ranunculaceæ*; by Bentham & Hooker referred to *Dilleniaceæ*, and by Engler made the type of the family *Crossosomataceæ*. Four much-branched woody plants of Mex., Ariz. and S. Calif.: very glabrous, with grayish bark and whitish wood: lvs. oblong or narrower, entire, alternate, nearly or quite sessile, some of them fascicled: fls. mostly white, solitary and short-stalked at the ends of the branchlets. *C. californicum*, Nutt., has been mentioned in gardening literature abroad: 3-15 ft. high: lvs. 1-3 in. long, not much fascicled: fls. large, with nearly orbicular white petals more than  $\frac{1}{2}$  in. long, the anthers long-oblong: follicles  $\frac{3}{4}$  in. or more long, many-seeded. Isl. of Santa Catalina. *C. Bigelovii*, Wats., is lower, the lvs. mostly fascicled and fls. only half as large, the petals white or purplish. Ariz. to S. E. Calif.

**CROTALÀRIA** (Greek, *rattle, castanet*; from the rattling of the seeds in the pod). *Leguminosæ*. RATTLE-BOX. Annual outside herbs, and shrubs grown in greenhouses or in the open far South.

Herbs or shrubs of various habit: lvs. simple (actually unifoliate) or compound: fls. in terminal racemes or rarely the racemes opposite the lvs.; calyx-tube short, the teeth narrow, as long as or a little shorter than the pea-like corolla.—A cosmopolitan genus of perhaps 250 species, in tropics and subtropics mostly. For best results, the seed should be started early indoors, after being soaked in warm water. The name is sometimes misspelled *Crotolaria*. Greenhouse kinds are subject to red spider. *C. juncea* yields the Sunn hemp of India. Our common rattle-box, *C. sagittalis*, is often a troublesome weed.

A. *Lvs. apparently simple.*

*retusa*, Linn. Annual,  $1\frac{1}{2}$  ft. high: branches few, short: lvs. entire, very various in shape, but typically obovate with a short mucro, clothed beneath with short appressed hairs: fls. about 12 in a raceme, yellow, streaked or blotched with purple; standard roundish, notched. Cosmopolitan. June-Aug.—Intro. 1896, as a novelty and called "dwarf golden yellow-flowering pea," "golden yellow sweet pea," etc. The fls. are much less fragrant than the true sweet pea.

*verrucosa*, Linn. Annual, erect and nearly glabrous, the branches and fl.-stalks 4-angled: lvs. ovate, shortly petioled, blunt: fls. racemose, numerous, their variegated blue corollas making a magnificent show in early spring. Cosmopolitan in the tropics. B.M. 3034. B.R. 1137. P.M. 13:223.

AA. *Lvs. foliolate (compound).*

B. *Fls. striped with brown or red.*

*longirostrata*, Hook. & Arn. Greenhouse plant, herbaceous or somewhat shrubby, much branched, 3 ft. high: branches long, slender, glabrous: petioles  $1\frac{1}{2}$  in. long; lfts. 3, oblong, with a minute mucro, glabrous above, hoary beneath, with very short, appressed, silky hairs: racemes erect; calyx with 2 upper lobes ovate, the 3 lower ones lanceolate; fls. as many as 25 in a raceme, yellow with reddish or reddish brown stripe along the back of the unopened fls.; standard wider than long, reflexed, notched. W. Mex., Guatemala. B.M. 7306. F.R. 1:809.—Flowering from Dec. to March. Intro. into Kew through the U. S. Dept. Agric. in 1891.

BB. Fls. not striped, pure yellow.

*incana*, Linn. A woody perennial, 2-4 ft., with stout round branches, the whole plant silky-hairy: lfts.  $1\frac{1}{2}$ -2 in. long, obtuse, cuneate below, membranous: fls. 12-20 in a raceme, yellow, at least  $\frac{1}{2}$  in. long: pod nearly sessile, loosely hairy. Common throughout the tropics. B.R. 377.

*capensis*, Jacq. Stout, much-branched shrub, 4-5 ft. high: branches terete, appressedly silky; stipules when present petiolulate, obovate and lf.-like, obsolete or wanting on many petioles: lfts. broadly obovate, obtuse or mucronulate, glabrous or minutely pubescent on one or both sides: racemes terminal or opposite the lvs., loose, many-fld., the fls. usually more than 1 in. long; calyx and pod pubescent; wings transversely wrinkled and pitted. S. Afr.—Cult. in S. Fla.

*C. Trôpez*, Mattei. An erect or prostrate annual: racemes lateral, often 20-fld. or more; fls. small, yellowish. Italian Somaliland.

WILHELM MILLER.

N. TAYLOR.†

**CRÔTON** (Greek name, probably of the castor bean). *Euphorbiaceæ*. Herbs, shrubs or trees of no special horticultural value; some cultivated for economic products which they yield.

Pubescence stellate or scaly: lvs. usually alternate: fls. mostly in terminal spikes or racemes, usually monœcious, sometimes diœcious; sepals usually 5-10, small, petals present at least in the staminate fls.; stamens 5 to many, incurved in the bud; ovary 3-celled, 1 ovule in each cell.—Five hundred or more species in the warmer parts of the world, chiefly in Amer. Several herbaceous species native in S. and W. U. S.

1119. *Croton alabamensis*.

For *Croton tinctorius*, see *Chrozophora*; for *C. sebiiferus*, see *Sapium*. See also *Codiaeum* for the commonly cultivated crotons of florists.

**Tíglium**, Linn. CROTON-OIL PLANT. PHYSIC-NUT. PURGING CROTON. Small tree: lvs. ovate, acuminate, serrate, petiolate, varying from metallic green to bronze and orange: pistillate fls. apetalous. S. E. Asia. Blanco. Fl. Fil. 383.—The powerful purgative, croton oil, is obtained from the seeds. Offered in S. Calif. as an ornamental and curious plant.

**Elutéria**, Benn. CASCARILLA. SEASIDE BALSAM. SWEETWOOD. Petals in both staminate and pistillate

fls.: lvs. ovate-lanceolate, acuminate subcordate. Bahamas. B.M. 7515.—This species and *C. Cascarilla*, Benn., Bahamas and Fla., yield the cascarilla bark.

*alabamensis*, E. A. Smith. Fig. 1119. Shrub, 6-9 ft. high: lvs. evergreen, nearly entire, oblong-lanceolate, upper side nearly smooth, lower side densely silvery scaly: both staminate and pistillate fls. with petals. Local in Ala., rarely cult. G.F. 2:594 (see Fig. 1119).

J. B. S. NORTON.

**CROWFOOT:** *Ranunculus*.

**CROWN IMPERIAL:** *Fritillaria Imperialis*.

**CRUCIANÉLLA** (Latin, a little cross; from the arrangement of the leaves). *Rubiaceæ*. CROSSWORT. Hardy rock plants of minor importance.

Herbs, often woody at the base: branches usually long, slender, 4-cornered: upper lvs. opposite, without stipules; lower lvs. or all in whorls of 3 or more, linear or lanceolate, rarely ovate or obovate: fls. small, white, rosy or blue.—About 30 species, natives of the Medit. region and W. Asia. The genus is closely related to *Asperula*, and is distinguished by the fls. having bracts, not an involucre, and the style-branches distinctly unequal instead of nearly equal. The first species below has lately been referred to *Asperula*. It is of easy cult., preferring light, moderate loam and partial shade. A delicate plant for the front of borders, and capital for the rockery. Prop. chiefly by division, and also by seeds.

*stylôsa*, Trin. (*Aspérula ciliata*, Rochel). Annual, prostrate, 6-9 in. high: lvs. in whorls of 8 or 9, lanceolate, hispid: fls. small, crimson-pink, in round terminal heads  $\frac{1}{2}$  in. diam.; floral parts in 5's; style club-shaped, long exserted, very shortly twice cut at the top. June-Aug. Persia.—Grown, and often acting in England, as a perennial.

*angustifolia*, Linn. Annual: lower lvs. 6 to a whorl, linear, on an erect or sometimes branching, smooth st.: fls. white, in spike-like clusters, small, the petals sometimes short mucronate. Medit. region. July.

*C. chlorostachys*, Fisch. & Mey. Annual, rough and spreading, but the whole plant only 4-6 in. high: fls. small, in spike-like clusters.—*C. glomerata*, Bieb. (*Asperula glomerata*, Griseb.), has yellowish green fls. in many interrupted spikes. Palestine to Persia. Properly an *Asperula*.

N. TAYLOR.†

**CRYPTÁNTHE** (Greek, for hidden flower). *Boraginaceæ*. NIEVITAS. This genus includes many species referred by some writers to *Eritrichium* and *Krynitzkia*, but probably none of them is in cult. They are mostly annuals, with white fls., which are usually sessile: calyx 5-parted to the base, as long as the corolla-tube; segms. more or less hispid or with hooked bristles, in fr. closely embracing the nutlets, eventually deciduous: nutlets 4, sometimes 3, 2 or 1, smooth, papillate, or muriculate, never rugose.—Over 60 species, in Pacific N. Amer., southward, into N. Mex. and Chile. *C. glomerata*, Lehm. (*Krynitzkia glomerata*, Gray), is a coarse biennial, 1-3 ft. high: lvs. spatulate or linear-spatulate. Plains, along eastern base of Rocky Mts. *C. barbígera*, Greene (*K. barbígera*, Gray. *Eritrichium barbígerrum*, Gray). Nine to 12 in. high: lvs. linear. S. Calif.

**CRYPTÁNTHUS** (Greek, for hidden flower). *Bromeliaceæ*. Brazilian epiphytal bromeliads, differing from *Echmea* and *Billbergia* (which see for culture) in the tubular calyx and the dense heads of flowers nearly sessile amongst the leaves.

Leaves crowded in a rosette, recurved-spreading, spinulose-serrate: fls. in a terminal head, nearly buried beneath the bracts; petals oblong, joined at the base; stamens attached to corolla-tube.—Monogr. by Mez (who recognizes 8 species) in DC. Monogr. Phaner. 9 (1896); by some, all are considered to be forms of one species.

*A. Lvs. not narrowed or petiolate above the sheath.*

**acaülis**, Beer (*Tillandsia acaülis*, Lindl. *C. undulatus*, Otto & Dietr.). A few inches high, suckering freely: lvs. sea-green, long-pointed and spreading, weak-spiny: fls. white, nestling deep in the foliage. B.R. 1157.—A very variable plant, of which Mez recognizes the following leading types:

**Var. genuinus**, Mez. Stemless or very nearly so: lvs. sub-elliptic-lanceolate, strongly undulate, gray-scurfy beneath, scurfy above.

**Var. discolor**, Mez (*C. discolor*, Otto & Dietr.). Stemless or nearly so: lvs. elongated, scarcely undulate, silvery-scurfy below, glabrous or nearly so above.

**Var. ruber**, Mez (*C. ruber*, Beer). Produces a branching st. or trunk: lvs. short, strongly undulate, reddish.

**Var. bromelioides**, Mez (*C. bromelioides*, Otto & Dietr.). St. tall: lvs. much elongated, scarcely undulate, remotely spinulose.

**Var. diversifolius**, Mez (*C. diversifolius*, Beer). St.-bearing: lvs. elongate-lingulate, deep green above, silvery-scurfy beneath.

**zonatus**, Beer. Fig. 1120. Lvs. oblong-lanceolate, the margin undulate and densely serrate-spinulose, marked with transverse bands of white: fls. white.

**bivittatus**, Regel (*Billbergia bivittata*, Hook. *B. vittata*, Hort.). Nearly or quite stemless: lvs. long-oblong, curving, long-pointed, somewhat undulate, spiny, dull brown beneath, green above and with 2 narrow buff or reddish bars extending the length of the lf.: fls. white. B.M. 5270.

*AA. Lvs. narrowed or petiolate above the sheath.*

**Beückeri**, Morr. Lvs. 10–20, oblong, pointed, canaliculate at base, very finely spiny, brownish green or rosy and spotted or striped with light green: fls. white.

*C. nitidus*, Bull. A recent importation from Brazil, described as a stemless species with sessile dark olive-green lvs., marked with a band of cream-color each side of the midrib.

L. H. B.

GEORGE V. NASH.†

**CRYPTOCORÏNE** (Greek-made name, referring to the spadix being inclosed or hidden in the spathe). Syn. *Myrioblástus*. *Aracæ*. Aquatic or paludose herbs of 20–30 species in Trop. Asia and the Malayan Archipelago, rarely seen in choice collections but apparently not in the trade. They have creeping and stoloniferous rhizomes, strongly ribbed oblong or linear or ovate lvs., monœcious fls. without perianth, the upper ones on the spadix staminate and the lower pistillate: spathe closed, the infl. wholly included. The species require the treatment given tender arums. *C. ciliata*, Fisch., 1 ft. lvs. narrow, stalked: fls. fragrant in a long tubular peduncled spathe which is fringed at the top. *C. retrospirâlis*, Fisch., plant slender with very narrow almost grass-like lvs., and small spathe terminating in a spiral or twist. *C. Griffithii*, Schott, with lvs. ovate or orbicular-oblong marked with fine red lines; spathe purple. B.M. 7719.

**CRYPTOGAMS** are flowerless plants, producing not seeds but spore. The whole vegetable kingdom was formerly thrown into two classes, the flowering plants or phanerogams and the flowerless or cryptogams. Cryptogam means “concealed nuptials,” and phanerogam “visible nuptials.” These names were given when it was thought that the sexual parts of the flowerless plants were very obscure or even wanting. The word is now falling into disfavor with botanists. Cryptogams are of less horticultural interest than the flowering plants, although they include the ferns, and some interesting smaller groups, as selaginellas, lycopods or club mosses. The word cryptogam is now mostly given up by botanists as representing a taxonomic group, as the name is founded on imperfect

or false analogies. The plants covered by this name are now distributed in the great divisions of thallophytes, bryophytes and pteridophytes; and the phenogams or phanerogams are spoken of as spermatophytes (see the categories on p. 2, Vol. I.).

**CRYPTOGRÁMMA** (Greek, *a concealed line*, alluding to the sub-marginal sori). *Polypodiaceæ*. Hardy subalpine ferns of both hemispheres of interest mainly to the collector.

1120. *Cryptanthus zonatus*.

Leaves of 2 sorts, the fertile lvs. contracted and the sori covered by the infolded margin of the segms., forming pod-like bodies. Besides our native species, a third one, *C. crispa*, is found in Eu., and a fourth in the Himalayas. Name often incorrectly written *Cryptogramme*. Cult. simple.

**acrostichoides**, R. Br. **ROCK-BRAKE**. Height about 8 in.: lvs. numerous, 4–6 in. long, on tufted straw-colored stalks, tri-quadriripinnatifid, with toothed or incised segms., the sporophylls with longer stalks, less divided and with pod-like segms. Canada to Colo., Calif., and northward.

**Stélleri**, Prantl (*Pellaea gracilis*, Hook. *P. Stélleri*, Baker). **SLENDER ROCK-BRAKE**. Lvs. 4–10 in. long, very delicate in texture, withering by Aug., few to a plant, about 2 pinnate.—Grown best in loose well-drained leaf-mold. A rather rare rock fern of the eastern states, offered by some dealers in hardy ferns. Grows in crevices of cliffs, or in moss.

R. C. BENEDICT.†

**CRYPTÓLEPIS** (Greek, *hidden scale*). *Asclepiadaceæ*. Shrubs, erect or twining, of Trop. Asia and Afr. Lvs. opposite: fls. in a loosely forking, few-fl. cyme; calyx deeply 5-parted, with 5 scales at base; corolla with spreading limb, the tube short-cylindrical or campanulate, the lobes 5 and linear, spreading or deflexed and twisted; corona of 5 scales attached at or near the middle of the tube: follicles terete and smooth, spreading.—Species 20. Cult. only in S. Calif. and S. Fla. *C. Buchananii*, Roem. & Schult. A twining shrub with yellow fls., resembling those of an echites: lvs. 3–6 in. long, leathery, shining above: cymes very short-stalked, paniculate. India. *C. longiflora*, Regel. Dwarf and compact growing, with long lvs. tinted with red; tubular white fls., as in *Bowardia jasminiflora*. Native country unknown.

**CRYPTOMÈRIA** (Greek, *kryptos*, hidden, *meros*, part; meaning doubtful). *Pinacæ*. Ornamental evergreen cultivated for its handsome habit and foliage.

Large pyramidal tree, with a straight slender trunk, covered with reddish brown bark and with verticillate spreading branches, ascending at the extremities: lvs. spirally arranged, linear-subulate, acute, slightly curved, decurrent at the base: fls. monœcious; stami-

nate oblong yellow, forming short racemes at the end of the branches, pistillate globular, solitary, at the end of short branchlets: cone globular, with thick, wedge-shaped scales, furnished with a recurved prict on the back and with pointed lobes at the apex, each scale with 3-5 narrow-winged, erect seeds.—One species in China and Japan, extensively planted for avenues, and as timber trees in the latter country, where the light and easily worked but durable wood is much used.

It is hardy as far north as New York, and thrives in sheltered positions even in New England. It seems, however, in cultivation, not to assume the beauty it possesses in its native country. With us, it looks best as a young plant, when it much resembles the *Araucaria excelsa*. It is therefore sometimes grown in pots. It thrives best in a rich, loamy and moist soil and sheltered position. Propagated by seeds or by cuttings of growing wood, especially var. *elegans*, which grows very readily. The horticultural varieties are also sometimes increased by grafting.

**japónica**, Don. Tree, attaining 125 ft.: lvs. linear-subulate, compressed and slightly 4- or 3-angled, bluish green,  $\frac{1}{2}$ -1 in. long: cone brownish red,  $\frac{3}{4}$ -1 in. across. S.Z. 124. H.I. 7:668. R.H. 1887, p. 392. Gng. 4:197. F.E. 10:510. G.F. 6:446.—Of the garden forms, the most desirable is var. *elegans*, Beissn. (*C. elegans*, Veitch). Low, dense tree, with horizontal branches and pendulous branchlets: lvs. linear, flattened, soft, spreading, longer than in the type, bright green, changing to bronzy red in fall and winter. Very handsome when young, but short-lived. Var. *araucarioides*, Carr. Of regular pyramidal habit, with short, thick falcate lvs., resembling *Araucaria excelsa*. Var. *compacta*, Beissn. Of very compact habit, with bluish green foliage. Var. *pyramidalis*, Carr. Of narrow pyramidal compact habit, dark bluish green, not changing to reddish brown during winter. Var. *Löbblii*, Carr. Of compact habit, with shorter and more appressed bright and deep green lvs. Var. *nana*, Knight. Dwarf and procumbent, densely veined form; adapted for rockeries. Var. *spiralis*, Veitch. Slender shrub, with strongly falcate lvs., twisted spirally around the branchlets. S.Z. 124, fig. 4. ALFRED REHDER.

**CRYPTOPHORÁNTHUS** (Greek, meaning to *bear hidden flowers*). *Orchidaceæ*. A few Trop. American orchids closely allied to Masdevallia and Pleurothallis, remarkable for the almost closed fl. within which is hidden the lip: sepals united at the base into a short tube and joined also at the apex, the petals being inside; there are openings or "windows" on either side where the sepals spread apart at their middles. The species require the cult. given Pleurothallis. Apparently none is in the American trade. *C. maculatus*, Rolfe (*Pleurothallis maculata*, Rolfe), is a little plant with numerous yellow densely crimson-spotted fls. *C. Dayanus*, Rolfe (*Masdevallia Dayanus*, Reichb. f.) and *C. atropurpureus*, Rodr. (*Pleurothallis* and *Masdevallia fenestrata*, Hort.), may be expected; the former has upper sepal yellowish white and purple-spotted keels, and inferior sepals (joined) orange with brown spots; the latter has dark purple solitary fls. *C. Moorei*, Rolfe, has small dull red-purple fls. with darker lines, the lateral openings about  $\frac{1}{2}$  in. long: lvs. broadly elliptic, purple beneath, about  $1\frac{1}{2}$  in. long.

**CRYPTOPYRUM**: *Triticum*.

**CRYPTOSTÈGIA** (Greek, *krupto*, conceal, and *stego*, cover; referring to the 5-scaled crown in the corolla-tube, which is not exposed to view). *Asclepiadaceæ*. Tropical climbers.

Leaves opposite: fls. large and showy in a terminal trichotomous cyme; corolla funnel-shaped, the tube short.—Only 2 species, 1 from Trop. Afr., and 1 from Madagascar. The juice of *C. grandiflora*, when exposed

to the sunshine, produces caoutchouc. See Dict. Economic Products India 2:625. The plant is cult. in India for this purpose. It is rarely cult. in Old World greenhouses for ornament. It is said to be of easy cult. in a warmhouse and prop. by cuttings.

**grandiflora**, R. Br. (*Nerium grandiflorum*, Roxbg.). St. erect, woody: branches twining: lvs. opposite, short-stalked, oblong, entire, 3 in. long,  $1\frac{1}{2}$  in. wide: fls. in a short spreading cyme, reddish purple, becoming lilac or pale pink, about 2 in. across, twisted in the bud: fr. a follicle. Old World, probably Indian origin, but established in the African Isls. of the Indian Ocean, especially Reunion. Hooker, however, thinks that it was originally a Trop. African plant. B.R. 435.—Once cult. at Oneco, Fla., by Reasoner, and not uncommon in botanic gardens under glass. Called pulay or palay in India where it is widely cult. as an ornamental. Not important as a rubber plant.

**madagascariensis**, Hemsl. A climbing glabrous shrub: lvs. short-petioled, leathery, variable in outline, 2-4 in. long: fls.  $2\frac{1}{2}$ -3 in. across, pink or whitish, not lilac as in many specimens of *C. grandiflora*; corolla-lobes longer than the tube. Madagascar.—A very showy greenhouse climber with cymose infl.

N. TAYLOR.†

**CRYPTOSTÈMMA** (Greek, *hidden crown*). *Compositæ*. Two or 3 hoary herbs, by some united with *Arctotis*, apparently not in the trade, but sometimes mentioned in gardening literature: diffuse or creeping, with basal or alternate lvs. that are dentate or lyrate-pinnatisect, villous above and white-tomentose or woolly beneath: heads radiate, yellow or more or less purplish, rather large, peduncled, or solitary on leafless scapes, the rays sterile: achene densely villous, 5-ribbed, the pappus paleaceous and in 1 series. *C. calendulaceum*, R. Br. (*C. lusitanicum*, Hort.), is a free-blooming annual with pale yellow rays and a dark brown disk, the heads on 1-fl. peduncles: lvs. pinnatifid, 3-nerved. Cape and Austral. B.M. 2252. G.C. III. 28:390, desc. *C. Forbesianum*, Harv., and *C. niveum*, Nichols. (*Microstèphium niveum*, Less.), of S. Afr., may be more or less in cult. Both have yellow rays, in the latter the heads being solitary and the plant decumbent or creeping and the lvs. ovate, cordate or orbicular; in the former the lvs. are mostly pinnatisect, the margins revolute.

**CRYPTÓSTYLIS** (*hidden style*, Greek). Syn. *Zosterostylis*. *Orchidaceæ*. Eight or 10 terrestrial orchids of the E. Indies, Malaya and Austral., allied to Pogonia. Lvs. solitary or few, narrow and membranaceous, on stiff petioles: fls. rather large, racemose or spicate on simple sheathed scapes, the sepals and petals very slender or even awl-like and nearly or quite equal; lip large, sessile, the broad base inclosing the column and then expanding into a broad blade. *C. arachnites*, Blume. Rootstock fleshy: lvs. erect, green, lanceolate: fls. on a scape 18 in. or less high, many and spider-like, the sepals and petals green and the fleshy lip purple and mottled, pubescent and grooved. India (Ceylon, Khasia). B.M. 5381. A curious indoor orchid.

**CTENÁNTHE** (Greek, *comb-flower*). *Marantaceæ*. About a dozen Brazilian plants closely allied to Calathea and Maranta, differing from the former in belonging to the 1-seeded section of the family and from the latter in having a shorter corolla-tube and different shaped fls. Sepals 3, free and equal, somewhat parchment-like; corolla-tube short but wide, the lobes 3 and nearly equal and hooded at the apex; staminal tube very short; 2 exterior staminodia petal-like, short, obovate and hooded, with lateral deflexed lobes. The ctenanthes are perennial herbs with basal and cauline lvs. that are more or less petiolate, and crowded fls. in terminal spikes or racemes. They are glasshouse plants requir-

ing the treatment of calathea; apparently little known in American collections. The species fall into two groups, those with variegated and those with green lvs. Of the former group are *C. Kummeriana*, Eichl., and *C. Oppenheimiana*, Schum., the former being 20 in. or less tall and with villous ovary and raceme, the latter robust and 3 ft. or more tall and ovary glabrous. Of the plain-lvd. kinds, *C. Luschnathiana*, Eichl. (*C. compressa* var. *Luschnathiana*, Schum.), and *C. setosa*, Eichl., may be found in choice collections; both species grow about 3 ft. high, the former having ovate-acute bracts and the latter long-acuminate brown-villous bracts.

**CUCKOO FLOWER:** *Cardamine pratensis*.

**CUCKOO-PINT:** *Arum*.

**CUCUMBER.** Plate XXXI. The common cucumbers are derived from an Asian species, *Cucumis sativus* (see *Cucumis*), which has long been known in cultivation. The so-called West India gherkin, which is commonly classed with the cucumbers, is *Cucumis Anguria*. The snake, or serpent cucumber is more properly a muskmelon, and should be designated botanically as *Cucumis Melo* var. *flexuosus* (cf. A. G. 14:206). The "musk cucumber" is *Cucumis moschata*, Hort., which is probably identical with concombres musqué, referred to *Sicana odorifera* by Le Potager d'un Curieux, known in this country as cassabanana. The Mandéra cucumber is *Cucumis Sacleuxii*, Paill. et Bois. (Pot. d'un Curieux), but it is not in cultivation in this country. None of these is of any particular importance except the common types of *Cucumis sativus*. These are extensively cultivated in all civilized countries as field and as garden crops. They come into commerce as pickles packed in bottles and barrels, and are very extensively used in this form. Of late, the forcing of cucumbers under glass has come to be an important industry in the eastern states.

#### Field culture.

The common cucumber is an important field and garden crop and may be classed as one of the standard crops of the vegetable-garden. The fruit is used as a table salad, eaten raw, with the usual salad seasonings, and is pickled in large quantities. The cucumber is pickled in both large and small sizes, both by the housewife and commercially on a large scale. The small fruit, of not more than a day or two's growth and measuring from 1 to 2 inches in length, makes the most desirable and delicate of pickles. These are packed in bottles for the commercial trade and bring fancy prices. Larger sizes are pickled and sold by the keg or barrel.

The cucumber is a native of the tropics and tender of frost. It should be planted in a warm location, after danger from frost is past. For the early crop—and earliness is of prime importance to the commercial vegetable-grower—a sandy soil is preferable, supplied with an abundance of well-rotted stable manure. The seed may be sown in hills 3 feet apart with rows 6 feet apart, or may be planted by machine (the common seed-drill) in drills 6 feet apart. In either case, an abundance of seed should be used, for severe injury by insect pests often occurs in the early stages of the cucumber's life. Plants may be started under glass to hasten maturity. The seed is sometimes sown in pots or baskets or in inverted sods and these protected and so managed that the cucumber plant receives those conditions most suitable to its rapid and healthy growth. These conditions are: a temperature between 60° and 65° at night, which may be allowed to rise to 100° in bright sunshine; an ample supply of moisture; sufficient ventilation, without draft, to prevent a soft brittle growth. It is almost impossible to transplant cucumber seedlings and secure satisfactory results if the roots are disturbed. A glass-covered frame may be used over seed planted in the field, and yields good returns on labor and equip-

ment. Any method whereby marketable cucumbers may be obtained a few days earlier, if not extravagant of time and labor, will pay handsomely.

The cucumber, in the field, should yield marketable fruits in seven to eight weeks from seed and continue in profitable bearing until frost. It is customary among commercial growers to allow two or three plants to the hill, and when grown in drills, one plant is left every 18 to 24 inches.

During the height of the growing season, which is usually in August when the days are hot and nights moist and warm, the cucumbers need to be picked every day. The fruit is ready to harvest when it is well filled out, nearly cylindrical in shape. When immature it is somewhat furrowed. When allowed to remain too long, it becomes swollen in its middle portion and cannot be sold as first quality. Cucumbers are marketed by the dozen, the field crop often bringing as much as 60 cents a dozen at the first and selling as low as 5 cents a dozen at the glut of the market.

The cucumber plant is affected by serious insect pests and fungous diseases. Of the insect pests, the striped cucumber beetle is the most serious and difficult to combat. It feeds on the leaves, usually on the

1121. House of English cucumbers.

under sides, and appears soon after the cucumber seedlings break ground. This cucumber beetle seems to be little affected by the common remedies for chewing insects. This is probably largely due to its activity, the beetle moving to unpoisoned parts of the plant, and also to the fact that rarely, in commercial practice, is the under side of the leaves thoroughly poisoned. Arsenate of lead applied in more than ordinary strength is the most satisfactory remedy. Hammond's Slug Shot, dusted lightly over the plants, will drive the bugs away, while a teaspoonful of paris green mixed with two pounds of flour makes also an excellent mixture with which to fight the bugs. Or cover the young plants with small wire or hoop frames, over which fine netting is stretched. If the plants are kept quite free from attack till these protectors are outgrown, they will usually suffer little damage. Plants started in hotbeds or greenhouses may usually be kept free at first, and this is the chief advantage of such practices. The cucumber beetles are kept away somewhat at times by strewing tobacco stems thickly under the plants; and kerosene emulsion will sometimes discommode the young squash bugs without killing the vines, but usually not. What is known as the cucumber blight (*Pseudoperonospora cubensis*) has done much to discourage the growth of cucumbers. This fungus may be repulsed by thorough spraying with bordeaux and the plants should

be kept covered with bordeaux throughout their growth. This will require at least three or four sprayings. The growth of the vines, which usually completely covers the ground, prevents late sprayings, which are often necessary to maintain healthy growth and insure maximum returns.

The common field varieties most popular in the United States grown for a slicing cucumber are of the White Spine type. Many of the so-called White Spine varieties now on the market are not typical of the original White Spine cucumber, which is a fruit averaging about 6 inches in length, rather blunt on both ends, with white prickles appearing at frequent intervals over the surface. The seed end is light-colored, in mature specimens almost white with whitish stripes extending toward the stem end from one-third to one-half the length of the cucumber. What is often cata-

1122. Three prominent varieties of English or Forcing cucumber. S. Sion House; E. Duke of Edinburgh; T. Telegraph. ( $\times \frac{1}{2}$ )

logued as the Improved White Spine has become more popular among growers within recent years. This type possesses some of the characteristics of the popular English type of cucumber known as the Telegraph. The improved type has been obtained by crossing the White Spine with the Telegraph or some closely related variety. This cross has resulted in an increased length and darker green color, with a fewer number of spines and seeds and a more common tapering of the ends. All of these changes have apparently been beneficial and have been well fixed by careful selection. This is well illustrated by the cucumber of the White Spine type sold as Woodruff Hybrid.

The English type of cucumbers is raised on a small scale in this country but infrequently for market purposes.

#### *Forcing of cucumbers.*

The commercial production of cucumbers under glass has assumed large proportions. This crop ranks second in commercial importance among greenhouse-

grown vegetable crops, lettuce only exceeding it in importance. The cucumber crop is ordinarily grown in the spring of the year after two or three crops of lettuce have been removed, and it continues to occupy the ground until the vines cease bearing, due either to poor management, pests or some similar trouble. The cucumber should come into bearing six to eight weeks after setting in the houses. It is the customary plan to plant the seed in 4- to 6-inch clay pots about two weeks before the house to be used is ready for setting. These pots are often placed over manure heat and should always be in a warm house separate from the lettuce. Two weeks should be sufficient to allow the plant a good start, two or three pairs of leaves being all the development desired before setting in the permanent location. Careful management is essential to a healthy growth, for many pests prove more serious in the glasshouse than in the field. A night temperature not below 60° F. is very essential, while the day temperature may go to 90° F. without danger in bright sunshine. The appearance of the plants will immediately indicate, to the experienced observer, the conditions under which the crop has been grown. A short stocky growth between joints with dark green foliage is desirable. There are localities in which growers make cucumbers the all-the-year-round crop in the glasshouse, usually growing crops from two seedings during the entire season. It requires more skill to produce good cucumbers during the fall and winter months than from February on, and the yield is much lighter in the late fall and early winter than for the spring crop. All cucumbers require an abundance of moisture and food. It has become a common practice in certain sections to mulch the cucumber vines in the greenhouse with good quality straw manure to the depth of 3 or 4 inches and apply the water directly on the manure. This practice eliminates the packing and puddling of the soil often caused by direct heavy watering, increases the supply of readily available plant-food and gives the roots a good opportunity to grow near the surface where air is available and still be protected from the drying out which occurs when the soil is directly exposed to the sun.

The pruning and training of the cucumbers in the greenhouse is of much importance. A number of methods are in common use, one of the most common and practical of which is: Stretch a wire tightly the length of the house at the base of the plants which may be set in rows 3 feet apart and 18 inches to 2 feet apart in the rows; fasten at the base of each plant a soft but strong twine known in tobacco-growing sections as tobacco twine, securing this single twine to an overhead wire running parallel and directly over the ground wire, but not stretching the string tight. As the cucumber plant grows, it is twined about this string to which it clings by tendrils. When the plant reaches the upper wire it is either allowed to grow at will over wires provided for an overhead support and from which the cucumbers usually hang down where they can be easily picked, or it is pruned and the encouragement of fruiting along the upright stem continued. In the meantime more or less fruit has been harvested and at each joint a lateral branch has appeared. It is necessary to cut these off. Some growers prefer to take them off back to the main stem, while others, if a cucumber is obtainable on the first joint of the lateral, nip the lateral just beyond this point.

"In the greenhouse, cucumbers are liable to damage from mite, aphid, root-gall and mildew. For the mite, syringe the plant and pick off the infested lvs.; for aphid, use tobacco fumigation and pick infested lvs.; for root-gall, use soil which has been thoroughly frozen; for mildew, improve the sanitary conditions, and then use sulfur."—Bailey, "Forcing-Book."

Yields of twenty-five to one hundred and twenty-five cucumbers have been secured from single plants. The expert growers, under normally good circumstances,

may expect to obtain a yield of six to seven dozen marketable cucumbers from a plant.

#### Varieties of cucumber.

There are a great many varieties of cucumbers in cultivation. This means that the group is variable, the varieties comparatively unstable, and varietal distinctions somewhat uncertain. Nevertheless, there are certain dominant types which may be separated, and around which most of the varieties may be conveniently classified. The principal types are the following:

#### Common cucumber, *Cucumis sativus*.

I. English forcing type (var. *anglicus*): Fig. 1122. Large-lvd., strong-growing, slow-maturing plants, not suited to outdoor cult.: fr. large, long, smooth, usually green, with few or early-deciduous black spines. Telegraph, Sion House, Tailby Hybrid, Kenyon, Lorne, Edinburgh, Blue Gown.

#### II. Field varieties (hill or ridge cucumbers).

##### a. Black Spine varieties.

1. Netted Russian type: Small, short-jointed vines, bearing more or less in clusters, small, ellipsoidal fr. covered with many small, black, deciduous spines: fr. green, ripening to dark reddish yellow, on a cracking, chartaceous skin. Early-maturing and prolific. Netted Russian, Everbearing, New Siberian, Parisian Prolific Pickle.
2. Early Cluster type: Small or medium vines: fr. small, usually less than twice as long as thick, indistinctly ribbed, green, ripening yellow, with scattered, large, black spines. Early Cluster, Early Frame.
3. Medium Green type: Intermediate in size of vine and fr. between the last and next: fr. about twice as long as thick, green, ripening yellow, with scattering, large black spines. Nichols Medium. Green, Chicago Pickle.
4. Long Green type: One of the best fixed types, representing, perhaps, one of the more primitive stages in the evolution of the group. Vines large, long and free-growing: fr. large and long, green, ripening yellow, with scattered, large, black spines. Long Green, Japanese Climbing.

##### b. White Spine varieties.

5. White Spine type: A strong and important type: plants medium large, vigorous: fr. medium large, about thrice as long as thick, green, ripening white, with scattering, large, white spines. There are many selected strains of White Spine. Cool and Crisp, Davis Perfect and Fordhook Famous belong here.
6. Giant Pera type: Mostly poorly fixed varieties, having large rather unthrifty vines, bearing large frs. tardily and sparsely, which are white or whitish, smooth or with scattering, deciduous, usually white spines. Chicago Giant, Goliath, Giant Pera, White Wonder, Long Green China.

Sikkim cucumber, *Cucumis sativus* var. *sikkimensis*. Plant small and stocky, much like the common cucumber: fr. large, reddish brown marked with yellow. (The Egyptian hair cucumber, of Haage & Schmidt, as we have grown it, is apparently an odd form of *Cucumis sativus*, and may belong here. It has a medium-sized white fr., densely covered with soft, white hair. The plant resembles the Sikkim cucumber.) Not in general cult.

1123. Staminate flower of *Cucumis Melo*. (Nat. size)

Snake or Serpent cucumber, *Cucumis Melo* var. *flexuosus*. Vines resembling those of muskmelon: fr. very long, twisted, ribbed-cylindrical, green, tardily yellowing, covered with dense, woolly hairs.

West India gherkin, *Cucumis Anguria*. Figs. 1127, 1128. Vines small and slender, somewhat resembling a slender watermelon plant: fr. very abundant, small, ellipsoid, covered with warts and spines, green, tardily whitening. Good for pickles.

These varieties are mostly all good for one purpose or another. The small sorts are naturally preferred for

pickling, the medium sorts for slicing, and the large, late varieties for ripe fruits. The White Spine varieties are great favorites for slicing, and only less so for pickling.

F. A. WAUGH.  
H. F. TOMPSON.

#### CUCUMBER TREE: *Averrhoa* and *Magnolia*.

**CÛCUMIS** (old Latin name). *Cucurbitaceæ*. Tendril-bearing soft tender herbs, some of which are grown for their edible fruits.

Annual or perennial-rooted (the common cult.

1124. Pistillate flower of *Cucumis Melo*. (Natural size.)

species annual), with large alternate entire or palmately lobed or dissected lvs.: monœcious (rarely diœcious); sterile fls. in clusters, not long-stalked, the fertile ones solitary and mostly short-stalked in the axils; corolla of 5 deep acute lobes; stamens not united; stigmas 3, obtuse; tendrils simple: fr. a pepo, mostly 3-celled, usually indehiscent, fleshy or thick, globular, oblong or cylindrical, sometimes echinate, many-seeded.—About 30 species of villous or spinescent climbers and trailers with annual sts., in warm parts of the globe, most abundant in Afr. Monogr. by Cogniaux, DC. Monogr. Phaner. 3. See, also, Naudin, Ann. Sci. Nat. (Bot.) IV. 11:9; 12:108.

A. The melon group: fr. smooth at maturity or only pubescent (not spiny or tuberculate).

**Mêlo**, Linn. **MELON**. **MUSKMELON**. Figs. 1123, 1124. Long-running, hairy or villous annual: lvs. large, soft-hairy, round-heart-shaped or reniform, sometimes rounded-lobed and more or less denticulate:

1125. *Cucumis sativus*. Staminate flower at s; pistillate at p. ( $\times \frac{1}{2}$ )

male fls. clustered, the peduncle short: fr. very variable, pubescent or becoming glabrous. S. Asia and Trop. Afr.—Very variable, and widely cult.

1. Subspecies or var. *agr stis*, Naudin. The wild or run-wild or spontaneous plant: slender: fls. small, short-peduncled, often in 2's or 3's: fr. oblong or turbinate, size of a plum, not edible.—To this subspecies

Cogniaux refers such names as *C. Chate*, Linn., *C. pubescens*, Willd., *C. maculatus*, Willd., *C. campechianus* Kunth, *C. Gurmia* and *C. Chaeta*, Wall., *C. maderas-patanus*, Roxbg., *C. eriocarpus*, Boiss., *C. picrocarpus* and *C. jucundus*, Muell., *C. trigonus*, Benth. (not Roxbg.), *C. Pancherianus*, Naudin, and the varietal names *maculatus*, *Cossonianus*, *texanus*, *cantonianus*, *saharunporensis*, *anatolicus*, *æthiopicus* of Naudin.

2. Subspecies or var. *culta*, Kurz. The many forms of the cult. melon: plant very robust; fls. longer-pedunculate, 3-5 together and large; fr. large to very large, edible; widely variable; when forced under glass the lvs. tend to be more prominently lobed. See *Melon*. Forms of this group may be distinguished as follows: Var. *Chito*, Naudin (*C. Chito*, Morr.). ORANGE MELON. MANGO MELON. MELON APPLE. VINE PEACH. GARDEN LEMON. VEGETABLE ORANGE. Vine less robust than that of the muskmelon, and lvs. smaller: fr. size, shape and color of an orange or lemon, without markings, with a white or pale yellow cucumber-like flesh, with no muskmelon odor. Not edible in its natural state, but useful for the making of preserves (or "mangoes") and pickles. Name pronounced *keeto*. Cf. Bull. 15, Cornell Exp. Sta.; A.G. 14:206.—The "Lemon cucumber" offered by dealers is apparently a form of *C. sativus*, the fruit being nearly round with yellow and green markings and smooth skin, like the lemon.—

Var. *Dudaim*, Naudin (*C. Dudaim*, Linn. *C. odoratissimus*, Moench). DUDAIM MELON. POMEGRANATE MELON. QUEEN

ANNE'S POCKET MELON. Vine small, as in the last: fr. size and shape of an orange, somewhat flattened at the ends, very regular and smooth, marbled with

longitudinal markings of cinnamon-brown overlying yellow, exceedingly fragrant. A most handsome gourd-like fr. and highly and deliciously perfumed. Not eaten. A nearly odorless and scarlet-rind form is separated by Naudin as var. *erythraeus*.—Var. *acidulus*, Naudin. CUCUMBER MELON. Frs. oblong or cylindrical, mottled or unicolored, the flesh white and cucumber-flavored. No varieties in the American trade are of this group, but they are occasionally seen in botanical gardens and experimental grounds that import seeds of oriental plants.—Var. *flexuosus*, Naudin (*C. flexuosus*, Linn.). SNAKE MELON. SNAKE CUCUMBER. Fr. many times longer than broad, greenish at maturity, variously curved and furrowed. A.G. 14:203. Fr. often 2-3 ft. long, and 1-3 in. diam. Grown mostly as an oddity, but it is useful for the making of conserves. The hard-shelled snake gourd is a *Lagenaria* (which see).—Var. *inodorus*, Naudin. WINTER MELON. Lvs. lighter colored, less hairy, narrower: frs. possessing little or none of the common musk-

melon odor, and keeping long. The winter muskmelons are little known in this country, although they are worthy of popularity. Much cult. in parts of the Mediterranean.—Var. *saccharinus*, Naudin. PINEAPPLE MELON. Comprising varieties of oblong shape and very sweet flesh. Not sufficiently distinct from the next.—Var. *reticulatus*, Naudin. NUTMEG or NETTED MELONS. Frs. softer rinded, more or less netted, or sometimes almost plain or smooth. Comprises the common muskmelons, aside from cantaloupes.—

Var. *cantalupensis*, Naudin. CANTALOUPE.

ROCK MELONS. Frs. mostly hard-rinded, more or less warty, scaly or rough, often deeply furrowed or grooved.

Name derived from Cantalupi, near Rome, a former country seat of the Pope, whither this type of melons was brought from Armenia. In the U. S. the word cantaloupe is often used as a generic name for muskmelon, but it is properly a name of only one group of muskmelons—the hard and scaly-rinded (see Waugh, G.F. 8:183).

AA. The cucumber group: fr. spiny or tuberculate (nearly unarmed in *C. Sacleuxii*).

*sativus*, Linn. CUCUMBER. Figs. 1125, 1126. Long-running, prickly: lvs. usually 3-lobed (or strongly angled), the middle lobe most prominent and often pointed: fr. prickly or muricate, at least when young, but in some varieties becoming smooth, mostly oblong, the flesh white. S. Asia. See *Cucumber*. Runs into many fr.-forms in cult., but not so widely polymorphous as *C. Melo*.—Var. *anglicus*, Bailey. Figs. 1121,

1122. ENGLISH or FORCING CUCUMBER. A product of cult. and selection, distinguished from the common or field cucumbers as follows: frs. (and ovaries) very long and slender, little if any furrowed, spineless or nearly so when

grown, nearly or quite green at maturity, comparatively few-seeded: fls. very large: lvs. very broad in proportion to their length,

with shallower sinuses: vines very vigorous, with long and thick tendrils.—Var. *sikkimensis*, Hook. f., cult. in the Himalayan Mts., but not known to be in this country; has large 7-9-lobed lvs. and cylindrical-club-shaped fr. B.M. 6206.

*Anguria*, Linn. (*C. echinatus*, Moench. *C. anguriformis*, Roem. *C. grossulariæformis*, Hort.). BUR CUCUMBER. WEST INDIAN GHERKIN. GOOSEBERRY GOURD. Figs. 1127, 1128. Sts. slender, hispid: lvs. deeply cut into 3-5 narrow obovate or spatulate divisions, watermelon-like: fls. small, the pistillate long-stalked: fr. 1-3 in. long, cucumber-like but more spiny. Supposed to be native to the American tropics. B.M. 5817.—Cult. both for the oddity of its frs. and for the making of pickles. The gherkins of mixed pickles, however, are young cucumbers.

*dipsaceus*, Ehr. (*C. bcrdàna* and *C. ambigua*, Fenzl. *C. erinaceus*, Hort.). DIPSACEOUS GOURD. OSTRICH-EGG GOURD. HEDGEHOG GOURD. Plant and foliage like that of *C. Melo*: fls. long-stalked: fr. 1-2 in. long, oblong or nearly spherical, becoming hard and dry, densely beset with long scales or hairs, and looking like a bur. Arabia,

1126. Branch of *Cucumis sativus*.

1127. Spray of *Cucumis Anguria*. (×½)

1128. Fruit of *Cucumis Anguria*. (×½)

Afr. R.H. 1860, p. 210.—Cult. as an ornamental gourd.

**Sacleuxii**, Paill. & Bois. **MANDERA CUCUMBER.** Slender, hairy, whitish: lvs. roundish-reniform, obscurely lobed and irregularly dentate, scabrous on both surfaces and grayish green: fls. solitary; males on long-filiform peduncles, the females on shorter but slender peduncles and with hairy ovary: fr. ovoid, 3-4 in. long and half as thick at the middle, somewhat scabrous, with longitudinal stripes of lighter green; seeds brown,  $\frac{1}{5}$  in. long. Zanzibar.—Said to be ornamental and the fruits useful for pickles.

1129. Young Turban squash, on which the remains of the corolla still persist. The central part of the fruit is the ovary.

*C. acutangulus*, Hort.=Luffa.—*C. Citrullus*, Ser.=*Citrullus vulgaris*.—*C. Colocynthis*, Linn.=*Citrullus Colocynthis*.—*C. metuliferus*, Mey. Hispid annual, with palmately somewhat 3-lobed cordate petiolate lvs., and oblong-obtuse spiny fr., about 4 in. long. S. Afr.—*C. perennis*, James=Cucurbita.—*C. prophetarum*, Linn. Slender perennial with ashy scabrous long-stalked mostly 3-5-lobed lvs., and longitudinally white-striped softly spinose fr. 1-1 $\frac{3}{4}$  in. long. Afr.—*C. Vilmorinii*, Hort. A plant of unrecorded origin, with cut lvs. and abundance of canary-yellow soft-spined frs.

L. H. B.

**CUCURBIT:** A plant of the genus *Cucurbita*. Sometimes shortened to *Cucurb.*

**CUCURBITA** (classical name). *Cucurbitaceæ*. **GOURD. PUMPKIN. SQUASH.** Vine-like tender herbs, tendril-bearing, grown for their edible and ornamental fruits.

Annual, or the root perennial-rhizomatous, rough-hairy and scabrous, with large often palmately lobed lvs., the tendrils bifid or multifid: fls. monœcious, large, yellow, solitary in the axils, the staminate long-stalked, the pistillate short-stalked; corolla 5-lobed; stamens 3, arising from the bottom of the fl., and united in a column; stigmas 3, but 2-lobed; ovary inferior, inclosed in a hollow receptacle; tendrils 2-3-forked.—About 10 species in warm parts of Asia, Afr., Amer. The morphology of the pepo or gourd-fruit may be illustrated by the Turban squash. Figs. 1129-31. In this fr., there is a "squash inside a squash." The inner part bears the

corolla and the styles. It is the ovary. The corolla is attached about the edge of the inner squash, as the withered remains in Fig. 1129 show. Sometimes the withered corolla becomes detached, but hangs to the withered remains of the stigmas, as in Fig. 1130. The longitudinal section of the flower

1130. Young Turban squash, in which the withered corolla has become detached, but hangs to the remains of the styles and stigmas.

(Fig. 1131) explains the structure. The corolla is shown at c, d. The top of the ovary is at o. The stigmas are on the ovary. The part encircling the ovary (outside of o) is the hollowed receptacle. Ordinarily the receptacle is closed at the top, completely confining the ovary; but in the Turban squashes the receptacle does not extend over the top of the ovary, and the ovary therefore protrudes. The older morphologists held this outer part of the squash to be adnate calyx, rather than receptacle. The cucurbits are monographed by Cogniaux, DC. Monogr. Phaner. 3. Also by Naudin, Ann. Sci. Nat. (Bot.) IV, vol. 6. See *Pumpkin* and *Squash*.

1131. Section of flower of Turban squash. Showing the ovary inside the hollowed receptacle.

The terms squash and pumpkin are much confused. In Europe, the large varieties of *Cucurbita maxima* are known as pumpkins, but in this country the fruits of this species are known usually as squashes. In America, the words pumpkin and squash are used almost indiscriminately, some varieties in all species being known by those names. The field or common pie pumpkins are *C. Pepo*; so are vegetable marrows; also the summer squashes, as the Scallop, Pattypan and Crookneck varieties. The Hubbard, Marblehead, Sibley and

1132. Plant of *Cucurbita Pepo*.

Turban kinds are *C. maxima*. The Cushaws, Canada Crookneck, Japanese Crookneck, Dunkard, and Sweet Potato pumpkins (or squashes) are *C. moschata*. The fruit stem (as shown in Figs. 1133, 1136, 1141) is a distinguishing characteristic of the ripe fruits. *C. Pepo* and *C. maxima*, and *C. maxima* and *C. moschata* apparently do not intercross. *C. Pepo* and *C. moschata* have been crossed, but it is doubtful if they intermix when left to themselves. In Europe, the word gourd (or its equivalent in various languages) is used generically for cucurbits; but in this country it is restricted mostly to the small, hard-shelled forms of *C. Pepo* (var. *ovifera*) grown for ornament, and to *Lagenaria vulgaris*.

A. Plant annual.

B. Lvs. lobed: stalks of frs. strongly ridged.

**Pèpo**, Linn. (*C. Melopèpo*, Linn.). **PUMPKIN.** Figs. 1132, 1133. Annual: long-running, prickly on sts. and petioles: lvs. 3-5-lobed, dark dull green: corolla-tube widening upwards, the pointed lobes erect; calyx-lobes narrow, not lf.-like; peduncle very hard and deeply furrowed when mature, not enlarging next the fr.: the fr. very various in form, color, season, size. Probably native to Trop. Amer., but unknown wild.—Cult. by the Indians when Amer. was discovered, in fields of maize. For studies in the nativity

1133. Stem of *Cucurbita Pepo*.—Early Sugar pumpkin.

of the pumpkins and squashes, see De Candolle, Origin of Cultivated Plants; Gray and Trumbull, Amer. Journ. Sci. 25:372; Sturtevant, Amer. Nat. 1890:727; Wittmack, Ber. der Deutschen Bot. Gesell. 6:378 (1888).

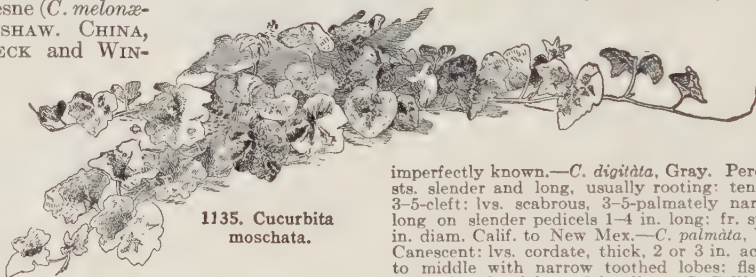

1134. *Cucurbita Pepo* var. *ovifera*.

Var. *condensa*, Bailey. BUSH PUMPKINS. SCALLOP and SUMMER CROOKNECK SQUASHES. Plant compact, little or not at all running. Of horticultural origin.

Var. *ovifera*, Bailey (*C. ovifera*, Linn.). GOURD. Fig. 1134. Plant slender, running: lvs. smaller than in *C. Pepo*, usually very prominently lobed: fr. small, hard and inedible, egg-shaped, globular, pear-shaped, oblate, often striped. R.H. 1894:429.—Sold in many vars. by seedsmen, under the names of *C. Pepo* vars. *pyriformis*, *depressa*, *annulata*, etc. See Gourd.

*moschata*, Duchesne (*C. melonæformis*, Carr.). CUSHAW. CHINA, CANADA CROOKNECK and WINTER CROOKNECK SQUASHES. Figs. 1135–37. Annual: long-running, less prickly and sometimes soft-hairy: lvs. more rounded than those of *C. Pepo*, but lobed, often grayish: fl. with a widening tube, and large, erect lobes; calyx-lobes large, often lf.-like; peduncle becoming deeply ridged and much enlarged next the fr. Possibly of E. Asian origin.

1135. *Cucurbita moschata*.

BB. Lvs. not lobed (except sometimes on young shoots): stalks of frs. not prominently ridged.

*máxima*, Duchesne. SQUASH. Figs. 1138–41. Annual: long-running, the sts. nearly cylindrical, little prickly and often hairy: lvs. orbicular or kidney-shaped, commonly not lobed, the basal sinus wide or narrow, the margin shallowly apiculate-sinuate: corolla-tube nearly the same diam. at top and bottom (Figs. 1139, 1140), the corolla-lobes large and soft, and wide-spreading or drooping: peduncle at maturity soft and spongy, not ridged nor prominently enlarged next the fr.: fr. very various, but not light yellow nor warty nor crookneck-shaped, usually late-ripening, the flesh orange and not stringy. Nativity undetermined. Var. *sylvestris*, Naudin. A form found wild in the Himalayan region, with fr. as large as a man's head.

AA. Plant with perennial root.

*foetidissima*, Kunth (*C. perennis*, Gray. *Cucumis perennis*, James). CALABAZILLA. Fig. 1142. Perennial: long-running, scarcely prickly: lvs. large, cordate-

triangular, grayish pubescent, the margin shallowly apiculate-crenate: fl. nearly as large as in *C. Pepo* and similar in shape, the pistillate on a peduncle 2–3 in. long: fr. size and shape of an orange, smooth, green and yellow splashed, not edible. Sandy arid wastes, Neb. and Colo. to Texas and Mex. and westward to Calif. R.H. 1855:61; 1857, p. 54.—In its native haunts, the root is tuberous, 4–7 in. diam. and penetrating the earth 4–6 ft. Roots at the joints. The plant has a fetid odor. Sold by seedsmen as a gourd, but the fr. does not often ripen in the northern states. Useful on arbors and small trees, when coarse vines are wanted.

*ficifolia*, Bouché (*C. melanosperma*, A. Br.). St. very

long, stout, becoming somewhat woody: lvs. pale green, often marbled, in outline ovate or suborbicular, cordate at base, roundly 5-lobed and the sinus rounded: calyx-tube short and campanulate: fr. large (often 1 ft. long), fleshy, round-ovoid, white-striped, the flesh white; seeds ovate, black. E. Asia, but widely cult. in warm countries for its ornamental watermelon-like frs. A var. *mexicana*, Hort. (*C. mexicana*, Spreng.), is mentioned, with seeds twice the size of those of the type, and said to grow wild in the neighborhood of Mazatlan, Mex.

*C. Andreana*, Naudin. Allied to *C. moschata*: sts. long and rooting at the nodes: lvs. large, marbled with white: fls. of the form of those of *C. maxima* but much smaller: fr. obovoid, 8 in. long, marked with white and yellow. Uruguay. R.H. 1896, pp. 542–3.—*C. californica*, Torr. Canescent: lvs. thick, 2 in. across, 5-lobed, the lobes triangular and mucronate: tendrils parted to the base: fls. 1 in. or more long on pedicels  $\frac{1}{2}$ –1 in. long. Calif.;

imperfectly known.—*C. digitata*, Gray. Perennial, the root fleshy: sts. slender and long, usually rooting: tendrils short and weak, 3–5-cleft: lvs. scabrous, 3–5-palmately narrow-lobed: fls. 2–3 in. long on slender pedicels 1–4 in. long: fr. subglobose, yellow, 2–4 in. diam. Calif. to New Mex.—*C. palmata*, Wats. MOCK ORANGE. Canescent: lvs. cordate, thick, 2 or 3 in. across, palmately 5-cleft to middle with narrow toothed lobes: fls. 3 in. long on stout peduncles: fr. globose, 3 in. diam. S. Calif.

L. H. B.

**CUDRANIA** (derivation unknown). *Moræceæ*. Woody subjects cultivated for their foliage and as hedge plants. Deciduous trees or shrubs, often thorny, with alter-

1137. Fruit of *Cucurbita moschata*—Tonasu, a Japanese variety.

nate, petioled and stipulate lvs.: fls. dioecious, in axillary globular heads; staminate with 4 sepals and 4 stamens and 2-4 bracts at the base; pistillate with 4 sepals inclosing the 1-ovuled ovary, growing into a fleshy subglobose fr. with a crustaceous rind.—About 3 species, in S. and E. Asia and Trop. Austral., of which only one is sometimes cult. It requires protection in the N. and is usually prop. by greenwood cuttings in summer under glass.

*tricuspidata*, Bureau (*Maclura tricuspidata*, Carr. *C. triloba*, Hance). Shrub, or small tree, to 20, rarely to 60 ft., with slender, thorny branches: lvs. elliptic-ovate, acuminate, entire, sometimes 3-lobed at the apex and on young plants even tricuspidate, nearly glabrous, 1½-3 in. long: fl.-heads axillary, solitary or in 2's, on short peduncles: fr. globose, about 1 in. across. China. R.H. 1864, p. 390; 1872, p. 56; 1905, p. 363 (habit). H.I. 18:1792.—Recently recommended as an excellent hedge-plant for the S. In China the lvs. are used as a substitute for mulberry lvs. and it is called silkworm thorn; the fr. is edible. Between this species and *Maclura pomifera*, a hybrid has been raised, described as *Maclurandra hybrida*, André. R.H. 1905:362. ALFRED REHDER.

**CULINARY HERBS** are those herbs used for flavoring in cookery, but the term has a wide application, including species used for garnishing and sometimes as potherbs. The culinary herbs are of very minor importance in American gardens, and yet a few of them, as anise, caraway and coriander, are well and favorably known. The species are mostly aromatic. They are largely of the Umbelliferae and Labiatae. No special

**Basil** (*Ocimum basilicum*). *Labiatae*. Annual. *Uses*: As flavor in highly seasoned dishes; oil as perfumery. Propagated by seeds.  
**Borage** (*Borago officinalis*). *Boraginaceae*. Annual. *Uses*: Herbage as potherb and salad; garnish; flavor in beverages. Propagated by seeds in spring.  
**Caraway** (*Carum Carvi*). *Umbelliferae*. Biennial or annual. *Uses*: Herbage eaten cooked or as salad; roots as vegetable; seeds for flavoring; oil in manufacture of perfumery and soaps. Propagated by seeds in May or early June.

1138. *Cucurbita maxima*.

**Catnip or catmint** (*Nepeta Cataria*). *Labiatae*. Perennial. *Uses*: As bee forage; leaves as condiment; formerly a medicinal remedy. Propagated by seeds in autumn or spring.  
**Chervil** (*Anthriscus Cerefolium*). *Umbelliferae*. Annual. *Uses*: Leaves for seasoning and for mixed salads. Propagated by seeds.  
**Chives** (*Allium Schanoprasum*). *Liliaceae*. Perennial. *Uses*: Leaves for flavoring. Propagated by individual bulbs or division of clumps in early spring.  
**Clary** (*Salvia Sclarea*). *Labiatae*. Perennial. *Uses*: Leaves in cookery; wine made from plant when in flower. Propagated by seeds in spring.  
**Coriander** (*Coriandrum sativum*). *Umbelliferae*. Annual. *Uses*: Seed in confectionary and as ingredient in condiments; flavor in beverages. Propagated by seeds in spring or autumn.  
**Cumin** (*Cuminum odorum*). *Umbelliferae*. Annual. *Uses*: Seeds as ingredient in curry powder; for flavoring pickles, pastry and soups. Propagated by seeds in spring.  
**Dill** (*Anethum graveolens*). *Umbelliferae*. Annual. *Uses*: Seed as seasoning, extensively for commercial pickles; oil for perfuming soap; young leaves as seasoning and salads; dill vinegar as condiment. Propagated by seeds in spring.  
**Fennel** (*Foeniculum vulgare*). *Umbelliferae*. Biennial or perennial. *Uses*: Herbage as garnishes and flavors; as salads; seeds for flavoring beverages, and for confectionary; oil as perfumery. Propagated by seeds, and grown as an annual.  
**Finocchio or Florence fennel** (*Foeniculum dulce*). *Umbelliferae*. Annual. *Uses*: As a vegetable. Propagated by seeds.  
**Fennel Flower** (*Nigella sativa*). *Ranunculaceae*. Annual. *Uses*: Whole plant or seed used in cookery. Propagated by seeds in spring.  
**Hoarhound, or horehound** (*Marrubium vulgare*). *Labiatae*. Perennial. *Uses*: Formerly in cookery and medicine; now for candy only. Propagated by seeds in spring.  
**Hyssop** (*Hyssopus officinalis*). *Labiatae*. Perennial. *Uses*: Herbage in salads; oil in preparation of soaps, etc. Propagated by divisions, cuttings and seeds in spring.  
**Lavender** (*Lavandula angustifolia*, L. *Spica*). *Labiatae*. Perennial. *Uses*: Flowers and oil in perfumery; sometimes as condiment and in salads. Propagated by divisions or cuttings, or rarely seeds.  
**Lovage** (*Levisticum officinale*). *Umbelliferae*. Perennial. *Uses*: Young stems in confectionary. Propagated by division or seeds in late summer.

**Marigold** (*Calendula officinalis*). *Compositae*. Annual. *Uses*: Flower-heads as seasoning; fresh flowers to color butter. Propagated by seeds in spring.  
**Marjoram** (*Origanum vulgare* and *O. Marjoram*). *Labiatae*. Perennial (*O. Marjoram* treated as annual). *Uses*: Herbage for seasoning; oil in perfuming soaps, etc. Propagated by cuttings, division or layers and seeds in spring.  
**Mint** (*Mentha spicata*). *Labiatae*. Perennial. *Uses*: Herbage as seasoning; leaves in jelly. Propagated by cuttings, offsets and divisions in spring.  
**Parsley** (*Petroselinum hortense*). *Umbelliferae*. Biennial. *Uses*: Roots as vegetable; top as potherb; leaves for seasoning and garnish. Propagated by seeds in spring.  
**Pennyroyal** (*Mentha Pulegium*). *Labiatae*. Perennial. *Uses*: Leaves as seasoning; pennyroyal oil. Propagated by division, or rarely cuttings.  
**Peppermint** (*Mentha piperita*). *Labiatae*. Perennial. *Uses*: Oil as flavoring; perfume in soaps, etc. Propagated by division or running rootstocks.

1140. Pistillate flower of *Cucurbita maxima*—Hubbard squash. (×½)

difficulty attaches to their cultivation, and little more may be said here than to present an alphabetical list with statements as to uses, duration of plant, and means of propagation. They all thrive in mellow fertile garden land. Usually they are grown at the side of the main garden plantation, and they may add a certain charm to the garden as well as to supply an agreeable aroma to the kitchen products. See the little book on "Culinary Herbs" by M. G. Kains, 1912.

**Angelica** (*Archangelica officinalis*). *Umbelliferae*. Biennial or perennial. *Uses*: Stems and leaf-stalks as salad, or roasted like potatoes; garnish; as "candied angelica;" stems blanched and used as vegetable; leaves as spinach; seeds for flavoring; oil of angelica obtained from seeds for flavoring. Propagated by seeds in late summer or early autumn.
